In paralytic Disorders a serene and temperate Air is of great Use: Hence *Cælius Aurelianus*, in *Lib. 2. Cap. 1. Chron.* orders the Patient to be laid in a light Place, so that the Chamber must be neither too hot, nor too cold, but temperate. The Aliment ought, also, to be light, and of easy Digestion, especially in the Beginning, when the Palsy is, for the most part, an acute Disorder, and the Force of the Stomach always languid. Nor are Wines, or Malt Liquors, of any Kind, to be used, especially in the Beginning: But, when the Disease is of a longer Standing a fuller Diet may be allowed.

For washing the paralytic Parts when dry, or affected with an Atrophy, we are by no means to use Spirit of Sal Ammoniac, which is rather to be used when the Parts are swell'd; in which Case it is, also, expedient to inclose the tumid Parts in a small Sack, filled with the following Species:

Take of Bran and Millet, each four Handfuls: Mix them in any Kettle, or proper Vessel; dry them over a gentle Fire; put them in the Bag, which is to be applied warm to the Part affected, when the Patient goes to Bed.

Violent Disorders of the Head, such as Lethargies, Apoplexies, and Hemiplegies, are very familiar to old Persons, and almost incurable. For the sake of Prevention, therefore, it is expedient, they should carefully abstain from all those things, which can weaken the nervous System, or render the Circulation of the Blood through the Head slower; and particularly from Cold, especially when the Body is disposed to sweat, from liberal drinking of spirituous Wine, from Grief, from Terror, and from the Intermittion of usual Venesection. Old Persons ought, also, to abstain from the excessive Use of Tobacco, vaporous Preparations of Wormwood, thick Ale, and a moist and vapid Air. That in old Persons these Disorders are rarely cured, is, in my Opinion, owing to this, that their Blood abounds with a pituitous and glutinous Humour, which greatly contributes to hinder the Reflux of the Blood through the small Veins, and venous Sinuses of the Brain, the former of which it obstructs by its Viscidity. But 'tis no easy Task to remove those Obstructions, which are deep-seated in the Vessels of the Brain.

Paralytic Patients, when abounding with Fat, and a Redundance of peccant Humours, are not easily restored to Health and Strength, unless they use a drying Regimen, which consists in abstaining from Broths, boiled Meat, and moist Substances; in using little Drink, especially of the thick Kind. They are only to use a small Quantity of the Decoction prepared of China Root, Shavings of yellow Saunders, Safafras, and Raisins. They may, also, drink a moderate Quantity of generous Wine. They must eat no Flesh, but what is roasted; and may be allowed stoned Raisins. The Body, and its various Members, ought, also, to be carefully exercised. *Hoffman.*

A Palsy is such a lax State of the Muscles, as is sufficient to produce an Immobility not to be surmounted by any voluntary or vital Efforts. In this Disorder Sensation is sometimes absolutely destroy'd; at other times, a small Degree of it, accompanied with a Stupor, and, as it were, a slight punctory Pain, remains.

The most immediate Cause of this Disorder is always found to be an intercepted Influx of the nervous Fluid from the Brain, or of the arterial Blood into the paralytic Muscle.

This Disorder may therefore arise,

1. From every Cause capable of producing an Apoplexy;
2. From every Circumstance which renders the Nerves unfit for transmitting the animal Spirits; and,
3. From every Circumstance which hinders the Ingress of the arterial Blood into the Muscle. Hence we understand the respective Natures of a Paraplegy, an Hemiplegy, and a Palsy of a particular Part.

A Palsy may therefore be produced by an Apoplexy; a slight Parapoplexy; an Epilepsy; Convulsions; intense and long-protracted Pain; a Retention of any of the usual Evacuations, attended with a subsequent Vertigo; such as, a Suppression of the hæmorrhoidal and menstrual Discharges; the stopping of

Abcesses and Fistulas; the Retention of the Fæces, Urine, and Saliva. This Disorder is, also, produced by Translations of any morbid Matter, either in acute or chronical Diseases; by whatever injures the Nerves, either by Obstruction, Solution, Compression, Ligature, Distortion, Distraction, or Constriction: Hence a Palsy may be produc'd by gross Humours, Wounds, Erosions, Abcesses, Gangrenes, inflammatory Tumors in the Integuments of the nervous Medulla, in the Ganglions, and the Nerves themselves; by serous, purulent, ichorous, and scirrhus Tumors; by strong and tight Ligatures; by Fractures, Luxations, highly astringent Aliments, Medicines, and Poisons. Hence a Palsy may be generated by excessive Cold, intense Heat, a cold and moist State of the Air, the continual and excessive Use of warm Water, and the Steams of Antimony, Arsenic, recent Lime, Mercury, and other Poisons.

The immediate and remote Causes already enumerated, and concurring to the Generation of a Palsy, produce various Effects, according to the different Seats where they reside; according to their different Strength; according to the Diversity of the Part affected, as it is more or less, more mediately or more immediately, necessary to Life; for, from these Circumstances, the Disorder may be reckoned more or less mortal, curable or incurable.

A Palsy of the Heart, Lungs, Muscles subservient to Respiration, and the Throat, soon proves mortal: A Palsy of the Stomach, Intestines, and Bladder, arising from internal Causes, is highly dangerous: A Palsy of the Muscles of the Face is bad, and easily convertible into an Apoplexy: A Paraplegy is highly dangerous, prognosticates an Apoplexy, and, when the latter happens, the former proves mortal: An Hemiplegy is bad, partakes of the Nature of a Paraplegy, and, consequently proves mortal, when an Apoplexy happens: A Palsy, accompanied with Coldness, Insensibility, and Atrophy of the Part, is bad, and rarely curable: A Palsy, accompanied with violent Convulsions, and an intense Heat of the opposite Part, is bad; but, from the Symptoms opposite to these, 'tis known what Palsies are curable and less dangerous; as, also, what in this Disorder are the Causes of so sudden Deaths, which happen without any previous Sign, or almost any concomitant Symptom.

The Physician who applies what has been said to all the Muscles, whatever their Functions are, will understand the Causes, and know the Diagnostics and Prognostics, of an almost infinite Number of surprising, and, otherwise, unaccountable Diseases.

Nature cures a Palsy, by attenuating and dissipating the morbid Matter, by a bad Crisis deposited in the exterior Parts of the Brain, its Ventricles, about the Medulla oblongata, the Medulla spinalis, and the Egress of the Nerves from the Marrow, by resolving the impacted Matter by a violent supervening Fever, by moving the impacted Matter by a convulsive Tremor of the Part, and by eliminating this Matter by a copious and long-protracted Diarrhoea.

The Cure requires a Removal of those Causes which hinder the Functions of the Nerves and Arteries; and then a Restoration of the free Circulation of the Fluids.

The Causes hindering the Functions of the Nerves and Arteries are removed by various Methods, easily applicable to these Causes previously known.

If the internal Cause of a Palsy is a gross and stagnant Matter, such Medicines must be used, as are capable of producing those Circumstances, by which Nature cures this Disorder.

The Cure of a Palsy is to be attempted,

1. By attenuating and dissipating Medicines; such as aromatic, cephalic, nervous, and uterine Vegetables, the express'd Juices, Infusions, Decoctions, Spirits, or Preserves of which may be used: By fixt Salts obtained from these, by Calcination; by volatile Salts obtained from them, by Distillation or Putrefaction: By Oils obtained from these, by Expression, Coction, Infusion, and Distillation: By saponaceous Substances artificially prepar'd of a Combination of these: By the strong-scented Parts of Animals, and the Juices, Spirits, Oils, Salts and Tinctures of Insects: By fossile Salts, metallic Crystals, and such Compositions as principally consist of these Substances: By all these so judiciously mix'd, as that they shall mutually assist each other: By these means the Attenuation and Dissipation of the Matter, together with a febrile Heat, are obtain'd.
2. The Cure is to be pursued by strong Stimulants, and such Substances, as, by exciting a nervous, tremulous, and convulsive Motion, powerfully dissipate the impacted Matter: Of this Kind, the most considerable are strong Sternutatories and Emetics, especially when frequently repeated.
3. The Cure is to be attempted by hot, resolvent, aromatic, or fossil and acrid, metallic, mercurial and antimonial Purges; and consequently strong Hydragogues exhibited in large Doses, and for several Days successively repeated; by which means

means a copious, and sometimes a long-protracted Diarrhoea may be excited.

4. By filling the Vessels of the Body with large Quantities of attenuating Liquors; and then exciting a greater Degree of Motion and Sweat, by means of the Steam or Vapour of kindled Spirits.

Hot, dry, external Frictions to a Redness of the Part, or Frictions with penetrating and stimulating animal or vegetable Spirits, or with nervous Oils, Liniments, Balsams, and Ointments, are beneficial in the Cure of this Disorder. Vapour-baths, and Immersions; acrid, aromatic and attractive Plasters; Cuppings; Scarifications; Vesicatories; Fustigations; and such Things as excite Pain, and a gentle Inflammation, as Nettles, are also serviceable in the Cure of a Palsy. Formulæ for this Purpose are these following.

Take of Mastich, Olibanum, and Amber, each half an Ounce; mix up into a Powder: Let half a Dram of this be sprinkled on live Coals, and when the Steam arising is receiv'd into an hot and dry Linen Cloth, let the Parts affected be strongly rubbed with it.

Take of the Spirit of Lavender, three Ounces; of Sal Ammoniac, two Drams; of the Tincture of Castor, four Drams; and of distil'd Lavender-water, six Ounces: Make into a Mixture, with which the Parts affected are to be rub'd.

Take of Cumin-plaster, Melilot-plaster, and pure Galbanum, each one Ounce; and of the Oil of Castor, half an Ounce: Make into a Plaster, to be applied upon Leather to the Part affected, after previous Friction.

Take of the Oils, by Infusion, of Wormwood, Dill, Chamomile, Nep, Rue, sweet Trefoil, Castor, Saffron, Orris, Earth-worms, Spikenard, and Earth, each one Dram; and of the Unguentum Agrippæ, the Unguentum Arantæ, the Unguentum Martiatum, and the Unguentum Nervinum, each six Drams: Make up into a Liniment, to be applied to the Parts affected.

Acrid Plasters are the Cumin-plaster, the Galbanum-plaster, the Melilot-plaster, and some others.

But we are above all things to take care, that all these Remedies may, if possible, be applied to the Seat of the Cause, when detected. Now the Part affected, the various Parts labouring under the same Disorder, a Knowledge of the Muscles and Nerves, of their Unions, Origins, and Distributions, and a Knowledge of the Functions depending on each of these, when compared with each other, clearly indicate and point out the latent Seat of the Disorder. *Buerhaave Aphorism.*

A PALSY IN THE IRIS.

The excessive Contraction and Dilatation of the Iris are occasioned by a sort of Palsy in its Muscles. The Dilatation proceeds from a Palsy of the circular Muscle; the Contraction is caused by a Palsy in the radial Muscle. The general Cause of these Palsies must be deduced from an Obstruction in the Nerves of the Choroides; which, by their Communication with the Nerves of these Muscles, produce their Motion. It happens, tho' seldom; that the Pupil is almost deprived of any Motion, either of Contraction or Dilatation while the Sight, tho' weak, still remains. In this Case, 'tis to be observ'd there is a Palsy in the nervous Filaments of the Iris; and that the Impression of the Object is convey'd to the Optic Nerve, by means of its close Union with the Choroides. I have always remarked, that the Palsy of the Choroides is attended with that of the Iris; and that the Palsy of the nervous Fibrils of the Iris does not damage the Choroides, tho' it weakens the Sight; which seems to be occasioned from the too great Dilatation or Contraction of the Pupil, which, by admitting either too many or too few Rays, renders the Sight imperfect.

A PALSY OF THE UPPER EYE-LID.

The upper Eye-lid becomes paralytic, when it is drawn down, and cannot be rais'd; or when it is rais'd, and cannot be brought down. In the first Case, the Elevator Muscle is affected; in the second, the Orbicular, or Depressors. This Palsy is either perfect, or imperfect: It is said to be perfect, when the Eye-lid is almost destitute of Motion; and imperfect, when the Eye-lid has some Motion. This last Sort has several Degrees, which differ only in their having more or less Motion. When the Eye-lid remains always open, and without Motion, it is what the Antients called the Hare's Eye.

In the Palsy in general, both Sense and Motion are often lost; but, in this sort of Palsy, the Defect is in the Motion; whilst the Sense is not injured, or, at least, very seldom.

As Palsies are generally the Effects of an Apoplexy, this may be called a sort of slight or insensible Apoplexy. The Matter which causes it is thrown upon, obstructs, and compresses the Nerves, that supply the Fibres which move the Eye-lids. Purgatives, and all Remedies used for the Palsy in general, are proper in the present Case. The hot mineral Waters, the Success of which we daily experience, are equally beneficial in this Palsy. I have cured several of this Disease by Purges, Sudorifics, and, above all other Remedies, with Viper-broths.

The following Fumigation receiv'd in the Eye, and the neighbouring Parts, may be used. It is made of Rosemary, Thyme, Sage, and Wine boiled in a Coffee-pot: Let the Pot be covered with a Funnel; the broader Part of the Funnel must fit the Coffee-pot exactly: Let the Eye be placed before the Steam, which comes out of the End of the Funnel, as from a little Chimney; this must be done Night and Morning, for about a Quarter of an Hour. It is of the same Efficacy, as the pumping of hot mineral Waters on paralytic Parts: Care must be had to place the Eye at a due Distance, to support the Heat. The following Method must be used at the same time: Take a little pewter Pan, that will cover the Eye-lid, with a Pipe at its Bottom in the Form of an Handle, about four Fingers in Length. Let this Pipe be filled with Spirits of Wine distilled several times on Cloves, Lavender, Origanum, and Thyme: Afterwards lay the Pan on the Eye, and heat the Handle with your Hand. The Spirit thus rarefied bears on the Part, and there excites the animal Spirits in the moving Fibres. Care must be had to repeat this three times a Day. Several have been cured by these Means, especially when the Disease has not been inveterate.

The Eye-lids are likewise attacked with a quick, involuntary Motion, or Vibration, which I take to be a convulsive Motion of the Eye-lids. When this Accident happens seldom, it is of no Consequence; and is cured by rubbing the Palm of the Hand with Hungary Water, and applying it afterwards to the Part, for some Moments, three times a Day.

This convulsive Motion degenerates, sometimes, to a total Convulsion of the Eye-lid; then the Eye-lid remains shut about a Minute, and is afterwards rais'd; this happens often in the Day: During the Time of this Convulsion, the Fibres of the orbicular Muscle, which it affects, become stiff and tense. It may be compared to that Sort of Convulsion commonly called the Cramp, which seizes the Leg in the Night, and continues some time before the Position of the Leg can be altered. The Cause of this Convulsion must be deduced from the irregular Motion of the animal Spirits, which, flowing with too great Rapidity into the Fibres of the orbicular Muscle, obstruct, for a short time, the Action of the Musculus attollens.

This Convulsion may be instantaneously removed, either by rubbing the Hand round the Orbit and the Eye-lids, or making the Persons sneeze in the Time of the Fit.

Although either of these Methods give immediate Ease, yet they do not prevent the Return of the Convulsion; for which Reason proper Remedies, both internal and external, must be employed, as Bleeding, Purges, and Antiepileptics; such are, Piony-roots and Seed, a Decoction of the sudorific Roots and Woods, the Mistle of the Oak, Cinnabar of Antimony, the volatile Salts, and the like. Among all these Remedies, I have not found a more efficacious one; than the sublimed Flowers of Sal Ammoniac, mixed with the Caput Mortuum of Oil of Vitriol; they must be wash'd in common Water to carry off their Salts, and afterwards they must be dried; three Grains of them must be taken every Morning in the Confection Hyacinthi. This Medicine commonly removes the Fits of the Convulsion before the eighth Day. As to external Remedies, let the upper Part of the Eye-lids be rubbed with an Ointment made of the Oil of Earth-worms, mixed with some Drops of Sal volatile oleosum, or compound Baum-water. The distilled Water of Elder-flowers is, likewise, very beneficial in the Convulsion and Palsy of the Eye-lid.

When the Eye-lid remains shut, and cannot be rais'd, there is an Operation which takes off Part of the Skin of that Eye-lid. When the Wound is healed, and the Skin is less extended, the Musculus attollens of that Eye-lid recovers its Motion, the Disease is cured, and the Person opens and shuts his Eye-lid at Pleasure. *St. Yves.*

PARAMERIA, παραμρία. The internal Parts of the Thighs.

PARAMESOS, παραμέσος. The Ring-finger; that which is next to the Little-finger.

PARA-

PARANOEA, *παράνοια*, from *παράνοος*, to be delirious. A Delirium, or Alienation of Mind.

PARAPAR. Clus. A sort of Indian Kidney-Bean. *Raii Hist. Plant.*

PARAPECHYON, *παρὰπύχον*. The Radius, a Bone of the Arm.

PARAPHIMOSIS.

When the Prepuce is either naturally so short; or so swelled and contracted; that it cannot be drawn over the Glans, a Disorder is produced, called by the *Greeks* Paraphimosis. By this Stricture of the Prepuce, the Circulation of the Blood in the Glans is generally so much obstructed, that not only a Tumor of the Glans is occasioned, with violent Inflammation, and most acute Pains, but a Sphacelus is induced, and the Penis must be subjected to Incision. Those are most affected with this Disorder, who have naturally a Prepuce too narrow, and who exert themselves too vigorously in Coition, especially with Virgins, in whom the Vagina is strait. Young Husbands are sometimes egregiously mistaken, when, after the Embraces of a new Spouse, they find themselves affected by this Disorder; and therefore imagine her to have been unchaste and infected, while the real Cause was, the natural Stricture of Virginity. Sometimes those Youths, or Boys, are affected by this Disorder, who, having a very tight Prepuce, lasciviously draw it back, while the Penis is in a State of Flaccidity; by which means, an Erection being occasioned, the Glans becomes tumid, and the Prepuce cannot be returned. Thus have I seen a surprising Tumor of the Prepuce occasioned behind the Glans. Nor is it to be denied, that those are, sometimes, liable to a Paraphimosis, who have engaged in impure Embraces; for while the Penis, and interior Skin, are infected and corroded by the virulent Matter, the Prepuce may very readily be attacked with an Inflammation, Tumor, and those other Disorders before-mentioned.

The Cure of a Paraphimosis principally consists in reducing the Prepuce so, that the naked Glans may again be covered; for such a Reduction is immediately followed by a Remission of the Pain, and other Symptoms. Meanwhile, because a violent Inflammation seizes the tumid Part of the Penis, which renders the Return of the Prepuce difficult, and often impossible, it will not be improper to apply to the Penis digestive and emollient Fomentations or Cataplasms, or warm Wine, or camphorated Spirits of Wine; if, upon renewing the Application, no Erection appears, the Prepuce may be attempted to be drawn over the Glans; which being effected, all the other Symptoms immediately vanish. But because Wine, and camphorated Spirit of Wine, by their acrimonious Quality, and the emollient Cataplasms by their emollient Power, produce a Flux of the Blood towards the morbid Part, and, consequently, increase the Distention of the tumefied Penis, some prefer the Application of cold Water; for, when the Penis is immersed in the Water, and when it is plentifully sprinkled on, or applied by Compresses to the Abdomen or Scrotum, and if, at the same time, copious Bleeding be used, the Tumor and Erection generally soon subside. The Penis, thus becoming flaccid, should be lubricated with the Oil of Olives, or with Butter: Then let the Surgeon take the Penis between his fore and middle Fingers of both Hands, and with his Thumbs strongly repress the naked Glans, while the Prepuce is, at the same time powerfully drawn forwards with his Fingers, till the naked Glans be again covered. During this Operation, the Patient is obliged to suffer excruciating Pain, and he makes miserable Outcries; which, however, the Surgeon should entirely disregard, or, as *Celsus* advises, dispatch his Business the sooner, upon which all Complaint ceases; for, after returning the Prepuce, little or nothing else is required for completing the Cure. If the Penis is affected with a slight Inflammation, where there is little Virulency, it generally suffices to bathe it in warm Water.

But if the tumefied Penis, by reason of the violent Inflammation, or long Continuance of the Disease, tends towards a Gangrene, it will be most proper, first, to bleed in the Arm, and afterwards, in the superior Part of the Penis, till it becomes flaccid; then the Prepuce may be returned as before directed, and the Bleeding stopt. *Petit* used a different Method in curing the Paraphimosis. He compressed the tumefied Glans with a narrow perforated Bandage, and, extending the Prepuce, he again brought it over the Glans. Sometimes the Prepuce is so distended with the serous Part of the Blood, that it appears like a Blister produced by a Burn, or a Vesicatory; and the contained Humour is conspicuous to the Eye, much obstructing the Reduction of the Prepuce over the Glans. In this Case, the distended Skin should be opened with a Knife, or a Lancet: Thus the Serum being discharged, the Wound must be cleansed with warm Wine, and the Skin may be again stretched over the Glans. In order to prevent the wounded Skin from growing to the Glans, the Patient, as often as he

makes Water, should retain it a little between the Prepuce and the Glans; he should likewise frequently draw the Skin backward and forward, till all Danger of its Cohesion with the Glans disappear. The same Intention may, also, be answered, by often injecting warm Spirit of Wine between the interior Skin of the Prepuce, and the Glans; or by interposing soft Lint between the Glans and the Skin. If the Prepuce already adheres to the Glans, they should be forthwith separated by a Tooth-picker, a blunt Lancet, or a Knife armed with a Button; but particular Caution must be used to avoid wounding the Glans, which would occasion a large Hemorrhage. The Prepuce and Glans, being thus discharged, their reuniting must be prevented, by the Methods above directed. The Skin and Glans ought to be the more carefully kept asunder, while they are so; because, if once they are firmly united, they cannot be separated without the greatest Difficulty. After the Operation, the Penis should be bound up to the Belly, left, by its hanging downward, the Afflux of the Blood being easier, an Inflammation and Tumor might be induced. I have sometimes seen the Prepuce, after it has been drawn back over the Glans, affected with a large hard Tumor, which could by no means be dissolved.

When all these Remedies prove ineffectual, *Petit* directs the following Method: Introduce a small crooked Knife between the Penis and Prepuce, with its Edge turned upwards towards the Prepuce, till the swelled, constricted Part of the Skin can be conveniently divided by it. If the Prepuce be constricted and tumefied in more Places, as in two, three, or four, like so many Rings, the Operation must be as often repeated, as the Nature of the Disorder requires. All the constricted Parts of the Prepuce being thus divided, the Penis must be fomented and wash'd with warm Wine; and, the Prepuce being drawn over the Glans, the Part must be carefully bound up, and healed as before. *Heister Chirurg.*

PARAPHORA, *παράφορα*, from *παράφορος*, to deprave. A slight Delirium, or a Delirium in general.

PARAPHRENITIS. An Inflammation of the Diaphragm, or Parts adjacent.

If a Disease similar to the Pleurisy seizes that Part of the Pleura which surrounds the Diaphragm, or affects the Diaphragm itself, a terrible Species of Disorder, call'd *Paraphrenitis*, is produced.

This Disease is far more frequent than is commonly believ'd, since, when present, it either remains undiscover'd, is neglected, or treated as if it was another Disorder.

A *Paraphrenitis* is known from an highly acute and continual Fever; an inflammatory Pain of the Part affected, intolerable on account of the nervous Membranes. This Pain is greatly augmented during Inspiration, Coughing, Sneezing, Repletion of the Stomach, a Nausea, Vomiting, and a Compression of the Abdomen in discharging the Fæces, or the Urine. Hence the Disorder is accompanied with an erect, small, quick, and suffocating Respiration, performed only by the Action of the Thorax, the Abdomen remaining at Rest; with a perpetual Delirium; a Revulsion of the Hypochondria, inwards and upwards; the Rîsus Sardonius; Convulsions; Madness; and a Gangrene.

A *Paraphrenitis* terminates in the same manner with a Pleurisy; but, in consequence of the great and continual Motion of the Part affected, its Necessity to Life, and the Tension of the nervous Membranes, all the Symptoms are quicker, and more fatal. Hence arises a purulent Ascites.

Hence the Cure of a *Paraphrenitis* requires the same Distinctions and Cautions with that of a Pleurisy, and almost the same Remedies, such only excepted, as the Situation of the Part affected cannot admit of. Emollient Clysters, in consequence of their acting on the Parts next to that affected, are often beneficial.

But when the Diaphragm, previously inflam'd, comes to a Suppuration, and the Abscess, breaking, discharges its Pus into the Cavity of the Abdomen, the Pus is there collected, congested, and putrefied, produces a Tumor, a Corrosion of the Viscera, a violent Tabes, and, at last, Death.

This Species of *Paraphrenitis*, tho' known, is yet absolutely incurable. *Beerb. Aphorism.*

PARAPHROSYNE, *παράφροσύνη*, from *παράφροος*, to be delirious. A Delirium, or Alienation of Mind.

PARAPLEGIA, *παράπληγία*, from *πᾶρα*, importing somewhat injurious; and *πλησσω*, to strike. A Paraplegy, or Palsy of all the Parts below the Neck, as it is now understood; but in *Hippocrates* it seems to import a Palsy of any particular Part, in consequence of an Apoplexy, or Epilepsy. See *APOPLEXIA*, and *PARALYSIS*.

PARARMA, *παράρμα*. The Lift of Cloth. *Galen, in Hippocrat. de Arte.*

PARARTHREMA, *παράρθρεμα*. A slight Luxation.

PARAR-

PARARRHYTHMOS, *παράρρυθμος*. An Epithet for a Pulse which is not suitable to the Age or Nature of a Person.

PARASCHIDES, *παράσχιδες*, from *παράσχω*, to cleave. The Fragments, or Splinters, of fissur'd Bones. *Hippocrates, de Fract.*

PARASEISMA, *παράσεισμα*. A Concussion of the Body, esteem'd a Species of Exercise. *Hippocrates de Dieta, L. 2.*

PARASITICAL PLANTS are such as are produced out of the Trunk or Branches of other Plants, from whence they receive their Nourishment, and will not grow upon the Ground, as the Mistletoe and others.

PARASPHAGIS, *παράσφαγίς*. The Part of the Neck contiguous to the Clavicles.

PARASTATÆ, *παράσταται*. This, in *Hippocrates*, signifies the *Epididymis*. But *Herophilus*, and, after him, *Galen*, call'd these the *Varicose Parastatæ*, in order to distinguish them from the *Glandulose Parastatæ*, now call'd *PROSTATÆ*. The Word is deriv'd from *παρίστημι*, to be situated near.

PARASTREMA, *παράστημα*, from *παράστροφω*, to distort, or pervert. A Perversion, or convulsive Distortion, of the Mouth, or any Part of the Face. *Hippocrates, Protrhet. L. 2.*

PARASYNANCHE. A Species of Quinsy. See *ANGINA*.

PARATHENAR.

PARATHENAR MAJOR.

This is a pretty long Muscle forming Part of the outer Edge of the Sole of the Foot. It is commonly termed *Hypothenar*, but very improperly, according to the Signification of that Word.

It is fix'd backwards, by a fleshy Body, to the outer Part of the lower Side of the *Os Calcis*, from the small posterior external Tuberosity, all the Way to the anterior Tuberosity. There it joins the *Metatarsus*, and, at the Basis of the fifth Metatarsal Bone, separates from it again, and forms a Tendon, which is inserted in the Outside of the first Phalanx of the little Toe, near its Basis, and near the Insertion of the *Parathenar minor*.

PARATHENAR MINOR.

This is a fleshy Muscle fixed along the posterior Half of the outer and lower Side of the fifth Bone of the *Metatarsus*. It terminates under the Head of the Bone, in a Tendon which is inserted in the lower Part of the Basis, of the first Phalanx of the little Toe.

The tendinous Insertion of this Muscle is very closely united to the cartilaginous Ligament of this Part. The same thing is to be observed, concerning the other Muscles, which go to the lower Parts of the Basis of the first and second Phalanges of the Toes. In aged Persons, some Parts of these Ligaments are often turned to Bone, and thereby form these bony Portions, which are taken for distinct Sefamoid Bones.

The *Parathenar major* serves, particularly, to separate the little Toe from the rest; and the *Parathenar minor* bends the first Phalanx of that Toe. Both these Muscles seem to be too large and strong for the necessary Motions of so small a Part on so weak a Joint: But as the little Toe makes a Part of the outer Edge of the Sole of the Foot, which is very much exposed to external Violence when we walk bare-footed; and no Part of it so much exposed as the little Toe, very powerful Muscles were necessary to strengthen it on these Occasions.

Besides the two Uses already mention'd, the great and small *Parathenar* may have another, in which they may, also, be assisted by the *Thenar*; and that is, to bend the Sole of the Foot according to its Breadth, which Action is very requisite in walking a Tip-toe, in going up a Ladder, and in climbing; on which Account, the two *Parathenars* deserve the Name of the *Tiler's Muscles*, much better than the *Transversalis Pedis*. *Winslow.*

PARDALIANCHES. The *Aconitum Pardalianches* is, according to *Boerhaave*, a Name for the *Ranunculus*; *folio Cyclaminis*; *radice Asphodeli, major*.

PARDUS. Offic. *Jonf. de Quad. 81.* Aldrov. *de Quad. Digit. 64.* Charlt. *14.* *Pantherus, Pardalis, Pardus, Leopardus.* Gefn. *de Quad. Digit. 824.* *Pardalis.* Raii *Synop. A. 166.* **THE LEOPARD.**

The Fat is esteem'd one of the best Cosmetics. *Dioscorides.*

PAREAS. The Name of a Serpent said to be found in Syria, some of which are of the Colour of Brass; others, blackish. The Bite is not mortal, but only excites an Inflammation. *Castellus from Forestus.*

PAREDRIA, *παρεδρία*, from *παρά*, importing near; and *εδρα*, a Seat. An Affociation, Vehemence, or Assiduity (of a Disorder, or Disorders.) *Hippocrates Præcept.*

PAREGORICUS, *παρηγορητικός*, from *παρηγορέω*, to console, or mitigate. Mitigating, lenient; an Epithet for Medicines which relieve Pain.

This Root is commonly about the Bigness of the little Finger; tho' sometimes larger. It is of a brown Colour, wrinkled both ways on the Surface; but its inner Substance is fibrous, like the *Thymelæa*. *Zanoni* says, that, when cut transversely, it represents the Sun, and its Rays; but this Conceit is without Foundation. It is of a sweetish Taste, with a disagreeable Mixture of Bitter, and without any Smell. Authors pretend that this Root comes from *Brasil*, for this Reason, because we get it from the *Portuguese*: But it is much more probable, that it is of *East-India* Growth; for a Surgeon sent it from *Surat* to *M. de Jussieu*, by the Name of *Boutua* Root; and wrote, that it grew along the Coast of *Malabar*.

This Root is much celebrated by the *Portuguese*, as an Alexipharmic, and an Antidote against all poisonous Plants. It is, undoubtedly, a very good Diuretic, and very proper in Nephritic Colics.

The Way of using it is, Boil about a Quarter of an Ounce, scraped or rasped, in two or three Pints of Water, till reduced to a Pint; of which the Patient is to drink a Glass every half Hour, in a warm Bath, his Body being before prepared by Bleeding and Clysters.

A small Quantity of the Syrup of the Five opening Roots may be added to the Decoction; and, by this Method alone, *Geoffroy* the elder cured the great *Abbé Bignon* of a Stone-colic, and made him void a very large Stone. When given in a large Dose, it heats considerably. It seems to act by dissolving the slimy Matter contained in the Kidneys and Bladder; and has been given with great Success, mixed with Balsam of Capivi, in Gonorrhœas, after sufficient Evacuations. The Decoction already mentioned has, also, done Wonders in hepatic Colics, arising from an Obstruction of the Orifice of the Gall-bladder, a Glass being drank every three Hours, to the Quantity of a Quart. The *Portuguese* use this Root powder'd, for Quinsys and Diseases of the Thorax. *Geoffroy.*

There is, also, another Sort of *Pareira Brava*; which *Dale* thus distinguishes:

Pareira Brava alba. Geoff. *Tract. 287.* *Pareira Species secunda.* Lochn. *Sched. 32.* **THE WHITE WILD VINE.**

This is said to come from *Brasil*. It is more woody than the former, composed of Fibres, of which some are longitudinal, the rest orbicular. The Bark of this Root is white, but the Substance within yellow, like Liquorice. *Geoffroy.*

PARENCEPHALIS. The *Cerebellum*.

PARENCHYMA, *παρεγχυμα*, from *παρεγχύω*, to pour into. A Term introduc'd, as is said, by *Erasistratus*, importing all that Substance, which is contained in the Interstices betwixt the Blood-vessels of the Viscera, which he imagin'd to be extravasated and concreted Blood. The Moderns, having discover'd all the Viscera to be vascular and glandulous, have rejected this Term, together with the Doctrine.

PAREISIS, *πάρεσις*, according to the Definition of *Areteus*, *Chron. L. 1. C. 7.* is a Palsy of the Bladder, when the Urine is either suppress'd, or discharg'd involuntarily.

PARIETALIA OSSA. The Temporal Bones. See *CAPUT*.

PARIETARIA.

The Characters are;

The Flower is male, tetrapetaloid, stellated, furnished with four Stamina, and with Testiculi, having a small Apex in the Centre without an Ovary. The Flower is female, consisting of a foliaceous, trifoliated Calyx, in whose Centre is a conoidal Ovary, furnished with a fimbriated Tube in another Place of the Plant. The Floscules and Ovaries are closely collected in thick Nodes to the Stalks.

Boerhaave mentions two Species of *Parietaria*; which are, 1. *Parietaria*; *Officinarum*, & *Dioscoridis.* *C. B. P. 121.* *Tourn. Inst. 509.* *Boerb. Ind. A. 2. 92.* *Helxine, Parietaria.* Offic. *Parietaria.* Ger. *261.* *Emac. 331.* *J. B. 1. 976.* Raii *Hist. 1. 206.* *Synop. 66.* *Parietaria vulgaris.* Park. *436.* **PELLITORY OF THE WALL.**

Pellitory of the Wall has several smooth, redish, succulent Stalks, half a Foot or a Foot high, with roundish, sharp-pointed Leaves, set on alternately upon long Foot-stalks, of a Deep-green above, and lighter underneath. The Flowers are small and

and flammous, redish before their Opening, white afterwards, growing among the Leaves all along the Stalks; it grows upon old Walls, flowering in May. The whole Herb is used.

It is cooling, opening, and cleansing, abounding in nitro-sulphureous Salt, and is accounted very good for the Stone, Gravel, Stoppage and Heat of Urine; and for these Purposes the Juice, or Decoction, is given in Draughts, or in Glysters; some commend the same for Coughs. *Miller's Bot. Off.*

By the chymical Analysis, Pellitory yields a great deal of Oil; a great deal of fix'd Salt, and Earth, and several Liquors, of which some are acrid, and the rest acid: As for the volatile Salt, one obtains none that is concrete from this Plant; but it yields an urinous Spirit.

Dioscorides affirms, that it lenifies and resolves, and is good to stop Tetters, and spreading Ulcers: They applied it, in his Time, to the Parts affected with the Gout; they gave the Juice to drink in an old Cough, made a Gargarism of it for the Diseases of the Throat; and injected it into the Ears to appease their Pain. *Cæsalpinus* says, it provokes Urine, and opens the Kidneys; *Tragus* very much commends the Decoction, to remove Obstructions of the lower Belly. Take, according to him, Pellitory of the Wall and Water-cress-leaves bruised; add a sufficient Quantity of Wine; mix, and put them in a Frying-pan; apply them in Form of a Cataplasm, moderately hot, to the lower Belly, for Suppression of Urine. *Dodonæus* only makes a Cataplasm of the Leaves, and Oil of sweet Almonds. *Hildanus* uses Oil of Scorpions, instead of Oil of sweet Almonds. *Tragus* makes another Cataplasm for Contusions, frying it with Bean-meal, Mallows, Wheat-bran, Oil, and Wine. *Camæarius* prescribes it bruised with Vinegar, and applied hot to the Testes, in case of Ruptures. *Aurelius Victor* says, that *Constantine* gave the Name of this Plant to the Emperor *Trajan*; because his Statues and Inscriptions were on all the Walls of Rome, like Pellitory. It is now used in all detersive and lenitive Decoctions, and Semicupiums. The Syrup of Pellitory gives great Relief to hydropic Persons. *Martijn's Tournefort.*

Parietaria absterges, and is somewhat astringent and cooling; it is seldom used internally; yet some commend it for the Cough: Externally, it is of Service in Tumors, Erysipelas, and Abscessions; and, being slightly bruised and apply'd, it is said to be very effectual for the Cure of recent Wounds. The Powder of the dry'd Herb, taken in Honey, or drank in Beer, or Posset-drink, is an excellent and approved Remedy for an inveterate Cough, and Consumption of the Lungs; and was usually prescribed by the Antients for the Cough and Asthma. The Decoction in Wine, or Hydromel, is conducive to the same Purposes; but the Powder is more effectual. This Plant affords a nitro-sulphureous Salt, as well as Borage and Bugloss. That it abounds with nitrous Salt, is evident from its detorsory Virtue.

It is called *Parietaria*, and *Muralis*, from *Paries*, or *Murus*, a Wall, because it grows on Walls: *Helxine*, from *ἑλξω, ἑλξω (helco, helxo)* to draw or attract; because its rough Leaves and Seeds draw and tenaciously adhere to Cloaths: *Perdix*, from *Perdix*, a Partridge, because Partridges usually feed on it: *Vitriaria* and *Urceolaris*, because, by its *Mucousness*, it is of Service for scouring and cleansing Pots and Glasses. *Raii H. P.*

2. *Parietaria*; minor; *Ocymi*. *G. B. P.* 121. *Boerb. Ind. alt. Plant. Vol. 2.*

PARILI. H. M. The Name of a tall Tree, which grows in Malabar.

The Root and Leaves are said to correct a melancholy Disposition of the Blood; and to temperate acid and salt Humours. Of the Leaves, together with the Leaves of the *Carretti*, boiled in the lacteous Juice of the Coco-nut, a Potion is prepared, which mitigates the Pains of the Piles, either Internal, or external.

PARIS HERBA. See HERBA PARIS.

PARISTHMIA. *παρίσθμια.* The Tonfils; or Disorders of the Tonfils. See TONSILLÆ.

PARITI, or TALI-PARITI. A Species of *Alcea*; which grows in Malabar, the Flowers of which, bruised in Milk; are put into the Ears, as a Remedy for Pains of the Head.

PARKINSONIA.

The Characters are;

It hath a polypetalous, anomalous Flower, consisting of five dissimilar Leaves, from whose Cup arises the Pointal, which afterwards becomes a rough-jointed Point; each Knot or Joint containing one Kidney-shaped Seed.

Miller mentions but one Species of this Plant; which is, *Parkinsonia aculeata, foliis minutis, uni costæ adnexis.* *Plum. Nov. Gen.*

This Plant was discovered by Father *Plumier*, in America, who gave it this Name, in Honour to the Name of Mr. *John Parkinson*, who published an universal History of Plants, in English, in the Year 1640.

It is very common in the Spanish West-Indies; but, of late Years, it has been introduc'd into the English Settlements in

America, for the Beauty and Sweetness of its Flowers. This, in the Countries where it grows, naturally rises to be a Tree of twenty Feet high, or more; and bears long slender Branches of yellow Flowers, which hang down after the same manner as the *Laburnum*. *Miller's Dictionary.*

PARNASSIA.

The Characters are;

The Leaves are roundish, and disposed in a Circle; the Calyx is pentaphylloidal; the Flower roseaceous, one on a Stalk, consisting of greater and smaller fimbriated Petals. The Ovary becomes a small conoidal Fruit, opening into three or four Keel-shaped Cells, full of minute Seeds.

Boerhaave mentions but one Sort of *Parnassia*; which is the *Parnassia*; palustris & vulgaris. *Tourn. Inst.* 246. *Boerb. Ind. A.* 243. *Raii Synop.* 3. 355. *Hepatica alba.* *Offic. Gramen Parnassi.* *Ger. Emac.* 840. *Raii Hist.* 2. 1049. *Gramen Parnassi vulgare.* *Park. Theat.* 429. *Gramen Parnassi, flore albo simpliciter.* *C. B. P.* 309. *Gramen Parnassi Dodonæo, quibusdam Hepaticus flos.* *J. B.* 737. *Cistus humilis palustris, Hederæ folio, perfoliata nostras.* *Pluk. Almag.* 108. *Pyrola rotundifolia palustris nostras flore unico ampliore.* *Hist. Oxon.* 3. 505. **GRASS OF PARNASSUS.**

It grows in putrid and marshy Places, and flowers in August: The Parts used in Medicine are the Root, Herb, and Seed.

The Juice of the Leaves, and Decoction of the Root, are most approv'd Medicines for the Eyes. The Seed is a powerful Provocative of Urine, and stops a Looseness and Vomiting. *Dioscorides.* It strengthens the Liver, and frees it from Obstructions. *Chab.* It is vulnerary and astringent, and is said to be effectual in stopping Hæmorrhages. *Hist. Plant. adscript. Boerhaav.*

PAROCHETEUSIS, *παροχέτευσις*, from *παρά*, and *ὄχευσις*, of *ὄχευσις*, a Canal; or Duct, Derivation, is used by *Hippocrates* to signify a Derivation of the Humours from one Part; in order to evacuate them by another not far distant. The Laws of Derivation, in *Hippocrates*, *Lib. de Humoribus*, are thus express'd: *Παροχέτευσις ἐς κεφαλὴν, ἐς τὰ πλάγια, ἢ μάλιστα πρὸς τὴν* "Derivation is made to the Head, to the Sides, and where there is the greatest Tendency." Or, otherwise, 6 *Epid. Sect. 2. Aph. 5.* *παροχέτευειν πρέπειεν ἀπὸ τῶν αὐτῶν ἀπὸ τῶν αὐτῶν* "Derivation is to be used, when you have done something immediately towards a Revulsion, and Reintences are to be subdued (or mollified)." *Galen* very well explains *Derivation*, in his Comment on these Words: "*Hippocrates*, says he, uses the Word *Parocheteusis*, Derivation, when an Humour requires to be evacuated, and does not take its Course the Way which it ought to do, nor yet very remote from the proper Passage, nor to the most contrary Place; for Instance, when the Urine tends to Evacuation through the diseased Kidneys and Bladder, it may be best, in that Case, to make a Derivation of it by the Intestines, in the same Manner as when the Course of the Humours is directed towards the Intestines, if the Intestines are vitiated; a Derivation is to be made by the urinary Passages. Thus, in Women, Derivation is to be made, sometimes, to the Uterus, or the contrary; sometimes a Derivation is to be made of an uterine Flux towards the urinary Passage, or the Intestines." And, *Lib. 1. ad Glauc.* he says, "While the Humours are in a flowing State, Revulsion, ἀπὸ τῶν αὐτῶν; as *Hippocrates* calls it, is the proper Remedy; but, when they are settled and fixed on some particular Part, Derivation is to be attempted."

PARODONTIDES, from *παρά*, frequently signifying, in Composition, the same as the Latin, *prater*, by, nigh to; by the Side of; and *ὀδὸς*, Tooth. The same as **PARULIDES**; which see.

PARONYCHIA, in Surgery, is a Whitloe.

By a *Paronychia*, or Whitloe, is meant an intense, corroding Pain which affects the Phalanges, and especially the Ends of the Fingers, and which is attended with a violent Pulsation, and preternatural Heat. The Fingers are, for the most part, tumefied; and sometimes there is no Tumor, when the Disorder lies deep, or about the Bone: Sometimes these Pains extend to the Cubitus, or Shoulder; because of the Connection between the Fingers and those Parts by the Flexor Muscles: Sometimes the Pain is gentle or moderate; and sometimes the Pain is so violent and intolerable, that the Patient is obliged to pass both Day and Night without any Sleep, in a miserable Condition: Nor is it altogether unusual, to see those of more delicate Constitutions so tormented with the Pain of a Whitloe, that a Fever, Faintings, Convulsions, great Heat and Deliriums, with a violent Inflammation of the Arm; an Abscess, or Spacelus, are induced; and, unless timely Assistance intervene, Life itself is endangered.

As, therefore, the *Paronychia* is more mild, or more violent, according to the different Parts affected by it, several Species of it have been constituted by Surgeons. *Garengot* reckons

four, and *Gouty* five; but I can see no Reason for making more than three. 1. When the Disorder arises in the Skin or Fat, in the back, or fore Part of the Finger, or even under or near the Nail; in this Case, the Pain may be severe, but the Symptoms are usually not malignant. 2. When the Periosteum is attacked, inflamed, or corroded; and then the Patient is tormented with most violent Pains, which, however, are more or less intense, as that tender Membrane is more or less affected. 3. The most malignant Species is, when the nervous Coats of the Flexor Tendons of the Fingers, or the Nerves near them, are seiz'd with this Disease; for then it is attended with the most excruciating Pains, the most malignant Symptoms, and the Patient is every way disordered.

The immediate Cause of a Paronychia appears to me to be, an Inspissation of stagnated Blood, whence proceeds an Inflammation of the adjacent Parts; and this is evident from the Heat and Pulsation of the Part affected. This Inspissation may be produced, partly by internal Causes, as a Crudity and Acrimony of the Blood; and, partly, by various external Causes, as the Prick of a Pin, a Thorn, or a Splinter, or by a Contusion or Bruise, and other like Accidents: So that a Paronychia is more or less dangerous and troublesome, in proportion to the Degree of the Wound or Inflammation, or the Sensibility of the morbid Part. Some Physicians have asserted, that in Fingers thus affected Worms have been observed, to which they ascribed the Cause of the Disorder; and, perhaps, upon this Account, the *Germans* named it the Worms in the Fingers.

In the Beginning of the first Species, the affected Part of the Finger swells, with a slight Hardness, but little or no Pain. Afterwards Redness, with Inflammation and Pain, appears, which are gradually succeeded by the Symptoms already mention'd: But, tho' the Tumor wonderfully increases, the Pain and other Mischiefs seldom become intolerable in this Species, or extend themselves beyond the affected Finger, as in the other Kinds. In this Sort, the peccant Matter is so far from being lodged deep, that it is often perceptible to the Eye: But the nearer the Inflammation reaches to the Periosteum, or Tendons of the Fingers, the more intense are the Pains, so as, sometimes, to affect the whole Arm; and in lax, delicate Constitutions, induce almost continual Watchings.

The second Species of Paronychia may be distinguish'd from the first, by the intense Pain, either in the End of the Finger, or over its whole Extent, accompanied with great Heat, a Fever, Watchings, Convulsions, and sometimes with a Delirium. The Tumor and Inflammation scarcely appear outwardly, nor does the Pain reach the Wrist.

The third Sort of Paronychia may be known by the following Symptoms. There is either no Tumor about the End of the Finger, or it is very small; especially if the Inflammation affects the interior Coat or Vagina of the Tendon, more than the exterior. Here the Pain is so intense and intolerable, that the Patient is in extreme Agonies: Nor is the Finger only affected, but the whole Hand and Carpus; especially that Part of the Hand near the Carpus, under the transverse Ligament of the Hand. The Pain even extends over the Arm, to the internal Part of the Elbow, where the Flexor Muscles of the Fingers have their Origin; and is sometimes propagated to the Top of the *Humerus*, inducing almost continual Watchings, with a Fever and Convulsions.

If the corrupted Matter is lodged in the Coat of the Tendon, its hard and compact Substance makes little or no Swelling upon the Fingers, excepting towards the Joints, where it is but moderate. The Hand is more swelled than the Fingers, but its Pain is milder; and sometimes the Arm has become so surprisingly tumid, that *Garengot* says, he has seen it as large as the Thigh.

The Paronychia terminates variously, according to its different Degrees and Symptoms. In the first Species, there is generally little Danger: If the Parts about the Nail be affected, the Nail generally separates from the Finger, occasioning much Pain to the Patient; tho' sometimes only that Half of the Nail comes away, which is nearest to the Whitloe. But if the morbid Matter is lodged under the Nail, or extends itself towards a Tendon, the Patient is tormented with very intense Pains. In the Paronychia of the second Kind, the Pains and other Mischiefs are so violent, that, as some affirm, the Life of the Patient is sometimes endangered; tho' I have seldom seen the Disorder increased to such a Degree. Sometimes, after the Inflammation and Suppuration, I have seen the Bone attacked with a Caries; and, if this happens in the last Joint, it will be more likely to come away entire, as being very small, than that the carious Part should separate from the sound. But the third Species of Whitloe is the most dangerous, and the most malignant. If, in this Case, an Abscess or Gangrene happens, the Pains are so excruciating, and attended with a Fever, Tumor, and Inflammation of the Arm, and other pernicious Concomitants, that, unless timely Assistance be administer'd, a mis-

erable End may be put to the Patient's Life. If an Abscess should be formed in the Arm, near the *Musculus Quadratus* of the Radius, under the annular Ligament, *Garengot* is of Opinion, that, without Incision, the Case ought to be deem'd incurable; and, even then, the Patient may be in danger of losing the Use of the morbid Finger, notwithstanding the most prudent Treatment; and then the inevitable Consequences of the Disorder are often, by the Ignorant or Malevolent, imputed to the Negligence or Unskillfulness of the Surgeon.

With regard to the Cure of a Paronychia, *Garengot*, without mentioning any other Remedy, directly proposes Incision. But I think it more prudent, as in other Diseases, according to the Advice of *Hippocrates*, (*Secl. 8. Aphor. 6.*) first to try the Effects of Medicine, before I assume the Knife, so much dreaded by the Patient. In this Practice, I am confirmed by Experience, not only in other Diseases of this Kind, but even in the Paronychia itself, when I have exhibited Medicines proper for digesting the inspissated, stagnant Blood; and for mitigating the Inflammation. For this Purpose, let the Patient often hold his Finger, for some Hours at a time, in the best Spirit of Wine, or camphorated Spirit, mixed with a little *Venice Treacle*. A Decoction of Garlick in Milk, or of an Handful of Sabine and Germander, may answer the same Intention; in which warm Liquor the Finger should be constantly immersed, or fomented very frequently with it. The Academy of Sciences at *Paris*, in their Memoirs for 1707. have advised to dip the morbid Finger often in boiling Water, for a small Space of Time. Others prescribe a Plaister of *Asa-fœtida*, thick spread on Linen, to be apply'd to the Part. Others recommend, from Experience, the thin, white Membrane between the Shell and Substance of a boiled Egg, to be apply'd like a Plaister. *Riverius* says, that a Whitloe may be easily cured, by a frequent Intrusion of the diseased Finger into the Ear of a Cat. If, during the Use of these Remedies, the Fever and Inflammation are violent, proper internal Medicines, and Bleeding, ought not to be neglected. If by any of these Means the Patient finds Relief, he should persist in the Use of them till the Finger be without Pain, and perfectly recovered: But if these Remedies operate but slowly, or have no Effect, so that a Suppuration seems to be advancing, Recourse must be had to Incision, as the safest Remedy. Meanwhile, as the Patients are apprehensive of Incision, because of the great Pain it produces, it will not be improper, in the first or milder Species of the Paronychia, to apply a Plaister of *Diachylon cum Gummis*, or, the like, for ripening the Suppuration, till the Situation of the morbid Matter becomes more conspicuous, and the Operation may be performed with less Pain. But in the two other severer Species of this Disorder, the least Delay is dangerous; because the Periosteum, and small Bones, are soon corroded by the malignant Matter, which may induce more intense Pains, larger Abscesses, a Caries, or a Gangrene of the whole Arm, and, probably, the Death of the Patient.

For the easier Cure of a Paronychia, its Species should first be considered: If it be of the mild, or first Kind, and has not penetrated deep, the Cure may, without Difficulty, be obtained. As soon as the purulent Matter becomes prominent, like a Tubercle, or Blister, let the Surgeon place a Finger on each Side of the affected Part; and, stretching the Skin, by drawing it, on both Sides, from the Whitloe, make the Incision: Thus will the Matter be discharged, and the Finger will generally heal spontaneously. *Hildanus*, in *Cent. 1. Obs. 97.* gives the following safe and ready Method of curing a Paronychia, which he had frequently tried with Success. He first fermented the Finger, several times, with the Decoction of the Flowers of the Chamomile, and Melilot, and Fenugreek, and Quince-seeds, boiled in Cows-milk; then he gradually cut off the Surface of Skin, where the Pain was. The Skin being thus removed, some red Specks appeared, in which, upon Incision, he found one or two small Drops of a red Water; and, this being discharged, he applied a Linen Cloth moistened with a Solution of *Venice Treacle* in Brandy; the Pain immediately ceased; and, next Day, the Finger was found.

If the Disorder is seated near the Roots of the Nail, beneath it, or at either of its Sides, the Whole, or Part of the Nail, is generally lost. If the purulent Matter is concealed under the Nail, it affects the adjacent Parts with Inflammation, and most intense Pains. In this Case, *Solingen*, with other Surgeons, advises, first, to remove that Part of the Nail, under which the morbid Matter stagnates, either by extirpating it intirely, or by making an Incision in it; and, having expressed the Matter, the Wound may be easily healed, by the Application of Lint moistened with Spirit of Wine, or Lime-water.

If the peccant Matter lie deeper under the Skin, it must, also, be discharged by Incision, without Delay; for otherwise it would, probably, rather affect and consume the subjacent Bone, than

than burst the external Skin, which is generally both thicker and harder than in other Parts. If the Patient is unwilling to undergo the Operation, the Danger to which he exposes himself, should be remonstrated to him, and the Surgeon should be cleared from the Blame that may arise from the Consequences. In the mean time, in order to ripen the collected Matter, and bring it to Suppuration, apply to the Part a Plaster of Diachylon with the Gums. If, by this Method, the external Skin bursts, the Orifice must be immediately widened, if it be too narrow; and the Wound may be deterged by some digestive Ointment, or the Liniment of *Arcaus* warmed, and mixed with Spirit of Wine; and then apply the before-mentioned Plaster with a proper Bandage; but, if the Patient be willing to submit to a surgical Operation, it is to be thus performed. Let the morbid Finger be laid on a Table, with the affected Part upwards; then let a strong able Assistant firmly hold the Hand and Arm of the Patient, left, being almost unable to sustain the intense Pain, he should suddenly retract his Arm, which, in the Operation, would be extremely detrimental. Then let the Operator penetrate through the Middle of the affected Part, with a strong sharp-pointed Knife, to the very Bone. Thus the Skin and Fat being laid open to the Extremity of the Finger, the stagnant Blood, or corrupted Matter, may be discharged, though the Quantity be sometimes but small, and the Bone will be preserved from Infection.

In the second Species of Paronychia, when the Periosteum is corroded, and the peccant Matter has penetrated to the very Bone, an Incision should be made for its Discharge, according to the preceding Directions; but particular Care must be taken, that the Knife reaches to the Bone. Although little, and sometimes no Matter, appears to be evacuated, because the Quantity is sometimes extremely small; yet, if the Pain gradually remits after the Operation, it is a Signal of a speedy Cure.

Some Authors advise, always to make the Incision in one of the Sides of the Finger, and never in the fore or back Part of the last Bone, to avoid wounding the Tendons: But this is an unnecessary Caution; partly, because it is plain, that the Tendon reaches no farther than the Beginning of the last Bone of the Finger; and, partly, because we learn from Experience, that an Incision may be safely made, either in the fore or back Part of the Finger. *Garengot*, however, without offering any Reason for his Opinion, advises, that the lateral Method of Incision should be strictly observed; he likewise directs, that if the Pain does not abate, after the Operation is performed upon one Side, it must likewise be performed on the other, and upon this Account, because the Pain, continuing after the Incision, intimates that the true Seat of this Disorder had not been laid open. But, in my Opinion, the lateral Incision should only be used, when a Tumor appears on the Side of the extreme Phalanx of the Finger, or when it arises in the second and third Phalanges towards the Hand: On the contrary, I think, the Wound is better made in the Middle of the Extremity of the Finger, when all that Phalanx is affected, or when the morbid Matter indicates its Situation there. Besides, it will neither be agreeable to the Inclination of the Patient, nor the Reputation of the Surgeon, to make two Incisions, when Reason and Experience shew, that one may be sufficient.

The Incision being thus performed, the Blood should not only be suffered to flow out; but should, also, be carefully expressed. Then let the Wound be filled with dry Lint, over which apply a Diachylon-plaster, and the Compress in the Form of a *Malta* Cross, dipped in warm Spirit of Wine, securing the Whole with a proper Bandage. When the Dressings are taken off next Day, there generally appears a little fungous Flesh, which often alarms an unskilful Surgeon, but without a Cause; for it is no bad Symptom, and may, without Difficulty, be removed by the Scissars, by a corrosive Medicine, or by digestive Ointments mixed with a gentle Escharotic. The Wound may then be healed, like those in which the Bones are affected, with the Essence of Myrrh, or Amber, or with *Peruvian* Balsam. If the Bone appears to be corroded, the Wound should be filled, and kept open, with Lint moistened with the Essence of Myrrh, or of round Birthwort, till an Exfoliation of the morbid Part is procured, or, which often happens, the Bone comes away entire; for, till the first Bone be removed, the Wound cannot be healed.

The third Species of Paronychia, when the malignant Matter is lodged in the Vagina or Coat of a Flexor Tendon, has rarely occurred to my Observation. *Garengot* first laid down the Method of Cure in the following manner: In the small Tumor, which, with the intense Pain, generally discovers the concealed Matter to be lodged at the End of the Finger, must be made a longitudinal Incision, so as to penetrate the Vagina of the Tendon. After this Operation, some Lymph will be discharg'd, to the great Ease of the Patient;

but both the Disorder and Pain, contrary to all Expectations will soon return. Sometimes the morbid Matter will spontaneously burst the Coat of the Tendon, and make its Way through the external Skin; and then the State of the Patient is the same as above. Near the Orifice, by which the Humour is discharged, appears a small Caruncle extremely sensible, which is continually moistened by Humours flowing from the Hand to the Fingers. He, therefore, orders a Director to be introduced through the external Orifice within the Coat of the Vagina; and then with a Knife, or Scissars, expeditiously to lay open the Flesh lying above the Director; by which means, a thick, inspissated Matter will be discovered at the Bottom of the Sinus. If, after this Operation, the Seat of the Disorder is not found, the Director must be again introduced, and the Operation repeated, till the Seat appears. If the Sinus of the Paronychia is situated in the middle Phalanx of the Finger, and the Incision is carried to the Middle of the first Joint, *Petit* advises to continue the Incision about a Quarter of an Inch into the Hand, in order to remove the Stricture which that Part of the Tendon, at the Extremity of the Finger, occasions, where it is hard, and, as it were, cartilaginous; but where the Tendon continues soft and membranaceous, there is no need for continuing the Incision into the Hand.

If the Disorder extends to the membranous Part of the Vagina in the Hand, and proceeds under the transverse and annular Ligaments of the Hand to the Arm; so that the Fat upon the *Musculus Quadratus* of the *Radius* begins to degenerate into a purulent Matter, the Director must be gradually and gently introduced into the Abscess, towards the transverse Ligament, and an Incision must be made into the incumbent Flesh, till it reaches that Ligament; which done, the Patient's Hand must be bent to relax the Parts; and then the Director being convey'd under the Ligament, an Incision must be made into the Skin and Flesh, as far as the Director can be perceived to reach. The Aperture being thus made, and sufficiently enlarged, the Tendons and Muscles about the Carpus must be with great Caution disengaged, so that the Abscess will gradually come in View, and sometimes a copious Discharge of the purulent Matter will be made. In the next Place, as *Garengot* informs us, *Thibaut*, late an eminent Surgeon at *Paris*, rightly advised, that, as is usual in making a Seton, we should convey a proper Cord through a Passage previously marked out by a Probe; since, by this means, at every fresh Dressing, the Matter collected in the Ulcer may be commodiously eliminated, and the Ulcer itself cleansed, whilst the Ligament is preserved entire. But if, by these Measures, a Remission of the Pains, the Fever, and other Symptoms, is not obtained, the most proper, and, at the same time, the most expeditious Method of the Relief is, according to *Petit*, forthwith to raise the Tendon that is most affected above the Ligament, and cut it off near to the Muscle; by which Method, he asserts, the Pain has instantly ceased, and the Patient been happily cured. He, also, thinks, that the transverse Ligament should be used in the same manner, if it is found to be affected with the purulent Matter and Inflammation, so as to excite acute Pains; the Success of which Practice is confirmed by the Instances of *Arnaud*, formerly a celerated Surgeon of *Paris*. But, if the Probe cannot be readily convey'd under the transverse Ligament, an Incision should be made between the Radial Artery, and the Tendons of the Muscles, called *Perforatus*, and *Perforans*; which being cautiously enlarged, the Abscess should be searched, and the inclosed peccant Matter discharged. To recommend this Practice, *Garengot* relates an Instance of a Patient of *Arnaud's*, whose Case was so desperate, that the Surgeons judged that the Arm should be amputated, for the Preservation of the Patient's Life; but, upon *Arnaud's* dividing the transverse Ligament, the Patient was, in a sudden and surprising manner, cured. One Caution must be particularly observed, that the Hand be not extended during the Operation, nor for some time after; for, when the Hand continues bent, the divided Ligament will more readily unite, and the Hand recover its usual Motions: But if the Hand be imprudently extended, the Tendons under the divided Ligaments may start out of their Places, and the Hand never recover its proper Motions.

With regard to the Dressings, if the Vagina of a Tendon be opened, lay several oblong Dossils of dry Lint on each Side of the Tendon, by compressing of which the Hæmorrhage may be stopped. But if one of the large Blood-vessels be cut, so that the Bleeding is very copious, it ought to be stitched up with a crooked Needle and Thread; for corrosive and styptic Medicines, proper for suppressing Hæmorrhages in other Cases, cannot be safely used here. Warm emollient Cataplasms must be applied to the Hand and Arm, and carefully secured by the Eighteen-headed Bandage, represented *Tab. XXX. Fig. 4. B B.* The Advantage of this Bandage over the long ones is evident;

evident: because, when it is used, the Dressings may be removed at Pleasure, without moving or stretching the Parts. To finish the Dressing completely, the entire Part of the Bandage should be applied to the sound Part of the Limb, opposite to the Wound; and thus will the Dressings be more effectually secured by the Heads of the Bandage. *Heister's Surgery.*

PARONYCHIA.

The Characters are;

The Root is perennial, the Calyx shaped like a Baſon, and divided into five Parts, which are shaped like a Capucin. The Flower consists of five Stamina, and the Ovary, which is seated in the Centre of the Calyx, produces a single erect Tube, and becomes with the Calyx a pentagonal Fruit, pregnant with a single Seed. The Flowers are surrounded with a Multitude of very thin Silver-colour'd Spangles, disposed in a Circle.

Boerhaave mentions two Sorts of *Paronychia*; which are,
1. *Paronychia, Hispanica. Clus. Hisp. 478. Polygonum, minus, candidans. C. B. P. 281.*
2. *Paronychia, Hispanica, nivea: polyanthos. Barr. Obs. 137. Polygonum, montanum, niveum, Polyanthos. Barr. In. 725. Berb. Ind. alt. Plant. Vol. 2.*

It is called *Paronychia*, from *παρά*, *para*, near to, or importing Resemblance, and *ὄνυξ*, a Nail; because it is of a shining, Silver-like Colour, or, probably, from *Paronychia*, a malignant Ulcer, affecting the Part about the Nail; but, whether this Herb be of any Effect towards curing that Disease, I cannot say; only, that it is a remarkably emollient Plant. *Hist. Plant. adscript. Boerhaav.*

Paronychia rutaceo folio. A Name for the *Saxifraga; verna, annua, humilior.*

PAROPIÆ, παροπίαι. The external Angles of the Eyes.

PAROPTESIS, παροπίσις, from *πείνω*, to roast. A Provocation of Sweat, by making the Patient approach a Fire of live Coals, or by placing him in a Bagnio, or Stove.

PARORASIS. An Imbecillity of Sight.

PAROTIS, παροτίς, from *παρά*, importing near, and *τίς*, the Ear. One of the salivary Glands. See **SALIVA**. An Inflammation, or Abscess of the parotid Glands, is, also, call'd *Parotis*. See **ABSCESUS**.

Alexander Trallianus lays down a very good Rule, in relation to a *Parotis*; that is, at first to be sure to bleed, before any discussing or drawing Application be made; that those who have been forward in doing this without Bleeding, have been the Instruments of strangling their Patients. And, upon the same Principle, he very justly explodes the Use of strong Repellers, and Astringents; such as Solanum, Alum, &c. He describes the Medicines which are proper to make these Parotids yield to Discussion: An Application which ought always to be attempted, where the Case is capable of being cured by it, rather than Suppuration: But if, upon this, the Tumor does not in the least subside, and the Pain continues, all Endeavours, he says, should be used to bring it to suppurate; and 'tis a Sign, that Matter is making, if a Rigor and Fever, which were not before, come on unexpectedly, and the Pain increases. And in this he agrees, in the main, with *Celsus*, who gives us a very good Distinction to guide our Practice in the Point; which is, when the Swelling comes originally of itself, without any other Distemper, to try moderate Repellents first, and Discutients; but where it attends or follows upon another Disease, as no Case is more frequent, it must then be brought to Maturation, and opened as soon as possible; for, in this Case, the Swelling is critical, and solves the Distemper. And *Hippocrates* pronounces those Parotids, which succeed long Fevers, mortal, unless they suppurate. When these are obstinate, and can't be ripen'd by external Applications, there have been Instances, where Burning has brought them to suppurate. And *Severinus*, and *Valesius* before him, have given an Account how they have tried this Practice in malignant Parotids, with Success. *Freind's History of Physic.*

There is a Species of Tumors, which arise with Inflammations in particular Parts of the Body; for Instance, under the Armpits, in the Groin, or under the Ears, in the parotid Glands; whence they are called *Parotides*; but, in the other Place, *Bubos*.

These Tumors are either mild, or malignant; they are said to be mild, when they arise spontaneously, without any preceding contagious or pestilential Disease, as they frequently do in growing Children; and these are generally not dangerous. Of this kind, also, are those which arise after gentle Fevers, being a critical Translation of the Disease. Those *Bubos* are called malignant, which happen in the Pestilence, or Venereal Disease; whence they are denominated Pestilential or Venereal *Bubos*.

The mild *Bubos* are produced, like all other Inflammations, proceeding from internal Causes, from a Stagnation of the

Blood, in a viscous inspissated State; and they differ from other Inflammations only in their Situation, under the Armpits, in the Groins, and below the Ears, in pinguious, glandular Parts.

The Diagnostic is easy, if we consider, whether they are preceded by a venereal or pestilential Infection.

The mild, or less dangerous, Species are seldom attended with any ill Consequences, as they may either be discussed; or brought to a Suppuration; but a speedy Discussion or Suppuration of them becomes more difficult in Persons of an ill Habit; and sometimes, from their Suppuration, proceed Fistulas, which cannot be easily cured. The Parotides are brought to a Suppuration with great Difficulty, the Inguinal *Bubos* with more Ease, and the Axillary, with very little Trouble.

Against those *Bubos*, which are unaccompanied with any other Disease, as in Children, the most effectual Remedies are Purgatives mixed with *Mercurius Dulcis*, which must be often repeated: By these Medicines, the glutinous inspissated Blood is discussed, and drawn from the Part affected. Other Medicines for attenuating the Blood should be, also, used; but, if the Tumor be attended with a slight Fever, a Physician should be consulted, in order to treat the Fever with proper Medicines.

When the Inflammation is very gentle, and a Discussion may be expected, for this Purpose, digestive Plaisters, as simple Diachylon, the Plaister of *Sperma Ceti*, Galbanum, Soap; or of Frogs with Mercury, may be outwardly applied.

If the Inflammation be more violent, and attended with more intense Pains, so that digestive Plaisters are of no Effect, it must, without Delay, be brought to a Suppuration; and for this Purpose apply a Plaister of Diachylon with the Gums. But, if the Pain be extremely severe, digestive Cataplasms often laid, warm, upon the Part affected, will not only mitigate the Pain, but, also, promote a Discussion. These Cataplasms may be made of the Crums of Wheat-bread boiled in Milk to a proper Consistence, with the Addition of a little Saffron; or of Meal, with Honey, and fresh Butter, mixed over the Fire, to which a little Treacle may be added.

These, and Cataplasms of the like Nature, should be often applied to the Tumor, till it appears to be suppurated; and then, without Delay, it must be opened either with a Caustic, or a Knife. But, in Incision, great Care must be taken to avoid wounding any of the large Blood-vessels near the Abscess, which might occasion a fatal Hemorrhage. After the Abscess is opened, it may be treated as directed under the Article **ABSCESUS**. A Plaister of Diachylon will be very proper to soften and discuss any remaining Hardness about the Mouth of the Ulcer. *Heister.* See **SUPPURATIO**.

PAROXYSMUS, παροξυσμός, from *παροξύω*, to irritate, or render sharp. A Paroxysm; Access, or Fit, of a Disease.

PARTHENIASTRUM. Bastard Feverfew.

The Characters are;

It has a radiated discous Flower, consisting of several Florets, which occupy the Disk; but are barren: The Half-florets, which are shaped like an Heart, are succeeded by black Seeds, which are naked, having no Down adhering to them: To which may be added, the Flower-cup is simple, and cut into five Parts to the Bottom.

Miller mentions two Species;

1. *Partheniastrum artemisiae folio, flore albo.* Acad. Reg. Scien.

2. *Partheniastrum helenii folio.* Hort. Elth.

The first Sort grows wild, in great Plenty, in the Island of *Jamaica*, and in some other Parts of the *English* Settlements in the *West-Indies*, where it is called wild Wormwood, and is used by the Inhabitants as a vulnerary Herb.

The second Sort grows plentifully in several Parts of the *Spanish West-Indies*, whence the Seeds have been brought into *Europe*. They are both annual Plants. *Miller's Dictionary.*

PARTHENIUM. The same as **MATRICARIA**; which see.

PARTUS. A Birth. See **OBSTETRICATIO**.

PARVIBULUS. See **BRACHYPOTÆ**.

PARULIS, παρulis, from *παρά*, near, and *ῥλον*, a Gum. A Boil, or Abscess, of the Gums.

A painful Tumor of the Gums, with Inflammation and Swelling of the Cheek, more or less, is sometimes occasioned by the Tooth-ach. These Tumors are called, by the *Greeks*, *Parulides*. They must be treated in the same manner with other inflammatory Tumors, by digestive Medicines. If these are not effectual, or if the Disorder be neglected, it sometimes degenerates into an Abscess, or Fistula. If the Disorder be recent, in order to alleviate the Pain, which will not suffer the Patient to sleep, and to discuss the Tumor, boil Chamomile, Sage, the Flowers of Elder, and the like digestive Herbs; and let the Patient often hold, for a considerable time, a little of the warm Decoction in his Mouth. Outwardly let him apply a

Bag

Bag filled with the same Herbs, or a Plaster of Mehlol, or simple Diachylon with Camphire; or, if these cannot be readily procured, apply a warm Cloth to defend the Part from the Cold, and obtain an easy Resolution; not omitting internally, diaphoretic and resolvent Medicines. If by these means a Resolution cannot be obtained, recourse must be had to Emollients, as Marshmallows, Mallows, Mullein, Figs, and the like, boiled in Milk, and frequently held in the Mouth. To accelerate the Maturation, apply half a Fig, roasted upon the Coals, to the Tumor; and outwardly an emollient Cataplasma upon the Cheek. As soon as the Softness indicates a Suppuration, an Incision must be made into the Tumor, with all Expedition, though the Matter should not be entirely matured; lest, by its Continuance there, the Bone should be affected and corroded; whence the most malignant Fistulas are often produced. The Ulcer being opened, the corrupted Matter must be carefully expressed with the Fingers; and then let the Ulcer be often cleansed with warm Wine, or a Decoction of Agrimony, and St. John's-wort, mixed with Honey of Roses; and the Wound will heal spontaneously. If the Disorder has penetrated deep, let the Decoction be injected with a Syringe; and, the Liquor being carefully pressed out, apply a Compress to the Bottom of the Ulcer, which must be secured with a Bandage, that it may begin to heal from the Bottom. But if the Ulcer should degenerate into a Fistula, which is often accompanied with a Caries of the Bone, after using the above-mention'd Injections, a little of the Oil of Myrrh *per Deliquium*, or of the Elixir Proprietatis, should be intilled into the Ulcer for deterring and healing it. By this Method I have not only cured simple Ulcers of the Gums, but likewise a Fistula attended with a Caries of the Bone, even after it had continued above a Year. But, if none of these Medicines succeed, the Fistula must be laid open by Incision, and the Caries extirpated either by Medicines, the Rasp, or the actual Caustery. Sometimes a Fistula may be occasioned in the Gums by a corroded Tooth, which are usually called *Fistulas of the Teeth*, or *Maxillary Fistulas*; the Tooth, therefore, must be first extracted before the Application of proper Medicines. The Miscellanea Berolienfis contain some particular Observations on the Parulides: Whence it appears, that suppurating Medicines have but little Effect; and that, if these Tumors are not quickly laid open by Incision, and the Tooth extracted, they degenerate into Fistulas. It is, therefore, a better Method, as we have already directed, to discharge the Matter early by Incision, although crude, than, by delaying it, to endanger a Caries of the Bone. *Schelhammer*, in 1692. published an excellent Dissertation *de Epulide & Parulide*, very proper to be consulted: See EPULIS. *Heister. Chirurg.*

PARUS. Offic. Bellon. des Oyse. 369. *Parus major*. Aldrov. Ornith. Gefn. de Avib. 578. Jonf. de Avib. 86. Charlt. Exer. 96. Mer. Pin. 178. *Parus carbonarius*. Schw. A. 318. *Parus carbonarius major*. Schrod. 5. 322. *Fringillago seu Parus major*. Raii Ornith. 240. Ejusd. Synop. A. 73. Wil. Ornith. 174. THE TITMOUSE.

This Bird is celebrated for its Virtues against the Stone in the Kidneys, and colic Pains, if eaten as Food, or burnt, and taken as a Medicine.

PASIONIS PASTILLUS. The Name of a Pastil, described by *Galen*, *Oribasius*, *Aetius*, and *Nicolaus Myrepsus*.

PASMA. The same as CATAPASMA.

PASSA. An Epithet for Grapes, importing their being dried in the Sun.

PASSA, in *Paracelsus*, is a Whitloe.

PASSAVANTICUS PULVIS. The Title of a cathartic Powder, described by *Schroder*, L. 2. Cap. 77.

PASSER VULGARIS. Offic. Schrod. 5. 322. *Passer*. Gefn. de Avib. 581. Bellon. des Oyse. 362. *Passer domesticus*. Aldrov. Ornith. 2. 534. Jonf. de Avib. 65. Schw. A. 321. Mer. Pin. 175. Wil. Ornith. 182. Raii Ornith. 249. Ejusd. Synop. A. 86. *Passer domesticus vulgaris*. Charlt. Exer. 86. THE HOUSE SPARROW.

Because it is a very salacious Bird, it is recommended, especially the Brain of it, as a Strengtheners and Incentive to Venery.

PASSER TROGLODYTES. Offic. Schrod. 5. 322. Aldrov. Ornith. 2. 655. Mer. Pin. 177. Gefn. de Avib. 588. Schw. A. 324. Jonf. de Avib. 82. Bellon. des Oyse. 341. Will. Ornith. 164. Raii Ornith. 229. Ejusd. Synop. A. 80. THE WREN.

The Bird is very much commended for its Virtue in the Attraction and Expulsion of the Stone; whether it be taken whole, and eaten raw season'd with Salt; or burnt to Ashes, and so exhibited. *Schroder*.

PASSERINA. The Name of a Plant, which *Parkinson* calls, *Passerina*, *Linaria folio*, Sparrows Toad-flax. Some make it a Species of *Linum*; others of *Lithospermum*.

PASSIO. A Passion, Affection, or Disease. Thus there

are the Hiac Passion, the Hysteric Passion, and many others, distinguished by their proper Epithets.

PASSULÆ. See UVA.

PASSULATUM. The Form of a Medicine, consisting of the Pulp of dry'd Grapes (*Passæ*) passed through a Sieve.

PASSUM, γλυκὺ, Raisin-wine; that is, Wine made of dry'd Grapes, or of Grapes suffer'd to remain upon the Vine, till they are much wither'd by the Heat of the Sun.

PASTA, πᾶσα. A kind of Aliment, prepared, according to *Hesychius*, of unsalted Cheese, fine Flour, and Sesamum. It is, also, explain'd, a sort of Gruel, made of bruised Puls, mixed with Meal; and, Pottage, thicken'd with Flour.

PASTA REGIA. A Lozenge.

PASTA EPISPASTICA. The blistering fine Paste:

Take of Cantharides in Powder, and Wheat-flour, each as much as you please; and of strong Vinegar, a sufficient Quantity, to make into a fine Paste.

PASTÆTUM. A Pasty; a well known Species of Aliment.

PASTILLUS. A Troche, or Pastil.

The *Pastillus ex Seminibus* is thus described by *Paulus Aegineta*, L. 7. C. 12.

Take of the Seeds of Anise, Bishops-weed, and Fennel, each four Drams; of the Seeds of Smallage, and Henbane; and of Opium, each two Drams. Bruise them in Water for Pastils.

PASTINACA.

The Characters are;

The Root is thick, carious, and succulent; the Leaves are large and broad, and strengthen'd by a thick Rib. The Seed is oval, large, thin, marginated, and casts its Husk.

Boerhaave mentions eight Species of the *Pastinaca*; which are,

1. *Pastinaca sylvestris latifolia*. C. B. P. 155. *Raii Hist.* 1. 409. Synop. 3. 206. *Tourn. Inst.* 319. *Boerb. Ind.* A. 66. *Pastinaca sylvestris Elaphoboscum*. Offic. *Pastinaca latifolia sylvestris*. Ger. quoad Descript. 870. Emac. 1025. Park. Theat. 944. *Pastinaca Germanica sylvestris, quibusdam Elaphoboscum*. J. B. 3. 149. *Bancia*. Offic. Volck. 320. WILD PARSNEP.

The wild Parsnep is much less than the Garden Parsnep, both as to the Thickness of its Roots; and the Height of its Stalks; which are not so much branched as those of the other. The Leaves are smaller, hairy; and of a strong Smell. The Flowers are small and yellow, growing not only on the Top, but coming forth from the Sides of the Stalks, at the Setting on of the Leaves, and are succeeded by the like Seed: It grows frequently by Hedges, and Way-sides, and flowers in June. The Root and Seed are used, though but seldom.

They are said to open Obstructions of the Liver and Spleen; to expel Wind, and help the Colic; to provoke Urine, and the Menes; and to be useful against the Bittings of venomous Creatures. *Miller's Bot. Off.*

It agrees in Virtues with the Garden Parsnep; which, as *J. Bauhine* thinks, differs from it only in Cultivation.

2. *Pastinaca sativa latifolia*. Ger. 870. Emac. 1025. *Raii Hist.* 1. 410. Park. Theat. 944. *Parad.* 506. *Raii Synop.* 3. 206. C. B. P. 155. *Tourn. Inst.* 319. *Boerb. Ind.* A. 67. *Pastinaca*. Offic. *Pastinaca sativa latifolia Germanica luteo flore*. J. B. 3. 150. PARSNEP.

The Parsnep is a Root well known to every one, being large, running deep into the Earth, not much branched, white in the Inside, of a pleasant sweet Taste; it has many large, winged, hairy Leaves, of a dull-green Colour, divided into several tripartite Sections. The Stalks grow to be five or six Feet high, much branched and channelled, beset with several smaller Leaves, which grow at the Divisions; on the Tops grow Umbels of yellow five-leav'd small Flowers; and, after them, come smooth, flat, oval Seed, two growing together, as in other umbelliferous Plants: It is planted in Gardens, and flowers in June and July. The Root is only used.

Parsneps are more used for Food than Medicine, being a pleasant nourishing Root, tho' somewhat windy; and thought to be Provocatives to Venery. *Miller's Bot. Off.*

It is said, that the Seeds of the wild Parsnep, twice sowed in a rich and fat Soil, produce Garden Parsneps, in the same manner as Garden Carrots are produced from the Seeds of the wild Carrots. *Casalpinus* relates, that an Electuary is prepared of the Roots with Sugar, which is very much in Use among the Peasants for Women in Child-bed, and Persons recovering from Sickness, to renew their Strength; it, also, creates an Appetite. That it is of an inciding, attenuating, deterring, and deobstruent Quality, is evident, says *J. Bauhine*, from the very Taste and Smell. They who pull the Roots in Winter, says the same Author, must beware of the *Cicuta*, or *Cicutaria*;

Ciataria; because, while he was at *Mompelgard*, he saw two Families, who were almost dead with eating the Roots of these Plants instead of Parsneps; but they recover'd by the Help of Vomiting, *Theriaca Andromachi*, *Pulvis Saxonicus*, and some Purgatives. It is an Opinion among our People, says *Ray*, that old Parsneps, which have endured Years in the Ground, induce Deliriousness and Madness; for which Reason they give them the Name of MADNEPS, that is to say, MAD PARSENEPS. *Raii Hist. Plant.*

3. *Pastinaca*; *sylvestris*; *altissima*. *T.* 419. *Panax costinum*. *C. B. P.* 156.

4. *Pastinaca*; *Olusatris folio*. *Boerb. Ind. A.* 67. *Panax Herculeum*. *Offic. Panax Herculeum majus*. *Ger.* 850. *Emac.* 1003. *Raii Hist.* 1. 410. *Panax Pastinacæ folio*. *C. B. P.* 156. *Panax Herculeum*. *Hist. Oxon.* 3. 315. *Panax Herculeum alterum sive peregrinum Dodonæi*. *Park. Theat.* 948. *Pastinaca sylvestris altissima*. *Tourn. Inst.* 319. *Spondylion vel potius Pastinacæ Germanicæ affinis Panax vel Pseudocostus flore luteo*. *J. B.* 3. 156. **HERCULE'S ALL-HEAL.**

This is a large tall Plant, growing to be two or three Yards high, having many large Wings, of a yellowish-green Colour, a Foot or more long divided into five or seven Divisions, of longish round-pointed rough Leaves, crenated about the Edges, having one Side of the Leaf growing lower and deeper toward the Bottom than the other. The Stalk is hollow, having several Joints beset with the like Leaves; and on the Top roundish Umbels, of small yellow five-leav'd Flowers, each of which is succeeded by two broad flat oval Seeds. The Root is large, branched, of a yellowish Colour on the Outside, and white within. This Plant grows naturally in *Syria*, as, also, in *Italy*, *Sicily*, and the Southern Parts of *France*, though in these last Places it yields but little Gum. See *OPOPANAX*. *Miller's Bot. Off.*

The Roots of this Plant are said, by those who import it, to be effectual in all cold Affections of the Brain and Nerves, for Disorders of the Breast, and tormenting Pains of the Stomach; for all Obstructions of the Viscera, and Diseases of the Kidneys, Bladder, and Womb; on which Account, they are of Service in inveterate Pains of the Head, Vertigo, Epilepsy, Stupor, Lethargy, Convulsions, Palies, Asthma, Cough, Jaundice, and Dropsy: They expel Wind, kill Worms, provoke Urine, and the Menfes, break the Stone, and promote the Birth. The Decoction is given in Clysters, for the Colic and Sciatica. *Raii Hist. Plant.* The *Opopanax* is the concreted Juice of this Plant; an Account of which see in its proper Place.

5. *Pastinaca*; *folio quasi Libanotidis latifolia*. *Panax, folio glabro, nitente, lato*. *Ind.* 16.

6. *Pastinaca*; *femine longissimo*. *Panax, folio glabro, nitente, lato, altior*. *Ind.* 16.

7. *Pastinaca*; *sylvestris, altissima*. *T.* 319. *Hoc nomine mist D. Salvadore; differt à tertia, foliis majoribus, scabris, asperis*.

8. *Pastinaca*; *fativa*; *radice turbinatâ*. *Vaill. Boerb. Ind. alt. Plant.*

This Plant has its Name *Pastinaca*, à *Pastu*, from Feeding, because its Root is much used in Food; it is, also, called *Elaphoboscum*, from *ἐλαφος*, (*Elaphos*) a Stag, and *βόσκω*, (*bosco*) to feed, because Deer eat the Herb.

It is a Plant of great Note in Medicine: The Seed hereof, with the Seed of the *Daucus*, are very serviceable in breaking the Stone. Hence there was a very celebrated Physician, who prescribed the Flour of these Seeds, together with the Root of Liquorice, reduced, also, to a Flour, in Cases which required Lithontriptics: It is, also, good for the Pain of the Colic proceeding from Phlegm; for the Strangury, Hiccups, and Obstructions of the Menfes; it is hurtful in nephritic Disorders proceeding from a cold Cause. The second Species has a Root which is eatable, on account of its soft Pulp; and, boiled in Milk, is good for consumptive and lean Persons, being very nourishing. The third Species is by some taken for the Original of the *Opopanax*; its Seeds are not remarkably acrid. But the fourth is the true Plant whence the *Opopanax* proceeds; of which I made an Experiment this last Summer, when upon making a Wound in it, there flowed out a Juice, which, being a little inspissated in the Sun, had the perfect Smell and Taste of *Opopanax*. *Hist. Plant. adscript. Boerhaav.*

PASTINACA AQUATICA. A Name for the *Sium, latifolium*.

PASTINACA ECHINOPHORA. A Name for the *Echinophora*; *Pastinacæ folio*.

PASTINACA SYRIACA. A Name for the *Tordylium*; *Orientalis*; *Secatul Arabum dictum Rauwolfia*.

PASTINACA TENUIFOLIA. A Name for several Sorts of *DAUCUS*.

PASTINACA, is, also, the Name of a Fish, which is thus distinguished by Authors:

Pastinaca. *Salv. de Aquat.* 144. *Rondel. de Pisc.* 1. 331.

Pastinaca marina. *Offic. Charit. Exer.* 10. *Aldrov. de Pisc.* 424. *Jonst. de Pisc.* 19. *Gesn. de Aquat.* 679. *Pastinaca marina laevis*. *Bellon. de Aquat.* 95. *Pastinaca marina prima Rondeletii*. *Raii Ichth.* 67. *Pastinaca marina laevis Bellonii*. *Ejusd. Synop. Pisc.* 24. *Aquila Piscis, seu Pastinaca marina*. *Mer. Pin.* 185. **THE POISON-FISH, FIRE, or FIERCE-FLAW.**

It is taken in the main Sea; the Parts of it used in Medicine are the Liver, and the Prickle, which grows out of its Tail. The Liver is said to be good for the Itch; and, boiled in Oil, deterses the Lichen and Leprosy; the Prickle, as *Dioscorides* says, cures the Tooth-ach, by breaking and expelling the grieved Tooth.

PATELLA. The Knee-pan.

PATETHEISÆ, or **PATETÆ UVÆ**, *πατιθῆσαι*, or *πατεται σαφῶς*, Grapes suffered to remain on the Vines, till they are much wither'd, and dry'd by the Sun.

PATHEMA, *πάθημα*. An Affection, or Disorder.

PATHETICUS. An Epithet of the fourth Pair of Nerves, so called, because they direct the Eyes to intumescence the Passions of the Mind.

PATHOGNOMONICUS, *παθγνωμονικός*, from *πάθος*, a Disorder; and *γινώσκω*, to know. An Epithet for a Symptom, or Concourse of Symptoms, that are inseparable from a Distemper, and are found in that only, and no other.

PATHOLOGIA, *παθολογία*, from *πάθος*, a Disorder; and *λέγω*, to speak, or commemorate. That Part of Medicine, which explains the Nature of Diseases, their Causes and Symptoms.

PATIAS. The same as *Squama Eris*. *Rulandus*.

PATIENTIA. A Name for the *Lapathum*; *hortense*; *folio oblongo*; sive *secundum Dioscoridis*.

PATIENTIÆ MUSCULUS is a Name for the *Levator Scapulae proprius*, otherwise called *Angularis*.

PATOR NARIUM. The Sinus, Cavity, or Chasm of the Nose. *Scribonius Largus*.

PATOS, *πάθος*. The same as *ΡΗΥΡΟΣ*; which see.

PATRIMONIUM. The Genitals are sometimes called by this Name. *Castellus*.

PATURSA. The Venereal Disease. *Castellus* from *Fallopianus*.

PAVATE. *Acoftæ*. *Lugd. Caff. Ap. Arbor Erysipelas curans Lusitanis, Vasaveli Canarin.*

This is a Shrub which grows on the Banks of the Rivers *Mengate*, and *Cranganor*, in *America*.

The *Indians* use its Wood and Root, as Specifics against an *Erysipelas*. They reduce them to Powder, and infuse the same in a Decoction of Rice, till it becomes sour; and with this Liqueur they foment the *Erysipelas*, and make the Patient drink it twice a Day, after they have purged the Stomach. They give it, also, to those who labour under burning Fevers, Inflammations of the Liver, and Fluxes of the Belly. *Lemery des Drogues*.

PAUCIFERUS. An Epithet of Wine, importing the same as *Oligophorus*.

PAVEL. A Name for the *Momordica*; *Zeylanica*; *pampinea fronde*; *fructu breviori*.

PAVIA. The scarlet-flowering Horse-chestnut.

The Characters are;

The Leaves are like those of the Horse-chestnut, and conjugated; but so disposed, as to have every consequent Order cross the preceding. The End of the Pedicle becomes a long tubulous red Calyx, of the same Colour with the Flower, with a Margin divided into six Segments. Within the Calyx grows an anomalous pentapetalous Flower, so disposed, as, with its five Petals, to resemble a monopetalous bilabiated Flower; for the two upper Petals, in Conjunction, form a kind of Galea; the two lateral ones, the Jaws, and the under one, the Beard. The Flower incloses eight Stamina, each furnished with its Apex, and the Flowers are disposed in Spikes. The Ovary in the Bottom of the Calyx shooting forth a long, cylindrical, red Tube, becomes a tricapsular, triccoccus Fruit, containing globular Seed.

Boerhaave mentions but one Sort of *Pavia*; which is,

Pavia. An *Ricinoides*, *Americana*, *Castaneæ folio*. *Plum. T.* 656. *Saâ mouna Pisonis*. *Plukn. Phyt.* 56. 4. *Boerb. Ind. alt. Plant.*

The Flowers are like those of *Brank-Ursine*. Many Authors will have it to be the *Ricinoides Americana*; but their Flowers do not agree. I am unacquainted with the Virtues of this Plant; but it is of an acrimonious Quality, like the *Tithymalus*. *Hist. Plant. adscript. Boerhaav.*

PAULA. The Name of a Plaster described by *Paulus Aegineta*, *Lib. 7. Cap. 17.*

PAULADADUM. A Name for the *Terra Melitæa*, otherwise called *Terra Sigillata Sancti Pauli*. *Dorneus* says, *Pauladadum* is a Species of Seal'd Earth, which is found in *Italy*.

PAVO. Offic. Schrod. 5: 322. Aldrov. Ornith. 2: 8. Mer. Pin. 172. Schw. A. 323. Gefn. de Avib. 393. Jonf. de Avib. 37. Charlt. Exer. 80. Will. Ornith. 112. Raii Ornith. 158. Ejusd. Synop. A. 51. *Pavus & Pavo*. Bellon. des Oyle. 234. THE PEACOCK.

What is used in Medicine is the whole Bird, the Fat, Gall, Dung, Feathers, and Eggs. The Broth of a Peacock, especially if it be fat, is said to be a Specific against the Pleurisy; the Fat, with the Juice of Rue, and Honey, is an excellent Medicine for the Colic. The Gall cures Dimness of Sight, represses Defluxions of the Eyes, and cures the Asperities of the Eyelids. The Dung, dried and pulverized, and the Weight of a Dram macerated at Night in Wine, and exhibited for many Days together, has a peculiar Virtue of curing the Vertigo and Epilepsy. The Feathers are used in Suffumigation, for the Hysterics; and the Eggs are prescribed for the Cure of what they call the *Erratic Gout*. Dale from Schrod.

PAVOR. Besides Fear, the usual Signification, it sometimes imports the Itch. *Castellus*.

PAUSIS, *παυσις*, from *παύω*, to cease. A Remission, or Cessation, of a Disease.

PAYCO HERBA. *Monard*. The Name of a Species of *Peruvian* Plantain.

The Powder of it, taken in Wine, is said to remove nephritic Pains proceeding from Flatulencies, or a cold Cause; and the Plant itself, boiled, and applied in Form of a Plaster to the Part affected, is said to work the same Effect; which *Monardes*, as he assures us, found to be true by Experience. *Raii Hist. Plant.*

PECHEDION, *πυχέδιον*. The *Perinaeum*.

PECHYAGRA, *πυχάγρα*. The Gout in the Elbow.

PECHYS, *πύχυς*. The Elbow.

PECHYTYRBE. An Epithet for the Scurvy. *Castellus* from *Forestus*.

PECTEN. The Pecten. In Zoology, it signifies a Shell-fish, called a Scallop. These are esteemed a good Food, and are recommended as deterfive, aperitive, and carminative, and are said to increase the seminal Juices. The Shells agree with those of the Oyster in Virtues.

PECTEN VENERIS. A Name for the *Scandix*; *Cretica*; *minor*. Shepherd's Needle, or Venus's Comb.

PECTINÆUS MUSCULUS. This is a small flat and pretty long Muscle, broad at the upper Part, and narrower at the lower, situated obliquely between the Os Pubis, and upper Part of the Os Femoris. It is commonly a single Muscle; but I have sometimes found it double.

It is fixed above by fleshy Fibres to all the sharp Ridge, or Crista, of the Os Pubis, and to a small Part of the oblong Notch, or Depression, on the fore Side of that Crista; in which the upper Extremity of this Muscle is lodged.

Thence it runs down obliquely towards the little Trochanter, under, and a little behind which, it is inserted obliquely by a flat Tendon, between the superior Insertion of the Vastus Internus, and inferior Insertion of the Triceps Secundus, with which it is united.

The Pectinæus is an Assistant to the Psoas and Iliacus, in moving both the Thigh, and the Pelvis. It may, likewise, assist in bringing the Thigh inward, or toward the other, whether it be extended, or bent, at the same time. *Winslow*.

PECTINATIO. Combing the Head. This is recommended by some as an Exercise conducive to Health, and considered as a Species of Friction; it is certainly very useful, not to mention that, by cleaning the Head from Scurf and Dirt, it prevents Obstruction of the cutaneous Pores.

PECTORALIS. Pectoral; an Epithet for Medicines appropriated to Disorders of the Breast and Lungs.

The Pectoral Decoction is thus directed in the College Dispensatory:

Take of stoned Raisins, one Ounce; of Dactyls, No. six; of fat Figs, No. eight; of Barley cleansed, one Ounce: Boil these in three Pints of Spring-water to the Consumption of a third Part; towards the End putting in, of Liquorice-root, half an Ounce; of the Leaves of Maiden-hair, Ground-ivy, Scabious, and Coltsfoot, of each one Handful. Let them stand in Infusion a quarter of an Hour, and then strain out the Liquor.

PECTORALIS MAJOR.

This is a large, thick and fleshy Muscle, covering the fore Part of the Breast, from the Sternum, where it is very broad, to the Axilla, where it contracts in its Passage to the Arm. It is naturally divided into two Portions, one superior and small, which may be termed *Clavicular*; the other inferior and large, which we may call *Thoracic*.

The Clavicular Portion is fixed by a fleshy Insertion in almost half the Clavicle next the Sternum, ending under the Insertion

of the Sternal-mastoidæus. Thence it runs obliquely down toward the Axilla, contracting by small Degrees, and ends in a flat Tendon, or tendinous Band. In this Passage, it borders on the anterior Edge of the Deltoides, from which it is distinguished only by a pinguious or cellulous Line, and a small Vein, named *Vena Cephalica*.

The Thoracic Portion is broad, and, in some measure, radiated. It is fixed by its anterior Circumference in the lateral Part of the Outside of the Sternum, in the Outside of the Cartilages, and in a small Part of the Bones of all the true Ribs, and of the first, and sometimes of the second, small Ribs. All these Insertions are like so many Digitations.

The Insertions in the Sternum end by a great Number of very short Tendons, which run toward the Middle of the Bone, meeting, and decussating those from the same Muscle on the other Side.

The lower Insertions are most distinctly digitated, and they mix with those belonging to the Rectus, and Obliquus Externus, of the Abdomen; there being, likewise, several Fasciculi of Fibres common to the Pectoralis, with these Muscles. This Portion is, also, fixed to the Ribs by internal fleshy Strata, covered by the external Insertions, and forming together with them the Thickness of the Muscle.

From thence all the fleshy Fibres contract in Breadth, and approach each other in their Passage to the Arm: The superior Fibres run downward, joining those of the Clavicular Portion; those next them run less obliquely; the following, more or less transversely; and the inferior run upward in the same manner. This whole Portion ends at length in a flat Tendon, joined to that of the small Portion, and folded back upon it in the following Manner:

The inferior fleshy Fibres of the Thoracic Portion, before they reach the Tendon in their Passage to the Arm, are gradually turned inward under each other, and then run up behind the Extremities of the superior Fibres. By this Turn, the lower Part of the Tendon answers to the superior fleshy Fibres, the middle Fibres of both to each other, and the upper Part of the Tendon to the lower fleshy Fibres; and so on: Thus the Tendons of both Portions, adhering closely by their flat Sides, and united at their Edges, form a double tendinous Plane; the Fibres crossing each other. The anterior, or external Plane, belongs to the Clavicular Portion; the internal, or posterior Plane, to the Thoracic Portion.

The Tendon thus formed is inserted according to its Breadth, at about one fourth Part of the Length of the Bone from the Head, in the osseous Ridge of the great Tuberosity, that is, in the outer Edge of the Groove or Chanel, the Cavity of which it lines in Conjunction with another Tendon, by a Stratum of very thin, shining transverse Fibres. This Insertion lies between that of the Tendon to the Deltoides, which it touches, and that of the Latissimus Dorsi, which is on the other Side of the Groove.

This Muscle, together with the Deltoides, sends off an Aponeurosis, which, joining that of the Biceps, is spread over the Muscle of the Arm. It partly covers the Pectoralis minor, and Serratus major; and by its broad Tendon it covers transversely the Brachial Chanel, and the Tendon of the Biceps lodged there. Lastly, it forms the anterior Border of the Hollow of the Axilla, as the posterior is formed by the Latissimus Dorsi.

The Pectoralis major serves in general to bring the Arm near the Ribs, to press it strongly against them, and to carry it towards the fore Part of the Thorax. This last Motion may be performed without separating the Arm from the Ribs, as when one Arm is crossed over the other; and it may likewise be done with the Arm raised, as when the Hand of one Side is laid over the Shoulder of the other Side; and in that Case the anterior Portion of the Deltoides may assist this Muscle in great Efforts.

By means of the Fold in its Tendon, the superior and inferior Portions may act as two distinct Muscles, that is, one may act without the other. The superior fleshy Portion, which answers to the lower Portion of the Tendon, serves chiefly to raise the Arm forward.

The inferior fleshy Portion, which is joined to the upper Portion of the Tendon, by its Insertion in the Os Humeri, and by the Connection of that Bone with the Scapula, may depress the Shoulder, or keep it from rising, with more or less Force, much after the same manner as the inferior Portion of the Latissimus Dorsi; the inferior Portions of these two Muscles concurring in the same Use; as when we support ourselves upon our Hands, or walk with Crutches.

It is, likewise, by means of the lower Portion of this Muscle, that we can suspend the whole Body by the Hands grasping the Branch of a Tree in climbing, and the like. In this Case, also, the Latissimus Dorsi acts in Concert with the Pectoralis; and this Co-operation the Painters and Carvers have taken Care to express in Crucifixes.

The inferior Portion of this Muscle cannot perform these two Uses, without the Assistance of the Muscles of the Abdomen, which, by pulling the Ribs downward, become, in a manner, a Continuation of the Insertion of this Portion. The same thing may be observed concerning that Part of the inferior Portion of the Latissimus Dorsi, which is inserted in the false Ribs.

The Uses of the superior Portion of all the Body of the Pectoralis cannot take place without the Co-operation of the Muscles, which move the Scapular on the Trunk, especially the Serratus major; because the Scapula must be securely fixed, before it can be a Fulcrum for the Os Humeri to move upon. The same thing is to be observed concerning the Deltoides, and all the other Muscles, which move the Os Humeri on the Scapula. *Winflow.*

PECTORALIS MINOR.

This is a small fleshy Muscle, something of a triangular Shape, situated at the superior, lateral, and anterior Part of the Thorax.

By its Basis it is inserted in the external Labium of the upper Edge of the second, third, fourth, and fifth true Ribs, near their Union with the Cartilages, by the same Number of Digitations, or separate fleshy Portions, because of the Intervals between the Ribs; and for that Reason it has been called *Serratus minor Anticus*.

From thence these Portions run up more or less obliquely toward the Shoulder, and form a fleshy Belly, which contracts as it passes before the two first Ribs; and then, becoming a short, flat, and broad Tendon, is inserted in the upper Part of the Apophysis Coracoidea of the Scapula, reaching all the Way to the Point of that Process.

This Muscle is covered by the Pectoralis major, and adheres very closely to the external intercostal Muscles. The Digitations commonly taken notice of cover and hide several others, by which the Number of Fibres, and Thickness of this Muscle, are increased. Its Tendon unites a little, at the Apex of the Coracoide Apophysis, with the Insertion of the Coracobrachialis, and with that of one Portion of the Biceps.

The Pectoralis minor assists the Rhomboides and Angularis, as Moderators of the Action of the Trapezius, and Serratus major, in turning the Point of the Acromium upward, the superior Angle downward, and the inferior Angle forward.

It is, likewise, an Assistant to the Rhomboides and Angularis, in restoring the Scapula to its natural Situation; when the Trapezius and Serratus major cease to act; by drawing downward the Apophysis Coracoidea, in which it is inserted.

It has been reckoned among the Muscles employ'd in Respiration, by some who imagine, that, in some Cases, the Shoulder may be kept so steady, as that this Muscle may be able to raise the Ribs in which it is fixed. But as the Serratus major, which must principally be employ'd in keeping the Shoulder in a fixed Position, is partly inserted in the same Ribs, and in this Action must keep them depressed, it will be impossible for the Pectoralis minor to raise them. *Winflow.*

PECTUNCULUS. Offic. Schonef. Ichth. 55. *Pectunculus vulgaris, albidus, rotundus, circiter 26 Striis majusculis, & planioribus donatus.* List. Hist. A. A. 189. *Capite minore, rotundiore, & magis aequali margine.* Ejusd. Hist. Conch. N. 171. *Concha striata altera.* Rondel. de Aquat. 2. 21. *Concha striata altera Rondeletii.* Aldrov. de Exang. 449. *Concha cordiformis aequaliter umbone cardinum unito striato.* Lang. Meth. Test. 60. **THE COCKLE.**

The Fish is esteemed a delicious Food, either raw, or boil'd. Of the Shells calcin'd; and powder'd, excellent Dentrifices are prepared. *Dale.*

PECTUS. The Breast. See **THORAX.**

PEDAGRA. Tartar. *Rulandus.*

PEDETHMOS, *πυλινθίος.* The Beating, or Pulsation, of the Arteries. *Hippocrates.*

PEDICULARIS. See **ALECTOROLOPHUS.**

PEDICULATIO. The lousy Evil. See **PHTHIRIASIS.**

PEDICULUS. Offic. Schrod. 5. 345. Aldrov. de Insect. 542. Jonf. de Insect. 89. Mouff. 259. Charl. Exer. 52. Mer. Pin. 202. **THE LOUSE.**

Lice are taken by the Country-people, as a Remedy against the Jaundice, and an Atrophy. *Schroder* takes notice of a very whimsical Use of this Insect, which is, to put it into the Beginning of the Urethra, in order to excite Urine.

PEDICULUS, in Botany, is the Foot-stalk. See the Explanation of Terms under the Article **BOTANY.**

PEDILUVIUM.

This Word signifies no more than a Bath for the Feet, which may be prepared of the same Ingredients with other Baths; and, as it requires a less Apparatus, is for that Reason frequently used as a Succedaneum to them; for a Bath for the Feet may either consist of pure light Water alone; or, in order to correct the Qualities of heavy and hard Waters, a Lixivium, or Bran of

Wheat, or Chamomile-flowers, may be added; or such Waters may be mixed with Milk. But, tho' Baths for the Feet are only immediately applied to the inferior Parts and Extremities of the Body, yet their Virtues and Efficacy diffuse themselves farther, and alleviate violent Disorders in remote and distant Parts of the Body; for, whilst the Feet are cherished with such a warm Liquor, the nervous, tendinous, and muscular Fibres, by the Intertexture of which they are formed, are relaxed and unbended; the Pores and Ducts, before constricted, are enlarged; the Blood has Access to the Parts; and the Return of the Humours from them is rendered free and uninterrupted. By this means, the Impetus of the Blood on other Parts is diverted; and, to the surprising Relief of the Patient, derived to the inferior Parts. Besides, Baths for the Feet, by their temperate Heat, act upon the Blood and Humour, which, during their Use, pass through the Vessels of the Feet, render them more thin and diluted, and by that means qualify them for passing more expeditiously through all the various Ducts and Parts of the Body. Hence it is, that, if pretty hot Baths for the Feet are used, they increase the Pulse, and excite a Sweat over all the Body. Besides, the Consent of the Feet, as being nervous and tendinous Parts, of an exquisite Sensation, is so great with all the other nervous Parts of the Body, especially those of the Abdomen, that, if the Feet are only rendered thoroughly cold, a Colic is forthwith produced, the Patient becomes costive, the Skin is render'd rough, Perspiration is intercepted, and the salutary Evacuations from the Uterus, and hæmorrhoidal Veins, stop. For this Reason, 'tis not to be doubted, but when the Feet are fomented, and their spasmodic Stricture removed by means of a tepid Liquor, the salutary Effect must, also, be propagated to those remote Parts of the Body, with which they have so near and immediate a Consent.

Baths for the Feet are certainly highly expedient for the Purposes of Derivation in those Diseases which arise from Congestions of the Humours to the Head and Breast, produced by Spasms of the inferior Parts, and, especially of the Hypochondria. Among this Kind, besides lethargic Diseases, we may reckon almost all Disorders of the Head, such as Madness, melancholy Cephalæas, Hemicranias, the Clavus Hystericus, Vertigos, Tooth-achs, Pains of the Ears, a Gutta Rosacea, Inflammations, and Defluxions of saline Humours on the Eyes; immoderate Hæmorrhages from the Nose, and long Watchings. Of this Kind are, also, some Disorders which affect the Breast, such as convulsive Asthmas, Dyspnoeas arising from a Plethora, Palpitations of the Heart, dry Coughs, and Spittings of Blood. Besides, Baths for the Feet, in consequence of their singular Efficacy in relaxing Spasms, are highly beneficial in spasmodic and convulsive Disorders, in Pains; Cardialgias, Colics, especially of the hæmorrhoidal Kind, Gripes produced by the Stone, and Inflation of the Stomach, accompanied with an Uneasiness of the Præcordia. Besides, Baths for the Feet promote the salutary Excretions by Perspiration, Urine, and Stool, together with those made from the Uterus, and hæmorrhoidal Veins, by procuring a free Circulation of the Blood, attenuating the Humours, and soliciting them to the Emunctories of the Body. Baths for the Feet, also, remove and prevent very terrible Disorders of the Head and Breast, especially those which return at certain Periods; and I myself, says *Hoffman*, have known the daily Use of these Baths for the Feet remove the most terrible and obstinate Cephalalgias. Some, also, in intermittent Fevers, advise the Use of these Baths, tho' not on the Days of Remission. And this Piece of Practice is productive of very salutary Effects, as is obvious from *Obs. 144. Decad. 2. An. 6. Miscell. Nat. Curios.* where we have an Account of a Quartan Fever cured by means of Foot-baths, and *Kozak de Salib. Sect. 12. Cap. 10.*

But 'tis to be observed, that Baths for the Feet produce far more happy Effects, if, before they are used, the Quantity of Blood is lessen'd by Venesection in the Feet; if they are used about Bed-time, and the Feet not exposed to the Cold after them, but kept duly warm, till the Patient gets to Bed; by which means the Perspiration, all over the Body, is increased. But Baths for the Feet must not be used about the Time the Menses are about to flow, or already present, because, by diverting the Course of the Blood from the Uterus, and soliciting it to the inferior Parts, this salutary Discharge is either stopped, or prevented. On the contrary, Baths for the Feet, used some Days before the stated Period for the menstrual Discharge, excellently promote it, especially if, at the same time, the Pilulæ Becheri, or temperate Emmenagogues, are used. We must, also, carefully abstain from astringent, aluminous, and sulphureous Baths, in order to prevent a Sweating of the Feet, discuss oedematous Tumors, cure Ulcers, or remove arthritic Pains; since by means of such astringent, aluminous, and sulphureous Baths, the virulent Matter is repel'd to the internal and more noble Parts. And because the common hot Spring in the *Caroline* Baths, commonly call'd *Der Prudel*, is

possessed of an highly repellent Quality; so bathing in it ought to be very cautiously used in all Disorders affecting the Surface of the Body, and more especially in gouty and arthritic Pains. *Hoffman.*

PEDION, *πεδιον*. The Sole of the Foot.

PEDORA. The Sordes of the Eyes, Ears, and Feet. *Castellus.*

PEDRO DEL COBRA. See COBRA DE CAPELLO.

PEDRO DEL PORCO. See HYSTRIX.

PEDUNCULUS. The same as PEDICULUS, with respect to both Significations.

PEGANELÆON, *πηγάλαον*. Oil of Rue.

PEGANERON, *πηγανερν*, according to *Gorræus*, is the Name of a Plaister, described by *Actius*, and *Paulus Ægineta*, in which Rue is an Ingredient.

PEGANUM. A Name for the *Ruta, sylvestris, minor*.

PEGANON, *πηγανον*. Rue.

PEGE, *πηγή*. A Fountain. But the internal Angles of the Eyes are call'd *πηγαί*. *Pega.*

PEGERNUS. Mercury. *Rulandus.*

PELA. A Name for the *Guajava; rubra; acida; Fructu rotundiori.*

PELADA. A kind of Alopecia, or shedding of the Hair, from a Venereal Cause. *Castellus* from *Forestus*.

PELAMYS, *πελαμύς*. The Tunny-fish. See THUNNUS.

PELARION, *πηλάριον*, from *πηλός*, Mud. The Name of a Collyrium, described by *Paulus Ægineta*, *Lib. 7. Cap. 16.* and of a Plaister, in the same Author, *Lib. 7. Cap. 17.* See EDESSINUM.

PELECANUS. The Pelecan. See ONOCROTALUS. An Instrument for drawing Teeth, is, also, called a *Pelecan*.

PELECANUS. A Pelecan, or Vessel of Glass, formerly used in Chymistry, for the Digestion and Circulation of Liquors, poured in at their narrow Necks, which were afterwards Hermetically seal'd. The Figures of the Peleicans were various; some were round, and others long. But, at present, we use, instead of the Pelecan, two Matraffes, the Neck of one of which enters into that of the other. *Lemery Pharmacop. Univers.*

PELECINUS.

The Characters are;

It is, in all respects, like the *Astragalus*, except that the Pod is flat, long, bicausal, bivalve, and full of Kidney-shaped Seeds.

Boerhaave mentions but one Sort of *Pelecinus*; which is, *Pelecinus vulgaris*, *T. 417. Lumaria, radiata Robini. J. B. 2. 348. Securidaca peregrina. Clus. H. 238. Boerb. Ind. alt. Plant. Vol. 2.*

There are no Medicinal Virtues ascribed to this Plant at present, that I know of.

PELIAS. The Name of a Serpent, mentioned by *Actius*, *Tetrabib. 4. Serm. 1. C. 32.*

The now quoted Author informs us, that the Symptoms attending the Bites of the *Pelias* were so generally known, that no Author before him had described them. Those, however, says he, who are bit by the *Pelias*, have a Pain and Putrefaction about the Part affected, which, nevertheless, are not dangerous. They are, also, afflicted with a Dimness of Sight, in consequence of a Distribution of the Poison to their Eyes. Patients labouring under this Misfortune are cured by the Juice of Pusan, and Oil, exhibited in some proper Liquor, by way of Drink; as, also, by a Decoction of the Oxylapathum, and the simple Remedies proper in a Jaundice. The Eyes of such Patients are to be washed with the Urine of young Persons who are Strangers to Venery, both by itself, and when mixed with Brine. Their Heads are, also, to be anointed with the same. Then, after purging the Body, their Eyes are to be anointed with Opobalsam and Honey, or with some Collyrium capable of increasing the Sight, and removing the Obstructions of the Vessels; for, by this means, the Poison will be discharged along with the Tears. But, if this Practice should be succeeded by a Pain of the Eyes, it must be allay'd by means of mild Collyriums, which operate without inducing a Stupor of the Parts. See ELAPS.

PELICIDE. Boiled Honey. *Rulandus.*

PELIOMA, *πελιωμα*. A livid Sugillation.

PELLICULA. A Pellicle, or thin Membrane.

PELLIS. A Skin of an Animal. In a Dropsy, or Inflation of the Uterus, *Riverius* directs the Skin of a Sheep just killed, and sprinkled with generous Wine, to be applied to the Belly. Some of the French Writers in Midwifery advise to involve the Belly in a warm Sheep-skin, after a difficult Labour; and the same is an excellent Application, by way of Fetus, in case of inflammatory Pains of any of the Viscera.

PELMA, *πέλμα*. The Sole of the Foot, or a sort of Sock adapted to the Sole of the Foot, made of Leather, or any other Substance.

PELORIS. The same as Chama.

PELTATIS CARTILAGO. A Name for the Scutiform Cartilage of the Larynx.

PELVIS. A Name for the inferior Part of the Cavity of the Abdomen. See ABDOMEN. It is formed by the *Ossa Iliæ*, and *Ischia*, the *Os Sacrum*, and *Os Coccygis*, and the *Ossa Pubis*. See INNOMINATA OSSA. If the Pelvis is too small, or too flat and narrow, it is evident, that these Circumstances must occasion a difficult Birth: But *Henricus à Deventer* says, that a too great Wideness of the Pelvis is frequently an Obstruction to the Birth, and of bad Consequence. By too large a Pelvis, says this Author, I mean one, which, when compared with the Fœtus, and the Uterus, is so large, as without any Pains easily to suffer the Head of the Infant, together with the Uterus, as yet closed up, to fall down to the Lips of the Pudenda. In consequence of such a large and capacious Pelvis, the superior Parts of the Uterus are either not sufficiently, or not at all, surrounded and retain'd. Hence, neither the Head of the Fœtus, nor the Waters, can, by the Force and Impression of Pains, act sufficiently on the Mouth of the Uterus, to open it; so that the Pudenda alone must retain the Uterus, and hinder it from falling entirely out of the Body along with the Fœtus. In a Case of this kind, the Waters are generally perceived to possess a large Space; and their containing Membrane is sometimes found to protuberate so much without the Lips of the Pudenda, that the Infant seems ready to be discharged, and brought into the World with them; and, when this Circumstance happens, it is attended with little Danger, and renders the Labour easy: But, sometimes, the Mouth of the Uterus is thick and hard, whilst, at the same time, the Vagina is lax. Hence the former is with Difficulty, and the latter with Ease, dilated: In which Case the Waters, tho' not possessing a large Space, are yet discharged from the Body, with a great Impetus; and the Mouth of the Uterus penetrates far into the Pudenda. Then the Membrane being broken, not only the Head of the Infant appears without the Lips of the Pudenda, but, also, the Mouth of the Uterus; and, unless this latter is duly retained, it falls so far down, in consequence of the excessive Relaxation of the Vagina and Ligaments, as to pave a Way not only for a Falling out of the Vagina, but, also, of the Uterus. For this Reason, 'tis the Duty of the Midwife, as soon as possible, to replace and retain the Mouth of the Uterus, before it falls down so far; for, in this Case, the Hands of the Midwife must perform the Office of the Vagina. *Heur. à Deventer Operat. Chirurg.*

PELVIS AURIUM. The Cochlea. See AURIS.

PELVIS CEREBRI is the Infundibulum. See CEREBRUM.

PELVIS is, also, a Name for the Cavity of the Kidneys, which receives the Urine, and conveys it to the Ureters. See RENES.

PEMPHIGODES, or Pempingodes, *πεμφιγώδες ἢ πεμψιγώδες πυρετός*. Fevers, distinguished by Flatulencies and Inflation, or a windy Spirit; in which we feel a sort of aerial Effluvia passing through the Skin of the Patient, in manner of an Exhalation, and striking upon the Touch. This is the Sense which *Galen* seems to chuse among various others, which he gives us of the Word *πεμφιγώδες*, in his Comment on 6 *Epid. Sect. 1. Aph. 17.* where it is used by *Hippocrates*; Sometimes by the Term *Pempingodes*, as *Galen* says, is meant, a Fever attended with pustulous Eruptions, and; therefore, of a pestilential kind; sometimes a Fever which seems to strike the Touch, like Sparks of Fire, penetrating through the Skin; and sometimes a Fever attended with a Delirium, according to the various Significations of the Word *πεμφιγώξ*, which he there gives us. *Πεμφιγώδες πυρετός*, in *Galen's* Exegesis, are expounded to be Fevers in which there is a Redundance of Humidities, or Flatulencies. The Author of the *Definitiones Medicæ* tells us, that *πεμφιγώδες πυρετός*, is a Fever, which, by the Intensity of its Heat, excites Pustules in the Mouth; and *πεμφιγώξ*, in *Varinus*, is a Breath, Spirit, and Ray of the Sun. Some will have *πεμφιγώδες πυρετός*, to be a Synochus, not of the putrid Kind, but proceeding from a Redundance of hot Blood, by its Fervor and Ebullition distending and inflating the Veins; and, therefore, it is called, by Practitioners, an Inflation Fever. *Foessius.*

PEMPTÆUS, *πεμπταῖος*. An Ague, the Paroxysm of which returns every fifth Day.

PENICILLUS. A Pledget, or Tent.

PENIDIUM SACCHARUM is thus prepar'd. Dissolve Sugar as much as you please, and clarify it with the White of an Egg; then strain and inspissate it gently; or slowly, till great Bubbles appear: This done, take it off the Fire, till the Bubbles subside; and then pour it out upon a Board, which has been rub'd over with Oil of Almonds; and, when it is somewhat harden'd, take it up with your Hook, and with your Hands, sprinkled with Starch, speedily reduce it into its proper Form, and lay it up for Use. *Schroder.*

PENIS. Having given, under the Article GENERATIO, a general Account of this Organ, I shall, in this Place, insert the curious Remarks of Mr. *Cowper*, relative thereto.

Regnerus de Graaf, in his elaborate Treatise of the Organ of Generation, has accurately describ'd this Part; and *Ruyfch*, in

in his late Anatomical and Chirurgical Observations, demonstrated the Structure of its Glans, which the Former has not so well observed; to which I shall add what a strict Inquiry on this Subject has given me occasion to discover.

I shall not here repeat those many synonymous Appellations, which lascivious Wits, or other sedulous Authors, have invented. The *Penis* is an Organ contriv'd by the Author of Nature, for the Ejection of the Seed, and Emission of Urine, composed of certain spongy and cavernous Bodies, with their Vessels and Integuments, of which in their Order. First, of its external, or common containing Parts, as the *Cuticula*, *Cutis*, and *Membrana Carnosa*.

In the *Cuticula*, we could never observe any considerable Difference from that of other Parts, except on the Glans, where we find, by the Assistance of a Microscope, that its exterior Surface is villous or downy.

The true Skin, or *Cutis*, in this and the Scrotum, is much thinner than we find it in other Parts; and both have a peculiar Disposition of their Blood-vessels: The Arteries are called here *Pudenda*, which, arising from the external Branch of the *Iliac*, and running under the superior Part of the Skin of the *Penis*, divide themselves into many Branches, the larger of which are still subdivided, till they become capillary; from whose Extremities are continued so many Veins, which, again, uniting into larger Branches, pass into those that partly arise from the *Corpora Cavernosa Penis*; and, marching under the common Integuments, empty themselves into the upper Part of that continued from the *Saphena Vein* of the Foot: These, for Distinction, we call *Vena Præputii*.

Besides the Blood-vessels now mention'd, it has Lympheducts, which I had first an Opportunity of observing, by injecting this Part with prepar'd Mercury; which confirms the Opinion of *Schellhammer*, and the accurate *Nuck*, concerning the Origin of these Ducts: But whether they arise here from that Part of the *Canalis Sanguineus* call'd the Artery, or the Vein, did not appear from my Experiment; since I made Injection into both promiscuously: I observ'd divers Trunks on each Side, passing under the common Integuments accompanying the *Vena Præputii*, which (as I suspect) afterwards empty themselves, like those arising from the inferior Parts, into the *Glandula Inguinales*. This Contemplation may serve to inform us, how the morbid Matter comes to be convey'd more particularly to those Glands in Venereal Cases, and cause those Tumors that frequently happen on that Occasion, commonly called *Buboes*; which Conception is the more confirm'd, by observing those Phenomena that are previous to that Effect, as Ulcers and Inflammations on the Prepuce, and by the too early Use of astringent Topics, which probably may inspissate the reflux Lymph, and render it unfit to pass through those *Vesiculæ Glandosæ* into their exporting Lympheducts; from which Obstruction begun, a Tumor may arise: Hence an Account may be, also, given, how soon the Malignity may be sometimes convey'd into the Mass of Blood, by the common Passages of the Lymph; and a very good Reason offer'd for the Practice of opening those Tumors before the usual Time of Suppuration.

In that Part where the *Præputium* is contiguous to the *Balanus*, my very good Friend, that judicious Anatomist Dr. *Tyson*, has discover'd certain small Glands, which he calls, from the great Scent their separated Liquor emits, *Glandula Odorifera*: Their Number is uncertain; in those that have the *Præputium* longer than ordinary, they are not only more, but, also, larger, and separate a greater Quantity of their Juice, which, being lodged there, often grows acrid, and corrodes the Glans. They are very conspicuous in most Quadrupeds, particularly in Dogs and Boars, in the latter of which, their separated Liquor is contain'd in a proper Cist, at the Verge of the *Præputium*; out of which there is a large Aperture, whereby it is remitted again to lubricate the *Penis* of that Animal.

The third common Tegument is the *Membrana Carnosa*; this Part commonly wanting Fat, for divers Reasons: First, lest its Erection into that necessary Stiffness should be thereby hinder'd: Secondly, lest it should be too bulky; and, lastly, it would have dull'd the Pleasure the Male is affected with in Venereal Enjoyments: But whether these Considerations induced the Author of Nature to frame this Part without a *Membrana Adiposa*, does not appear, since its want of Fat may not unlikely depend on its great Alteration from that Flaccidity when it is not erected, to that Extension of it when it is. In the former, tho' we can conceive no great Obstacle, why its Adipose Cells should not be supply'd with their Oil, except its too great Laxity should retard the influent Blood in its Passage through its Papillary Arteries; yet, in the latter, its great Extension may not unlikely compress them to void their contained Oil; which may be the Cause, why the Interstices of the Muscles, and other Parts most quiescent, are subject to be fill'd with Fat. And in the *Penis* itself in Children, before Erection has been frequent, I have observ'd its *Membrana Adiposa* to be extended with Fat;

but, afterwards, tho' the Membrane remains, yet the Increase of Fat is hinder'd, and therefore we find it commonly without: Yet, in some Subjects, and those adult too, I have found it almost cover'd with Fat; but what Inconvenience the Party suffer'd when living, was not my Fortune to be acquainted with.

I come next to take notice of its Ligaments; first, of that called the *Frænum*, which ties the Prepuce to the lower Part of the Glans. This, in some, we have found so short, that we have been obliged to divide it to procure a complete Erection; in others, I have been oblig'd to do the like, where a Cicatrix has been made after large Ulcers on it, which frequently happens in Venereal Infections.

The next Ligament which I shall speak of, I call *Suspensorium*: Altho' it has escap'd the Observation of Anatomists, yet it is very conspicuous, and of remarkable Use; of which hereafter, when we come to give an Account how this Part becomes erected. It ariseth from the anterior Part of the *Os Pubis*, and is fix'd to the upper Part of the *Dorsum Penis*, on each Side its great Vein. The rest of the Ligaments are such as compose its Capsulæ, or divide them as their Septums: These we shall mention in treating of its internal or contained Parts; which are, the two *Corpora Cavernosa Penis*, the *Corpus Cavernosum Urethrae*, their Septums, Muscles and Vessels, of which as they appear in Dissection.

First, of the Vessels that carry Blood to it, as, the Arteries. They arise, sometimes, from the *Rami Iliaci interni*; at other times, from the inferior Parts of the umbilical Arteries: Whence an Account may be given, why this Part is less than usual, by tying the Umbilical Rope too close to the Belly; and that not only from the Retraction of the *Urachus*, but by the Constriction attending these Arteries by the great Extension of the Umbilical ones, from which they have their Rise; whereby may be denied that Plenty of influent Blood; but this we leave to future Observation. As these Arteries pass towards the *Penis*, they send forth two or three Branches on each Side, the two inferior of which run to the *Musculi Directores Penis*: The two superior administer Blood to the adjacent Parts, particularly to the *Musculi Elevatores Ani*, between which, and the *Marsupiales Femorum*, these great Trunks pass; but, marching over the Cavernous Bodies of the *Penis*, they are both subdivided into two large Branches, the two inferior of which pass to the Bulb of the Cavernous Bodies of the *Urethra*; but the two superior are both subdivided again, the external running on the superior Surface of the Cavernous Bodies of the *Penis*; the internal, entering the Capsulæ, pass through the Middle of each Cavernous Body; wherein they divide themselves into innumerable Branches, from whose Capillary Extremities are continued so many Veins, in the Canals of which are divers Apertures into as many Cells, which communicate with each other, and empty themselves into the larger venous Ducts running on the superior Surface of the *Penis*, some of which join with those of the Prepuce; others make one large Trunk, which we call *Vena ipsius Penis*, marching on the *Dorsum Penis*, immediately under the Ligament that ties the *Os Pubis* together internally, whereby it is compress'd in Erection; but, proceeding farther on the Prostatæ, it is there bifurcated, and enters the *Rami Iliaci Interni*, on each Side. The Veins which arise (in like manner) from the *Corpus Cavernosum Urethrae*, pass from its Bulb through the *Musculi Acceleratores*, whereby they are compress'd when those Muscles are in Action.

The Nerves that belong to this Part, are derived from the Trunk, composed by the Coalection of the Third of the *Os Sacrum*, and a Branch remitted from the great Crural Nerve; which, after their Union, provide Nerves for Testes, Perinæum, and Muscles of this Part, ascending on the Cavernous Bodies of the *Penis*, and, expanding themselves on its superior Surface, are distributed to all its Parts. Its Lympheducts we mention'd in describing its external Integuments: Wherefore we proceed, next, to its Cavernous Bodies.

The *Corpora Cavernosa Penis*, by *De Graaf* called *Nervosa*, by others *Nervosa Spongiosa*, are two Capsulæ, or oblong Folliculi, every-where outwardly fenc'd with a thick Membrane, by *Vesalius* and *Columbus* suppos'd to be like Ligaments, whose external Surface is cover'd with Nerves and Blood-vessels. They spring with two distinct Originals from the lower Side of the *Os Pubis*; whence, stretching forwards, they meet each other, leaving an Interstice before their Conjunction, in which the *Urethra* is convey'd, where they leave the *Os Pubis*; they are each cover'd with a Membrane, and are afterwards joined to each other by the Intervention of a *Septum intermedium*, which, the nearer it approaches the Glans, is more diminished; and, before it arrives to the Middle of the *Penis*, its Fibres ascend from the *Urethra* to the *Dorsum Penis* like the Teeth of a Comb, as *De Graaf* has well observ'd; but is not obliterated, and the two Cavernous Bodies united near the Glans, as he would persuade us; but, on the contrary, rather grows thicker

thicker and narrower, as *Ruyfch* has well observed. In Inflation the Wind, I confess, may sometimes pass from the Cavernous Bodies of the Penis to that of the Urethra, which yet will not always happen; which Communication depends on the Mediation of their Blood-vessels, as our last-named Author also takes notice. Anatomists differ concerning the internal Constructure of these Cavernous Bodies: *Vesalius* accuses *Galen* for his Inadvertency herein. *Columbus* first observ'd their Arteries, which, proceeding strait to their Extremities, disperse themselves into innumerable Branches; which escap'd the Observations of former Anatomists, as he writes. Dr. *Whorton* imagines they are partly compos'd of glandulous Flesh; others conceive they are intertext with divers Nerves, from whence the Name of *Nervosa* was first impos'd on them. *Diemerbroeck* supposes they are not a mere Texture of Vessels intricately interwoven in the manner of a Net, as *Bauhine*, *Riolan*, and *Veslingius*, imagine; but their Substance is fibrous, fungous, and cavernous, like the Lungs, receiving into their hollow Interstices Blood and Spirits, from the Vessels that are dispersed through their Substance: the Inquiries I have made inform me, that there is a great Analogy between the Structure of this, and that of the Spleen, which *Columbus* also remarks; in both which the Sides of the Veins have large Apertures, or Cells, which most plainly appear in the Bulbus of a Dog's Penis; but, in an human one, they are here much less, and larger in the Spleen, and also open into each other: Wherefore, when the refluxent Blood is stop'd, the Penis becomes equally distended thereby, and it is driven forwards towards the Glans, when its Muscles contract.

Under these Cavernous Bodies of the Penis lies the Urethra, which has also its *Corpus Cavernosum*, differing very much in Figure from that of the two former, they being less at each End, and largest in the Middle; whereas this, on the contrary, is there least, and largest at its two Extremes; neither is its proper Tegument so dense. The superior Part of it, lying between the two Crura of the former, we call, from its Figure, *Bulbus*, which is cover'd with the *Musculus Accelerator Urinae*. It possesses the lower Part of the Urethra, extending itself in the Perinaeum; and is divided in cutting for the Stone, in which Operation Caution ought to be had to its Arteries, which enter that Part of the Bulb towards the Anus laterally. It has, also, a *Septum intermedium*, (though not hitherto taken notice of by Anatomists) dividing the Right Side of the Bulbus from the Left, which, descending to the End of the bulbous Part, is there obliterated. The Office of this Septum, we conceive, is to direct the refluxent Blood to the exporting Ducts, its two Veins mentioned before. As this *Corpus Cavernosum* descends on the inferior Part of the Urethra, it is lessened; but, when it approaches the Extremities of the two former, it again dilates itself, and covers them, composing that Body which we call *Glans*, or *Balanus*, which *De Graaf* had mistaken for fleshy Substance distinct from either. This *Ruyfch* has well described and figured in his above-mentioned Century of Observations. Its Cells in the Glans are much less than those of the former; but towards its superior Part, or Bulbus, they equal them. Having already described the Muscles of this Part, we shall proceed to give an Account how it becomes erected.

Galen, and the former Anatomists, not knowing the Circulation of the Blood, or that it pass'd from the Arteries into the Veins, were extremely deceived in their Ideas of the Erection of the Penis. *Columbus*, who has given an almost complete Description of that grand Work, still conceiveth the Arteries of this Part pour out Spirits with great Force into it, by which means it is extended. *Caspar Bauhine* supposes, in a Venereal Appetite, the Blood and Spirits flow into this Part in great Plenty; and, being fill'd, like a Gut, with Wind, it begins to swell, and grows hard, which he imagines is done by a Sphincter Muscle constricting the Neck of the Bladder, and Roots of its Cavernous Bodies. *De Graaf* assigns two Kinds of Vessels, with its Muscles, for the Performance of this Office: The Nerves, by which the animal Spirits flow into its membranous Parts, and render them more rigid and tumid; and the Arteries carrying Blood to distend the *Corpora Cavernosa*: "For, as he reasons, we are firmly persuaded the principal Extension of the Penis is from Blood; first, by injecting Water into its *Corpora Cavernosa*, by its Arteries, in a dead Body, we see it extended to the same Dimensions as when the Animal was living: Secondly, in firmly tying a Dog's Penis in Coitus, and afterwards examining it, we find nothing but Blood to distend it." To which may be added, that in Criminals which hang long after Death, this Part becomes erected, the Blood in that Position of the Body falling to the inferior Parts: And, by inflating the Blood-vessels of a dead Animal, it will also erect; which we first practis'd in a human Body, by inserting a Blow-pipe into the *Vena Saphena*, whereby it was not only erected, but afforded a Prospect of the external Disposition of its Blood-vessels, particularly its Veins; which

suggested to us a Contrivance in Nature in this Action, which has hitherto escap'd the Reflection of Anatomists. *De Graaf*, not considering the Use of the adjacent Parts, assigns its Erection to its Muscles; imagining that, by the Intumescence of their Bellies, they not only compress the *Corpora Cavernosa*, and drive the contained Blood towards the Glans, but likewise the Passages through which it ordinarily flows back; which latter we can by no means admit in the Cavernous Bodies of the Penis itself, since the *Musculi erigentes* are so remote from their great Vein. Our Hypothesis, founded upon the Observation above-mentioned, and compar'd with the Structure and Situation of its Parts, is as follows: The Penis is approximated to the *Ossa Pubis*, when those Muscles act, by means of the *Ligamentum Suspensorium*; whereby the Blood is not only driven forward towards the Glans in greater Plenty, and its Veins distended; but their great Trunks, running over the *Dorsum Penis*, are compress'd as they march close under the *Ligamentum Transversum* of the *Ossa Pubis*. The like cannot happen in the Cavernous Body of the Urethra, since there is no Bone whose Position can have that Effect upon its Veins, as the *Ossa Pubis* have upon those of the Penis itself: Wherefore the *Musculi Acceleratores*, compressing those of its Bulb, do that Office: Hence it happens, in an imperfect Erection, the Glans is not equally extended with the Penis itself, and, at other times, is soonest relax'd; but, when Muscles act, the Blood contained in the Bulb is driven forwards towards the Glans, whereby it becomes more extended: So in a Piece of Gut, which if fill'd with Water, or Wind, and either End compress'd, the opposite being tied, we shall see it strut out, and be more distended, as *De Graaf* instances after *Caspar Bauhine*. The Blood, thus hinder'd in its Return, distends the Cavernous Bodies, which is thereby erected; the Arteries which before were flaccid, having then their Trunks also extended, do more plentifully import Blood into this Part: But since it is absolutely necessary some Part of the detained Blood should be still passing off, lest it become grumous, and unfit for a Reflux; to this End, the *Venae Praeputii* are joined to those of the Penis itself, as above noted, and are placed under the Skin only; and, running over the *Ossa Pubis*, carry off Part of the impell'd Blood to give way to a fresh Supply from the Arteries; and preserve the Circulation uninterrupted. I remember, once, in an obstinate Priapisma, which would not yield to ordinary repeated Phlebotomy, I opened the Vein of the Penis itself, not without the expected Success, it immediately losing its troublesome Rigidity, by which I was confirm'd in my Conjecture.

This elegant Contrivance in disposing these exporting, sanguiferous Ducts, that some are liable to be compress'd, while others remain altogether free, is not only observable in the Penis of Men, and Clitoris of Women, but in that of all Animals which have hitherto fell under our Examination, as well as in the Pudenda of all Females; and is, indeed, an Artifice that deserves our Admiration.

PENNA. A Feather. It, also, signifies a submarine Plant, which grows upon the Rocks, resembling a Bird's Wing. It is call'd, likewise, *Mentula Alata*.

PENO-ABSOU. An American Tree, the Bark of which is very fragrant. The Fruit is about the Size of an Orange, and contains six, and sometimes ten Nuts, of the Size of an Almond; which are each furnish'd with a Kernel, or small Almond, from which an Oil is drawn by Expression. This Fruit is poisonous. The Oil is said to cure the Wounds made by Arrows, and other Wounds, if apply'd thereto.

PENTADACTYLON. A Name for the *Palma Christi*. *Blancard*.

PENTAMOERON. The Name of an Ointment describ'd by *Aetius*, *Tetrabib.* 3. *Serm.* 4. *C.* 44. It consists of Stryax, Mastich, Wax, Opobalsamum, and Ointment of Nard. This is, also, describ'd by *Paulus Aegineta*, *L.* 7. *C.* 20. under the Title of *Pentamyron*.

PENTAMYRON. See **PENTAMOERON**.

PENTANEURON. A Name for the *Plantago*; *angustifolia*; *major*.

PENTAPHARMACUM. A Medicine consisting of five Ingredients. It was, also, the Name of a favorite Aliment of the Emperor *Adrian*, as *Aelius Spartianus* informs us, which consisted of the *Sumen*, or Udder of a Sow; a Peacock, Ham, a sort of Paste or Cake, and Brawn; the five Ingredients from which it acquir'd the Name.

PENTAPHYLLOIDES.

The Characters are;

It agrees, in every thing, with the Cinquefoil, only the Leaves are not radiated to one Centre, but rather dispos'd in the Form of Alæ, or pennated; and terminate in an odd Lobe.

Boerhaave mentions nine Species of *Pentaphylloides*; which are,

1. *Pentaphylloides*; *palustre*; *rubrum*. *T.* 298. *Quinquifolium palustre rubrum*. *C. B. P.* 326.

2. *Pen-*

2. Pentaphylloides; majus erectum; flore luteo; ternis foliis, Fragariae instar hirsutis. *M. H.* 2. 193. *Fragaria, Pentaphylli fructu.* *M. H.* Bælf.

3. Pentaphylloides; Ulmariae facie. *M. H.* Bælf. 291. *Quinquefolium fragiferum.* *C. B. P.* 326.

4. Pentaphylloides; rectum; fruticosum; Eboracense. *M. H.* 2. 193.

5. Pentaphylloides; argenteum; alatum; seu Potentilla. *Tourn. Inst.* 298. *Boer. Ind. A.* 41. *Argentina, Potentilla, Anserina.* *Offic. Argentina.* *Ger.* 841. *Emac.* 993. *Raii Hist.* 1. 617. *Potentilla.* *C. B. P.* 321. *Park. Theat.* 593. *Potentilla seu Argentina.* *J. B.* 2. 398. *Pentaphylloides, Argentina dicta.* *Raii Synop.* 3. 256. **WILD TANSEY.** *Dale.*

This is a low Plant, which never arises up to the Stalk, but creeps upon the Ground, emitting Fibres from the Joints, by which it roots in the Earth, and spreads very much; the Leaves are made up of several Pinnæ set opposite; each being about an Inch long, and not half so broad, serrated about the Edges, and having several small Pieces among them like Agrimony, cover'd over with a shining silver-colour'd Down: The Flowers grow at the Joints, on long Foot-stalks, of five yellow Leaves like Cinquefoil. The Root is slender, with many Fibres of a dark-brown Colour. It grows in moist barren Places, and where Water has stood, all the Winter, flowering in May.

The Leaves only are used, and are accounted refringent and vulnerary; good to stop all Kinds of Fluxes, and preternatural Evacuations, to dissolve coagulated Blood, to help those who are bruised by Falls: Outwardly, it is used as a Cosmetic, to take off Freckles, Sun-burn, Morpew, as, also, in refringent Gargarisms. *Miller's Bot. Off.*

This Plant is of an herby Taste, a little saltish, but styptic; it gives a very deep Tincture of Red to the blue Paper; which makes us conjecture, that the acid Part of the natural Salt of the Earth, filtrating itself through the Texture of this Plant, produces there, with the Earth, a kind of Salt very aluminous, united with a little Sulphur.

All Authors agree, that the wild Tansey is astringent, vulnerary, and deterfive. They infuse it a whole Night in Wine: They drink it after the manner of Tea: They prescribe it in Ptisans, and Broths, for the Looseness, Bloody-flux and Hæmorrhages. I have seen it have wonderful Effects upon the Whites, especially if seven or eight Cray-fish are added to each Decoction of wild Tansey. It abates the Inflammation of the Kidneys and Bladder, and tempers the Heat of Urine. Its distilled Water is good for the Blearedness and Ulcers of the Eyes; for Tanning and Redness of the Face. *Martyn's Tournefort.*

It is moderately refrigerant, but more powerfully astringent, drying and binding; whence it is good for an Hæmoptoe, Diarrhoea, and other Fluxes of the Belly and Uterus: It is, also, an excellent Lithontriptic, and very serviceable in the Cure of Wounds and Ulcers. Externally, it is much in Use for the Tooth-ach, putrid Gums, and for mitigating the Heat in Fevers; for which Purpose it is of great Efficacy, being bruised, and apply'd to the Soles of the Feet, or to the Wrists. The Women in England use the distilled Water as a Remedy for Itch, Freckles, Sun-burns, and other cutaneous Defections. In *Yorkshire*, about a Town call'd *Settle*, it is customary for the Boys to dig up the Roots, which they call *Moors*, and eat them, for they are of a sweet Taste, and as grateful as a Parsnep, as I have been credibly assured, says *Ray*, by an Apothecary who lived in those Parts. *J. Agricola*, by a remarkable Experiment, found the Juice of this Herb, with the Powder of the common *Colchicum*, to be a Cure for the Disease of the Anus, called the *Marisca*. *Caster Durantus* advises to put it in the Shoes of those who labour under a Dysentery, and assures us, that not only the Dysentery, but all preternatural Fluxes of the lower Belly, as well as an immoderate Flux of the Menfes, and even an Hæmorrhage, at the Nose may be cur'd by the same Experiment; *Sim. Paulus.* *Hartman* affirms, that this Remedy was effectual in a Dysentery which had eluded the Prescriptions of Physicians: And the same is the celebrated Arcanum of *Petr. Borellius*; *Cent.* 1. *Obs.* 12.

Diuretics are sometimes beneficial in Fevers, among which *Anserina* is specifically adapted to such a Purpose; and so is the Salt of *Anserina*, which I regard as a Specific. *D. Soame* from *Doleus.* *Raii H. P.*

6. Pentaphylloides; supinum. *J. B.* 2. 398. *Quinquefolio fragifero affinis.* *C. B. P.* 326. *Fragaria, vesca.* *Ger.*

7. Pentaphylloides; orientale; erectum; Pimpinellæ folio, & facie. *T. Cor.* 21.

8. Pentaphylloides; Canadensis; folio Agrimoniz. *Saracen.*

9. Pentaphylloides; erectum. *J. B.* 2. 398. *Boerb. Ind. alt. Plant.*

The fifth Species is most commended, and has its Names *Argentina* and *Potentilla* from its noble and potent Effects. It

is endu'd with the Virtues of the *Peruvian Bark*; for if the Herb be bruised, and the express'd Juice taken an Hour before the Paroxysm of an intermitten Fever, it removes it with one or two Doses, if the Disease be of a kindly Sort, as well as the Bark. If there be any Malignity in the Fever, it is externally apply'd; if an Ulcer or Wound bleed excessively, being apply'd in the Form of a Cataplasm, it rarely fails of answering the Purpose. Internally, it is of Service in all Diseases which consist in Openings of the Vessels, and Evacuations of the Liquids; whence it cures the Dysentery, which has its Original from Liquids. Outwardly, it is consider'd, also, as an Antiphlogistic: If any one has his Feet inflamed with too much Walking, this Plant, apply'd thereto, cures him. If Infants have their Ears oppress'd with Sordes, the Remedy is the bruised Leaves of this Herb mix'd with a little Cerus. There is prepar'd a Conserve of this Herb, which is well worth the keeping, but the distilled Water is of no Use. The Seeds and Root are astringent, for which Reason they cure the Diarrhoea and Hæmorrhages. A Decoction of the Plant, with River-crabs, is a very good Remedy in the Fluor albus; and the Seeds have the same Effect in an immoderate Flux of the Menfes, and an Inflammation of the Bladder. *Hist. Plant. adscript. Boerb.*

PENTAPHYLLUM. A Name for several Species of *Quinquefolium* and *Pentaphylloides*.

PENTAPHYLLUM PEREGRINUM. A Name for the *Sinapisrum*; *Lusitanicum*; *triphyllum*; *flore rubro*; *siliquis corniculatis*.

PENTAPLEURUM. A Name for the *Plantago*; *angustifolia*; *major*.

PENTATHETON. The Name of a Plaister describ'd by *Oribasius*, *Synop. L.* 3. and mention'd by *Actius* and *Actuarius*.

PENTOROBUS. Peony. *Actius, Tetrabib. 1. Serm. 1.*

PEPASMOS, πεπασμός, or PEPANSIS, πεπανσις. Concoction. See *Coctio*.

PEPASTICA. Digestive Medicines. *Blancard.*

PEPITAS DEL PERU. The Name of a *Peruvian* Fruit, to which I find no Virtues ascrib'd.

PEPLION, PELOS, πέπλιον, πέπλος, were Medicines much of the same Kind and Quality, and prescrib'd by the ancient Physicians as Cathartics for evacuating the Body of Bile and Phlegm. This is evident from *Dioscorides*, *Ruffus Ephesius* in his Fragment of Cathartics, and *Actuarius*, who says, also, that those Medicines, after evacuating black Bile and Phlegm, expel Flatulencies, especially such as give Rise to Melancholy; and even that they cure Inflammations of the Spleen, Uterus, and larger Intestines. *Hippocrates* usually prescribes *Peplium* as a Purge for black Bile, which, as *Galen* says, it evacuates, as well as black Hellebore, and is more effectual in expelling Flatulencies. It is prescribed also, by *Hippocrates*, as a Purge in an Erysipelas of the Lungs, and the first Appearance of a Consumption. The *Peplon*, *Lib. 2. Epid.* was order'd to be taken by *Scopus* afflicted with a Swelling of the Spleen, and a great Distention of the Hypochondria, and lower Parts of the Belly, from Flatulencies; and, *Lib. de Superfæt.* it is recommended for mollifying the Orifice of the Uterus. In *7 Epid.* the *Peplon* is prescribed under the Name of *Meconium, μωκόνιον*, as a Purge for Bile and Phlegm, as, also, *Lib. de R. V. I. A.* And, in the Book *de Mulier. Morbis*, it is recommended under the Names of *Mecon*, *Meconium*, and *Meconis*. *Peplium*, in *Galen's* Exegeſis, is expounded to be the same with what is, also, called *Peplis*, and wild *Andrachne*, which Names are taken from *Dioscorides*, *Lib. 4. Cap.* 169. We find, in the same Exegeſis, the *Peplon* to be the same with what is called, also, *Chamaſyce*, *Papaver Spumeum*, and *Meconium*, which *Pliny* also writes, *Lib. 27. Cap.* 12. *Erotian* says, that *Peplon* is a kind of Herb which some call *Peplion*, and others *Symphytum*. *Foefius.*

Hippocrates used to add *Peplium* to black Hellebore, but it is not certain what Kind of Plant it was: Many refer it to the *Esula*, and *Matthiolum* assures us, that there is, at this Day, in *Italy*, a Species of *Esula*, which they call *Pepla*, or *Pepla*. Because *Hippocrates*, in some Places, gives it the Name of *Meconis*, *Dioscorides* seems to call it *Papaver spumeum*, tho' the Marks he there gives of it leave us at an Uncertainty to what Species of the *Papaver* we are to apply the Name of *Peplion*. It is a Question whether it be not the *Papaver album* of *Hippocrates*, because it is reckon'd by him as a Purgative; and this, indeed, seems probable, because there is a Species of *Papaver*, which *Pliny* says is called *Tithymalus*. *Schultzei Hist. Med.*

PEPLIS. A Name for the *Tithymalus*; *annuus*; *erectus*; *folio oblongo, acuminato*.

PEPLUS. A Name for the *Tithymalus*; *rotundis foliis, non crenatis*.

PEPLYMENON. The Name of a Cerate mentioned by *Celsus*, *Lib. 5. Cap.* 18.

PEPO.

The Characters are ;

The Flower consists of one Leaf, which is Bell-shap'd, expanded at the Top, and cut into several Segments: Of these Flowers, some are male, and some are female, as in the Cucumbers and Melons. The female Flowers grow upon the Top of the Embryo, which afterwards becomes an oblong, or round, fleshy Fruit, having sometimes an hard, rugged, or uneven Rind, with Knobs and Furrows; and is often divided into three Parts, inclosing flat Seeds, that are edged, or rimmed about, as it were, with a Ring, and fix'd to a spongy Placenta.

Boerhaave mentions fifteen Species of *Pepo*; none of which have any particular Medicinal Virtues ascrib'd to them, except the first; which is,

Pepo; oblongus. *C. B. P.* 311. *Raii Hist.* 1. 641. *Tourn. Inst.* 115. *Boerb. Ind. A.* 2. 78. *Pepo*. *Offic. Park.* Parad. 526. *Pepo maximus oblongus*. *Ger.* 773. *Emac.* 919. COMMON POMPION, or MELON.

The Pompion takes up a great Compass of Ground, with its large, thick, creeping Stalks, furnish'd with large Claspers; its Leaves are very large and rough, in Shape like those of Melons. The Flowers are large, in Shape and Colour like a yellow Lily. The Fruit is of a great Bigness, having large, white, oval, flatish Seed. The Pompion is sown in Dunghills, being ripe in September and October; it is rarely used in Physic.

The Seed is cooling, and of the Nature of the Melon, and other cold Seeds; and may serve very well to make Emulsions. *Miller's Bot. Off.*

All the Kinds of Pompions are cooling; moistening, allay sharp Humours, and quench Thirst.

They are hard to be digested, weaken the Stomach, and cause Wind and Colic.

Pompions contain much Phlegm, a middling Quantity of essential Salt, and a little Oil.

They agree in hot Weather with young, bilious People; but Persons of a cold and phlegmatic Constitution ought to abstain from them.

They usually mix the Pompions with some aromatic Herbs, such as Parsley, Onions, Mustard, Pepper, and several other sharp and volatile Things, fit to attenuate the viscid Phlegm of this Fruit in the Stomach.

They preserve Pompions with Sugar, in order to make them more pleasing to the Taste, and more wholesome. In short, they rarefy their gross Substance by boiling them well; and besides, the Sugar, wherewith they are mix'd, gives them a little sort of pricking Quality, that makes them less insipid to the Taste, and more easy of Digestion. Preserv'd Pompions may be used in Distempers of the Breast, in order to allay the Sharpnesses that are there.

Pompions contain a great many Seeds, which are flat, oblong, cover'd with an hard Rind, that is a little woody, whitish or greyish. Under this, there is a small sweet and very pleasant Kernel, which contains a great deal of Oil, that may be easily press'd out of it; and is proper to soften the Skin, and make it more smooth. *Lemery on Foods.*

PEPTICOS, πεπτικός. Digestive, or promoting Digestion. It is used with respect to the Digestion of the Aliments, the Concoction of the Humours, or the Formation of Matter.

PEQUEA, or PEKIA. *Pison. I. De Laet.* The Name of an Indian Tree which bears a Fruit somewhat larger than an Orange, the Juice of which is extremely sweet and delicious, and esteem'd by the Europeans as good in Disorders of the Breast. *Raii Hist. Plant.*

PERAGU. *H. M.* The Name of a Shrub, which grows in Malabar. The Root, taken in acid Milk, or Wine, is said to be good for a Lientery, the Colic, and Gripes; and the Powder thereof is said to dry up Pustules. The Juice of the Leaves, taken internally, kills Worms of the Intestines. *Raii Hist. Plant.*

PERCA. *Offic. Schrod.* 5. 331. *Rondel. de Pisc.* 2. 196. *Mer. Pin.* 190. *Perca fluviatilis*. *Bellon. de Aquat.* 295. *Gefn. de Aquat.* 698. *Raii Ichth.* 291. *Ejusd. Synop. Pisc.* 97. *Salv. de Aquat.* 296. *Perca major*. *Charlt. de Pisc.* 41. *Jonst. de Pisc.* 47. *Perca fluviatilis major*. *Aldrov. de Pisc.* 622. *Perca major* *Schonef. Ichth.* 55. THE PEARCH.

This Fish is very frequently found in Rivers; and the only Parts of it used for medicinal Purposes, are the Bones found in the Head near the Beginning of the Spina Dorsi, and in the Shops called *Lapides Percarum*; which, in Virtues, agree with the other testaceous Powders, and are used in dissolving the Stone, and cleansing the Kidneys. Externally they are, also, used in Dentifrices, and for drying Wounds. *Schrod. Dale.*

There are two Sorts of this Fish; the River and Sea-Pearch: The latter, in Latin, is called *Perca marina*, and is of a red-brown, or blackish Colour; it is smaller than the River Pearch: They find it near Rocks, where it preys upon smaller

Fish: It is hard, like Leather, viscid, not easy of Digestion, and ill-tasted, according to *Rondeletius*: They do not use it for Food, and so we shall say no more of it here. The River Pearch is subdivided into two sorts, the great and small one, which are both of them excellent Victuals. You are to chuse those that are fat, well-fed, middle-aged, tender, yet firm and well-tasted; and they should be such as are caught in fine clear Rivers.

The Pearch is nourishing, produces good Juice, and easily digests.

It is pretended, that when this Fish is too fat and old, it has an ill Taste, and is hard of Digestion; they, also, say the same thing of that which breeds in Marshes, and muddy Places.

Ausonius reckons the Pearch of the Number of those Fishes that have a delicious Taste. It may be said, in general, that the Pearch has but few gross Humours; that it produces many good Effects, and but a few bad ones: And the Reason is, because this Fish lives generally, and out of Choice, in pure, clear, and rapid Waters, rather than in those that are muddy, and run slowly. Moreover, it feeds upon good Food, and is very active, which, also, contributes to make it more delicious and wholesome. It is nourishing, and affords good Food, because it contains many balsamic Parts, and most pure Juice. It is, also, easy of Digestion, when middle-aged; for then 'tis of a middling Consistence: When, on the contrary, 'tis too young, or too old, 'tis soft and viscid, or else hard, like Leather. *Lemery on Foods.*

PERCEPIER.

The Characters are ;

The Calyx is quadrifid; the Flower is produced in the *Alae* of the Leaves; the Seeds are produced single in each Seed-vessel, which is formed by the Calyx.

Boerhaave mentions but one Sort of *Percepier*; which is, *Percepier Anglorum*, quibusdam. *J. B.* 3. 74. *Boerb. Ind. A.* 2. 93. *Percepier*. *Offic. Percepier Anglorum*. *Ger. Emac.* 1594. *Raii Hist.* 1. 209. *Synop.* 67. *Polygonum. Selinoides*. *Park.* 448. *Chærophylo nonnihil similis*. *C. B. P.* 152. *Alchimilla montana minima*. *Tourn. Inst.* 508. PARSLEY-PIERT.

This is a small low Plant, lying generally upon the Ground, whose round hairy Branches are seldom an Hand-breadth long; they are full of small Leaves, set alternately at the Joints, a little hairy, narrow at the Stalk, and broadest at the Ends, cut into three round Sections; the Flowers are small, and staminate, growing in Clusters at the Joints, among the Leaves; they consist of four Leaves, and are succeeded by small round Seeds. The Root is full of Fibres. It grows in dry Places, and in fallow Fields, as, also, among Corn.

Parsley-piert is not an official Plant, and is seldom prescribed by Physicians; but the Vulgar have a great Opinion of it, as a Breaker or Bringer away of the Stone and Gravel, and a Provoker of Urine; and it is given by them for that Purpose, either in Powder, or a Decoction of it in White-wine. *Miller's Bot. Off.*

It is said to be a very speedy, as well as potent Provoker of Urine, and to break the Stone: It is eaten raw, as a Green; and is, also, preserved in Pickle. The distilled Water of this Plant is very useful. *Raii H. P.*

PERCEPIOLUM. An approved or tried Remedy for a Disease. *Dorn. Diet. Paracels.*

PERDETUM, in *Paracelsus*, is the Root of Skirret.

PERDICUM. A Name for the *Parietaria*, Pellitory of the Wall.

PERDITIO sometimes imports a Miscarriage.

PERDIX. *Offic. Schrod.* 5. 323. *Perdix cinerea*. *Aldrov. Ornith.* 2. 140. *Jonst. de Avib.* 46. *Charlt. Exer.* 83. *Will. Ornith.* 118. *Raii Ornith.* 166. *Ejusd. Synop. A.* 57. *Perdix minor fulva*. *Bellon. des Oyse.* 258. THE COMMON PARTRIDGE.

The Parts of this Animal, used for medicinal Purposes, are the Flesh, Marrow, Blood, Liver, Gall, and the Feathers. The Flesh, if eaten, augments the Quantity of Semen and Milk, and proves a Stimulus to Venery. The Marrow, as, also, the Brain, when drank in some proper Liquor, are said to afford Relief to those who labour under a Jaundice. The Gall is, by some, highly extolled in Disorders of the Eyes. The Blood is used as an Ointment for the Eyes, when they are Blood-shot, and in recent Wounds of them. The Liver, dried before the Fire, and reduced to a Powder, stops an Epilepsy; and is accounted an highly efficacious Medicine against Fevers, if frequently exhibited in Yarrow-water. *Crato.* The Feathers, used by way of Fumigation, and applied to the Nostrils, are beneficial in a Suffocation of the Uterus, as, also, for alleviating, mitigating, and removing Colics, and other Pains of a like Nature. *Schrod. Dale.*

There are several sorts of Partridges, which ought to be chosen while they are young, tender, well-fed, and of a good Taste. When a Partridge is old, his Flesh is hard, like Leather, not easy of Digestion, and disagreeable to the Taste.

The Partridge, in all the Parts of it, contains much Oil, and volatile Salt.

It agrees, in cold Weather, with any Age and Constitution, but, more especially, with Persons recovering from Sickness, and those who are of a cold and phlegmatic Temper.

The Partridge's Flesh is firm, and full of viscous Moisture; and, for that Reason, 'tis very well tasted, good in Diarrhoeas, and for pituitous and phlegmatic People. The eating of Partridge increases Seed, is very nourishing, and wholesome for Persons recovering from Sickness; not only because it contains many oily and balsamic Parts, that are fit to unite with the solid Parts, and to restore them; but, also, by the Assistance received from its volatile Salts, which keep the Liquids in a just Fluidity, and increase the Animal Spirits.

A Partridge ought not to be eaten as soon as it is killed; but should, for some time, be exposed to the Air; for by that means its Flesh will grow more tender and short. *Lemery of Foods.*

PERDIX. Schw. A. 327. Gesn. de Avib. 606. *Perdix rufa*. Mer. Pin. 173. Charlt. Exer. 83. Jons. de Avib. 46. Aldrov. Ornith. 2. 139. Will. Ornith. 119. Raii Ornith. 176. Ejust. Synop. A. 57. *Perdix major rufa*. Bellon. des Oyse. 256. THE RED-LEGGED PARTRIDGE.

It agrees in Virtue with the preceding.

There is, besides, another Species of Partridge, called

PERDIX ALBA, or LAGOPUS: This is a Bird whose Legs are hairy, and resemble those of an Hare; there are two Species of it, one as large as a Pigeon, cover'd with Feathers as white as Snow, except those of the Tail, which are variegated with some black Spots: Its Beak and Feet are, also, of a blackish Colour.

The other Species resembles a Quail; but is larger, and covered with Feathers, partly white, and partly of a yellow Saffron-colour.

Both Species are found in the Alps, and Pyrenean Mountains, and delight in Snow. They are excellent Food, and contain a large Quantity of volatile Salt, and Oil. They are, also, of a restorative and corroborating Quality. *Lemery des Drogues.*

PERDIX MARINA is the Sole. See SOLEA.

PERDONIUM. Wine medicated with Herbs. *Dorn. Dist. Paracels.*

PERELLE. A sort of scaly Earth, brought from *St. Tour in Auvergne*. *Lemery des Drogues.*

PERESKIA.

The Characters are;

It hath a Rose-shaped Flower, consisting of several Leaves, which are placed orbicularly, whose Cup, afterward, becomes a soft fleshy globular Fruit, beset with Leaves; in the middle of the Fruit, are many flat roundish Seeds, included in a Mucilage.

Miller mentions but one Species of *Pereskia*; which is, *Pereskia aculeata*, flore albo, fructu flavescente. *Plum. Nov. Gen.*

This Plant grows in some Parts of the Spanish West-Indies, from whence it was brought to the English Settlements in America, where it is called a Gooseberry; and, by the Dutch, it is called *Blad-apple*. *Miller's Dictionary, Vol. 2.*

PERETERION. The perforating Part of the Trepan.

PERFOLIATA.

Boerhaave mentions three Species of *Perfoliata*; which are, 1. *Perfoliata*, vulgarissima, five arvensis. C. B. P. 277. *Boerb. Ind. A. 72. Perfoliata*. Offic. *Perfoliata vulgaris*. Ger. 430. Emac. 556. Raii Hist. 1. 470. Park. Theat. 580. *Perfoliata simpliciter dicta*, vulgaris, annua. J. B. 3. 198. *Bupleurum perfoliatum rotundifolium annuum*. Tourn. Inst. 310. Raii Synop. 3. 221. THOROW-WAX.

Thorow-wax has a small, fibrous, sticky Root; from which spring smooth, and frequently redish Stalks. The Leaves are of a bluish-green Colour, of an oval Shape; smooth, and not indented about the Edges; full of Nerves, which run obliquely from the Centre to the Circumference of the Leaf: They are perforated by the Stalk, which runs through them, and is divided towards the Top into several Branches, at the Ends of which grow small Umbels of yellow Flowers, usually five together upon one Stalk, with as many small Leaves under each Umbel; the three outermost being the largest: Each Flower is succeeded by two oblong striated Seeds. It grows only among the Corn, and flowers in June and July. The whole Plant is used.

Thorow-wax is reckoned among the vulnerary Plants, and is especially serviceable in green Wounds, Bruises, Ruptures,

Contusions, as also, for old Ulcers and Sores, either given in Powder, or the Decoction. *Miller's Bot. Off.*

It is reckoned among Plants of a consolidating and conglutinating Quality. The Decoction of the Herb in Wine, or the Powder of the Leaves, is exhibited for the Cure of internal Affections, as Ruptures, or Bruises by Falls. It is much recommended in Hernias, especially of Children, and particularly, according to *Schroder*, an umbilical Hernia, whether taken inwardly, or fresh bruised, and applied outwardly, in a Cataplasim, with Wine and Flour; in the same manner it resolves stumous Swellings. *Schwenckfeld* affirms, that it is of great Efficacy in Fractures, Hernias, and the Erysipelas.

The following Prescription, says *S. Paullus*, is a sovereign consolidating Remedy for the *Exomphalon*, or Prominence of the Navel: Take *Perfoliata*, Root and all, one Handful, Mouse-ear, Rupturewort, Plantain, Moss, *English Acacia*, of each half an Handful: Boil them in a sufficient Quantity of red Wine, and apply them to the Place affected. *Raii H. P.*

2. *Perfoliata*, annua, longioribus foliis. J. B. 3. 198. M. H. 3. 290. *Bupleurum perfoliatum, longifolium, annuum*. T. 310.

3. *Perfoliata*, montana, latifolia. C. B. P. 277. *Bupleurum montanum latifolium*. T. 310. *Boerb. Ind. alt. Pant. Vol. 1.*

PERFORANS MANUS. The Name of a Muscle of the Fingers.

This Muscle is very like the *Perforatus*, or *Sublimis*, and it is situated much in the same manner; only it lies lower, and is covered by the *Perforatus*: It is composed of four Muscles, which at first seem to make but one Mass, and afterwards terminate in four Tendons.

The fleshy Portions of the first and largest, and, also, of the second, are fixed in the superior Parts of the Ulna, and interosseous Ligament, down to their Middle; the fleshy Portion of the third is joined to the Tendon of the *Ulnaris Internus*, by a sort of common Aponeurosis; and that of the fourth is fixed along the Ulna.

The four Tendons have often several small collateral Tendons, sometimes five in Number, united to the Tendons of the neighbouring Muscle, as they pass under the large annular Ligament of the Carpus; but the Tendons themselves are separated from the others by thin Septa, which form a kind of particular Rings. Being thus strengthened, they separate, and, running along the Palm of the Hand, in distinct membranous Vaginae, like those of the *Perforatus*, by which they are covered, they enter the ligamentary Vaginae of the first Phalanges, together with the former; and, having passed through the Fissures thereof, and through the ligamentary Vaginae of the second Phalanges, they are inserted in the flat inner Side of the third, near the Basis.

The ligamentary Vaginae of the second Phalanges appear sometimes stronger near the Bases, near the Heads of the Bones.

The *Perforans* bends particularly the third Phalanges, in which it is inserted; and by the same Motion it may likewise bend the first and second Phalanges. We may apply to this Muscle all that is said concerning the tendinous Septa in the *Perforatus*, and concerning its Action, which is sometimes common to all the four subaltern Muscles, sometimes peculiar to one or more of them.

It may, likewise, be esteemed an Assistant to the *Ulnaris* and *Radialis Interni*, in great Efforts; and these Muscles may reciprocally be looked upon as Assistants to the *Perforatus* and *Perforans*.

Each of these four Tendons passes under a distinct annular Ligament, as under a Pulley; for, having accompanied that of the *Perforatus* through the great Ligament of the Carpus, through the Furcae of the Aponeurosis *Palmaris*, and through the ligamentary Vaginae of the first Phalanx, and having passed through the Slits of the *Perforatus*, it leaves this Tendon, and continues its Course to the third Phalanx through the ligamentary Vagina of the second.

In its Passage through the Slit of the *Perforatus*, it is liable to no Compression, even in the most violent Efforts of that Muscle. The reciprocal Contortions of the two flat Portions of the Fissure, and their crucial Insertion in the flat Side of the third Phalanx, hinder the little oblique Grooves, mentioned in the Description, from closing, and the two lateral Portions of the Fissure, from coming together, even after the Tendon of the *Perforans* has been removed; and the more this Part of the Tendon is pulled, the more perfectly does the Fissure form a sort of a Chancel with solid Sides, and with the two Ends cut obliquely.

Without such an artful Structure as this, the Tendon of the *Perforans* would have been continually exposed to Compressions and Contusions by the Sides of an ordinary Fissure; and, without passing through the Tendon of the *Perforatus*, it could not have been inserted in the middle of

of the flat Side of the third Phalanx, but near one of the Edges.

In the Insertion of these two Tendons in the Phalanges, we may observe still a farther Contrivance. This Insertion is angular in both, that is, the Extremities of the Tendons are not inserted according to their Breadth, in a transverse Line; but the Sides of their Breadth make an Angle with the Middle.

PERFORANS PEDIS, SIVE FLEXOR DIGITORUM LONGUS.

This is a long Muscle, fleshy above, and tendinous below; lying on the back Side of the Leg, between the Tibia and the Flexor Pollicis longus, covered by the Soleus, and covering the Tibialis posticus.

It is fixed, above, by fleshy Fibres, to a little more than the Middle third Part of the back Side of the Tibia, near its external Angle, below the Insertion of the Soleus; and, also, to a kind of Ligament, which runs down from the Middle of the Tibia. It afterwards ends in a Tendon, which passes behind the inner Angle on one Side, and a little behind the Tibialis posticus, in a separate annular Ligament.

From thence it runs under the Sole of the Foot, sending off a Detachment, by which it communicates with the Flexor Pollicis longus. There it is divided into four small flat Tendons, which go to the third Phalanges of the four small Toes, in the same manner as the Perforans of the Hand.

These four Tendons agree, likewise, in this, with those of the Hand, that they give Insertions to the Lumbricales; but they differ from them in this, that before the Separation they are joined, laterally, by an auxiliary fleshy Body, which I name *Flexor Digitorum accessorius*.

The *Perforatus*, or *Flexor Digitorum brevis*, binds the second Phalanges; and the *Perforans*, or *Flexor longus*, the third; the Use of these Muscles being nearly the same with the *Perforatus* and *Perforans* of the Hand. *Winslow*.

PERFORATA. A Name for the HYPERICUM.

PERFORATIO. Sometimes signifies a *Seton*.

PERFORATUS MUSCULUS.

PERFORATUS MANUS, VULGO SUBLIMIS.

This Muscle is considerably large, lying along the Inside of the fore Arm, fleshy for the greatest Part near the Articulation of the fore Arm with the Os Humeri, and near the Carpus terminating in four distinct Portions, which become the same Number of long small Tendons. The Name of *Sublimis* has been given to it; because it lies almost on the Surface of the fore Arm; and that of *Perforatus*, from the Slits found near the Extremities of its Tendons.

It is commonly made up of four Muscles, closely united by their fleshy Portions, representing there one large Body of Muscles. It is fixed above to the superior internal Parts of the Ulna and Radius, (this last Bone being considered in its natural Situation) and to that of the interosseous Ligament. A little below the Middle of the fore Arm, this large fleshy Body is divided into four distinct Muscles, which, on the lowest Quarter of the fore Arm, end in four flat Tendons of different Sizes.

These four Tendons are inclosed in a common membranous, or mucilaginous Vagina, which, likewise, furnishes each Tendon with a particular thin Vagina. In this manner they advance to the Carpus, and pass under the large annular transverse Ligament: Beyond this Ligament, they spread again, in the Palm of the Hand, still retaining their particular Vagina, and run between the Aponeurosis Palmaris and Metacarpus, toward the Fingers, separating more and more by degrees. Sometimes there are at first only three Tendons, one of them being afterwards divided into two, in their Passage to the Fingers; sometimes they communicate, by a kind of Detachment, with the Tendons of the Perforans.

Having reached the Heads of the metacarpal Bones, they pass under the four Arches, or Fræna, formed by the Furca of the Aponeurosis Palmaris, and particular Septa of the great transverse Ligament of the Palm of the Hand; and then each Tendon, having got beyond the Head of one metacarpal Bone, and beyond the Basis of the first Phalanx, enters the ligamentary Vagina, and the flat, or inner Side of that Phalanx; and is inserted in the flat Side of the second Phalanx, near its Basis, the membranous Vagina accompanying it to its Insertion. The ligamentary Vagina is stronger towards the Basis, than towards the Head of the first Phalanx.

In passing along the Inside of the first Phalanx, the Tendon is divided by a long Slit, which gives Passage to a Tendon of the Perforans, and from thence the Names of these two Muscles are taken.

This Fissure, or Opening, is contrived in a very singular manner: The Tendon is, first of all, divided in two flat Portions,

and each Portion is contorted on the flat Side of the Phalanx; so that the Edges, which were nearest, become opposite, and the opposite Edges are joined together all the Way to the Extremity of the Tendon. By this Contortion, the Fissure seems to form two small oblique Grooves, which surround the Tendon in opposite Directions; one Groove being covered by the Tendon, and the other covering it.

This is not all: The two Portions, having formed this double Groove by their mutual Contortion, are not united, only by simply approaching each other at their Extremities; for each Portion is at that Place again divided into two others, smaller and shorter than the former; so that, in all, there are four narrow Portions, the two nearest of which cross each other, and join the other two, so that from the four narrow ones are formed two broad Portions anew, which are joined by their Edges, and afterwards inserted in the Bone at a small Distance from each other.

The *Perforatus* serves to bend the second Phalanges of all the Fingers, except the Thumb; and the particular Muscles, of which it is made up, may act separately, by reason of their distinct Insertions in these Phalanges. The Union of the fleshy Bodies by intermediate tendinous Septa may have several Uses, the principal of which is, that these Septa, being very broad and thin, give Insertion to a great many fleshy Fibres in a very small Compass, and thereby supply the Place of four large Tendons, which would have taken up much more Room; but by this Union these four Muscles are more disposed to act jointly than separately.

They not only bend the second Phalanges on the first, but, also, the first on the metacarpal Bones, and the Metacarpus and Carpus on the fore Arm. To conceive the Mechanism and Force of these Muscles, which is very great, and necessary in certain Circumstances, it must be observed, that as, in the Muscles of the Scapula, every Muscle, which can move a Bone in any given Direction, is, likewise, able with the same Force to keep it immoveable in any Situation, against whatever tends to move it in a contrary Direction. The following Examples will sufficiently illustrate this Observation.

It is by bending the Fingers that we raise the greatest Weights, that Sailors pull large Oars, that Printers turn the Screws of their Presses, and that Climbers support their whole Bodies, even with an additional Burden upon them. It is by means of the Fingers, when bent, that we tear, pull up, bruise, and the like, things that require great Force to be so treated.

The Strength of Muscles depends on the Multitude of their fleshy Fibres, and the Extent of their Motions, on the Length of these Fibres; and, consequently, where-ever Strength is more necessary than large Degrees of Motion, there we find the Fibres of Muscles proportionably increased in Number; and, where-ever there is more Occasion for a large Degree of Motion than for Strength, the fleshy Fibres are of a proportionable Length.

In the *Perforatus* we meet with both these Contrivances, a great Number of Fibres for Strength of Motion, and a great Length of Fibres for Extent of Motion. The different tendinous Septa serve to give Insertions to a Number of moving Fibres, sufficient for the Strength required in the Cases already mentioned.

Large Degrees of Motion are, likewise, sometimes very necessary in this Muscle, as for Instance, when we bend the Fingers at the same time that the Metacarpus and Carpus are bent on the fore Arm; and, in this Case, certain Fasciculi of Fibres are chiefly employ'd, which appear to be longer than the rest.

The particular Use of the Tendons of this Muscle is best understood with that of the *Perforans Manus*.

PERFORATUS PEDIS, SIVE FLEXOR DIGITORUM BREVIS.

This is the undermost of all the common Muscles of the Toes, being situated immediately above the Aponeurosis Plantaris, which it resembles something in Figure; and hence we see, that it has been very improperly termed *Sublimis*.

It is fixed by fleshy Fibres to the anterior and lower Part of the great Tuberosity of the Os Calcis; and to the neighbouring Part of the upper Side of the Aponeurosis Plantaris.

From thence it runs forwards, being divided into four fleshy Portions, which terminate in the same Number of Tendons, split at their Extremities in the same manner as those of the *Sublimis*, or *Perforatus* of the Hand, and inserted in the second Phalanges of the four small Toes, a little nearer the Inside, than in the Hand. *Winslow*.

The Uses of this Muscle are mentioned under the *Perforans Pedis*.

PERFRICTIO. A great Shivering, or Coldness.

PERIAMMA, or PERIAPTOS, from *πείνω*, to connect, or bind to. An Amulet.

PERIBLEPSIS;

PERIBLEPSIS, *περίβλεψις*, from *περίβλεπω*, to stare about. That kind of wild staring Look, and Instability of the Eyes; which is perceived in People labouring under a Delirium.

PERIBOLE, *περίβωλη*, from *περίβάλλω*, to surround. In *Hippocrates, de decenti Habitu*, it signifies the Dress, Garb, or Cloathing of a Person. In other Places it imports a Translocation of the Humours, or morbid Matter, to the Surface of the Body. Thus, when a Disorder is relieved by a copious Eruption of Pustules, this is a *Peribole*, or Removal of the morbid Matter from the internal Parts to the Surface.

PERICARDIUM. See *COR*.

PERICARPIUM, *περικάρπιον*, from *περί*, about, and *καρπός*, Fruit. Whatever surrounds the Fruit of Vegetables, whether Membrane, Husk, or Pulp. Some restrain the Signification to the soft and moist Pulp, which covers the Seeds, as in Apples, Pears, and Peaches. But,

PERICARPIUM, from *περί*, and *καρπός*, the Wrist, imports a topical Medicine apply'd to the Wrist.

PERICHAREIA, *περιχάρεια*. An Excess of Joy, which has been sometimes known to produce sudden Death.

PERICHRISIS. A Liniment.

PERICLASIS, from *περί*, about, and *κλάω*, to break. A Fracture with a great Wound, wherein the Bone is laid bare.

PERICLYMENUM.

The Characters are ;

It has the Appearance of the Honeyfuckle. The Flower is monopetalous, resembles, in some measure, a Tube, and has its upper Part divided into several almost equal Segments. The Ovary has its Top adorned with a dentated Crown, and becomes a soft Berry, full of a compressed, roundish Seed.

Boerhaave mentions but one Sort of *Periclymenum*; which is, *Periclymenum*; *perfoliatum*; *Virginianum*; *sempervirens*, & *florens*. *H. L.* 484. 485. *Jo. & Descr. Boerb. Ind. alt. Plant.*

There are no particular medicinal Virtues ascribed to this Plant at present, that I know of.

PERICLYMENUM is, also, a Name for several Sorts of *CAPRIFOLIUM*; which see.

PERICNEMIA, from *περί*, about, and *κνήμη*, the Tibia, or Leg. The Parts about the Tibia.

PERICRANIUM, *περικράνιον*. The Name of a Membrane, which covers the Bones of the Skull. See *CAPUT*.

PERIDROMOS. The extreme Circumference of the Hairs of the Head.

PERIESTECOS, *περιεστηκός*, from *περιεστημι*, to surround, or guard. An Epithet for Diseases, Signs, or Symptoms, importing their being salutary, and that they prognosticate the Recovery of the Patient.

PERIGRAPHE, *περιγραφή*. An inaccurate Description, or Delineation. In *Hippocrates, de decenti Habitu*, it seems to import, a Characteristic. In *Vesalius, Perigraphæ* are certain white Lines and Impressions, observable in the *Musculus Rectus* of the *Abdomen*.

PERIN, *περίν*. A Testicle. Some explain it, the *Perinæum*; others, the *Anus*.

PERINÆUM. The Space betwixt the *Anus* and Parts of Generation, divided into two equal lateral Parts, by a very distinct Line, which is longer in Males, than in Females. This Part is subject to Laceration in a difficult Birth. See *OBSTETRICATIO*. And in this Part an Operation is perform'd, call'd *The Puncture of the Perinæum*. See *ISCHURIA*.

But the principal Disorders to which this Part is subject, are Abscesses, and Fistulas.

A FISTULA OF THE PERINÆUM.

Sometimes, after the Operation of Lithotomy, or after a Puncture of the *Perinæum* or Bladder, or from an Abscess in the *Perinæum* near the Urethra, or from a Scirrhus in the *Glandula Prostatata*, or when, by the bad Habit of the Patient, a Wound or Ulcer can by no means be healed, but its Lips become callous, a Fistula is formed, through which the Urine is preternaturally discharged with great Uneasiness to the Patient. These Fistulas are sometimes generated in the *Perinæum* by malignant Abscesses, which spread amongst the Fat under the Skin, to the *Intestinum Rectum*, and *Scrotum*, the Urethra remaining entire; but these cannot be called *Urinary Fistulas*, because no Urine is discharged by them. The urinary Fistulas are often occasioned by the Use of Tents, or Pipes, which have been too long retained in the Wound after extracting the Stone; or when the *Perinæum* has been greatly distended, lacerated, or burst, by a large rough Stone; or when, by the Obstruction of a Stone in the Urethra, the Acrimony of the Urine corrodes the adjacent Parts, and at last the Skin, especially if the Patient be of an ill Habit of Body.

The Cure of this Fistula varies according to the Habit of the Patient, and the Degree of this Disorder. When the

Fistula is large, and has consumed a great Part of the Urethra, and the Patient is of an ill Habit and weak, a Cure is not without great Difficulty, and very seldom, obtained; and the more callous, or inveterate, the Fistula is grown, the harder is the Task to remove it. On the other hand, if the Fistula is small, and not much indurated, if the Patient is young, and of a good Habit, the Cure may proceed with Ease and Expedition. But if a Scirrhus is produced in the Prostate Glands, before a Cure can be effected, the Scirrhus must first be removed, which I have learned by Experience to be a most difficult Task.

There are four Methods of treating these Fistulas: 1. The Tent-pipe, or whatever is contained in the Wound, which occasioned the Fistula, must be immediately removed. Then the Patient must be laid upon the Bed, or a Seat, in the same Position as is required for performing the Operation of Lithotomy; and the indurated Sides of the Fistula must be extirpated with great Dexterity. After the Application of a vulnerary Balsam, or Powder, the Lips of the Wound must be brought into Contact by an adhering Plaister, and over it should be laid a narrow Compress on each Side of the Wound, and the Whole must be secured with a tight Bandage. After the Operation, the Patient should be confined to his Bed, with his Knees tied together, and strictly enjoined to abstain from Motion, that the Lips of the Wound may more easily coalesce. For a few Days a very little Drink must be allowed him, that he may not be often excited to make Water. The Dressings ought not to be renewed till the second or third Day, or as long as the Patient can contain his Urine. The Wound being, by these means, almost conglutinated, the Patient may be treated in the same manner, as if he had been cut for the Stone; and, if he has Youth in his Favour, he may begin to walk about gently, and by degrees. Thus, if the Fistula is not malignant, he may be restored to his former Health. 2. Another Method of Cure is, by consuming the indurated or callous Lips of the Fistula with corrosive Medicines; and, after removing the Eschar with Basilicon, or a digestive Ointment, the Wound may be conglutinated by a vulnerary Balsam, and adhesive Plaister, as before. The most proper Corrosives in this Case are, the Troches of red Lead, the Lapis Causticus, or Infernalis, or white Precipitate mixed with *Arcaus's* Balsam; or, in a recent Fistula, a Piece of Blistering-plaister, according to *Chefelden's* Method, as we are told by *Douglas*, in the Appendix to his History of the lateral Operation.

It is to be observed, that the Cure of these Fistulas sometimes advances slowly, especially if the Orifice be wide; if the callous Parts are not totally extirpated or consumed; and if the Patient cannot sufficiently refrain from Motion, or observe a proper Diet. If from these, or the like Causes, the Fistula is not removed, but begins to renew its Callosity, the Operation must be repeated, till the Parts appear sound. 3. Sometimes these Fistulas may be cured, by bringing the Lips of the bleeding Wound, after the callous Part is cut off, into Contact, with a proper Suture, of two or more Stitches. The Dressings may be those before directed; and, as the Lips of the Wound appear to conglutinate, the Threads may be cut and extracted. 4. It may be sometimes necessary, during the Cure, to keep a Catheter in the Bladder and Urethra, by which the Urine may be discharged, and its Course turn'd from the Wound, the Conglutination of which it would greatly obstruct. If the Orifice of the Fistula be too small to admit of these Methods, it may be dilated with a Sponge-tent, or enlarged by Incision.

I shall only mention another Way of treating these Fistulas, which is called *The palliative Method*. For this Purpose is the Instrument described by *Nuck* and *Solingen*, and proposed by *Winslow*, which, while the Fistula is compressed, and closed by it, prevents the Efflux of the Urine that Way; and thus the Disorder, when a perfect Cure cannot be obtained, may at least be mitigated. But Experience informs us, that this is not to be depended upon, as the Urine easily escapes through it, and it is troublesome to the Patient. *Heister. Chirurg.*

In August 1725. Mr. La Serre, Apothecary to the King, recommended an English Officer to me, who was sixty-six Years of Age, and in a declining Condition.

He had the Scrotum very large and hard, covered with fistulous Sinuses, through which Pus and Urine were discharged; which extended from the Anus to the Root of the Penis, and the Number of them daily increased.

As it was the Urine that occasioned all this Ravage, to prevent its escaping this Way, I endeavoured to introduce the Algaly; and was fortunate enough to pass it into the Bladder, though with much Difficulty, the Canal of the Urethra being very callous and winding in its whole Extent. You know, that, in Fistulas in *Perinæo* of a short Date, the Canal loses its Pliancy, becoming hard and uneven; that it, also, loses its Figure, growing crooked in proportion to the Number of Callosities.

lofities. I was obliged to change the Direction of my Probe every Inch, in order to advance it: At length, having penetrated into the Bladder, I judged it most proper to leave it there five or six Days, to form the Passage. During the Space of three Weeks I did nothing more than to withdraw the Probe sometimes to clean it, and to introduce another of the same Shape immediately. The Size of the Scrotum was much diminished in this time, and no more Fistulas were formed; some even closed up, and other fresh Callosities were resolved, those only remaining which had so long subsisted.

These not being curable without an Operation, I had a Consultation with Mr. Petit, Mr. Malaval, and Mr. Boudou; when we agreed to make a Passage that should go directly to the Bladder, that we might introduce a Cannula into it, and to take off as much of the Callosity as we could, being persuaded, that the Remainder would dissolve by an ample Suppuration.

I placed the Patient upon the Edge of his Bed, in the same Posture as for Lithotomy; and, instead of the Algaly, introduced a Catheter, and thrust the Point of the Incision-knife cross the Perinæum into its Groove. As the Callosity was two Inches thick from the Skin to the Urethra, I could not feel the Cuttature of the Probe with my Finger at the Perinæum; and as I cut, was obliged to put my Finger into the Wound sometimes, to seek for the Urethra, that I might not carry the Point of the Incision-knife on one Side the Catheter. The Point being lodged in its Groove, I made an Incision in the same manner as in the Operation for the Stone; and then, ordering an Assistant to hold the Catheter, I removed a Part of the Callosity; then, taking the Catheter into my own Hand, I introduced a Gorget into the Bladder, by means of its Groove, that I might the more easily pass the Cannula.

The first Week a slender Dissolution of the Callosities was procured by the Suppuration; and the Circumference of the Wound, becoming less, made the Dressing more difficult; when, very fortunately, an Abscess was form'd in the Scrotum, on the Right Side, near the Suture. I open'd it, and, taking Advantage of the Opportunity, extirpated all the Callosity between the fresh Wound, and that I had made eight Days before: Then I withdrew the Cannula, and substituted a round Piece of waxed Linen in its stead, as thick as my little Finger, covered with Mucilage-plaister and Diachylon with the Gums mixed together. I lessen'd the waxed Cloths by Degrees, that the Canal might contract a little, and leave a free Passage for the Urine through the Wound.

The whole Urethra being distemper'd, I judged it proper to suppurate that also: To this end, I thrust an Algaly into the Penis; and, passing it through the Wound, put a Seton into the Eye of it at the Extremity; and, withdrawing the Algaly, conducted the Seton through the Penis.

During the first Week, I armed the Seton with the *Unguentum Fuscum*, to consume the Callosities, and to procure a large Suppuration; then armed it afterwards with Diachylon, mix'd with Ointment of Marshmallows: I dressed the Wound at the same time with *Unguentum Fuscum*, or with Diachylon with the Gums melted; with which I armed both Dossils and Pledgets. In short, I desisted from the Use of the Seton, and waxed Linen; in three Weeks, all the Callosities being entirely dissolved.

Now I began to think only of a Reunion, and introduced a leaden Algaly into the Bladder, that the Urine might not pass through the Wound whilst it was healing, (was it possible to effect it) or, at least, till the Canal was form'd.

During all this time, we had terrible Symptoms to encounter. Notwithstanding the exact Regimen observed, the Patient had a very violent Fever for ten Days, his Pulse was intermittent, and the Buttocks almost mortified, by being obliged to lie upon them continually, and the Difficulty attending his being removed. Bleedings proportioned to the different Necessities and Strength of the Patient, a proper Regimen, with Emulsions, and other Remedies, at length quieted all these Symptoms.

While the leaden Algaly was in the Urethra, an Erysipelas came upon the Right Knee, which spread over the Thigh and Leg to the very Foot. I prescribed resolving Fomentations, and in eight Days the Erysipelas terminated by an Abscess of the Bigness of a Crown, covering a Part of the Rotula, and Part of the Ligament that fastens it to the Tibia.

I open'd it when the Matter was form'd, and was surprised to find a Stone with the Pus as big as a Lentil, the sixth Part of an Inch thick, and very rugged, resembling a Piece of carious Bone. Moreover, a large Quantity of small Gravel was mixed with the Pus, which adhered to some small Lumps of indurated Fat. I cut off a Part of the Lips of the Wound, making it flat and oblong: For the Space of a Fortnight, at each Dressing, I took out a Quantity of incrustated Gravel, the third Part of an Inch within the *Pannicula Adiposa*, round

the whole Circumference of the Ulcer; and then it took an happy Turn, and advanced in healing.

During this time the Urine passed by the leaden Algaly, and the Wound in the Perinæum visibly lessen'd.

The Quality of this gravelly Abscess, and that of the Urine, which was very muddy, and loaded with Films, proving a Disposition in the Blood to form Concretions and Petrefactions, I apprehended the Patient would become subject to the Stone, provided the Urine had not a very free Passage; therefore I changed my Opinion as to the Management of the Fistula in the Perinæum, and resolved to keep it open instead of healing it. Then, withdrawing the leaden Algaly that was in the Bladder, I put a Cannula into the Wound, whose Extremity reached beyond the bulbous Part of the Urethra, near the Prostate. This Cannula, supporting the Sides of the Fistula, which daily approached, suffered the Urine to pass with greater Facility, than by the Canal of the Urethra, which could not have been suppurated without being a little contracted. This Cannula did not confine the Neck of the Bladder; so that the Patient kept his Urine as long as he pleased: He wore it a considerable time, only drawing it out sometimes to clean it.

Eight Months after, he came to see me, and to inquire what Method it was most proper to take. He had drawn out the Cannula a Week before, because it was inconvenient when he sat; and could not introduce it again. I examined the Fistula, which was a little contracted, and seemed to be cicatrized: As no Matter issued from it, and he told me the Urine evacuated freely, both by the Fistula, and the Penis, I judged that these two Orifices would be sufficient for it, and prevent the Formation of a Stone; and therefore thought it unnecessary to continue the Cannula.

I saw the Patient about a Year after, when the Fistula was so contracted, that no Urine passed through it, but was freely discharged by the Penis. *Le Dran*.

It has been always an Axiom, that to heal a Wound by the Art of Surgery, or to perform an Operation belonging to it, a thorough Knowledge is requisite, both of the natural and preternatural State of the Part: I go still farther, and say, that the Operation should be performed two or three times in the Surgeon's Imagination, before he comes to the Patient; and that it is an improper Time to take his Measures for the Operation with the Instrument in Hand. The Distemper, which is the Subject of the following Observation, is one of those Cases, whereon (because they are not out of the general Rule) we cannot too much reflect before we begin.

In 1727. I had cut a Boy of twelve Years of Age for the Stone, extracting one considerably large; and he went from the Hospital perfectly cured. In 1729. he felt a Pain in making Water; and the Pain increasing for several Days, a small Hole was at length formed in the Perinæum, by which a Part of the Urine was discharged, the rest evacuating by the Penis. In May 1730. he was brought to *La Charité*; they examined his Distemper, and found a Stone of the Bigness of a Pea, fixed in the Fistula of the Perinæum, just under the Skin, which they easily extracted.

When I went to the Hospital to dress those Patients I had cut, Mr. Morand committed this Lad to my Care again. I examined him, and found a small Orifice in the Perinæum, surrounded with Callosities; and could only introduce a very small Probe into the Bladder, which was then confined in the Passage, as though it was in a Case. I endeavoured to introduce an Algaly into the Penis; but the Extremity of the Instrument, with my utmost Endeavours, would go no farther than the Bulb of the Urethra, because the callous, or fungous Flesh, had either broke, or turned the Passage, by possessing the membranous Part of the Urethra.

The Distemper seeming to me of no small Consequence, I deferred the Operation till the next Day. Having well reflected upon the Structure of the Parts, and upon the present Condition, to which the urinary Passage was reduced by the Cicatrices and Callosities, I placed the Lad upon his Bed, in the same Attitude as for the Operation of Lithotomy, with his Hands fastened to his Heels, and supported by assistant Surgeons. First, I introduced an Algaly into the Penis as far as it would go, and ordered it to be held by an Assistant, in such a manner, that the Handle made a right Angle with the Body of the Lad. Then I introduced a very slender Probe into the Bladder, and upon this an hollow one open at the End, so that, embracing the small Probe, it could not err, and withdraw'd the other.

The Groove of the Probe being turned towards the Symphysis of the Os Pubis, I conducted a long strait Bistoury by it to the End of the Probe, observing that the Edge directly answered the Extremity of the Algaly; so that all between the two Instruments was divided. I withdrew the Bistoury, and, turning the Groove of the Probe towards the Intestinum Rectum,

Rectum, I made a second Incision. This being performed, I passed a Gorget into the Bladder by means of the same Probe; and, by the Assistance of the Gorget, introduced a leaden Cannula. The same Day the Urine, a Drop whereof had not passed by the Penis for three Months before, resumed its natural Course, Part discharging by the Penis, and Part by the Cannula. Perhaps the sudden Thought I had, at the time of the Operation, of turning the Edge of my Bistoury towards the Extremity of the Algaly, occasioned the Success; and that, by this means, I opened and renewed the Communication from the Neck of the Bladder, to the nervous Part of the Urethra. If it had not been the first Day, it could not be done after the Dissolution of the Callosities. I continued the Use of the Cannula for the Space of eight Days, during which time I dissolved and destroyed the Callosities by the Assistance of Escharotics. At the End of this Term, I took out the Cannula, and left the Cicatrization of the Wound to Compresses and Bandage; and he was perfectly cured the twentieth of June.

AN ABSCESS OF THE PERINÆUM.

On the nineteenth of September 1726. a Gardener, about twenty-two or twenty-three Years of Age, leaving his Work in the Evening, was seized with an acute Pain in both Groins, which gave him a Difficulty in Breathing the whole Night. He sent for his Surgeon the next Day, who, having examined the painful Part, found neither Tumor, nor Inflammation: He bled the Patient, who was attacked with a Shivering some Hours after Bleeding, which was followed by a Fever. In the Evening he was bled again, and the Pains were a little quieted; but the third Day the Shivering and Fever returned about the same Hour; and then the Pain fixed upon the Perinæum. He was again twice bled the two following Days, and, at each time, his Pains went off, and began again soon after.

This induced his Surgeon to bleed him again the sixth Day. The Patient still complained; and, though neither Elevation nor Inflammation appeared upon the Part, they applied anodyne Cataplasms, which were continued for several Days: In this Interval, the Fever was become continual, the same Pains subsisted, and yet nothing appeared externally. The Surgeon gave the Patient several Clysters, and purged him, substituting emollient Fomentations instead of the Cataplasms. The Patient remained in this Condition till the Beginning of October, when a Tumor began to appear in Perinæo; and, on the seventh of that Month, he came to the Hospital.

Till this time he could not make Water, but with infinite Pain, and only by a Drop at a time; at length he had a total Suppression of Urine, and was obliged to be probed in the Night.

In the Morning I found the Tumor in Perinæo inconsiderable, and probed him to know in what Condition the Urethra was; and, the Catheter not passing without Difficulty, there was Reason to presume it was affected either by the Pressure or Inflammation.

To hasten the Suppuration, I applied a maturing Cataplasm, which occasioned the Tumor to rise considerably in the Night; and, finding a Fluctuation in the Morning, I open'd it, first introducing the Algaly into the Bladder, that I might not lose Sight of the Urethra. A great Quantity of serous Pus issued from it; and though the Incision was large, having dilated as much as possible, both above and below, all the Sinuses were not open'd, some extending beyond the Reach of my Finger: Then I dressed the Wound according to Art. The Patient made Water freely after the Operation, the Urethra not being affected, and no longer compressed. He was bled again that Day.

When the first Dressing was removed, all the Sinuses appeared, which furnished a large Quantity of Pus. There was one which passed from the Neck of the Bladder, even towards the Bottom of it, in the Cellular Texture that surrounds it, and another that extended behind the Tuberosity of the Ischion.

The Patient was bled again, but the Fever never left him; besides, he had a yellowish Complexion. I used detensive Injections to all the Sinuses in vain; the Wound was always of a bad Colour. The sixth Day after the Operation, he was seized with a Shivering, which was followed by many others very irregular; and, the Suppuration diminishing, he died on the ninth.

I opened the Body, and found, besides the Sinuses that extended by the Side of the Bladder into the Cellular Texture that surrounds it, the Os Pubis, and Os Ischion, so extremely carious, that you might crumble them between your Fingers, like a Piece of Touchwood.

REMARKS.

It is not surprising, that the Bone should be so far destroyed in so short a time; for the Os Pubis is of a spongy Texture,

like the Extremities of the large Bones; and their Cells are always lined with a Membrane furnished with Vessels and Glands, that separate the Succus Medullaris from the Blood. This being taken for granted, ought these Parts to be less susceptible of critical and symptomatic Abscesses, than those which are softer? Because the Membranes, lining those little Cells, are not exposed to external Injuries, are they less exempt than others from an Erysipelas or Inflammation? No, certainly; all the Difference is, that they are concealed from us, and lie beyond the Reach of Chirurgial Relief. For this Reason, a Distemper in them ruins the spongy Texture of the Bone, before any certain Sign makes it externally manifest; and, even when it becomes manifest, it is too late to stop its Progress, the Bone being destroy'd.

For this Reason Collections of Pus in the Cellular Texture of the Bones cannot be called *critical*, although the Mass of Blood may be depurated by them, as well as by Matter collected in the softer Parts. Therefore I shall call them symptomatic, since they can only cause the Loss of a Limb, when they are formed upon Parts that may be amputated.

With regard to the Method of Cure in such a Case, the Inflammation that preceded the Putrefaction of the Membranes, might have been dissipated by copious and repeated Bleedings. It is true, that the Patient was bled five times in five Days; but the Relief he received from each Bleeding, is a certain Proof, that, if these five had been performed the first Day, the Inflammation would have entirely yielded.

Though nothing appeared externally, yet there was a deep acute Pain; and whereforever that is found, it is sufficient to fear an Inflammation, if not already begun, at least at hand; and to act accordingly.

The Blood may, without doubt, be disposed to be inflamed, and fix indifferently upon one Part or another; but its Quantity, its rapid Course to one Part more than another, for Reasons of which we are ignorant, these two, jointly with the small Diameter of the Vessels, are what cause the Disturbance, which must of Necessity augment, while the same Causes subsist. We must, therefore, not only diminish the Quantity of Blood, and divert its Course, when it threatens any Part, by a convenient Regimen, but by copious and quickly repeated Bleedings.

Four Bleedings, in twenty-four Hours, often stop the Progress of an Inflammation, that twenty would not cure, when once arrived to a certain Degree. *Le Dran's Surgery.*

N. B. An Algaly is a sort of hollow Probe or Catheter.

PERIN-KARA. *H. M.* A wild Olive-tree of a vast Bigness, growing in *Malabar*, and bearing Fruit in Form, Size, and Substance, resembling the larger Sort of Olives; when ripe, they are of a purplish-azure Colour, of a sweetish acid and grateful Taste; but, when immature, they are of a yellowish Colour, and of an austere and bitterish Taste.

The Fruit is accounted a Delicacy, and preserved with Sugar, or kept, like Olives, in Pickle, to serve as Sauce for other Foods at Dinner and Supper, being strengthening to the Stomach, and greatly promoting Digestion. *Raii H. P.*

PERIN-NIROURI *seu Ma Nirouri. H. M.* A *Malabar*ian bacciferous Shrub, with a brittle Stone containing six Kernels.

PERIN-PANEL. *H. M.* A bacciferous *Indian* Shrub, bearing its Flowers in Clusters, and an oblong Fruit, containing four Seeds: It grows in *Malabar*, and is always green, and with Flowers and Fruit upon it. Of the Leaves dry'd, and put upon Coals, is made a Suffumigation, which is said to give a most effectual Relief in hysteric Paroxysms. *Raii H. P.*

Of the Flowers, Fruits, and Roots, boiled in Water, with Long-pepper, and the Seed of Cumin, is prepared a Drink, which is highly commended for the Asthma, Cough, Phthisis, and the like Affections of the Lungs. The Leaves with the Bark, boiled in an Infusion of Rice, and reduced to the Form of a Cataplasm, and thus applied to a Tumor, are said to be powerful Ripeners of the same. Of the Bark of the Tree boiled with Milk, Honey, and Butter, is prepared a Balsam, which, taken inwardly, and applied outwardly to the Place, is said to cure the Pleurisy. The *Tijerin Nirouri*, the Authors of the *Hortus Malabaricus* tell us, is very like the preceding; and they have given us no distinguishing Characters of it, nor added a Cut. *Raii H. P.*

PERINYCTIDES. Pustules, or Pimples, which break out in the Night.

PERIODEUTES, *περιόδευσις*. A Mountebank.

PERIODUS. The Period of a Disease is the Time betwixt the Access of one Fit, or Paroxysm, and that of the next, including the entire Exacerbation, Decline, and Intermission, or Remission. These, in some Diseases, are frequently very regular and constant, as in Fevers; but in chronical Disorders,

more irregular and uncertain, as in Epilepsies: Hence such Diseases are called *Periodical*.

The Period of the Blood is its Circulation.

PERIOSTEUM. The fine sensible Membrane of the Bones. See O s.

PERIPHIMOSIS. The same as PARAPHIMOSIS.

PERIPLEUMONIA. The same as PERIPNEUMONIA.

PERIPLOCA.

The Characters are ;

The Flower is monopetalous, and rotated ; the other Characters are the same with those of the scandent *Apocynum*.

Boerhaave mentions five Species of *Periploca* ; which are,

1. *Periploca* ; foliis oblongis. T. 93. *Apocynum, folio oblongo*. C. B. P. 303.

2. *Periploca* ; *Monspeliaca* ; foliis rotundioribus. *Tourn. Inst.* 93. *Boerb. Ind. A.* 315. *Scammonia Monspeliaca*. Offic.

Scammonia Monspeliaca foliis rotundioribus. C. B. P. 294. *Scammonia Monspeliaca dicta*. Park. Theat. 164. *Scammonia Monspeliaca flore parvo*. J. B. 2. 136. *Scammonia Valentina*. Ger. 716. Emac. 866. *Apocynum latifolium*. *Scammonia Valentina*. Raii Hist. 2. 1088. ITALIAN, or

FRENCH SCAMMONY.

It is cultivated by the Botanists, and flowers in August. The concentered Juice, which is useful in Medicine, requires to be given in a larger Dose than that of the true Scammony, as being less effectual. Dale.

3. *Periploca* ; *Monspeliaca* ; foliis acutioribus. T. 93. *Scammonia Monspeliaca affinis, foliis acutioribus*. C. B. P. 294. *Apocynum latifolium, amplexicaule*. J. B. 2. 135. M. H. 3. 611.

4. *Periploca* ; foliis *Scammonia* acutissimis.

5. An *Periploca* ; foliis atro-viridibus, maculatis, *Scammonia* latioribus? *Boerb. Ind. alt. Plant.*

The Plant is of a poisonous Quality, especially the fourth Species ; but not to such a Degree as the *Apocynum*. The Juice of the second is a Species of Scammony, and operates almost in the same Manner. Hist. Plant. adscript. Boerb.

PERIPLUSIS, περιπλυσίς. A Diarrhoea, when the Excrements discharged are extremely thin and watery, is sometimes called by this Name.

PERIPNEUMONIA VERA. A true Peripneumony, or Inflammation of the Lungs ; from περί, about, and πνεύμων, the Lungs.

When in those pulmonary Vessels which are susceptible of an Inflammation, a true Inflammation is form'd, the Disorder is called a *Peripneumony*.

The Vessels susceptible of such an Inflammation are the Bronchial and Pulmonic Arteries, and their lateral lymphatic Vessels.

Hence we may conceive two different Kinds of Peripneumonies, one of which has its Seat at the Extremities of the Pulmonary Artery, and the other in the Bronchial Arteries.

It is sufficiently obvious, that the former is far more dangerous than the latter ; that the more dangerous may arise from that which is less so ; and that they have many Causes in common.

These numerous Causes may be reduced,

1. To the general Causes of all Inflammations throughout the whole Body.

2. To those which in a particular manner affect the Lungs, such as an Air too humid, dry, hot, cold, heavy, or light ; or an Atmosphere impregnated with caustic, astringent, or coagulating Exhalations, and consequently unsalutary ; a thick, dry, and viscid Chyle, either mixed with acrid Particles, or free from such a Mixture ; violent Exercises of the Lungs by Running, Wrestling, Efforts, Singing, Crying, or Riding hard against the Wind ; coagulating, caustic, and astringent Poisons introduced into the Veins running to the Heart ; violent Perturbations of Mind ; a Quinsy accompanied with an Oppression of the Breast, and an Orthopnoea ; a violent Pleurisy, and an excessive Paraphrenitis.

If these Causes have once excited the Disease, it will produce various Effects, according to the Diversity of the Part affected ; for a Bronchial Inflammation, by Compression and Contagion, inflames the contiguous Extremities of the Pulmonary Artery.

When the Extremities of the Pulmonary Artery are inflamed, the Blood becomes stagnant, the Vessel is extended, the most liquid Part of the Fluids is, as it were, expressed by Transudation ; the thicker Part of the Fluids is accumulated ; and all the Blood, as yet capable of Circulation, is collected between the Right Ventricle of the Heart, and the Extremities of the Pulmonary Arteries : Hence the Lungs become oppressed, incapable of expanding themselves, and livid ; the Left Ventricle of the Heart is deprived of Blood ; a great Weakness is brought on ; the Pulse is small, soft, and highly unequal ; the Respiration is small, frequent, difficult, hot, accompanied with a

Cough, and incapable of being performed but in an erect Posture ; the Blood about the Right Auricle and Ventricle of the Heart stagnates ; the Face, Eyes, Countenance, Fauces, Tongue, and Lips, become unusually red ; and, at last, a suffocating Death, attended with an unsurmountable Anxiety and Delirium, ensues.

If a Peripneumony strongly affects both Lobes of the Lungs at once, a sudden and inevitable Death will ensue ; since, in such a Case, Nature can be assisted by no antiphlogistic Medicine.

But if a Peripneumony affects only a small Part of one of the Lobes of the Lungs, and does not proceed from violent Causes, there are some, though not infallible Hopes, that it may be happily cured.

From what has been said, we may deduce the diagnostic and prognostic Signs of a Peripneumony ; especially if we consider, that the Terminations of this Disorder are the same with those of an Inflammation. Hence it has, also, various Stages, according to the different Times of its Duration ; so that it may terminate in a Recovery, some other Disease, or in Death.

A Peripneumonia is cured,

1. By a benign Resolution ; if the Habit is lax, the Humour mild, the Viscidity not too great, and the Part affected, whether in the Bronchial, or Pulmonary Arteries, not considerable.

2. By a speedy, free, and copious spitting of yellow thickish Matter, mixed with a little Blood ; in consequence of which the Pain is alleviated, Respiration amended, the Pulse render'd larger and fuller, and the Spit itself soon transformed into a mild Nature, and changed into a white Colour. This principally happens, when the Seat of the Disorder, whether in the Bronchial or Pulmonary Artery, is not very large.

3. By a bilious Flux, which affords Ease, and in which a Matter, almost resembling the Spit already described, is eliminated.

4. By a copious, thick, and hypostatic Urine, which affords Ease, has, at first, a red, and then a whitish Sediment, discharged before the seventh Day. In this Case, the Respiration becomes easy, the Fever mild, and of a good Kind ; the Thirst is removed ; and the Heat, Moisture, Laxity, and Softness, are equal all over the Body.

A Peripneumony may terminate in some other Disease, depending either on the Nature of an Inflammation, or of the Lungs themselves, according as they are by this means deprived of their proper Action.

Hence, in the first place, a Peripneumony may terminate in a Suppuration ; which happens, when the inflammatory Matter, being neither resolvable by Nature, nor corrected by Art ; but, however, being mild, stagnant, hot, and acted upon, breaks the small Vessels, resolves them into Pus, and, by extending or corroding the Sides of the Vessels in which it is confin'd, forms an Abscess, or Apostem, within fourteen Days.

That this is about to happen, may be known from the following Signs :

1. If the sure Signs of a pretty severe, though not of the most violent Peripneumony, have previously appear'd.

2. If a Resolution, and its Signs, have not appear'd soon enough ; that is, before the fourth Day.

3. If the Symptoms are neither reliev'd by a concocted Spit, evacuated on the critical Days, which are the third, fifth, seventh, ninth, eleventh, and fourteenth, which indicates that the Cure is begun, by the successive Change of the Spit ; nor by Venesection, nor by Medicines, and a proper Regimen.

4. If on the contrary, the Symptoms, of themselves not very violent, obstinately remain, and are accompanied with a soft undulating Pulse, and a continual Delirium.

That an Apostem is really forming, may be known,

1. If the Signs above enumerated are present.

2. If slight, wandering, and often recurring Horripilations happen without a manifest Cause ; if the Pain remits, and the Dyspnoea continues ; if the Cheeks and Lips are red ; if a Thirst is present, and a Fever, especially towards the Evening, afflicts the Patient ; and if the Pulse is weak and soft.

That an Apostem is already form'd, may be known,

1. From the preceding Signs :

2. From the obstinate and dry Cough, which is increased after eating ; the difficult, small, and wheezing Respiration, which is accompanied with a kind of Noise, and increased after Eating or Exercise ; a Capacity of lying with Ease only on one, and that is the affected, Side ; a continual periodical Fever augmented after Eating, Drinking, or Exercise, and attended with a Redness of the Cheeks and Lips ; a Loss of Appetite ; an excessive Thirst ; Night Sweats, especially about the Breast and Forehead ; frothy Urine ; Paleness ; Extenuation ; and, lastly, from the extreme Weakness of the Patient.

An Apostem already formed has various Terminations ; for

1. It either suffocates the Patient by a Tumor possessing the whole

whole Lungs, and which either compresses, or hinders those Parts of them, which were before free; or,

2. An Apostem suffocates the Patient by an Eruption of Pus, the Apostem discharging itself into the Aspera Arteria all at once; or,

3. An Apostem is dissipated by purulent Spit, which consumes it, and frees the Patient from the Disorder; or,

4. An Apostem is terminated by a Falling of the Pus into the Cavity of the Thorax, or the dilated Vacuities of the *Mediastinum*: And,

5. Hence arise Consumptions, of various Kinds, and an Empyema, which generally proves mortal.

A Peripneumony terminates in some other Disease, if the purulent Matter, becoming inflammatory, is resorb'd into the Pulmonary Veins, mixed with the Blood, and deposited on some particular Parts. Hence the Lungs are freed, and some other Parts loaded; and, if these are less requisite to Life, the Translocation is good; but, if the Translocation is to the Liver, Spleen, or Brain, the Event is generally fatal. Hence peripneumonic Abscesses are form'd about the Ears, Legs, and Hypochondria.

That such Abscesses are about to be form'd, may be known,

1. By an Observation of the Signs of a Peripneumony not of the worst Kind; accompanied with a Fever, neither violent nor malignant, though continual; with a Pain, Anxiety, and Heaviness of the Thorax, and a Dyspnoea, which are not violent, and without being attended with the Signs of a Resolution.

2. If, in Conjunction with these Signs, the Pulse is greatly and continually fluctuating; and,

3. By the Pains, Redness, Heat, and Tension, about these Parts.

That such Abscesses are about to be form'd about the Legs, may be known,

1. If the Signs of future Abscesses are present; and

2. If, together with these, the Signs of a slight Inflammation about the Hypochondria are observed.

That such Abscesses are about to be form'd about the Ears, may be known,

1. If the Signs already enumerated are present; and,

2. If the Hypochondria are at the same time soft.

That the Matter of an Abscess is convey'd to the Liver, may be known,

1. If the before-enumerated Signs are present; and,

2. If there is a permanent Pain of the Liver, accompanied with a Discharge of yellowish Urine, and a yellow Colour of the Skin. Hence, an Apostem of the Liver arising, terrible Disorders are produced.

If these Abscesses in the Legs, and about the Ears, relieve the Lungs, and remove the Fever; if they remain purulent, running, and fistulous; and if they happen soon enough, that is, before the ninth Day; they are always salutary: But, if they arise after the Spit is already purulent, though not very yellow, and without affording Relief, they are bad; but if, after they are form'd, they disappear, the Disease being crude, and the Peripneumony returning, they are absolutely mortal.

A Peripneumony may, also, terminate in a callous or scirrhous Tumor of the Lungs, if an impacted Matter, and other Conditions, contributing to the Generation of a Scirrhus, concur. See INFLAMMATIO. Hence the Patient's Respiration during the whole remaining Part of his Life is difficult, attended with a Cough, cannot be performed but in an erect Posture, is increased after Eating and Exercise, and unaccompanied with the already described Signs of a latent Apostem. Hence arises the Adhesion of the Lungs to the Pleura.

If the Bronchial or Pulmonary Artery are, either from an internal or external Cause, seized with a violent Inflammation, a Gangrene soon arises; and hence a Sphacelus, on account of the Quantity and Motion of the Blood, and the continual Motion of these slender Viscera. That a Gangrene is about to happen, may be known,

1. By the Signs of an highly violent Peripneumony, not relieved by any Accident, or Art.

2. By the great and sudden Weakness, principally discovering itself in the Pulse; and,

3. By a Coldness of the Extremities. But that a Gangrene is already form'd, may be known, if these Signs have preceded, and if the Spit is ichorous, thin, cineritious, livid, black, and fetid. This State is soon succeeded by Death.

These various Changes of a Peripneumony are to be learned from an Observation of the History of the Disease, and a Dissection of the Carcasses of those who have died of it.

Hence 'tis obvious, that the Disorder which the Antients described under the Name of a *Peripneumony*, is a true Inflammation of the Lungs.

The Prognostic, therefore, will be clear and just, when we assert, that a Peripneumony is always dangerous, on account

of the great Necessity of the Function of the Lungs to Life, and the Correction of the inflammatory Matter; on account of the Quantity and Impetus of the Blood continually convey'd to the Lungs; on account of their perpetual Motion; on account of their Situation, which prevents the Application of Remedies; on account of the Tenderness of their small Vessels, which are easily destroy'd; and, lastly, on account of the Impossibility of a Revulsion, so requisite to the Cure of an Inflammation.

From what has been said we understand, when, why, and with what Symptoms, a Peripneumony proves mortal: For if the whole Lungs, together with the Heart, are inflamed; if the Heart falls to the Side; if the Patient is seized with a Paraplegy, becomes cold, and is deprived of Sensation; then he dies on the second or third Day. If, in the Beginning of the Disease, the Urine is good, and duly concocted, but thin after the fourth Day; if, in the Height of the Disorder, the Patient is obliged to sit erect; if he discharges Pus by Stool; if the Disease is of the dry Kind, and accompanied with an Heat and Noise in the Throat, proceeding, as it were, from a Stuffing of the Lungs; if the Disease is violent in very dry, hard, and callous Habits; and such as have been accustomed to Exercise; if it is of a bad Kind, and accompany'd with a Stillecidium of very red Blood; if it is of the dry Kind, accompanied with red Spots on the Breast; if a Coryza, or excessive Sneezing, either precedes or follows it; if it arises from a burning Fever; if a bilious Spitting with Pus begins immediately after the sixth Day; if from the Beginning the Spit is very bloody, entirely yellow, white, and round, very frothy without affording Relief; if it is dark-coloured, clayish, like the Lees of Oil, black, livid, unequal, or æruginous; and lastly, if neither the Fever, nor the Difficulty of Respiration, remit; the Patient dies on the seventh or ninth Day. And, when such Patients die, their Pulse fails, all the Parts of their Bodies become cold, except their Breast, Neck, and Head, which are intensely hot, and their Cheeks become red and livid.

The Cure of a Peripneumony is to be varied according to the different Stages of the Disease, and its Symptoms; so that what is beneficial at one time of the Disorder, is injurious at another.

If, therefore, in a Peripneumony, the Habit is lax, the Humour mild, the Viscidity not great, and the Part of the Bronchia and Lungs affected, not considerable, the Patient is to use Rest of Body and Mind, a tepid moist Air, a Vapour-bath of pure Water, applied to the pulmonary Region, the Nostrils, the Mouth, the Feet, and the Legs, slender Aliment, and light Drink; aqueous, nitrous, farinaceous Medicines, and Preparations of Honey. Thus,

Take of Barley-water, forty Ounces; of Nitre, two Drams; and of Oxyemel, four Ounces: Mix, and let the Patient drink two Ounces warm every Quarter of an Hour.

But if, in a Peripneumony, a speedy, free and copious Expectoration of yellow thick Spit, which alleviates the Pain, amends Respiration, renders the Pulse larger and fuller, and gradually becomes more mild and white, the last-mentioned Medicines are not only to be used, but, also, such as are of an emollient and depurating Nature, such as promote Expectoration, and are gently restorative, and Steams. In this Case we are to abstain from Venesection, Purgatives, Sudorifics, and every other thing capable of disturbing Expectoration.

Take of Pellitory of the Wall, Agrimony, and Dandelion, each one Handful; of the bruised Seeds of white Poppies, and Fennel, each one Ounce; and of Liquorice, one Ounce and an half: Boil in fifty Ounces of Water, and exhibit in the same manner, and for the same Purposes, with the former.

If a Peripneumony is attended with a bilious Flux, which affords Ease, and in which the Matter eliminated resembles the Spit above described, mild and emollient Clysters are to be used; gentle Fomentations are to be applied to the Abdomen; emollient and gently laxative Decoctions are, also, beneficial; taking, at the same time, the other Measures before recommended.

If, in a Peripneumonia, a copious, thick, and hypostatic Urine, with a Sediment at first red, and then gradually becoming whitish, is, to the Relief of the Patient, discharged before the seventh Day, let all the Measures already prescribed be taken; but let Baths for the Feet be added, and Fomentations of the Kidneys by internal emollient Clysters, and the Application of Linen Cloths externally: Let the Patient, also, drink Decoctions of a gently abstergent and diuretic Nature. For this Purpose,

Take of the Roots of Grafts, Butchers-broom, Parsley, and Fennel, each two Ounces; of Masterwort, two Drams; and of the bruised Seeds of Burdock and Parsley, each one Ounce: Boil with forty Ounces of Water, and exhibit for the same Uses with the former.

If the Inflammation is recent, great, and dry, in a robust Habit, a little before found, and habituated to Exercise, it may be discovered by the Signs already enumerated; and we are forthwith to have recourse,

1. To speedy and copious Venesection, which is to be instituted according to the Degree of the Disease, and duly repeated, that the Quantity of thick Blood may be lessened, and proper Room made for diluting Liquors.

2. To Vapour-baths of an emollient Nature, continually applied to the Pulmonary Region, and frequently to the other Parts of the Body.

3. To diluent, resolvent, emollient, laxative, antiphlogistic, nitrous, and anodyne Decoctions, to be often drank warm, and in small Quantities.

4. To mild antiphlogistic Clysters: And,

5. To a slender Diet, consisting of antiphlogistic Juices.

If the Inflammation, being great, accompanied with a Fever, and other violent Symptoms, lasts beyond the third Day, and if the Signs of an Inflammation tending to a Suppuration are present, there is always much Danger, though the Disease may be protracted so long, as to afford a due Time for the Cure. In this Case,

1. We are to use no Venesection; or, if some important Circumstance call for it, only a small Quantity of Blood is to be taken away.

2. We are to use slender Food, but somewhat incrassating, and consisting of maturing Substances, as Pot-herbs, farinaceous Vegetables, Peas, and ripe Autumnal Fruits.

3. Till the fifth Day, from the Beginning of the Disorder, we are to use Baths for the Region of the Lungs, consisting of emollient and maturing Ingredients.

4. On the fifth and sixth Days, we are to use these Baths, adding Sorbitions, which gently excite a Cough, and produce Repletion, that thus, on the seventh Day, the Part may be relieved by a Discharge of concocted Pus, the Vessels attenuated, and Life sustained. For this Purpose,

Take of the Vinegar of Squills, six Drams; Oxymel of Squills, three Ounces; Sal Polychrestum, one Dram; Barley-water, eight Ounces; and distilled Hyssop-water, four Ounces: Mix all together; and let the Patient drink one Ounce every Half-hour.

Take of Coffee, two Pints; of Honey, two Ounces; and of Elder-vinegar, half an Ounce: Mix all together, and let the Patient drink as much of it as he pleases warm.

If sufficient Signs inform us, that an Abscess is formed in the Lungs, its breaking into the Aspera Arteria is to be accelerated; after which the ulcerated Part is to be quickly and safely depurated.

The breaking of the Abscess is brought about, if, after the Use of many soft and subpinguious Aliments, and soft Wine, the Lungs already suppurated, and prepared by warm Steams, are agitated either by Crying, Coughing, Expectorants, Concussion in a Ship, or Coach.

But as soon as there are any Signs, that the Apostem is broken, we are to use a Milk, and a mild, and not easily putrefying, vegetable, Diet: Then, in the Day-time, we are to use aperient and deterfive Medicines; and, towards Evening, gentle Opiates: Emollient Steams, sailing in a Ship, riding on Horseback, or in a Coach, are, also, to be used.

Medicines of an aperient and deterfive Quality, proper for open Ulcers of the Lungs, are these following: The Leaves of the common, black, white, and golden Maidenhair, Agrimony, Lady's-mantle, Brooklime, Betony, Meadow-daisy, Borrage, Oak of *Jerusalem*, Bugle, Spleenwort, Germander, Ground-pine, Succory, Dandelion, Endive, Hedge-mustard, Fennel, Fumitory, Ground-ivy, Noble Liverwort, Star Liverwort, Alexanders, St. John's-wort, Hyssop, Woad, Lettuce, Harts-tongue, white Horehound, Devil's-bit, Moneywort, Rest-harrow, Primrose, Self-heal, Sage of *Jerusalem*, Soapwort, Scabious, Water Germander, Solomon's-seal, Flix-weed, Coltsfoot, Garden and wild Valerian, Vervain, Veronica, Periwinkle, and Goldenrod.

The same Intention is answered by Gum Ammoniac, Galbanum, Opopanax, Sarcocolla, Mastic, Myrrh, Olibanum, and Turpentine.

Take of the recent Leaves of Agrimony, Goldenrod, Betony, and Garden Valerian, each one Handful; of white Horehound, one fourth Part of an Handful; of the Five

aperient Roots, each one Ounce; of the Flowers of the Lesser Centaury, Agrimony, and St. John's-wort, each one Handful: Boil in four Pints of Water; of which let the Patient drink two Ounces every two Hours: Or,

Take of the Roots of Burdock, China, and Sarsaparilla, each three Ounces: Boil in Water for half an Hour; then add three Ounces of Sassafras-wood; and when they have boiled a little, add to three Pints of the Decoction, two Ounces of the Syrup of the Five aperient Roots. Its Use is the same with that of the preceding.

Take of the best and most transparent Myrrh, two Drams; and of the Yolk of a new-laid Egg, one Scruple: To these, when duly triturated together in a glass Mortar, add of the best Frankincense, two Scruples: Make into Pills, consisting of three Grains each, of which let the Patient take one or two before the Use of the Decoction.

Take of the best Myrrh, two Drams; and of Sperma-ceti, one Dram: Make into a Powder, to be divided into twelve equal Doses; one of which let the Patient take every Morning and Evening with the Decoction.

Take of Myrrh, and Olibanum, each one Dram; and of the purest Honey, two Ounces: Mix, and let the Patient take one Dram every Hour.

Gentle Opiates, to be used in the Evening, are these following:

Take of the Pilulæ de Cynoglossa, one Scruple; form into six Pills; of which let the Patient take one or two in the Evening, before going to Bed.

Take of the Styraz Pill, the same Quantity: To be used in like manner, and for the same Use.

Take of Opium cut into thin Slices, and gently dried, one Grain; of red Coral, twelve Grains; and of Olibanum, six Grains: Make into a fine Powder, to be used like the others, before going to Bed.

Taste of the Syrup of Diacodium, half an Ounce; of the Aqua Vitæ of *Matthiolum*, one Dram; and of distilled Hyssop-water, one Ounce: Make into a Draught, to be taken in the Evening.

Take of Opium, one Grain: Make into two Pills; one of which is to be taken in the Evening.

Take of Opium, one Grain; of the Syrup of Maidenhair, four Drams; and of the Water distilled from the Flowers of the red Poppy, one Ounce: Make into a Draught.

For an emollient Steam:

Take of the Leaves of Mallows, Marshmallows, and Pellitory of the Wall, each two Handfuls; and of the Powder of Linseed, two Ounces: Boil in Water; and let the Patient receive the Steam, as he draws in the Air.

If there appear Signs, that the inflammatory Matter is become purulent, resorb'd by the Veins in the Lungs, thence convey'd to the Blood, and deposited on some other Part, whence the Lungs are relieved, and the Part which receives the Matter oppress'd, without any Certainty whether the Matter will tend, then the Patient is to use a light, fluid, gently aromatic, and somewhat vinous Diet. His Body is to be preserved in a State of Rest: Let his Medicines be emollient, and gently aperient: Let his Lungs be treated with Emollients: Thus the peccant Matter will either be determined to some other Part, or farther dissolved and eliminated: For this Purpose,

Take of the expressed Juice of recent Chervil, and of sweet Milk, each four Ounces; and of the Syrup of Hyssop, one Ounce: Make into a Mixture; of which let the Patient drink one Ounce every two Hours.

But if to the Signs which indicate, that such Abscesses are about to be formed, those which signify a Determination of the Matter are join'd, the last-mentioned Measures are to be taken; and, at the same time, the Parts indicated for the Deposition of this Matter, whether Ears, or Legs, are to be so treated by Suction, Relaxation, Stimulants, and Aperients, that they may resist less, and attract the Matter more.

If the Matter is determined to the Liver, the same Measures are to be taken with those prescribed when the Abscess is absorb'd, without any certain Prognostic whether the Matter tends: But, at the same time, let Aperients somewhat stronger, saponaceous

ceous and hepatic Substances, be used : Then let Clysters, and Fomentations of the like Ingredients be, also, prescribed.

Take of the greater Soapwort, two Handfuls ; of recent Endive, four Handfuls ; and of the Flowers of wild Succory, three Handfuls : Boil in three Pints of Water ; and of the expressed Decoction, let the Patient drink two Ounces every two Hours.

When a Peripneumony terminates in a callous or scirrhus Tumor of the Lungs, it is rarely susceptible of a Cure ; tho' it may sometimes yield a little to external and internal Emollients, to riding on Horseback, or in a Coach.

When a Peripneumony degenerates into a Gangrene, it is absolutely incurable.

If in a Peripneumony, beginning to be carried off by Spit, the Expectoration is stopt, we are immediately to use all our Endeavours to recal it. The Causes which retard this Expectoration, are generally an excessive Cold, suddenly admitted to the Body ; and excessive Driness of the Parts all over the Body ; a burning Fever succeeding ; heating Medicines ; a Discharge of Stools, which does not prove critical ; excessive Sweating ; and violent Commotions of Mind.

Immediately upon this, a fresh Inflammation arises from a Suppression of the Matter, and an Increase of it from Congestion : Hence are forthwith produced the same Symptoms which arise from a primary Peripneumony ; but Accidents of this Nature generally soon prove mortal to Patients already weakened.

When a Suppression of Spit in a Peripneumony, beginning to be carried off by that means, happens, the Misfortune is prevented, by the Steam of some hot, moist, and emollient Substance, continually drawn into the Mouth and Nostrils, and by that means convey'd to the Lungs ; and by an Air artificially rendered simlar, or of a like Quality, with this Steam : The liberal Use, also, of Liquors of a like Nature, especially when prepared with Honey and Vinegar, is highly beneficial. The same Intention is, also, promoted by gently resolvent antiphlogistic Medicines, such as diaphoretic Antimony with fixed Nitre ; by gentle Opiates ; by avoiding Sweat ; and, principally, by preserving the Calmness and Tranquillity of the Mind. For this Purpose,

Take of simple Oxymel, three Ounces ; of the Syrup of the Five aperient Roots, two Ounces ; of a Decoction of Ground-ivy, ten Ounces ; and of pure Nitre, one Dram : Make into a Mixture ; of which let the Patient take one Ounce every Hour.

Take of pure Laudanum, two Grains ; of the Flowers of Sulphur, Sperma-ceti, and unwashed diaphoretic Antimony, each one Dram : Reduce to a fine Powder, to be divided into twelve equal Parts ; one of which the Patient may take every three Hours, with an Ounce or two of the preceding Mixture.

Take of the Flowers of Sulphur, two Drams ; of Olibanum, one Scruple ; of Sperma-ceti, half a Dram ; and of unwashed diaphoretic Antimony, one Dram. Reduce to a Powder, to be divided into twelve Doses, of which let the Patient take one every Hour, with an Ounce of the Mixture.

Take of the recent expressed Oil of Sweet-almonds, one Ounce and an half ; of the Syrup of Violets, Virgin-honey, and the Yolks of new-laid Eggs, each half an Ounce ; form into a Mixture ; of which let the Patient take half an Ounce every Hour, till the Expectoration returns.

PERIPNEUMONIA NOTHA. A spurious Peripneumonia.

This Disorder is frequently produced in the Winter by an Excess of Cold, and in the Spring by an Excess of Heat. It generally arises from a viscid Phlegm form'd in the Blood,

1. By farinaceous, crude, austere, and ill concocted Aliments :

2. By a Want of laudable Blood :

3. By a Weakness of the Vessels, Viscera, and Bile :

4. By a Diminution of animal Motion :

5. By a Dissipation of the more liquid Parts of the Fluids, in consequence of a Relaxation of the Secretory Vessels :

6. By a Retention of the grosser Parts of the Fluids, in consequence of a Weakness of the Instruments of Excretion.

This Phlegm gradually stuffs the Lungs, till the Disorder degenerates into this terrible, and, often unexpectedly, mortal Disease.

When this Disorder is of a considerable Standing, it produces various Effects in the Body, and especially those peculiar

to a slow Peripneumony : Hence its Cure must necessarily be difficult.

For Venesection, celebrated so much as is necessary, in some Cases of a true Peripneumony, is in this Disorder highly prejudicial, on account of the Weakness of the Viscera, and a Viscidity of the Juices : Hence, what at first seems to afford Relief, soon after increases the Symptoms.

Attenuants in this Case so much esteemed, whilst they augment the Impetus on the Pulmonary Vessels, often increase the Thickness and Impaction of the obstructing Matter ; by which means they soon render the Disorder mortal.

This Disorder is frequently incident to old Persons, those of pituitous, cold, and catarrhus Habits, or such as labour under frequent Coryzas. It is generally produced by all those Causes, which, by quickly moving the stagnant Matter, act upon the Lungs, such as Running, Crying, Singing, Drinking hard, especially of heating Liquors, high Feeding ; the Heat of a Fire, of a Bath, or of the Sun, especially if the Body is suddenly exposed to Cold after such an Heat.

This Disorder at first deceives the unwary Patient by its fallacious Lenity ; for, beginning with a slight Sensation of Fatigue and Weakness, a Prostration of almost all the Faculties of the Mind, a Difficulty of Breathing, and an Oppression of the Breast, it excites so gentle Commotions, that the Heat and Fever scarcely indicate any Danger. Soon after, wandering Horripilations, and the Paroxysms of a gentle Fever, appear. Hence the Difficulty of Breathing, and Weakness, suddenly increasing, Death happens, tho' hardly any Signs of it could be discovered, either in the Urine, or the Pulse.

This Disorder is most prudently cured,

1. By letting Blood from a large Orifice :

2. By a seasonable Injection of Clysters, which are to be repeated daily, till the Symptoms evince, that the Lungs are relieved. For this Purpose,

Take of Honey, three Ounces ; of Nitre, one Dram ; one Yolk of an Egg ; and of Barley-water, eight Ounces : Make into a Clyster.

3. Let the Patient use a slender Diet of Flesh-broth, especially such as are impregnated with mild Acids ; and let him drink a thin Liquor consisting of Water and Honey.

4. Let him use the Steams and Suffumigations described under the Article PERIPNEUMONIA VERA : He must, also, drink diluting, detergent, and gently aperient Decoctions : His Legs and Feet are to be bathed, and large Veficatories applied.

Take of the Roots of Fennel, two Ounces ; of the Roots of Grass, four Ounces ; of the Leaves of Pellitory and Agrimony, each one Handful and an half ; of the bruised Seeds of white Poppy, one Ounce ; and of Liquorice, an Ounce and an half : Boil for a Quarter of an Hour in two Pints and an half of Water ; of which let the Patient drink two Ounces every two Hours.

From what has been said, the Reason is obvious, why a Peripneumony is rarely incident to Children and Women ; as, also, why it hardly ever happens to those whose Solids are very lax ; why in such it is easily, and almost spontaneously, cured ; and, on the contrary, why it is otherwise in robust Constitutions, and those inured to Exercise. From what has been said, it, also, appears, that this Disorder is, for the most part, generated by some other Disease, which precedes it, before the Patient dies of it ; and consequently, that a Peripneumony is the immediate Cause of Death, and almost the last Effect of all mortal Disorders. *Boerhaave's Aphor.*

A Fever, attended with several peripneumonic Symptoms, arises every Year towards the Beginning ; but more frequently at the Close of Winter. It principally attacks such as are of a gross Habit of Body, middle-aged Persons, but oftener those who are more advanced in Years, and too much addicted to spirituous Liquors, especially to Brandy. For as the Blood of such Persons hath been loaded with phlegmatic Humours collected in the Winter, and is put into fresh Motion by the approaching Spring, a Cough is hereby immediately occasioned, whence these Humours hurry to the Lungs ; and then, if the Patient happens to live irregularly, and drinks more freely of spirituous Liquors, the Matter, occasioning the Cough, grows thick, and stops the Passage of the Lungs, and the Fever preys upon the Mass of Blood.

At the Beginning of the Fever, (1.) The Patient grows hot and cold alternately. (2.) Is giddy. And (3.) complains of an acute Pain in the Head, when the Cough is most troublesome. (4.) He vomits up all Liquids, sometimes with, and at other times without, Coughing. (5.) The Urine is turbid, and intensely red. (6.) The Blood taken away resembles pleuritic Blood. (7.) He breathes quick, and with Difficulty : If he be advised to cough, his Head aches, as if it would burst ; for

for so the Patient commonly expresses himself. (8.) A Pain of the whole Breast generally accompanies the Disease. And (9.) a Wheezing is heard by the Attendants, whenever the Patient coughs, the Lungs not being sufficiently dilated; so that the vital Passages seem to be closed by the Swelling; whence the Circulation is so intercepted, that there are no Signs of a Fever, especially in gross Habits; tho' this may, also, happen from the Abundance of the phlegmatic Matter, whereby the Blood is so surcharged, that it cannot rise to a perfect Ebullition.

In order to the Cure of this Fever, I judge it proper (1.) To take away that Blood which inflames the Lungs, and endangers Suffocation: (2.) To open and cool the Lungs by pectoral Medicines: And (3.) to abate the Heat of the whole Body by a cooling Regimen. But as, on the one hand, the Collection of the phlegmatic Matter contained in the Veins, and daily affording fresh Supplies for the Inflammation of the Lungs, should seem to indicate frequently repeated Bleeding; yet, on the other hand, I learnt from the most accurate Observation, that this Practice proved very prejudicial in feverish Persons of a gross Habit, especially if they were past the Prime of Life; so that Bleeding with Frequency was often contraindicated. I, therefore, had recourse to frequent Purging in its stead, which is properly enough substituted, where the Patient hath an Aversion to copious and frequent Bleeding.

Accordingly I proceeded in the following Manner: I directed Bleeding in the Arm in Bed, and forbid the Patient to rise till two or three Hours afterwards; because Bleeding, which, in some measure, weakens the whole Body, may, by this means, be more easily born; for the Patient can better bear to have ten Ounces taken away in Bed, than six or seven, when he sits up. The following Day I give this purging Draught in the Morning.

Take of fresh Pulp of Cassia, one Ounce; Liquorice-root, two Drams; three Figs; Sena, two Drams and an half; Troches of Agaric, one Dram: Boil them in a sufficient Quantity of Water, to leave four Ounces of Liquor when strained, in which dissolve an Ounce of Manna, and half an Ounce of solutive Syrup of Roses: Mix the Whole for a purging Draught.

The next Day I usually repeat the Bleeding, and, interposing a Day, I exhibit the purging Draught again, which is to be repeated every other Day, till the Patient recovers. On the intermediate Days of Purging, I advise the Use of a pectoral Decoction, Oil of sweet Almonds, and the like Remedies. In the mean time, I forbid Fleth, and Broth made thereof, but especially all spirituous Liquors; and, instead of these, I allow a Pisan, made of Barley and Liquorice, boiled in Water, for his common Drink, or small Beer, if he desires it.

This is the Method of curing the spurious Peripneumony, caused by an Abundance of phlegmatic Humours collected in the Blood, and by reason of the Coldness and Moisture of the Winter, thrown upon the Lungs; wherein both repeated Bleeding, and Purging, are indicated otherwise than in a true Peripneumony; which I esteem to be manifestly of the same Kind with the Pleurisy, with this Difference only, that a Peripneumony more universally affects the Lungs: And, indeed, both the Distempers are cured by the same Method, namely, by Bleeding principally, and cooling Medicines.

Though the spurious Peripneumony, in some measure, resembles the dry Asthma, both in the Difficulty of Breathing, and some other Symptoms, yet 'tis sufficiently distinguished from it, as being attended with manifest Signs of a Fever and Inflammation, which never appear in the dry Asthma; but they are much less considerable and apparent in the spurious than in the true Peripneumony.

It must be carefully remarked, that when this Disease attacks such as have been great Drinkers of Brandy, and other like spirituous Liquors, it is by no means safe to quit them of a sudden, but they must be left off gradually; for so sudden a Change makes way for a Dropsy: And this should be made a standing Rule in all other Diseases arising from the same Cause: *Sydenham*.

A pneumatic Fever is one of the acute, inflammatory Kind, arising from a Stagnation of the Blood in the Blood-vessels of the Lungs, or the small Ramifications of the Vena Azygos in the Pleura; and accompanied with an acute and pungent Pain of the Side, a Difficulty of Breathing, an immoderate Heat, an hard and frequent Pulse, a dry or a moist, and, sometimes, a bloody Cough: This Disorder is always dangerous.

There is no inflammatory Fever, which is so incident to Persons of all Ages, Sexes, and Temperaments, in cold as well as hot or temperate Climates, or which affects more epidemically, on account of the Inequality and Intemperance of the Air, than that which happens in the Thorax, whether in the Lungs themselves, or in the intercostal Muscles, both internal and external, lin'd internally with the Pleura, which is a nervous

Membrane. But, according as the Inflammation seizes different Parts of the Thorax, it not only receives different Names; but, also, differs widely with respect to the Symptoms, the Event, and the Method of Cure. The Antients, who were destitute of an accurate anatomical Knowledge of the Parts, thought the Pleura the Seat of a Pleurisy and Peripneumony; for which Reason they gave the Name of Pleurisy to almost every Inflammation in the Thorax: But *Hippocrates* made a Distinction between a Pleurisy and a Peripneumony. For this Reason all the antient Physicians, those of the intermediate, and those of the present Age, are of Opinion, that in a Peripneumony the Lungs were affected, whereas in a true Pleurisy the Lungs were not at all affected, but only the Pleura, and the Muscles which it lines. But this Assertion is false; for *Petrus Servius*, according to *Welschius*, in *Decad. 1. Curat. 4.* upon dissecting three hundred Subjects who died of a Pleurisy, always found one of the Lobes of the Lungs affected, and fill'd with Matter, whilst the Pleura was not sensibly, or at least but very little, corrupted. Hence, in my Opinion, the different Seats of an Inflammation in the Thorax are to be determin'd; that, if it only seizes the external Parts, a spurious Pleurisy is produc'd; if, like an Erysipelas, it seizes the Surface of the membranous pulmonary Substance, a true Pleurisy is produc'd; and the farther it penetrates into the Substance of the Lungs, the more violent the Pleurisy is, and what is called a Peripneumony is produced.

These different Species of Inflammations in the Thorax are, therefore, by the Physician, to be carefully distinguished, by certain peculiar and characteristic Marks: For, in a spurious Pleurisy, there is an acute and pungent Pain of the Side, which is increased by being touch'd; lying on the affected Side is difficult; there is a dry Cough without any Expectoration of the pituitous or bloody Matter, which, however, if it is violent, augments the Pain. It is, also, accompanied with a Fever, and a Pulse somewhat hard, depress'd, and frequent. It is produc'd not so much by a Stagnation of the Blood, as of the Serum, in the Extremities of the small Arteries, and Veins connected with the Vena Azygos, and in the Extremities of the small Ducts in the Pleura, or in the Periosteum of the Ribs, where the Sense is still more acute and intense. Hence 'tis no more than a Species of Rheumatism, and for that Reason incident to those who are subject to Catarrhs, rheumatic or arthritic Pains, or who are now-and-then afflicted with an Hemicrania, especially when they remove from an hot to a cold, or from a cold to an hot Air, particularly in the Evening: Nor, for this Reason, is Venesection necessary, but only a Diaphoresis, and an increased Perspiration; by which means it is generally easily terminated about the seventh Day, and is free from Danger.

But a true Pleurisy is a sanguineous Inflammation, arising from a Stagnation of Blood in the small Ducts of the Bronchial Vessels discover'd by *Ruyfch*, and which are only subservient to the Nourishment of the Membranes, Vesicles, and Vessels, which constitute the Fabric of the Lungs. Hence, in this Disorder, the Lungs are principally affected; tho' only as to their more external and superficial Part. Hence there is, in this Disease, a greater Difficulty of Breathing than in a spurious Pleurisy; there is, also, a Discharge of bloody Spit, and the Disease is terminated by Expectoration. It is, also, accompanied, for the most part, with a Fever, tho' of a more acute Kind than that attending a spurious Pleurisy. There are, also, Pains in the affected Side, tho' not so intense, nor capable of being augmented by the Touch; for the Pleura, which lines the Thorax, is, also, drawn into Consent; both because the exterior Pulmonary Membrane is form'd of the Pleura, and because in most Men the Lungs, at least on one Side, adhere to the Pleura.

In a Peripneumony the Pain is rather tense, obtuse and pressory, than acute, and is propagated to the Back and Scapulæ: But there is a greater Anxiety and Difficulty of Breathing, and a more painful Expectoration, in which Spit of various Colours is discharg'd; for, in a Peripneumony, the Vessels of the Lungs, which convey the Blood from one Ventricle of the Heart to the other, are affected, infarcted, and obstructed, by a thick Blood, which, in Process of Time, assumes a solid Nature. For this Reason it is attended with greater Danger, and soon destroys those whom it seizes, especially if they are old, or if seasonable Venesection is omitted.

But tho' the Antients were not very accurate in distinguishing the Inflammations of the Thorax; yet because this Misfortune was very frequent in those Parts where *Trallian*, *Arctæus*, *Caelius Aurelianus*, and others of them, liv'd, a more exact History of the Symptoms of the Disease may, perhaps, be drawn from them than from the Moderns. But, among all the others, *Arctæus* seems to be the most distinct, who, in *Lib. 1. Cap. 10. Acut.* speaks in the following manner: "It is accompanied, says he, with an acute Pain ascending to the Throat, and an intense Heat: But the Pain, in some Patients,

"ients, extends to the Back and Scapula; a Difficulty of Breathing, also, ensues; Watchings, Loathing of the Aliments, a Redness of the Cheeks, a dry Cough, a Spit which is discharged with Difficulty, pituitous, pretty bloody, or yellowish. It is still worse, if a bloody Spit is not expectorated, and if the Patients are delirious or comatous." The same Author, also, informs us, that the Patients die or recover within the seventh or fourteenth Day, according as the Symptoms are violent, or gentle; or, if the Disease is protracted to the twentieth Day, that they are seiz'd with an Empyema. He adds, that the Disorder is most frequent in the Winter, less frequent in the Autumn, still less in the Spring, unless it should happen to be very cold, and least of all frequent in the Summer. He, also, tells us, that old Persons are most subject to this Disorder; whereas Children are either not at all subject to it, or not endangered by it, because their Bodies are moist, rare, and subject to copious Exhalations.

But since the violent Symptoms, which accompany a pneumonic Fever, are only founded on the Inflammation of the pulmonary Substance, we may readily perceive, that all things which hinder the free Circulation of the Blood through the Vessels of the Lungs, either by an Obstruction of the Ducts, by a Redundance of thick Matter, or a strong spasmodic Constriction of them by a thin, acrid Matter, are subject to generate this inflammatory Fever, especially when many antecedent, procaccatic, and remote Causes concur to the Production of this Effect. Those, therefore, who by gross and impure Aliments, the Use of spirituous Liquors, a Defect of Moisture and Exercise, have a large Quantity of thick Blood, which Sydenham, by way of Distinction, calls pleuritic Blood, easily, when other procaccatic Causes concur, fall into this Disorder; especially when the Body, by intense Exercise, hard Labour, warm Baths, or the drinking of spirituous Liquors, is rendered excessively hot, and afterwards exposed to a cold Northern Air; or, which is still worse, when cold Liquors are greedily drank. This Disorder is, also, quickly generated in sanguineous and plethoric Habits, by the Omission of seasonable Venesection. The same Misfortune happens to Women, whose Menstrues flow either immoderately, or too sparingly, or if, through Age, they are entirely suppress'd; as, also to Men, in whom the hæmorrhoidal Flux is either not duly carried on, or entirely suppress'd.

I have frequently observed, that Gripes, Spasms, colical and hypochondriacal Pains, accompanied with a violent Costiveness, have been succeeded by Inflammations of the Lungs, especially in plethoric and cacochymic Habits; for such is the Nature and Quality of these, that by compressing the Vessels, especially the Veins, they hinder the free Circulation of the Blood, render its Motion greater, and its Congestion, especially to the superior Parts, more copious. By which means it afterwards happens, that the Blood is not only urg'd to those Ducts, which, on account of the Smallness of their Diameters, generally neither receive nor convey the Blood; but, also, remaining impacted in these narrow Channels, interrupts the equable Progress of the Blood, and disturbs all the natural Functions. And because Persons very subject to Hæmorrhages are, for the most part, of sanguineous Habits, and subject to spasmodic Strictures in the Abdomen, hence it is, that young Persons, who have been early subject to large Hæmorrhages from the Nose, Spittings of Blood, or the Hæmorrhoids, occasional Causes concurring, easily fall into Pleuritis or Peripneumonies. 'Tis, also, confirmed by frequent Experience, that Inflammations of the Breast have been produc'd by repelling Itches; by preposterously stopping simple or dysenteric Fluxes; by consolidating old Ulcers; by suppressing a critical and usual Sweat of the Feet, or of the whole Body; and by the Repulsion of chronic purple Eruptions by external Cold; for this recrementitious Matter, of an acrid and caustic Quality, being impacted in the nervous Coats of the Lungs and Thorax, by reason of the spasmodic Strictures it excites, hinders the equal and due Circulation of the Blood. Nor is it uncommon for an Inflammation to be produced in the Thorax after the Small-pox and Measles, since these Disorders always leave some Fault or Weakness in the Lungs.

Besides, in consequence of the preternatural Constitution of the Air and Weather, it frequently happens, that Pleuritis, both of the true and spurious Kind, rage epidemically. This principally happens in a long and cold Winter, as, also, when a warm Air, and a light State of the Atmosphere, is suddenly succeeded by a cold, northerly, and highly elastic State of the Air; and when this last happens, especially in the Spring and Autumn, Fevers, both of the catarrhal, malignant, benign, and pleuritic Kind, rage. After a severe Winter, I have observ'd crude Pleuritis raging, in which the Spit hardly appear'd on the ninth and tenth Day. These Pleuritis are, by Hippocrates, Lib. 2. de Morb. called dry Pleuritis; and, during the first Days of these, the Patients are greatly tormented and wasted with a racking Cough, so that the Discharge of Spit proceeding, the

Patients are hardly able to bear the Expectoration, and with great Difficulty recover: There are, also, endemial Peripneumonies; for it is certain, that a Peripneumony is a very frequent Disease, and proves mortal to many, in *Westphalia, Pomerania, Sweden, Denmark, and Russia*. This, in my Opinion, is owing to the gross and coarse Food, and the Coldness of the Air, in these Northern Climates.

In no Fevers have I more accurately observed the Crises, than in a Pleurisy and Peripneumony; for, in young and robust Persons, a bloody Spit generally appears about the fourth Day; and, on the seventh, the Disorder is spontaneously terminated by a profuse Sweat. In phlegmatic and languid Constitutions, as, also, when the Disorder has a deep Seat in the Lungs, there is a Termination of the Disease on the eleventh or fourteenth Day, partly by Expectoration, and partly by Sweat, the Pulse becoming softer, the Sleep calmer, and the Strength being increased. In an imperfect Crisis, a Sweat, tho' not sufficient, also, appears on the critical Days; for which Reason, it neither relieves the Patient, nor terminates the Disease: And, when the Disorder continues to the twenty-first Day, a dangerous Abscess of the Breast is to be dreaded. It is, therefore, a good Sign, when the Expectoration from the Lungs succeeds well, carrying off, on the fourth Day, a viscid, bloody, then yellow, and, sometimes, a purulent Matter; and the more expeditious the Spitting is, the greater Hopes there are of a Recovery; and, on the contrary, the slower it is, the less Hopes of Safety are to be entertained; only, we are to take care, lest, when the Disease terminates by a copious Expectoration of virulent Matter, it should be succeeded by a Phthisis, or an Hætic: But frequent Stools are never safe: Urine without a Sediment is a bad Sign; as, also, profuse Sweats happening not on the critical Days. But when, on the eleventh or twelfth Day, a moderate Looseness happens, in which a purulent Matter is sometimes discharged, a Recovery is not to be despair'd of. When, also, about the fourth Day, there is an Hæmorrhage from the Nose, it affords singular Relief.

No Inflammation so readily occurs as a pneumonic Fever, especially when deep-seated, and attended with an Abscess. I have known some, who, being hardly recovered, have, by an irregular Diet, and the liberal Use of rich Wine, relapsed in a Month's time; and the Event generally proves fatal. I have, also, known such an Inflammation return twice, thrice, four times, or oftener a Year, in the same Part in which it first appear'd. So that those who have once labour'd under this Disorder, ought always carefully to guard against a fresh Attack, by an exact and proper Regimen.

Those who die of an Inflammation of the Lungs, are suffocated, because they can no longer throw up, by Cough, the Matter lodged in the Vesicles of the Lungs, and the Ducts of the Bronchia. In dissecting such Subjects, the Lungs are found inflated, hard like the Liver; and, because the Vessels are infarcted with a thick and tenacious Blood, they subside when put into Water. I have, also, seen the Lungs full of small Abscesses, and hard Tubercles, whilst the Pleura was inflamed, sphacelated, and adhering to the Substance of the Lungs. I have, also, known Instances, in which polypous Concretions found in the Pulmonary Vein, as, also, in the large Artery, have hindered the free Circulation of the Blood through the Lungs, and brought on an Inflammation, by reason of the too large Quantity of Blood convey'd thither.

Since, therefore, a Stagnation of the Blood, which hinders its equal Circulation, is the immediate Cause of this Disorder, the principal Intention of Cure is, to render it capable of circulating freely; for obtaining which End, the following Measures are to be taken: First, the farther Stagnation of the Blood is to be prevented. Secondly, the Lentor observable in the Blood of pleuritic Patients is to be diluted and colligated. Thirdly, when the Part affected, and rigid by Spasms, Pain, and a copious Afflux of Humours, is soften'd and relax'd, that thus the impacted Matter may be again wash'd away, and put in Motion by the Action of the arterial Blood: And, fourthly, when the Excretion of the viscid, sanguineous, and purulent Matter, lodged in the Bronchia of the Lungs, is facilitated by Spit, and, by that means, an Abscess, and the Generation of an Empyema, prevented.

In order to prevent the Increase of the Inflammation, nothing is more useful than Venesection; which is the more beneficial, the sooner it is administered. For this Purpose, let a Vein be opened in the Arm of the affected Side, and a large Quantity of Blood taken away, if there is a considerable Plethora, and the Blood flows with a considerable Impetus: But if a viscid and glutinous Serum floats in the Blood, and the Respiration continues difficult, the Venesection is boldly to be repeated, especially if there is a Suspicion of a deep inflammatory Stagnation.

Among internal Applications, those are most beneficial, which render the Blood, Serum, and Humours, thin and fluid, colligate those which are thick and inspissated; and, at the same time,

time, promote a gentle Diaphoresis. The most proper things for obtaining these Ends are, an Infusion of Paul's-betony, Chervil, and Sage, each two Handfuls; Liquorice-root, one Ounce; and Fennel-seeds, two Drams; of which let the Patient frequently drink four or five Dishes. Then let him use the following discutient and diaphoretic Mixture.

Take of the Waters of Carduus Benédictus, Scabious, Elder-flowers, and the Egyptian Thorn, each two Ounces; of Treacle-water, half an Ounce; of distilled Vinegar, one Ounce; of Crabs-eyes, one Dram; of diaphoretic Antimony, two Scruples; of the Syrup of red Poppies, or of Saffron, (prepared of dissolved Sugar, an Ounce; and of Extract of Saffron, eight Grains) two Drams. Of this Mixture two or three Spoonfuls are, every two Hours, to be exhibited alternately with the following Powder.

Take of diaphoretic Antimony, or of the Cerus of Antimony, of Crabs-eyes, of the Jaws of the Pike-fish, of the Tooth of the Sea-horse, and of the Solution of Crabs-eyes, each one Dram; of pure Nitre, two Drams; and of Cinnabar, one Scruple: Make into a Powder, of which, half a Dram is to be taken for a Dose.

When the Patient is languid, and the Pleurisy epidemical, and of a bad Kind, to the foregoing Powder we are to add Camphire, which powerfully resists Inflammations, and hinders them from spreading; only we are to observe, that half a Grain is sufficient for a Dose; and that the Patient is to drink after it an Emulsion prepared of the Four greater cold Seeds, Ladies-thistle, Pine-kernels, and a Decoction of Barley and Harts-horn.

The acute Pains are mitigated, and the rigid Fibres relaxed, by the almost continual Application of a Bladder full of a warm Decoction of emollient Ingredients, such as the Flowers of Elder, Melilot, Mullen, Chamomile, Mallows, and white Lilies, the Four carminative Seeds, and Saffron, boiled in Milk. *Aretaus*, therefore, in *Lib. 1. Acut.* in the Cure of a Pleurisy, prudently orders a Bladder full of warm Oil to be applied to the Part affected, provided the Fomentation is not of such a Weight as to increase the Pain. And, certainly, by this Topic, the Pain is considerably alleviated, the Respiration facilitated, and the peccant Matter prepared for Expectoration, which is greatly promoted by the following Linctus.

Take of the Oil of sweet Almonds, half an Ounce; of Sperma-ceti, two Drams; of Saffron, ten Grains; of the Syrup of Violets, and Sugar-candy, each half an Ounce: Make into a Linctus; of which some is to be frequently taken in a Decoction of excorticated Oats, or in sweet Whey.

The principal Part of the Cure depends upon Venesection, concerning which *Aretaus*, in *Lib. 1.* has these Words: "In pleuritic Cases, no Delays are to be used; but we are to have recourse to the most powerful Remedy with all Expedition: For which Reason a Vein is to be open'd in the Arm the very first Day of the Disorder; and, when a moderate Quantity of Blood is taken away, the Patient is refreshed. Then, some time after, the Operation is to be repeated, if the Patient can bear it; if not, it is to be delay'd till the following Day." These Measures are not only useful in Youth, but, also, in old Age, because Persons in this last State abound more with a thick and tenacious Blood, which renders their Inflammations more fix'd, and worse to be discuss'd; for which Reason Venesection is, also, to be repeated in old Persons, if their Strength will admit of it. We are, above all things, to be careful, that the Quantity taken away bear a Proportion to the Strength and Quantity of Blood of the Patient; for, if too large a Quantity is taken, the Expectoration is not only hindered, but, also, the Stagnation of Blood to be dissolved more confirm'd, or the Disorder degenerates into a Sphacelus. But, if too small a Quantity is taken away, little Good is produced; the Blood, acquiring more Room, flows more impetuously to the Part affected; and the Stagnation and Inflammation are increased.

In a Pleurisy and Peripneumony, the Body is to be kept soluble, and the Intestines free from Spasms: This is the Advice of *Trallian*, and of *Hippocrates*, in *Lib. 3. de Morb.* where he tells us, "That, in the first four or five Days, the Body is to be rendered soluble; and so much the more, the slower the Fever, and the slighter the Pains are." For this Purpose, we recommend emollient, paregoric, and domestic Clysters, prepared with Oil of sweet Almonds, by which the Body is not only render'd soluble, but, also, the spasmodic Stricture of the Intestines is relaxed. *Aretaus*, also, justly observes, "That we are not to neglect Medicines applicable to

"the inferior Parts, such as Oil of Rue injected into the Anus of Men, and into the Uterus of Women." Which Experiment may be, also, made, if the large Intestines are spasmodically constricted, or in Cases where Women are afflicted with Spasms of the Uterus.

Trallian, in *Lib. 6.* in such inflammatory Disorders, greatly and justly commends Drinks prepared of Mulfum and Water, as, also, Cremer of Pusan, well boiled with sweet Almonds, and liberally drank. "It must, says he, be constantly exhibited warm, when Aliments, or other Potions, are given; for," adds he, "no other Medicine is found so beneficial to pleuritic Patients, even tho' the Fever is violent." *Hippocrates*, also, always commends his Pusan; and I myself from Experience affirm, that moistening Liquors, used tepid, are preferable to all other Medicines. But, in order to dilute the Humours, nothing is more beneficial than a Decoction of Oats, or Barley, with the Addition of a Quantity of Prussian Honey, and sweet Whey; and the larger Quantity of such a Liquor is taken, especially if the Body sweats much, the more salutary it proves.

As in all inflammatory Fevers, so especially in those of the pneumonic Kind, we are carefully to abstain from too warm a Regimen with respect to Bed, Chamber, and Drink: But we are, also, to guard against Refrigeration, and the Use of cold Liquors. In the Cure of this Disorder, none of those Medicines are to be used, which forcibly provoke Urine, Sweat, or Stools, lest the fine lymphatic Humours, by whose Assistance the Stagnation ought to be dissolved, should be drawn elsewhere; for *Hippocrates*, in *Lib. 3. de Morbis*, when speaking of Stools, justly informs us, "That, if, after the fifth Day, a large Quantity of Matter is discharged by Stool, it proves mortal, since, by that means, the superior Parts are dried, and the Spit not carried upwards. The Body must not, therefore, be too costive, lest the Fever should be acute; nor too soluble, that thus the Spit may be carried upwards, and the Patient's Strength preserved." But when two, or even four, Stools happen spontaneously, they are not to be checked.

In order to soothe the acute Pains, Anodynes and Opiates are generally commended: But they are to be abstain'd from, by those, especially if old, in whom the Humours are thick, and the Inflammation considerable. "We are, says *Trallian*, in such Cases, carefully to avoid Diacodium and Philonium; for they are dangerous, since they render the Humours difficult to be eliminated, impair the Strength, and render the Patient languid." But in young Persons, when the Pain is intense, we are not, except upon urgent Occasions, to exhibit stronger Anodynes, than Preparations of Poppies: Such as an Emulsion prepared of the Seeds and Syrup of Poppies, or the Diascordium of *Fracastrorius*, taking care, at the same time, always to mix nitrous and diaphoretic Medicines with them. Externally, in order to mitigate the Pains, and assist the Discussion, besides the things already recommended, a Fomentation, prepared with the warm Fat of a Capon, in an Ounce of which half a Dram of Camphire is dissolved, is useful.

Expectorating and sweet Substances are not to be too soon exhibited, that is, on the first Days; but only when the viscid Matter is concocted, moveable, and fit for Excretion; otherwise a greater Afflux to the Lungs is excited. Some recommend Sperma-ceti, taken in large Quantities, for dissolving the Blood: But I have observed, that this Medicine is more injurious than beneficial, on account of the Nausea it creates; nor, at the same time, is it of so dissolvent a Quality, as Vinegar mixed with Crabs-eyes.

When, on the critical Day, as it frequently happens unless the Physician imprudently raises Commotions, the Inflammation is terminated by a copious Sweat, which is succeeded by a freer Respiration, Ease of Body, and an Increase of Strength, we are still, for some time, to continue the Use of diaphoretic and diluting Medicines, but not to exhibit them so often. Particular regard is, also, to be had to the Method of Living, lest more should be eaten, than the weak Stomach is capable of digesting, that thus the Remains of the Disease may be consumed, and a Relapse prevented. *Hoffman*.

A PLEURISY.

A Pleurisy is said to be present, when the Patient labours under an acute, continual Fever, accompanied with an hard Pulse, an acute, pungent, and inflammatory Pain, which in Inspiration is greatly increased, but in Expiration, or during the Retention of the Breath, milder; as it is, likewise, when, without any Motion of the Thorax, Respiration is principally perform'd by the Assistance of the Abdomen: This Disorder is generally accompanied with a perpetual Cough, which excites such an intense Pain, as to endanger a Suffocation.

When, with these Symptoms, symptomatic Expectorations are made from the Lungs, the Disorder is call'd a moist Pleurisy; but, when such Expectorations are wanting, it is call'd a dry Pleurisy.

This Disorder affects all the Parts of the internal Integuments of the Thorax, the Whole of the Pleura, the Whole of the *Mediastinum*; and consequently, the anterior, posterior, right, left, superior, inferior, exterior, and deeper Parts, but especially the Sides, are affected by this Disorder.

When the Membrane internally lining the Ribs is the Seat of the Disorder, it is called a *true*, or *legitimate Pleurisy*: But, if the intercostal Muscles, and those lying above them, are farther affected, the Disorder is call'd a *spurious*, or *bastard Pleurisy*.

This Disorder principally attacks adult Persons of sanguineous Habits, those who eat and drink too copiously, who use violent Exercise, who are rarely afflicted with acid Eructations, and who are disposed to inflammatory Disorders in the Spring, especially, when an intense Heat suddenly succeeds a severe Cold; or, in the Winter, when excessively cold Winds blow: And, in such Cases, the Disorder is call'd an *idiopathic Pleurisy*.

But a Pleurisy arising from the Motion of the Matter of a previous inflammatory Disorder, and its Translation to the Parts already mention'd, is call'd a *symptomatic Pleurisy*.

This Disorder, for its antecedent Cause, has

1. Every thing capable of generating an Inflammation of any Kind.

2. Every thing which, in a particular manner, determines this general Cause to the Pleura; such as the Nature of the Patient, according as his intercostal Arteries are narrower or harder; a previous Disease, which leaves a Disposition to the same Misfortunes, such as a Scirrhus or Callus of the Pleura, or an Adhesion of the Lungs to that Membrane; the Nature of a raging epidemical Disorder; a cold Air convey'd forcibly thro' small Chinks to the naked Body, previously over-heated by Exercise, or the Influence of the Fire; cold Liquors copiously and suddenly drank, when the Body is over-heated; and cold Northerly Winds in the Winter-time.

3. A Translation of the inflammatory, ichorous, or suppuratory Matter, before lodged in the whole Body, or in some particular Part, to these Parts of the Thorax; as in the Measles, the Small-pox, ulcerous Tumors, large and broad Ulcers, which suddenly disappear in consequence of an Absorption of the peccant Matter into the Veins.

This History of the Disease, together with an Account of its several Stages, and a Dissection of those who die of it, sufficiently evinces, that it is an Inflammation of the sanguineous Kind in those Parts of the Thorax already mentioned; and generally arising from a preceding acute Fever.

Hence we may easily deduce the History of this Disease; for it often begins with a pretty keen Appetite for Aliments; a Coldness and Horror; a Weakness, Lassitude, and Fever; in Process of Time, it is attended with a moderate Heat, which gradually becomes excessively intense; a Thirst; a total Loss of Appetite; a Pain at first mild, but gradually becoming intolerable; and a considerably injured Respiration: At its Height it is attended with a violent, tho' less perceptible Fever, on account of the Respiration, which is check'd, and almost suffocated, by reason of the intense Pain. Hence the Physician is often shamefully mistaken; and the Disorder terminates in various Manners, which depend upon various Causes, but especially on the Diversity of Changes to which Inflammations are subject, specified under the Article INFLAMMATIO; on the Nature of the Parts affected; and a due Consideration of the following Circumstances: Whether there are more or fewer Parts affected at once? Whether the Impetus of the Blood is violent? Whether the Malignity of the primary Disorder is great, and accompanied with a Train of unlucky Symptoms? And especially, whether the Respiration, Pulse, and Excretions, recede from their natural State?

A Pleurisy, like other Inflammations, terminates in the Recovery of the Patient, some other Disorder, or Death.

This Disorder terminates in the Recovery of the Patient, either by the Assistance of Nature, or of Art, whilst the Disease is as yet simple and recent.

It is cured by the Assistance of Nature, either by means of a benign Resolution, or by a Concoction and Excretion of the peccant Matter.

A Pleurisy is cured by Resolution, when the Humours are mild, their Motion regular, the obstructing Cause not too obstinate and the Obstruction small; for, in this Case, the Benignity of the Symptoms indicates nothing to be done, but only to alleviate the Disorder by light Aliments, mild Aperients, and softening Fomentations.

A Pleurisy is cured by the Concoction and Excretion of the peccant Matter;

1. When, by the hæmorrhoidal Veins, a proper Liquor is in a due Quantity, and at a proper time, discharged.

2. When a copious, thick, hypostatic, strangurios, red Urine, with a white Sediment, is discharged, to the Relief of the Patient, before the fourth Day; such a Discharge of Urine, also, cures a dry Pleurisy.

3. When, before the fourth Day, copious, bilious, and yellow Stools, are discharged, to the Relief of the Patient.

4. When ichorous, purulent, fistulous, or long-flowing Abscesses begin, before the sixth Day, behind the Ears, or on the Legs.

5. When the Pain of the Side is translated to the Shoulder, Arm, or Back, and accompanied with a Stupor, Pain, and Heaviness of these Parts.

6. When the Spit is, in some measure, freely discharged, affords Relief, is unattended with a Coryza, copious at first, resembling Pus, soon after white, appears before the fourth Day, is continued, or returns immediately after its Suppression; for, in these Cases, the Patient recovers, either on the ninth, or the eleventh Day.

When the Signs, accurately observ'd, indicate, that the now described State of a Pleurisy is present; then the Physician is to make no Alteration, but suffer every thing to remain as it is. For this Reason, neither Venesection, nor Evacuation, nor any other Change, are to be attempted. The Patient is, therefore, first, to use soft light Food, Rest of Body and Mind, a temperate hot and moist Air, spontaneous Sleep, or such as is procured by gentle Narcotics, softening, thin, and gently aperient Medicines. Then, secondly, each particular Evacuation, which gives Relief, is to be promoted.

When, therefore, in a Pleurisy, a proper Liquor is in a due Quantity, and at a seasonable Time, discharged from the hæmorrhoidal Veins, the Anus is to be fomented with emollient, laxative, and aperient Fomentations; or, if these should prove ineffectual, Leeches are to be applied.

When the Urine is copious, thick, hypostatic, and such as has been already described, Fomentations, of the same Nature with those now recommended, are to be applied to the Kidneys, Perinæum, and Hypogastrium; lenitive and diuretic Aperients are to be used; the Patient is to be kept in an Air somewhat cool; Sweating, and other Evacuations, are to be avoided; and mild diuretic Clysters to be injected.

If, in a Pleurisy, yellow and bilious Stools are copiously discharged before the fourth Day, to the Relief of the Patient, the like emollient Fomentations are to be applied to the whole Abdomen, laxative Clysters are to be injected, and a laxative Regimen prescribed.

When ichorous, purulent, or fistulous Abscesses appear before the sixth Day, behind the Ears, or on the Legs, and if the Part affected is discover'd, then the Patient is to use a light, fluid, gently aromatic, and somewhat vinous Diet, to remain in a State of Rest, and to have emollient and gently aperient Medicines prescribed him. The Part, also, to which the Matter is determined, ought to be treated with Suction, Relaxation, stimulating and aperient Medicines, that thus it may resist less, and attract more. Then somewhat more strong Aperients may be used; as, also, saponaceous and hepatic Substances; to which may be added Clysters and Fomentations consisting of the same. Then the Aperture made in the Abscesses is to be kept open for some time, by suppurating Medicines.

When the Pain is translated to the Shoulder, Arm, or Back, and attended with a Stupor, Pain, and Heaviness of these Parts, besides the things commonly prescribed, the Parts to which the Pain is translated, are to be fomented with emollient Substances, rubbed gently with hot Cloths, and stimulated by Plasters, in some measure, attractive.

When the Spit is, in some measure, freely discharged, affords Relief, is unattended with a Coryza, is copious, at first resembling Pus, but soon becomes white, or appears before the fourth Day, is either continued, or returns immediately after its Suppression, then the whole Treatment is the same as in a true Peripneumony. See the Article PERIPNEUMONIA.

By Art, a Pleurisy may be cured without any other Disease, especially by the following Method: If a recent Pleurisy, before the End of the third Day, is accompanied with violent Symptoms of the dry Kind, and found in a robust, exercised, and dry Habit, without any Hopes, or Presence, of a Resolution, or of the Concoction and Excretion of the peccant Matter; then,

1. A large Quantity of Blood is speedily to be taken from a large Vein, with a large Stream, and from a large Orifice, the Patient, in the mean time, lying at Rest on his Back, and quickening his Respiration, as the Blood flows, by Coughing and Sighing. The Part affected is, in the mean time, to be fomented, and gently rubbed. The Discharge of Blood ought to be continued, till the Pain is considerably remitted, or the first Signs of a Deliquium brought on. The Venesection is to be repeated, according to the Return of the Symptoms it was intended to remove. The Absence of the Pellicle, formed upon inflammatory Blood, determines when 'tis time to stop. And,

2. We are immediately to use Fomentations, Baths, hot Applications,

lications, Liniments, and Plasters, to relax, resolve, to mitigate, and avert the Pain. See INFLAMMATIO.

3. Then such Medicines are to be exhibited, as dilute, resolve, relax, mitigate, refrigerate, and alleviate, or soothe Pain; which, when taken warm, in a moist Form, in a large Quantity, and determined to the Part affected, are highly beneficial, and may be varied, according to the Symptoms; always taking care, that such Ingredients be chosen, as resist Putrefaction.

4. A light, soft, refrigerating, and antiphlogistic Diet is necessary.

5. Every thing, which dries, heats, or increases the Impetus of the Blood, is to be avoided; such as the Heat of the Air, of the Sun, of the Fire, or of the Bed; as, also, heating Aliments and Medicines. A Fomentation may be prepared in the following Manner:

Take of the Leaves of Mallows, Marshmallows, and Pellitory of the Wall, each two Handfuls; of Garden-poppy, and Henbane, each one Handful; of the Leaves of Elder, Chamomile, and Melilot, each three Ounces: Boil in sweet Milk, for a Fomentation.

Liniments, for anointing the Sides, are these following:

Take of the Sugar of Lead, four Drams; of Vinegar, six Drams; and of the Oil of Roses by Infusion, one Ounce: Make into a Liniment; to be applied to the Side.

Or,

Take of the Unguentum Populneum, two Ounces.

Or,

Of the Emplastrum Diapompholygos, a sufficient Quantity: Spread on Leather, and apply for the same Purpose.

Take of the Leaves of Colts-foot and Mallows, each two Handfuls; of the Leaves of wild Poppies and Marshmallows, each half a Handful; of the Roots of Parsley and Sarsaparilla, each three Ounces; of bruised Linseed, four Drams; of the bruised Seeds of Lettuce and Ladies-thistle, each one Ounce: Boil in three Pints of Water, of which let the Patient drink two Ounces every Hour.

Take of the Four greater and smaller cold Seeds, each three Drams; and of white Poppy-seeds, two Ounces: Make into an Emulsion with Barley-water; with every fourteen Ounces of which mix, of the purest Nitre, one Dram and an half; and of the Syrup of Maidenhair, one Ounce. Let the Patient drink one Ounce every Hour, or every Quarter of an Hour.

Take of the distilled Waters of the Flowers of the red Poppy and Elder, each eight Ounces; of the distilled Water of Borrage, five Ounces; of Crabs-eyes, two Drams; of Sal Prunellæ, one Dram; of the Syrups of the Flowers of red and white Poppies, each one Ounce: Mix, and let the Patient drink two Ounces every Half-hour.

How long these Measures are to be persisted in, or repeated, is to be known from the Obstinacy of the Disease, its Remission, or its Change into a State of Health and Recovery.

A Pleurisy degenerates into other Disorders, first, when the inflamed Part suppurates; which we know, first, from the general Signs of a Suppuration, specified under the Article INFLAMMATIO; secondly, from the Obstinacy of the Pain, Cough, and Fever, beyond the fourth Day; thirdly, from the Absence of the Sign of a Resolution and Cure; and, fourthly, from a Neglect of the proper Measures of Cure.

That an Abscess is already forming, is known from the common Signs specified under the Article INFLAMMATIO; but especially, in this Case, from the often recurring Horror, without any manifest Cause, and the Signs specified in the Article PERIPNEUMONIA. Hence it is, also, known, when an Abscess is actually formed; which sometimes is evacuated by Spit, thro' the Lungs.

But such an Abscess is sometime broken by its own Pus, which drops into the Cavities of the Breast; whilst the Ulcer, as new Pus is formed and accumulated, fills the whole Cavity of the Breast, and consumes the whole Body. That such a Misfortune has happened, may be known from the preceding Signs: From the Duration of the Misfortune beyond the seventh Day; from the sudden Remission of the Symptoms, and their quick Return. Hence arises a Phthisis.

When, therefore, by the Signs already enumerated, we know that the Inflammation is forming into an Abscess, the Part, before painful, when known, is to be corroded by Caustics; an Incision is to be made quite to the Pleura, and kept open by suppurative Medicines, that the Matter, being forced outwards by

the Action of the Lungs, may be discharged from the Pleura; and prevent an Empyema; then the Part is to be softened, till it is quite cleansed.

But if there are Signs, that, the Abscess being broken, the Pus has already form'd an Empyema, the Thorax is forthwith to be opened, the Pus eliminated, and the Wound cured by proper Regimen and Medicines. See INFLAMMATIO and EMPYEMA.

A Pleurisy, also, degenerates into some other Disease, when, for Instance, the Part affected becomes scirrhus, or callous, or when the Lungs adhere to the Pleura; and, when this last Misfortune happens, there is produced an Asthma, a Dyspnoea, and a dry Cough, especially after Eating or Exercise; from which Signs the Disorder is known, if they are present without the Signs of an Abscess or Empyema, already specified; and, especially, if they continue long, without any great Increase of the Disorder.

This Misfortune, when known, is either absolutely incurable, or to be removed by abstemious Living, Exercise, a free Air, in the Country, violent and often-repeated Riding.

Such an Inflammation, also, degenerates into a Gangrene, first of the Side, and then of the Lungs, by reason of the Contiguity of the latter with the former.

This last-mentioned Disorder arises, either from the Violence of the Pleurisy, or from the acrid and putrid Matter accompanying it.

That a Gangrene of the Lungs is about to happen, or is already begun, may be known from various Circumstances: If, for Instance, the Spit is purulent, and somewhat bilious; round, purulent, and somewhat bloody, black, and fuliginous, dirty, or fetid; if there is a great Noise in the Breast, accompanied with a Sadness of the Countenance; if the Eyes are of a yellowish-red Colour, full of Sordes, and dim-sighted; or if the Spit is at first various; then the Patient often dies on the third or fifth Day: If there is a Stertor, none, or a difficult Expectoration, a languid Pulse, and an high-coloured Urine; if there is a Flux, the Matter of which is liquid, fetid, putrid, and symptomatic; if a violent Peripneumony comes on; if a second Paroxysm succeeds the first; if the Blood is highly florid, when flowing from an opened Vein, and without an inflammatory Pellicle, though it comes from a large Orifice, with a full Stream, and is received into a clean Vessel; if the Spitting is suppressed, whilst the Dyspnoea remains; or is increased, and accompanied with Pain, Heaviness of the Breast, an hard, small, quick Pulse, and an intense Heat; for, when these Symptoms are increased on the fifth Day, they prove mortal on the seventh; if the Urine is highly red, and dark-coloured, with a various and indistinct Hypostasis, the Disorder proves mortal within fourteen Days: If the Hypostasis is black, or fuscous, the Disorder proves mortal sooner: If the Pleurisy, being at first mild, is increased on the fifth or sixth Day, the Patient is in Danger on the seventh and twelfth, and are rarely cured, till after the fourteenth; if the Back, Side, and Shoulders are highly red and painful; and if there is a Flux, of which the Matter is green, and highly fetid.

If the Pleurisy is of the dry Kind, on account of the Defect of Strength, the intense Pain, the Unfitness of the Matter for Expulsion, the excessive Contraction and Crispation of the Vessels, and the excessive Use of hot Substances, the Pain, at the same time, tending to the superior Parts; if the Tongue is at first, dry, sordid, livid, or black, with a black Blister on it; if all or most of these Signs happen, the Disorder, which is generally mortal of itself, is not easily cured; but, for the most part, destroys the Patient by a Gangrene of the Part, either in the Side, or in the Lungs contiguous to it.

But when these Signs indicate, that such a Misfortune is already threatening the Patient, the most powerful Remedies are, without Delay, to be used; nor are we to trust to the Assistance of Nature, nor the Influence of gentler Medicines, provided the Patient has a sufficient Degree of Strength remaining.

In this Case, therefore, deep Eschars are forthwith to be excited in the Part affected with the actual Caustery; then they are to be covered with strong, cleansing Medicines, and kept continually warm with penetrating Fomentations; then large Quantities of strong, diluting, aperient, and antiseptic Liquors are to be taken; for by these, if by any, the Severity of the Disorder will be mitigated: For this Purpose,

Take of the Leaves of Scordium, Jack-by-the-hedge, and white Horehound, each two Ounces: Boil in two Pints of Water; with which mix, of the Oxyssel of Squills, eight Ounces; of Nitre, three Drams; and of Treacle-vinegar, one Ounce: Of this Mixture let the Patient, every Quarter of an Hour, take two Ounces as warm as possible.

But if the Violence of the inflammatory Cause produces the most severe pleuritic Symptoms, neither to be removed by the Assistance of Nature, nor by any antipleuritic Medicine, and if these Symptoms are suddenly removed without a Cause, so far

far as they depended on the Inflammation, the Pulse remaining quick, small, and intermittent, and the Sweat being small and cold; it is obvious, that a Gangrene has already seized the inflamed Parts. Hence a Delirium, and soon after Death, happens, especially if the Thorax is of a livid Colour. The same Thing happens, if the Patient, who expectorates a somewhat bilious Spit, is relieved of his Pain, without any manifest Reason; for, in this Case, a Delirium, the Prefage of Death, produced by a Gangrene, is present.

A Pleurisy terminates in Death, when its Causes are so violent, that the Pain produced, suppressing all Motion of the Thorax, soon creates a mortal Peripneumony, by stopping the Circulation of the Blood.

Hence the Reason is obvious, why a Peripneumony succeeds every violent Pleurisy: Why a Pleurisy is generally mortal to old Persons, Child-bed and pregnant Women: And why the Swathing of the Thorax with a Bandage so alleviates the Disorder, as to render it tolerable. *Boerhaave's Aphorisms.*

PERIPSYXIS, *περίψυξις*. The same as PERFRICTIO.

PERIPTOSIS, *περίπτωσις*. A Chance, or fortuitous Accident, by which Remedies for Diseases are sometimes discovered.

PERIPYEMA, *περιπύημα*. A Collection of Matter, surrounding any Part.

PERIRRHEDES, *περιρρέδες*. Bent or broke every Way, or both Ways, or in every Direction. It, also, imports, sprinkled, or irrigated all over. *Hippocrates.*

PERIRRHEPSIS, *περιρρέψις*. The Declination of a Bandage, when it recedes from its due Situation, either to one Part, or to another. *Hippocrates de Officina Medici.*

PERIRRHOEA, *πειρροία*, from *περιρρέω*, to flow from every Part. A copious Flux of the Humours, or morbid Matter, from all Parts of the Body, to the proper Emunctories, in order to their Discharge; or, rather, the Discharge itself.

PERISCELES, *περισκελές*. An Epithet for a Medicine in *Hippocrates*, importing, very hard, irritating, or pungent.

PERISCEPASTRUM. See CATHOLCEUS.

PERISCYPHISMUS.

This Operation, which, according to the Etymology of the Word, imports an Incision round the Cranium, is performed on those, who are afflicted with copious Defluxions on the Eyes, supplied by a large Number of deep-seated Vessels. During this Disorder, the Patients Eyes are extenuated, small, their Sight weak, and their Angles corroded; the Eyelids are exulcerated, and the Hairs fall from them; thin, acrid, and hot Tears are discharged; and an acute and deep-seated Pain of the Head afflicts the Patient, who, also, sneezes in a violent Manner, without Interruption. We are, therefore, in this Case, to shave the Head; and, avoiding the Temporal Muscles, to make a transverse Incision from the Left to the Right Temple: But let the Incision be confined to such Parts, as are possessed of no great Degree of Motion: Thus, for Instance, let it be made a little above the Forehead, taking care, at the same time, to avoid the coronary Suture. *Leonides* orders the Incision to be made in the Middle of the Forehead. When the Bone is denuded, we are to separate the Lips of the Incision by means of Tents, or a large Quantity of Lint; but the Extremities of the Incision are to have proper Dressings applied to them, which are to be moistened with Wine and Oil. When the Dressings are removed, and the Inflammation declining, we are to rasp the Bone, till it begins to produce Flesh, and carry on the Cure by means of incarning Powders. Among which are, that prepared of two Parts of the Flour of Wheat, and one Part of Colophony, the Powder called *Pulvillus Capitalis*, and incarning Compositions of Pumice; for, when the Skin is rendered thick by a Cicatrix of this Kind, the Orifices of the Vessels are shut up, and, by that means, the former Defluxion to the Eyes is prevented. *Paulus Aeginet. Lib. 6. Cap. 7.*

PERISPHALSIS, *περίσφασις*, from *περισφάλλομαι*, to wander about. A Circumrotation of a luxated Bone, in order to its Restitution.

PERISSOSIS, *περίσσωσις*, from *περισσός*, redundant. A Redundance, or superfluous Plenitude of the Humours. *Hippocrates.*

PERISTALTICUS, from *περιέλλω*, to compress, or contract. The vermicular, spontaneous Motion of the Intestines, by which the Fæces are protruded towards the Anus, is called the *Peristaltic Motion*.

PERISTERON. A Name, in *Dioscorides, L. 4. C. 6.* for the *Verbena*, Vervain.

PERISTOLE, *περιστολή*. In *Hippocrates, de decenti Habitu*, it imports a modest and composed Dress, or Habit. But it, also, signifies the compressive Power of the animal Fibres, and the peristaltic Motion of the Intestines.

PERISTOMA. The villose Coat of the Intestines.

PERISYSTOLE. The Interval of Rest betwixt the *Systole* and *Diastole* of the Heart.

PERITERION. The perforating Part of the Trepan.

PERITEXIS, *περιτήξις*. A Colliquation.

PERITONÆUM, *περιτόναιον*, from *περιτένω*, to extend round.

After the Removal of the Muscles of the Abdomen, in Dissection, the first Thing that appears, is a very considerable membranous Covering, which adheres immediately to the inner Surface of the transverse Muscles, and of all the other Parts of this Cavity; and involves and invests all the Viscera contained therein, as in a Bag. This Membrane is named *Peritonæum*.

It is of a pretty close Texture, and yet very pliable, and capable of a very great Extension; after which it can recover itself, and be contracted to its ordinary Size; as we see in Pregnancy, Dropsies, Corpulency, and Repletion.

It seems to be made up, at least, of two Portions, one internal, the other external; which have been looked upon, by many Anatomists, as a Duplicature of two distinct membranous Laminae: But, properly speaking, the internal Portion alone deserves the Name of a membranous Lamina; as being the main Body of the Peritonæum; the external Portion is no more, than a kind of fibrous, or follicular Apophysis of the internal, and may be properly enough termed the cellular Substance of the Peritonæum.

The true membranous Lamina, commonly called the *internal Lamina*, is very smooth and polished on that Side, which is turned to the Cavity and Viscera of the Abdomen, and continually moistened by a serous Fluid, discharged through, almost imperceptible Pores.

These Pores may be seen, by spreading a Portion of the Peritonæum on the End of the Finger, and then pulling it very tight on all Sides; for then the Pores are dilated, and small Drops may be observed to run from them, even without a Microscope.

The Sources of this Fluid are not as yet sufficiently known. Perhaps it comes out by a kind of Transudation, or Transpiration, like that which we observe in Animals newly killed. The whitish Corpuscles, found in diseased Subjects, are no Proof of the Glands, which some Anatomists place there in the natural State.

The cellular Substance, or external Portion, of the Peritonæum adheres very closely to the Parts, which form the Infides of the Cavity of the Abdomen; and it is not every-where of an equal Thickness. In some Places it is in a very small Quantity, and scarcely any appears at the tendinous or aponeurotic Portions of the transverse Muscles, and on the lower Side of the Diaphragm.

In all other Places, it is thicker, and forms Cells expanded into very fine Laminae, which, in diseased Subjects, become sometimes so broad and thick, as to resemble so many distinct Membranes.

In some Places this Substance is every way like a Membrana Adiposa, being filled with Fat, as round the Kidneys, and along the fleshy Portions of the transverse Muscles, to which it adheres. It entirely surrounds some Parts, as the Bladder, Ureters, Kidneys, and spermatic Vessels; and it is, in these Places, improperly termed the Duplicature of the Peritonæum.

Besides these Differences in Thickness, the cellular Substance has several Elongations, which have been called *Productions of the Peritonæum*. Two of these Productions accompany and invest the spermatic Ropes in Men, and the vascular Ropes, commonly called the *round Ligaments*, in Women. There are other two, which pass under the Ligamentum Fallopii, with the crural Vessels, which they involve; and they are gradually lost in their Course downward.

To these four Productions of the cellular Substance of the Peritonæum, we may add a fifth, which is spread on the Neck of the Bladder; and, perhaps, a sixth, which accompanies the Intestinum Rectum. All these Elongations pass out of the Cavity of the Abdomen, and may be termed external, to distinguish them from others, that remain in the Abdomen, and are called *internal*.

The great Blood-vessels, that is, the Aorta and Vena Cava, are likewise involved in this cellular Substance of the Peritonæum. In a word, it involves immediately, and separately, all the Parts and Organs, which are commonly said to lie in the Duplicature of the Peritonæum.

The true Lamina, or membranous Portion, of the Peritonæum is connected, by the Intervention of the cellular Substance, to the inner Surface of the Cavity of the Abdomen; but it does not naturally accompany the external Elongations of that Substance; it only covers the Origin, or Basis, of these Productions, without any Alteration in its own Surface at these Places.

It has, nevertheless, Productions of its own; but they are very different from those of the cellular Substance; for they run, from without, inward; that is, they advance from the convex Side of the great Bag of the Peritonæum, into the Cavity of that Bag, some more, some less, and, also, in different Manners;

ners; as if the Sides of a large Ball or Bladder were thruff inward into the Cavity of the Ball or Bladder.

Of these internal Elongations, or Intropressions of the true Lamina of the Peritonæum, some are simply folded, like a Duplication; some are expanded, like inverted Bags, or Sacculi, to contain some Viscus; some begin by a simple Duplication, and are afterwards expanded into a Cavity, which contains some Organ; some are alternately extended in the Form of simple Duplicatures, and of Cavities; and, lastly, some form only a small Eminence on the inner Surface of the great Cavity of the Peritonæum.

Under the first Species of these Productions we may bring the membranous Ligaments of the Abdomen, such as those of the Liver, Colon, &c. We see the second Species in the external Membrane of the Liver; the third in the Mesentery; the fourth in the Mesocolon; and the fifth at the Kidneys and Ureters.

Besides the external Productions of the cellular Substance of the Peritonæum, it has the same Number of internal Elongations with the true Lamina, which lie between all the Duplicatures, and line the Infides, of all the Cavities, or that Side, next the Viscera, contained in them.

The Uses of the Peritonæum seem to be very evident, from its Description; and the principal Uses are, to line the Cavity of the Abdomen; to invest the Viscera contained in that Cavity, as in a common Bag; to supply them with particular Coats to form Productions, Ligaments, Connexions, Folds, Vaginae, and the like.

The fine Fluid, which transudes through the whole internal Surface of the Peritonæum, prevents the Inconveniences, which might arise from the continual Frictions and Motions, to which the Viscera of the Abdomen are exposed, either naturally, or by external Impulses.

I must here observe, that it is the common Custom to demonstrate four ligamentary Ropes, termed the umbilical Vessels, before the Peritonæum is opened, because they adhere to the Umbilicus, and three of them are really Vessels in the Fœtus, two umbilical Arteries, and one Vein.

Three of these umbilical Ropes, or Ligaments, are involved separately, and sustained by a Production, or Duplication, which the Peritonæum sends into the Cavity of the Abdomen, in the Form of a Falx. *Winslow's Anatomy.*

PERIZOMA, from *περιζωω*, to gird about. A Belt, or Truss.

PERLA. A Pearl. See CONCHA MARGARITIFERA, and MARGARITÆ.

PERNA. A Sort of Shell-fish. See PINNA.

PERNIO. A Chilblain, or Kibe.

Tumors of this Kind are produced, generally, in the Hands and Feet, by extreme Cold; and they are attended with Redness, Inflammation, Heat, pricking Pains, and an Inability of Motion in the Part affected. Sometimes Pustules appear, and then the Ulceration penetrates deep. The Humour emitted is sometimes a little fetid, and either resembles Pus, or Sanies. Frequently the Inflammation degenerates into a Sphacelus. From these Symptoms, in my Opinion, Chilblains may be reckoned a Species of Inflammation; and so much the more, as, like other Inflammations, they excite a Sense of Heat, and terminate in a Discussion or Separation, or degenerate into a Gangrene and Sphacelus.

Chilblains may be known by various Symptoms: 1. The common Appearances of Inflammation are to be observed. 2. It must be inquired, whether the Parts affected have suffered by extreme Cold, as in performing a Journey, or in military Expeditions and Sieges undertaken in the Winter. 3. If the Patient feels an itchy Sensation, attended with Heat, and a pricking Pain, and if the Part becomes stiff and insensible.

When the Chilblains swell and redden, if the Part retains Sensation and Motion, without a great Degree of Heat and Pain, the Disorder is mild. On the other hand, when the Chilblains are livid, and the Part is affected with a Stiffness, Numbness, and pricking Pain, there is great Danger of its degenerating into a Gangrene, or, at least, a deep Exulceration. When Pustules rise upon the Skin, like those after a Burn, they are certain Signs of an immediate Gangrene. Lastly, when the Sensibility of the Part is lost, and it becomes livid, soft, flaccid, or fetid, there is Reason to suspect a Mortification, or Sphacelus.

The principal Cause of Chilblains is certainly Cold; for, by a violent Degree of Cold, as in other Inflammations, the small Blood-vessels are not only constricted, but the Blood is, also, inspissated. Nor is there any Degree of this Disorder, but may be readily accounted for, as a Consequence of these Causes.

Naturalists are not yet unanimous with regard to the true Nature of Cold, which has generally been imagined to be only the Effect of a Privation of Heat; but I am rather of Opinion, that some acrid, rigid, hard, and saline Particles, which were

before rendered soft, subtle, and volatile, by the Heat, are again condensed and indurated by the Cold. Now, when these Particles insinuate themselves into the small Pores of the Body, they constrict the small Blood-vessels; and, upon their bursting, the Blood is inspissated, and stagnates. Hence, in my Opinion, it happens, that the Skin of the Face, Lips, and other uncovered Parts, becomes chapped, broken, and affected with a continual pricking Pain, by the Cold. The slower the Motion of the Blood, and the smaller the Degree of Heat in any Member, the more gently is the Blood impelled into the Vessels of that Member. So that there is no Cause of Wonder, that the Hands, Fingers, Feet, Toes, Heels, Nose, and Ears, are more subject to Chilblains, than the rest of the Body, which are sometimes milder, and sometimes more severe. Sometimes the Cold is so extreme, as to stop the Circulation of the Blood entirely over all the Body; which necessarily occasions the Death of the Patient, and he is commonly said to have perished with Cold.

Chilblains are almost always, in some Degree, dangerous; and the more the Part affected has suffered by the Cold, both the Violence of the Symptoms, and the Danger, are the more increased. The Danger is, also, greater, when a whole Hand, or Foot, has suffered by the Inclemency of the Cold, than when only a single Finger or Toe is affected. But the most troublesome Circumstance is, that those, who have once been afflicted with Chilblains, are almost every Year subject to Inflammations and Pains; or, in an extreme Degree of Cold, to malignant Ulcers, Chaps, and even a Gangrene. Lastly, when Chilblains are unskillfully treated, when they are removed from the Cold, and suddenly exposed to an Heat, or the Fire, or wrapt up in warm Cloths, there is the utmost Danger, that the Part will become black, soft, and putrid, and, having lost all Sensation, contract a Sphacelus.

Hence, then, it may appear, that the principal Part of the Cure consists in restoring the inspissated Blood to its former Fluidity and Circulation; and this Intention must be answered by a Method different from those used in other Inflammations. For warm Applications, which are beneficial, and even absolutely necessary, in other Inflammations, are found to be extremely pernicious in Chilblains. Nor is it safe to expose those, who have suffered by extreme Cold, to a Fire, or Heat; because the sudden Vicissitudes of Heat and Cold produce an immediate Mortification. It seems, therefore, much more safe and convenient, to bring the Patient into a cool or temperate Air, and to order him to exercise his Limbs continually, and then to be gradually introduced into a greater Degree of Warmth. When the Patient is too weak to exercise himself, let the Part affected be well rubbed with Snow, or cold Water, which will seem warm to him; by which means the acrid, saline Particles, sticking in the Pores, will be extracted, and the natural Circulation of the Blood restored. As soon as the Sensation returns, comforting Medicines are gradually to be applied, such as Spirit of Wine alone, or mixed with Treacle, Oil of Petre, and Balsam of Sulphur. When the morbid Part has been well rubbed with these Remedies, the Patient may be gradually brought to the Fire, or put to-bed, afterwards endeavouring to raise a gentle Sweat.

For this Purpose let the Patient gradually drink a few Glasses of warm Wine, boiled with Cinnamon and Sugar; for by this Method the Patient will revive, and grow warm, and the Circulation of the Blood will be restored. Nor will it be improper to give, alternately with the Wine, a little of the following sudorific Mixture:

Take of the Waters of Goats-rue, Rue, and Scordium, each two Ounces; of the Aqua Theriacalis, and the Aqua Vitæ Matthioli, each six Ounces; and of the Aqua Prophylactica Sylvii, half an Ounce; of the Mixtura simplex, or of the Tincture of Bezoar, two Scruples; and of the Syrups of Cinnamon and Cloves, each half an Ounce: Mix all together.

About three Spoonfuls of this Mixture should be given to the Patient every Quarter of an Hour, and the hot Wine as often, till the Sweat appear. If Wine cannot be readily had, Ale boiled with Cinnamon, Cloves, and a little Sugar, may be used. Draughts of this kind must be taken, till the Sweat be kept up for an Hour, or half an Hour, or according to the Circumstances of the Patient. It can scarcely be imagined, how expeditious and effectual this Method of Cure is, in the most violent Degree of this Disorder, even when it tends to a Gangrene. In milder Degrees of Chilblains, those Medicines may not, indeed, be absolutely necessary, but are, at the same time, extremely beneficial.

When the Chilblain tends to Suppuration, it ought to be treated like other recent Abscesses. First cleanse the Wound with a digestive Ointment, or the Unguentum Ægyptiacum; then

then dress it with the Oil of Eggs, and of Wax, and the *Peruvian* Balsam, or the Essence of Aloes and Myrrh; and, lastly, apply a Plaster of Lead, or of Litharge. The Oil of Myrrh per Deliquium may be beneficial; and, also, burnt Mice, if we may believe the *Ephemerides Naturæ curiosorum*. Lastly, Lime-water mixed with camphorated Spirit of Wine, may be, also, used very advantageously, if a Compress dipt in it be applied to the Ulcer, either alone, or after the Application of the Medicines above-recommended. But, if a Gangrene or Sphacelus appears, it must be cured as such.

Those who are subject to Chilblains every Year towards Winter, in order to prevent their Return, carefully anoint the Parts affected with Petroleum, or Oil of Turpentine, during the Winter: Or, if the Chilblains begin to appear again, apply to the morbid Heel or Finger, a Bladder dipt in the fore-mentioned Oils; but the Cold itself should always be carefully avoided, or defended against, with proper Cloths or Coverings. Consult *M. A. Severinus Diff. de Pernionibus in Lib. de Abscessibus. Heister's Surgery*.

PEROLIDUS. A Term used by *Paracelsus*, and *Helmont*, by which they understand the extreme Circumference of the Body of Air surrounding the Earth.

PERONÆUS MUSCULUS. A Name for three different Muscles, the first of which is the

PERONÆUS MEDIUS, VULGO PERONÆUS ANTERIOR.

This is a long Muscle, situated anteriorly on the middle Part of the Fibula.

It is fixed above by fleshy Fibres, to more than the middle third Part of the anterior or Outside of the Fibula, and to the neighbouring Part of the Aponeurosis Tibialis.

It is likewise fixed to a Production from the Inside of that Aponeurosis, which runs to the upper Part of the Tibia, and there serves for a middle Septum, between this Muscle and the Extensor Digitorum longus.

From thence it runs down, and forms a Tendon, which, going in the Direction of the oblique Line on the Fibula, passes behind the external Malleolus, and then through an annular Ligament common to it; and to the Peronæus Maximus; and is afterwards inserted in the Tuberosity, at the Basis of the fifth Metatarsal Bone, sending off a small Tendon to the first Phalanx of the little Toe.

PERONÆUS MINIMUS.

This is a small Muscle, commonly thought to be a Portion of the Extensor Digitorum longus, though it is easily separable from it.

It is fixed by fleshy Fibres in the lower Half of the Inside of the Fibula, between the two oblique bony Lines, on one Side of the lower Part of the Extensor Digitorum longus, to which Muscle it is simply contiguous.

From thence it runs down, contracting in Breadth, and passes, with the Extensor Longus, through the common annular Ligament, forming a flat Tendon; which soon separates from those of the Extensor, and is inserted near the Basis of the fifth metatarsal Bone.

It is distinguished from the two other Peronæi, by a Septum, or Production of the ligamentary Aponeurosis of the Tibia.

The Peronæus Medius bends the Foot; and hinders the Leg from falling back, in the same manner as the Tibialis Anticus. By its Insertion in the Tuberosity of the fifth Metatarsal Bone, it turns the Sole of the Foot outward, at the same time that it bends it, when it acts without the Assistance of the Tibialis Anticus; the Co-operation of which Muscle is likewise necessary to enable it to counterbalance the Force with which the Leg would be carried backward, when we stand upon one Foot.

The Peronæus minimus is an Assistant to the Medius, in the Flexion of the Leg, in preserving the Equilibrium of the Leg, and in turning the Sole of the Foot outward; neither can it perform the first two of these Motions uniformly, without the Co-operation of the Tibialis Anticus.

The uniform Flexion of the Foot furnishes an Example of all the three Kinds of Levers: Of the first, when we bend the Foot, while off the Ground, in which Case the Fulcrum is in the Articulation between the two Extremities of the Lever: Of the second, when we walk upon the Heels, or Toes; for then the Weight is between the Power and the Fulcrum: Of the third, when we raise a Weight by the Toes; for then the Power is between the Weight and the Fulcrum.

PERONÆUS MAXIMUS, VULGO PERONÆUS POSTERIOR.

This is a long penniform Muscle, lying on the Fibula.

It is fixed above, to the anterior and outer Part of the Head of the Fibula, and to a small Portion of the Head of the Tibia; then to the Outside of the Neck of the Fibula, to the upper Half of the external Angle of that Bone, and to the Aponeurosis Tibialis, which, at that Place, makes a Septum between this Muscle and the Extensor Pollicis.

From thence turning a little backward, according to the Direction of the Bone, it forms a considerable Tendon, which, run-

ning down behind the external Malleolus, passes through a kind of hollow Groove, and through an annular Ligament, common to it, and to the Tendon of the Peronæus Medius, which lies before it: It passes, likewise, through an annular Ligament on the outer and anterior Part of the Os Calcis, and under the small lateral Tuberosity sometimes found there.

Afterwards running through the oblique Groove, in the lower Side of the Os Cuboides, it is inserted in the Side of the Basis of the first Metatarsal Bone, and, also, a little in the Basis of the Os Cuneiforme Majus.

The fleshy Body of this Muscle cannot always be distinguished from that of the Peronæus Medius.

When the Peronæus Longus, or Maximus, acts alone, it may extend the Foot, hanging freely in the Air; but, then, this Extension is obliquely outward. Together with the Gastrocnemii and Soleus, it likewise changes their Direction to an oblique Extension outward.

This Muscle, and the Tibialis Posticus, acting without the Gastrocnemii and Soleus, may extend the Foot almost directly; but they can overcome but a very small Resistance. When it acts with the other two Peronæi, the Sole of the Foot is turned more or less directly outward, towards the external Malleolus. *Winflow's Anatomy*.

PERONE. The Fibula. A Bone in the Leg. See **CRUR**.

PERPESSIO, in the Spagiric Phrase, is the Treatment of Metals by Fire.

PERPETUATIO, in Chymistry, is a Reduction of any moveable and volatile Substance to a State of Rest.

PERSEA. Offic. C. B. P. 441. J. B. 1. 169. Raii Hist. 2. 1552. *Persea Arbor.* Ger. 1606. *Persea Arbor Clusii.* Park. Theat. 1514. *Prunifera Arbor, fructu maximo, pyriformi, viridi, pericarpio esculento butyraceo, nucleo unicum maximum, nullum officulum testis, cingente.* Cat. Jamaic. 185. Raii Dendr. 48. *Abavacaquabuitl seu Arbor Querciformis butyraceo fructu.* Hem. 89. Jons. Dendr. 424. *Abavacaquabuitl.* Lact. 226. *Pyro similis fructus in Nova Hispania nucleo magno.* C. B. P. 439. *Pyri facie Aguacat.* J. B. 1. 107. *Nicaragua pomum Nuce rotunda.* Ejusd. 1. 210. *Mala Americana pyri facie.* C. B. P. 433. **SPANISH PEAR.**

The Tree has the Appearance of a Pear-tree, is wide-spreading, and always green; the Leaves are like those of the broad-leaved Laurus: The Flowers, pretty like those of the Laurus Hexapetalus, and growing in Clusters: The Fruit, at first, resembles a Plum; afterwards becomes of an oblong Figure, like a Pear, of a black Colour, and a pleasant Taste, and containing an Heart-shaped Kernel, in Taste much like a Chestnut, or sweet Almond.

The Persea-tree is mentioned by *Theophrastus*, *Strabo*, *Pliny*, *Dioscorides*, *Plutarch*, and *Galen*. Some will have the Persea to be the same with the *Persica Malus*; but they are refuted by *Scaliger* at large, though *Theophrastus* calls both those Trees *Persea*. The Description given of it by this last Author differs in many Characters from that of *Clusius*, given above, who never saw but one Tree, and that near the City *Valentia* in *Spain*, which was supposed to be brought thither from *America*.

Some Authors have written, as *Dioscorides* tells us, that this Tree, in *Persia*, is poisonous; but, being transplanted into *Egypt*, has its Nature so changed and meliorated, as to produce a Fruit fit for eating; *Galen* writes the same. *Pliny* says, that some industrious Authors have written, that this Tree in *Persia* has its mortal Poison attended with tormenting Pains; but, being by the *Persian* Kings transplanted to *Egypt*, in order to be employed as a Punishment, had its Qualities mitigated by the Soil: But this Relation is denied, he tells us, by the most learned Writers, who say, that the Persea-tree was planted at *Memphis*, by *Perses*. *Plin. Hist. Nat. Lib. 14. Cap. 13.* This last Opinion seems to me, says *Ray*, the most probable, though I do not deny, but there may be in *Persia* such a poisonous Tree, of a distinct Species from the *Egyptian* Persea; especially since *Rauwolfius* writes, that a *Persian* Merchant informed him of the poisonous Fruit of such a Tree, called by them *Sepha*, which, for that Reason, they would not meddle with. *Raii Hist.*

The Persea is a Native of *Jamaica*; the Fruit is good for the Stomach: And we are told by *Dioscorides*, that the Powder of the dried Leaves stops Hæmorrhages, being sprinkled on the Part.

The *Laurus Indica Aldini* is the Persea of *Clusius*.

Under the Head of **PERSEA**, *Ray* reduces

Persica Nuci similis Fructus Nucleo venenato Monardis. J. B.

This Fruit is of a cathartic, or rather of a septic Quality: For a certain *Indian*, as *Monardes* tells us, cured a female Negro, whose Legs were full of malignant and inveterate Ulcers, with the Powder hereof sprinkled on the Parts, which consumed the purrid Flesh; with the same Powder put upon Cotton, and applied to the Ulcers, he incarnated and cicatrized them. This Fruit is very common in the Island *Margarites*, and commonly eaten: It is of the Size of an *Adam's* Apple, or Orange, and contains a Nut like the Stone of a Peach, which, burnt to Powder, is good for the Purpose before-mentioned. The Kernel it contains is of so noxious and deleterious a Quality, that, eaten, it is present Death

Death to Man or Beast, without Hopes of a Remedy, as if it were Sublimate, or some Corrosive. It is probable, says Ray, that this Fruit, is the same with that of the *Manga Silvestris*, or *Mangas brava*, described by *Alofta. Raii Hist. Plant.*

PERSICA.

The Characters are;

The Leaves are narrow and oblong; the Calyx is monophyllous, deeply cut into five or six Segments, expanded and hollow. Within the Calyx is seated a roseaceous, pentapetalous or hexapetalous Flower, (the Petals growing on the Inside of the Margin of the hollow Calyx) and furnished with thirty Stamina: The Ovary is seated in the very Bottom of the Calyx, and is furnished with a long Tube, adorned with a globular scabrous Apex, and becomes a pulposus Fruit, almost globous, sulcated or furrowed lengthwise, and inclosing a Stone, adorned with little Pits and Cavities deeply cut, and containing, for the most part, only a single oblong Kernel: The Pedicle is very short.

Boerhaave mentions six Species of Persica; which are,

1. Persica; molli carne, & vulgaris, viridis & alba. C. B. P. 440. *Tourn. Inst.* 624. *Boerb. Ind. alt.* 2. 243. *Persica malus. Offic. Ger.* 1258. *Emac.* 1447. *Park. Parad.* 580. *J. B.* 1. 157. *Raii Hist.* 2. 1515. THE PEACH-TREE.

The Peach-tree is known to be a Tree of no great Bigness, being here, in England, generally planted against Walls: The Leaves are long and narrow, and serrated about the Edges: The Flowers consist of five pale-purple Leaves: The Fruit is covered with a downy Coat, full of pleasant juicy Pulp, having an hard reddish Stone full of wrinkled Cavities: It is planted in Gardens, and flowers in March, or the Beginning of April, and the Fruit is ripe in August and September.

The Flowers are only used in Physic; they are opening and gently purging, and principally given to Children, to carry off thin ferous Humours, and to kill Worms. The Fruit is cooling and moistening, grateful to the Palate, but subject to purify, and cause Surfeits.

The only official Preparation is *Syrupus Florum Persicorum. Miller's Bot. Off.*

Galen and *Paulus* condemn all Kinds of Peaches, as of bad Juice, and hurtful to the Stomach; for which Reason they advise to eat them at the Beginning of Repasts, before other Food, and to drink no Water, but pure Wine, after eating them. But I see no Reason, says Ray, why the Judgment of *Pliny* and *Dioscorides*, that Peaches are good for the Stomach, procure a good State of the Belly; and that nothing more innocent can be eaten, should be wholly condemned and rejected: Nor indeed it is probable, that a Fruit so savoury and delicious, and the most pleasing to our Palate of all Summer-fruits, as if Nature itself had recommended it to our Choice, should be quite noxious and unwholesome. We ought, however, to be careful in chusing these Fruits, and to observe a Measure in eating them. And, therefore, *Amatus* thinks, that what has been said by *Galen*, and others, concerning the bad Effects of Peaches, ought to be understood of those which have a very soft Pulp: For the Case, he says, is quite otherwise with the *Duracina*, (Peaches of an hard and firm Pulp) which emit a most grateful, comfortable, and reviving Smell; for these have a most delicious Savour, mixed with something of Austerity, which is agreeable and strengthening to the Stomach; and all Persons of Quality, in Spain and Portugal, and those of the most delicate Palates, eat them after Meals, though not before they are infused in Wine; and find no ill Effects from them.

Preserved Peaches are extremely grateful to sick Persons, especially to such as are afflicted with Thirst, and Dryness of the Tongue, for they strengthen at the same time they refrigerate; whence they are of excellent Service in all hot Distempers. *Brassavola* used to give his Patient a Peach or two roasted under the Ashes. *Amatus* affirms it to be a most delicious Food, and extremely grateful to sick Persons. The Leaves, on account of their Bitterness, being boiled in Beer, or Milk, destroy and expel Worms in Children. *Galen* says, that they work the same Effect, being bruised, and applied to the Navel. *Parkinson* affirms, that they purge gently, if taken in a sufficient Quantity; the Flowers operate in the same manner, and more effectually than Damask Roses; for which Purpose there is prepared of them a Conserve, to be taken chiefly in the Morning fasting; and a Syrup, also, is prepared thereof, which is very effectual for the same Intentions. The recent Flowers, says *Matthioli*, not only purge, but provoke Vomiting; and, eaten in Salads, prove Hydragogues in Dropsies; but not without disordering the Patient: The distilled Water is a Cosmetic. The Gum of this Tree is commended for Fluxes of the Belly, the Stone, Impetigo, Tumors of the Fauces, Roughness of the Windpipe, Spitting of Blood, Disorders of the Lungs, and the Dyentery. *Matthioli* recommends the Kernels for the Gripes, and to prevent Ebriety, being taken to the Number of six or seven before-hand; and, for the Alopecia, being bruised, and boiled in Vinegar, to a Pap-like Consistence. The Oil of the bruised Kernels, being rubbed on the Temples, procures Sleep, and eases the Hemisrania, or Megrim; drank, or used in Clysters, it cures the Colic; and, taken to the Weight of four Ounces, it gives Relief under the Iliac Passion, and the

Stone. The Water of fifty Kernels of Peaches, with that of an hundred Kernels of Cherries, and an Handful of Flowers of Elder, macerated in three Pints of Malmsey, then buried for ten Days under Ground, in an earthen Pot, and afterwards distilled, expels Stones from the Kidneys in a surprising manner, as we are assured by *Matthioli*. *Raii Hist. Plant.*

2. Persica; vulgaris; flore pleno. T. 624.
3. Persica; malus; Swollana. *Munting. Pract.* 1. 43.
4. Persica; Africana; flore incarnato, simplici. T. 625. *Amys; dalus Africana, vulg.*
5. Persica; Africana; nana; flore incarnato, pleno. T. 625.
6. Persica; succo quasi sanguineo. C. P. B. 440. *Boerb. Ind. alt. Plant. Vol. 2.*

It is called *Persica*, from *Persia*, the Country whence it was first transplanted. An Infusion of the Leaves, after the manner of Tea, is purging and opening, and kills Worms; as do, also, the Flowers. The Fruit is cordial, pectoral, and moistening: The Juice is of Service in burning Fevers: The Kernel is anticolical, and antinephritic: The expressed Oil thereof is good for the Ringing of the Ears. *Hist. Plant. adscript. Boerhaav.*

There is no Tree more common than the Peach-tree; and yet it has furnished *Salmasius* with Matter enough for a large Dissertation. The Greeks, it seems, had learned by a certain Tradition, that the Persians, who were Enemies to the Egyptians, had consulted to convey secretly into Egypt, and there to plant, a certain Tree, called *Persea*, from the Country whence it came, the Fruit of which was of a poisonous Quality: They supposed that the Egyptians, tempted by the Beauty of the Fruit, could not be prevented from eating it: They did indeed make no Scruple to eat it; but the Event was quite contrary to what the Persians expected from it; for the Goodness of the Egyptian Soil had so changed the Nature of the Fruit, by removing its noxious Quality, that the Egyptians could eat it with Safety. The Greeks and Romans, says *Salmasius*, who wrote since *Theophrastus*, as *Dioscorides* and *Pliny*, believed that the *Persea* of Egypt was different from the Persica; because they found, that the Description which *Theophrastus* had given of the first did not agree to the latter. But they did not consider, that there was no Peach-tree in Greece, in the Time of *Theophrastus*; that this Tree was brought thither very late, and from thence into Italy, and, consequently, that *Theophrastus* spoke of it as of an exotic Tree or Fruit. *Salmasius* concludes, that the *Persea* and Persica are the same Tree, because those who make them different, among whom is *Dioscorides*, give a good Description of the last, but by no means of the former, only saying, that it is a Tree peculiar to Egypt; which is a Proof, he says, that they had never seen that pretended Tree; or only spoke of it by Hearsay. The only Difference, according to *Salmasius*, between these two Names of the Tree is, that the first was in Use among the ancient Greeks, and the other among the more modern Greeks, as well as the Romans: He adds, that what has made the *Persea* of *Theophrastus* be mistaken, is, that this Author, instead of describing all the Species of the Peach-tree, has only described the Apricot-tree, which was, also, called *Persea*; but, for Distinction, was afterwards named *Persea praeox*, and by the Latins simply *Præcoqua*; whence the later Greeks formed their *Bepiroxa* (*Bericocca*); whence comes the French *Abricots*. The *Persea*, or Persica, was, also, called *Rhodocinea* and *Rhodacina*, because the first of these Trees had been planted at Rhodes, where *Theophrastus* remarks, that it only flower'd, and bore no Fruit. But that Philosopher might be misinformed, the Fruit in his Time being as yet a great Rarity in Greece; perhaps too the Soil, where it was first implanted, was improper for it. It is probable, however, that those Trees thrived very well afterwards in that Island, and were able to furnish Greece and Italy with Plants, where the Name *Rhodacina* was still preserved; whence, by a Transposition of Letters, which is very common, are formed the Names *Doracina* and *Duracina*, whence the French *Dureau*.

The Peach-tree has, also, been taken for the Lemon-tree, not for any Similitude between those Trees, or their Fruit; but only because the Lemon-tree was not only called *Malus Medica*, but *Malus Persica*. *Le Clerc, Hist. de la Med.* See PERSEA.

PERSICARIA.

The Characters are;

The Flowers are disposed in Spikes, at the Top of the Stalks and Branches: The Calyx is quadrid, though some take it for a tetrapetaloid Flower: The Stamina are six in Number: The Ovary, in the Centre of the Calyx, is compressed, of an oval or orbicular Form, and furnished with a bifid fimbriated Tube: The Seed is flat, and ovally acuminate. A Membrane surrounds the Stalk, at the Rise of the Leaves, and small Branches, opposite to the Leaves.

Boerhaave mentions eleven Species of Persicaria; which are,

1. Persicaria; mitis; non maculosa. C. B. P. 101. M. H. 2. 588.
2. Persicaria; mitis; non maculosa. C. B. P. 101. Flore albo. *Persicaria, Antverpiensis, floribus albis.* Lob. Obs. 171.
3. Persicaria; mitis; maculosa. C. B. P. 101. M. H. 2. 588. *Persicaria, mitis.* J. B. 3. 779. SPOTTED ARSMART.

Dale seems to make this and the first Species the same Plant.

This Arsmart has many round Stalks, two Feet high, or more, full of Branches, having their Joints thick and swelling, and covered with a thin Film, or Skin. The Leaves grow alternately, and are long and sharp-pointed, but broader in the middle, and larger than those of the *Perficaria aurea*; seu *Hydropiper*: They are smooth, and have a dark-brown or blackish semilunar Spot in the middle of each. The Flowers grow at the End of the Branches, in thick round pale-red Spikes, being small and staminate, containing flatish angular, sharp-pointed shining Seed. The Root is a Bush of Fibres; it grows in moist Places, and by Pond and Ditch-sides; and flowers in July. The Leaves are used.

They are said to be of a cooling Nature, and good for hot Tumors, Inflammations, Impositumes, and green Wounds, though they are but seldom used. *Miller's Bot. Off.*

Fuchsius has affirmed, that it is of a very astringent Taste; *Casalpini* found it acerb; *Tragus* and *Lobel* sourish; for my Part, I have found nothing but a little Astringency. This Plant gives a pretty deep-red Colour to blue Paper, which makes us conjecture, that its Salt resembles Sal Ammoniac, loaded with a great deal of Earth, and joined with a little Sulphur; thus this Plant is astringent, deterfive, and vulnerary. It yields a little volatile concrete Salt by the Analysis: The Decoction of the whole Plant is good for a Looseness, and for the Diseases of the Skin. *Martyn's Tournefort.*

4. *Perficaria*; mitis; maculosa; caulibus & ramis nodosissimis; rubris.

5. *Perficaria*; mitis; cum maculis Ferrum equinum referentibus. T. 509.

6. *Perficaria*; urens; seu *Hydropiper*. C. B. P. 101. *Boerb. Ind. a. 2.* 87. *Perficaria non maculata*, *Hydropiper*. *Offic. Perficaria acris* seu *Hydropiper*. J. B. 3. 780. *Perficaria vulgaris acris* seu *Hydropiper*. *Raii Hist.* 1. 182. Synop. 58. *Perficaria vulgaris acris* seu *minor*. *Park.* 856. *Hydropiper*. *Ger.* 361. *Emac.* 445. *Potincoba Lusitanis pulgura*. *Pil.* 221. *An Schoenanna-modela-muccu*. H. M. 12. 147. Tab. 76? LAKEWEED, ARSMART, or WATER-PEPPER.

This Arsmart grows not so much branched as the *Perficaria mitis maculosa*; the Leaves are long, and proportionably narrower, and more like the Leaves of the Peach-tree, whence it takes its Name *Perficaria*; but they are not serrated about the Edges, and they want the Spot that is in the Leaves of the mild Arsmart, and they have a very hot biting Taste, burning the Tongue like Pepper. The Flowers grow in long, slender, loose Spikes, of a paler Colour than the *Perficaria*; mitis; maculosa; but containing like Seed: It grows in like Places with that, and flowers about the same time.

This has been accounted an extraordinary Plant against the Stone, Mr. Boyle having, in his Book of the Usefulness of experimental Philosophy, given to the distilled Water of this Plant a mighty Character for its Virtues against that Distemper. It is commended, also, as very cleaning, and good for old stubborn Ulcers. *Miller's Bot. Off.*

Arsmart is of a very acrid and burning Taste, and gives a lively Tincture of red to the blue Paper. It is full of acid Sulphur and Earth; its Salt resembles that which results from the Mixture of the Salt of Coral with the Sal Ammoniac, loaded with a great deal more Acid than ordinary.

For this Plant, by the chymical Analysis, yields a great deal of Acid, Oil, and Earth, and a little volatile concrete Salt. Arsmart is very deterfive and vulnerary; and it is used in Glysters, for the Dysentery and Tenesmus. They give, at the same time, a Dram of this Powder in a Bolus, or mixed with Wine, thickened into a Syrup, with Sugar. Some carry this Plant in the Shoes; but it were better to boil an Handful of it in lean Broth, and strain it through a Linen Cloth, adding half a Dram of chalybeated Tartar, for the Jaundice and green Sickness. *Martyn's Tournefort.*

It is evidently of an hot and dry Quality, and is principally used externally for Wounds, indurated Tumors, inveterate Ulcers, and the like. *Schroder.* For a pained, hollow Tooth, take Water-pepper, and put it into the Cavity. With this Remedy *J. Heurnius* cured a Woman much afflicted with the Tooth-ach. There is nothing found more effectual for expelling the Flies; for whatever Wounds or Ulcers in Horses or Cattle are rubbed with the Juice of Arsmart, they remain secure from the Injuries of the Flies. *Tragus. Raii Hist.*

7. *Perficaria*; frutescens; maculosa; Virginiana; flore albo & carneo, Parkinsonii. *Theatr.* 857.

8. *Perficaria*; minor. C. B. P. 101.

9. *Perficaria*; major; Lapathi foliis; calice floris purpureo. T. 510.

10. *Perficaria*; Salicis folio; perennis. H. L. 488. *Potamogeton, Salicis folio*. C. B. P. 193. *Potamogeton*. *Dod.* p. 582.

11. *Perficaria*; Orientalis; Nicotianæ folio, calice florum purpureo. T. Cor. 38. *Commel. Rav.* 43. *ic. & Descr. T. Voy.* 2. 316. *Boerb. Ind. alt. Plant. Vol. 2.*

It is called *Perficaria*, because its Leaves resemble those of the Peach; the sixth Species is called *Hydropiper*, from ὕδωρ (Hydor) Water, and πιπερι, (Peperi) Pepper, that is, Water-

pepper; because it is an aquatic Plant with the Taste of Pepper.

The first Species is highly commended by Mr. Boyle, as an incomparable Lithontriptic: An English Nobleman, he says, cured every body of the Stone with the Juice and distilled Water of this Herb, and prepared every Year a vast Quantity of the distilled Water for the Use of the Poor. I have, also, try'd this Remedy, but without Success. A Decoction of the Leaves is of Service in the Diarrhoea, Dysentery, and all cutaneous Diseases. *Paracelsus*, observing an Impression of Spots on the second and third Species, pronounced them extraordinary Vulneraries, and asserted them to be an effectual Preservative for Horses against Galls and Attritions by the Saddle, being placed under the same. *Perficaria* is an astringent Vulnerary, and a Febrifuge; and is good for spitting of Blood, for immoderate Fluxes of the Hæmorrhoids, Menes, and the Fluor albus; the Leaves, bruised, and apply'd, repress an Hæmorrhage of the Nose. The sixth Species is a very burning Plant, and being chewed in the Mouth strikes the Tongue as it were Lightning. The Leaves, bruised, and apply'd to the Skin, raise an Inflammation and Exulceration, in manner of an Escharotic. This Herb deterges and depurates Ulcers, being mix'd with other Things of a more temperate Quality. It is heating, and, on account of its Acrimony, is temper'd with Raisins: Being thus prepared, it is of Service in the Dropsy, Jaundice, and all Obstructions of the Viscera. In Surgery it is a very good Medicine for discussing cedematous Tumors, if they be fomented with a warm Decoction of the Leaves. *Hist. Plant. adscript. Boerhaav.*

PERSICUS IGNIS. A Carbuncle, according to *Sennertus*. But *Avicenna* makes a small Distinction betwixt a Carbuncle and Ignis Persicus, calling that Species of Carbuncle attended with Pustules, and Vefications, an Ignis Persicus.

PERSISTENS FEBRIS. A regular intermitting Fever, the Paroxysms of which return at constant and stated Hours.

PERSIUM. The Peach-tree. *Oribasius, Medic. Collect. L. 1, C. 63.* See PERSICA.

PERSOLATA. The same as *Personata*.

PERSONATA. A Name for the Lappa. See BARDANA.

PERSPIRATIO. Perspiration. Having given an Account of Perspiration, and the Organs destin'd for this Secretion, under the Article CUTIS, I shall, in this Place, farther remark, that Perspiration is less in Women, than in Men; that a redundant Excretion of the perspirable Matter induces great Weakness, in proportion to its Excess, Faintings, and sometimes sudden Death. But if Perspiration is diminish'd, or utterly obstructed, the extreme cutaneous Vessels become dry, and are obliterated; and hence the Vessels, and Glands, destin'd for the Discharge of Sweat, and the oily Humour mention'd under the Article CUTIS, are dry'd; in consequence of which, the Circulation of the Blood is alter'd, the acrid perspirable Matter is retain'd, and Putrefaction, Crudities, Fevers, Inflammations, and Apostemations, ensue. *Boerhaave's Institutes.*

I must, farther, observe, that when the Orifices of the innumerable perspiring Vessels are obstructed, the Blood propel'd from the Heart meets with a stronger Resistance: Hence the Circulation labours, and must quickly cease, unless the Heart contracts itself with greater Force. But because, when the perspirable Matter is retain'd, the Quantity of the circulating Fluid is increas'd, on this Occasion the Blood returns more frequently to the Left Ventricle of the Heart: Hence the Contraction of the Heart is more frequent; and, in consequence of the stronger, and more frequent, Contraction of the Heart, there is a greater Attrition betwixt the Solids and Fluids, and a greater Heat, which we call a Fever.

PERTICE CASMIANA. The Name of a compound Medicine, in *Marcellus Empiricus, C. 20.*

PERTURBATIO ALVI. A Diarrhoea.

PERTUSSIS.

Tho' this Word, according to its natural and most genuine Signification, imports no more than a violent and terrible Cough; yet it is generally appropriated to that Species of Cough, call'd the Chin-cough, a Disorder principally incident to Infants and Children; especially in the Spring and Autumn, at which Seasons it is generally epidemical. The Patients, labouring under this Disorder, have frequent and violent Paroxysms of Coughing, in which the Organs of Respiration being not only oppress'd, but, also, spasmodically affected, variously interrupt, suspend, and pervert their respective Functions. But for the most Part, the Diaphragm convuls'd, either of itself, or by the Impulse of other Parts, so long protracts sometimes the Systole, and at other times the Diastole of the Heart, that Inspiration, or Expiration, being for a time obstructed, the Breath, so subservient to Life, can hardly be drawn; in consequence of which, the Patients are, as it were, suffocated; and, by reason of a Stagnation of the Blood, contract a kind of Blackness of Countenance; and if by chance the Organs, subservient to these Purposes, should not be so strongly convuls'd, as to hinder the free Coughing of the Patients, they are nevertheless forc'd to cough in a violent manner, and till their Strength is worn out.

The concurrent Cause of a Chin-cough seems to consist in these two Circumstances, that there is a frequent and violent Irritation of the Lungs, by which they are almost continually stimulated to throw up the Matter, which proves uneasy to them, by Coughing; and that the moveable Parts of the Thorax, that is, the Nerves, and nervous Fibres, being previously dispos'd to Spasms, as often as they are thus irritated, excite not a regular, but generally a convulsive Cough, and induce some Indisposition opposite to the Function of Respiration.

The Matter which, in all Probability, stimulates the Lungs so frequently to coughing, is Serum, by reason of its too thin Texture continually secreted from the Mass of Blood, and affecting the Parts of the Thorax; because it is not only convey'd thro' the Tracheal Arteries into the Cavity of the Aspera Arteria; but, also, copiously pour'd thro' the pneumonic Arteries into all the adjacent open Ducts.

The spasmodic Disposition of the moving Parts seems, as in other convulsive Disorders, to proceed from an heterogeneous and elastic Matter convey'd along with the nervous Fluid from the Brain through the Nerves into the moving Fibres of the Breast. For this Reason, when the Spirits, lodged in these Fibres, are excited to the violent Motions of Expiration, they fall into convulsive Motions.

As for the Prognostic of this Disorder, tho' a Chin-cough is rarely mortal, or very dangerous, yet it is not to be cured without the greatest Difficulty; and is frequently subdued and remov'd by a Change in the Season of the Year, rather than by Medicines.

The Measures taken for the Cure of other Coughs, are rarely effectual in removing this; for which Reason Nurses and Quacks use various Medicines of their own, such as Cup-mofs, and its various Preparations exhibited internally; and, if any farther Cure is necessary, they put the Child into a Fright, in order to remove its Disorder. But, if all these Measures should prove ineffectual, they generally reject Puffs, Syrups, Julaps, Decoctions, and other Medicines, whether pectoral, or of any other Nature, waiting, till the Disease either terminates spontaneously, or is cured by the succeeding Season of the Year.

Cup-mofs, so far as can be collected from its Taste, is of an astringent Quality, and contains somewhat acrid Particles, which smell strongly of a volatile Salt. Hence we may conjecture, that its Use consists in fixing the Blood; allaying the Defluxions of Serum, and in removing the spasmodic Disposition of the Parts, by volatilizing the nervous Fluid. Cup-mofs may be exhibited either in the Form of a Powder, a Decoction, or a Syrup: Thus,

Take of the Powder of Cup-mofs, one Dram; and of Sugar-candy, one Scruple: Mix all together, and divide into three equal Doses; one of which is to be taken every Morning and Evening, in some proper Vehicle.

Or,

Take of Cup-mofs, two Drams; of Milk of Sulphur, two Scruples; and of the Powder of Anise-seeds, one Scruple: Mix all together, and divide into six Doses; one of which is to be taken every Morning and Evening, in some proper Vehicle.

Or,

Take of Cup-mofs, one Dram: Boil in a sufficient Quantity of Milk; strain the Milk, and drink it every Morning and Evening. For such as do not like Milk, or are injured by it, we may prepare a Decoction of Cup-mofs, in Spring-water, that of Hyssop, or any other pectoral Water; two or three Ounces of which are to be drank twice a Day, edulcorated with Sugar, or some proper Syrup.

Or,

Take one Ounce of Cup-mofs: Boil in two Pints of some pectoral Water, till Half of it is consumed; to the Liquor, when strain'd, add one Pound of Sugar-candy, and let the Whole evaporate in a gentle Bath-marie, to the Consistence of Sugar-candy.

Another empirical Method of curing the Chin-cough, when Medicines prove ineffectual, is, to fright the Child, by putting it in the Hopper of a Mill, which makes a terrible Noise, and the Aspect of whose Wheels is dreadful; and by this Method a Chin-cough is sometimes suddenly cured; the Reason of which undoubtedly consists in this, not only that the animal Spirits, being, by the Fright, forced into new Divisions, leave their former inordinate Motions, but, also, that the Matter producing the Spasms is, by such a Perturbation, either dissipated, or forced into other Nerves, where it proves less troublesome.

But a more rational, and, according to my own Experience, a more effectual Method of curing a Chin-cough, is to begin with Purging; for which Purpose,

Take of the Syrup of Peach-flowers, one Spoonful, and of hysseric Water, one Scruple: Mix together, and exhibit to the Patient, who must, at the same time, use a proper Regimen.

Or,

Take of Calomel, six Grains; and of sulphurated Scammony, and Refin of Jalap, each three Grains: Reduce to a Powder, a small Quantity of which is to be exhibited to a Child of six Years old, the Dose being increased, or diminished, in proportion to the Age of the Patient. Let the Purge be repeated in six or seven Days.

If the Patient, as it frequently happens, is subject to Vomiting;

Take of Oxy-mel of Squills, six Drams; and of Salt of Vitriol, three Grains: Mix together, and exhibit to a Child of six Years old; and, according to this Proportion, the Dose is to be accommodated to Patients of other Ages. I have known an Emetic of this Kind, repeated every Morning for four or five Days successively, produce very happy Effects.

For the Cure of Chin-coughs, Vescicatories are frequently used, and applied sometimes to the Nape of the Neck, sometimes behind the Ears, and at other times to the internal Parts of the Arms near the Axillæ; and, when the Blisters begin to heal in these Parts, others are to be excited in others.

Instead of Ale, the Patient ought to use the following Decoction for ordinary Drink.

Take of China-root, an Ounce and an half; of all the Species of Sanders, each an Ounce and an half; of the Shavings of Ivory, and Hartshorn, each three Drams: Infuse in six Pints of Spring-water, which is to be boiled to the Consumption of one half; adding an Ounce and an half of stoned Raisins, and three Drams of Liquorice.

Or,

Take of the Spirit of Gum Ammoniac, prepared with Sal Ammoniac, one Dram; of the Syrup of Cup-mofs, three Ounces; and of hysseric Water, one Ounce: Mix all together, and give one small Spoonful for a Dose, every Morning and Evening.

Or,

Take of the Tincture of Sulphur, two Drams; of which mix three Drops, with one Spoonful of the Syrup of Cup-mofs; and exhibit for a Dose every Morning.

In Children of hot Constitutions, who, in Coughing, are seiz'd with an intense Redness, or rather a Blackness, of the Face and Countenance, I have sometimes, with great Success, ordered two or three Ounces of Blood to be taken away, either by Phlebotomy, or Leeches; after which the following Preparation is to be used.

Take of well-clean'd live Millepedes, two Ounces; of the Powder of Anise-seeds, one Dram; of Nutmegs, half a Dram; and of the whitest Sugar, one Ounce: Bruise all together, and pour upon them, of Hyssop-water, six Ounces. Agitate them a little with a Pestle, and make a strong Expression of the Liquor, two or three Spoonfuls of which are to be exhibited twice a Day for a Dose. *Willis.*

In a Chin-cough, *Ettmuller* informs us, that the Patients cough so long, that at last they throw up a mucous Matter from their Stomachs by Vomit; after which they are relieved, for some time, perhaps, half a Day, when the Disorder returns in the same manner. A Chin-cough, like most other Coughs of Children, according to *Walschmied*, proceeds from a Disorder of the Stomach, where, according to *Doleus*, it is produced by a tough, viscid, and acid Matter lodged in its Coats. But, according to *Ettmuller*, a Chin-cough is sometimes produced by a certain Salt communicated by the Air to the tender Bodies of Children, and coagulating the Lymph, which, becoming acrid, and stagnating, or overflowing, affects the Larynx in such a manner, as to produce a Chin-cough, which, he says, can hardly be cured without the Use of Emetics, but may be easily removed by Vomiting, which may be promoted by means of a Feather dipt in Oil.

Sydenham informs us, that in Chin-coughs Bleeding affords more Relief than the Use of pectoral Medicines; and affirms, that they may be happily cured by Venesection alone, and due Purging, with mild Cathartics, the Doses of which are to be proportioned to the Age of the Patient. He, also, tells us, that in this Disorder Drinks, and liquid Aliments, ought to be taken in smaller Quantities than usual, whilst, in their stead, the Patient is moderately to use a mild Decoction of Sarsaparilla, China-root, Sanders, the Shavings of Ivory, and calcined Hartshorn, together with diuretic and antispasmodic Ingredients. He, also, tells us, that many have been relieved by the Decoction, or Syrup, of Castor and Saffron, as, also, by a Decoction of the Roots of male Piony, Mistleto, and Hyssop.

Doctor Fuller, in his *Pharmacopœia Extemporanea*, orders the following Preparation for the Chin-cough.

Take of well-cleaned live Millepedes, two Ounces; of the Powder of Anise-seeds, one Dram; of Nutmeg, half a Dram, and of white Sugar, one Ounce: Bruise all together, and pour upon them of Penroyal-water, six Ounces; and of the compound Waters of Bryony and Piony, each one Ounce: Make a strong Expression, and of the expressed Liquor exhibit one Spoonful after every Paroxysm of Coughing, till the Disorder is removed.

Doctor Cheyne, in his Treatise of the Gout, informs us, that a Spoonful of the following Syrup, exhibited at a time, and repeated, infallibly cures the Chin-cough.

Take of Millepedes, a sufficient Quantity; immerse them in White-wine, express the Juice, and add a sufficient Quantity of Sugar to make a Syrup.

For the Cure of a Chin-cough, Turnep-broth is much recommended by old Women and Nurses; and a proper Quantity of Sperma Ceti, in common Broth, is said to be an admirable Remedy for this Disorder. The Flesh of fry'd Mice, eaten, is, also, among the common People, accounted a Specific: And Baglivi informs us, that the Moss which grows upon Trees, especially on the Oak, is from Experience found to be, of all others, the most effectual Cure for a Chin-cough. The *Aurum Mosaicum* is greatly recommended by some for the Cure of this Disorder, but ought only to be exhibited to such as are pretty far advanced in Age. The Oil of Sulphur by the Bell, the *Fulapium Moschatum*, and the *Syrupus ad Tussim Convulsivam*, are sometimes used with Success. Some order fresh Whey to be used for common Drink.

PERVERSIO. The same as **DIASTREMA**.

PERVIGILIUM. Watching, or Want of Sleep; a Symptom very common in Fevers, and always of bad Presage. See **PYRETOS**.

PERVINCA.

The Characters are;

The Branches are long and creeping; the Calyx is monophyllous and quinquefid, being divided into five long slender Segments. The Flower is monopetalous, and much in the Form of a Salver, deeply cut into five Lobes, and furnished with five Stamina adorned with elegantly bearded Heads. The Ovary seated in the very Bottom of the Calyx, between two lateral Placentæ, is bifid, and from the Centre of its Apex shoots forth a slender cylindrical Tube, expanded at the Top into a Circle, from whose Centre rises a beautifully plumous Apex; the Ovary at last becomes a Fruit consisting of two Pods, which contain oblong sulcated, and almost cylindrical Seeds.

Boerhaave mentions eight Species of *Pervinca*; which are,

1. *Pervinca*; vulgaris; latifolia; flore cœruleo. *Tourn. Inst.* 119. *Boerb. Ind. A.* 311. *Clematis Daphnoides major*. C. B. P. 302. *Raii Hist.* 2. 1091. *Synop.* 3. 268. *Clematis Daphnoides major flore cœruleo*. J. B. 2. 132. *Clematis Daphnoides latifolia sive Vinca Pervinca major*. *Park. Theat.* 380. *Clematis Daphnoides*. *Ger.* 747. *Clematis Daphnoides sive Pervinca major*. *Emac.* 894. **THE GREATER PERIWINKLE.**

It grows on Banks by the Sides of Ditches, but rarely flowers, in April; and it agrees in Virtues with the lesser or common Periwinkle, and may be used in its stead.

2. *Pervinca*; latifolia, variegata. T. 120. *Clematis Daphnoides major, flore variegata*.

3. *Pervinca*; vulgaris; angustifolia; flore cœruleo. *Tourn. Inst.* 120. *Boerb. Ind. A.* 311. C. B. P. 301. *Raii Hist.* 2. 1091. J. B. 2. 130. *Vinca Pervinca*. *Offic. Ger.* 747. *Vinca Pervinca minor*. *Ger. Emac.* 894. *Raii Synop.* 3. 268. *Vinca Pervinca vulgaris*. *Park. Theat.* 340. *Clematis Daphnoides, Vinca Pervinca*. *Chab.* 118. **PERIWINKLE.**

Periwinkle, from a stringy, creeping, fibrous Root, sends forth slender, smooth, weak Stalks, having two oval, smooth, shining-green Leaves, set opposite at a Joint. The Flowers grow single at a Joint, on long Foot-stalks, usually purple, sometimes white, in Shape like the Flowers of Jessamine, but more round-pointed, which are sometimes, but very rarely, succeeded by two long and slender Pods; it grows in shady Banks, and dry Ditches, and flowers in Summer. The Leaves are used.

This is a good vulnerary Plant, and of frequent Use in Wound-drinks, for Bruises, Contusions, inward Bleeding, and Wasting, Spitting of Blood, the Excess of the Catamenia, and the Fluor Albus. *Miller's Bot. Off.*

This Plant is bitter, and gives a considerable Tincture of Red to the blue Paper; it is very likely, that the Oil and Earth predominate in the Periwinkle. Its Salt resembles Alum; but it partakes a little of the urinous Salt, and is like the Alum, with which they mix some Urine, to make it crystallize the better. For,

By the chymical Analysis, we obtain from this Plant, besides several acid Liquors, a great deal of Earth and Oil, and very little volatile Salt. Periwinkle is vulnerary, astringent, and febrifugous. For spitting Blood, the immoderate Flux of the Piles, the Terms, or the Whites, pour two Quarts of boiling Water upon three Handfuls of the Leaves of Periwinkle, cover the Pot, remove it from the Fire, and give the Infusion to drink by Glass-fulls. Its Conserve and Extract have the same Virtues. For Bleeding at the Nose, stop it with these Leaves bruised. Milk curdled, with the Decoction of Periwinkle, is very good for the Phthisic: This Milk is prescribed for the Dysentery, and a Gargarism is made of it for the Diseases of the Throat. For the Dropsy they distil the Milk, after having macerated in it a whole Day the Leaves of Periwinkle, Tansey, and Agrimony. This distilled Milk is a much easier Medicine, than the curdled Milk. *Martyn's Tournefort.*

The Leaves of Periwinkle, held in the Mouth, stop Bleeding at the Nose, as we have frequently seen try'd, says *Costaus, Lib. de Stirp. Differ.* The fresh Leaves, spread upon coarse and thick brown Paper, and well-matted and pressed together, then covered with combed Flax, and afterwards suffumigated with Frankincense, being, by the Advice of an old Woman, apply'd to a strumous Swelling, dissolved it in a short time, after it had been, for a whole Year, under the Treatment of a learned Physician, without Effect. The old Woman had, before this, with the same Medicine, cured another, whose Case was reckoned desperate. *Raii Hist. Plant.*

4. *Pervinca*; vulgaris; angustifolia flore albo. T. 120. *Clematis, daphnoides, minor, flore candido*. C. B. P. 301. *Clematis, daphnoides, flore albo simplic.* J. B. 2. 130.

5. *Pervinca*; vulgaris; angustifolia; flore rubente. T. 120. *Clematis, daphnoides, minor, flore rubente*. C. B. P. 301. *Clematis, daphnoides, flore purpureo, simplic.* J. B. 2. 130.

6. *Pervinca*; vulgaris; angustifolia; flore pleno, saturate purpureo. T. 120. *Clematis, daphnoides, flore purpureo, pleno*. H. Eyst. o. 1. F. 8. Fig. 5.

7. *Pervinca*; angustifolia; vulgaris; variegata ex aureo & viridi.

8. *Pervinca*; angustifolia; vulgaris; variegata ex argenteo & viridi; flore purpurascente, pleno. *Boerb. Ind. als. Plant. Vol. 1.*

The Juice of this Plant is bitter, heating, penetrating, saponaceous, opening, deterfive, stimulating on all Sides, and vulnerary: Hence it affords a sovereign Remedy for Infirmities proceeding from pituitous Causes. The Juice, boiled in Water, and drank to a good Quantity, opens the Uterus, provokes the Lochia, and revives the vital Heat. The Leaves cut small, then boiled a little, and expressed, and the Juice taken in the Morning in Wine, is an excellent Remedy for the Scurvy, by depurating the Blood, and deterring the Primæ Viæ. It is proper for Virgins affected with the Chlorosis, and the Dysentery. The Plant is very serviceable in the Phthisis, and in Diseases of the Fauces. The Leaves, used in Butter-milk, are good for the Fluor Albus. *Hist. Plant. adscript. Boerhaav.*

PERUNDIS. See **ZENDA**.

PERUVIANUM BALSAMUM. Balsam of Peru. See **BALSAMUM**.

PERUVIANUS CORTEX. Peruvian Bark. See **QUINQUINA**.

PERYGUA. See **ALATERNUS**.

PERYSIAS, *περυσίας*. An Epithet of Wine, importing, that it is of the last Year's Vintage.

PES ANSERINUS. A Name for the *Chenopodium*; *Pes anserinus*; *primum & secundum Tabernamontani*.

PES CATI. A Name for the *Helichrysum*; *montanum*; *flore rotundiore*.

PES COLUMBINUS. See **GERANIUM**.

PES LEONIS. See **ALCHIMILLA**.

PES LEPORINUS. A Name for the *Trifolium*; *humile*; *spicatum*; *sive Lagopus*.

PES TIGRIDIS. A Name for the *Sclarea*; *Indica, floribus variegatis*.

PESSARIUM, a Pessary, a Medicine proper to be introduced into the *Pudendum muliebre*, for the Cure of several Diseases incident to the Uterus, has had different Names, according to its Variety of Forms.

When it is prepared of the Length of the fore Finger, and the Thickness of the Thumb, with a due Roundness and Smoothness, it is called *Pessarium*, or *Pessus*, "Pessary," and by some, *πριαπισκωτός* (*Priapiscotos*); but Preparations for the same Purpose, which are of a round Figure, like a Nodule, are called *Nasalia*. *Morellus*.

Among other external Remedies employ'd by *Hippocrates*, were *Pessaries**. These were a kind of Suppositories, which they introduced into the exterior Neck of the Matrix; they were prepared of Wool, or Lint, or Linen, mix'd with Powders, Oils, Wax, or other Things, and made round and long like a Finger.

* *Πεσσοί, προσβητά, κολλύρια* (*Pessi, Prosbeta, Collyria*); they were, also, call'd *πριαπισκωτά* (*Priapiscota*), from their Figure; but that Word is not to be found in *Hippocrates*.

The Use of Pessaries was very frequent in ancient Times; for they served almost as an universal Remedy for female Disorders. They were made to answer the Intentions of mollifying, suppling, opening, attracting, stimulating, closing, purging, and cleansing the Matrix, of drying it, retaining it in its proper Place, and for other Purposes. In order to attain those various Ends, they made use sometimes of Oils and Fats, sometimes of Juices of Herbs, sometimes of acrimonious and stimulating Ingredients, as Nitre, Scammony, Tithymalus, Cantharides, Garlick, and Cumia; sometimes of Astringents, as the Bark and Flowers of the Pomegranate, Rhus, or Sumach, Alum, and the like; sometimes of Aromatics, as Myrrh, Castor, and sweet-scented Plants. There was not a Distemper of the Uterus, in which they did not use Pessaries; they were the Remedy for the Suffocation, which they pretended was caused by that Part; with Pessaries they provoked or stopped the Menstrues; they served as Medicines for the Relaxation, or Falling out of the Matrix, for the superfluous Humidities, Ulcerations, and Inflammations of the same, for a Dropsy of the Uterus, and for the Fluor Albus, and Sterility. With Pessaries they facilitated the Expulsion of the dead Child, and the Afterbirth, and promoted the Child-bed Purgations, besides other Services; not to mention, that they made use of them, also, as a Means to procure Abortion.

Pessaries, or Tali, were by the Antients principally used in Disorders of the Uterus, and distinguish'd into three Kinds, that is, the emollient, the astringent, and such as open the Orifices of the Veins. Those of the emollient Kind were used in Inflammations, Ulcerations, Risings, Refrigerations, Distortions, and Inflammations of the Uterus. This Species of Pessaries was prepared of *Tyrrhenian Wax*, the Oleum Cyprinum, or Sufinum, the Fat of a Goose or Fowl, fresh Butter, dry'd Resin, the Marrow of an Hart, Fenugreek, and other Substances of similar Qualities: Such as open the Orifices of the Veins were used, when the Intention was to recal the menstrual Discharge, or remove a Closure, or Contraction of the Uterus. This Species was prepared of Honey, Mugwort, Dittany, the Juice of Cabbage, Liquorice, the Juice of Leeks, Rue, Scammony, and other Ingredients of a like Nature. But astringent Pessaries were used for Purposes quite different from those of the aperient Kind, since the Intention of the former was to check the menstrual Discharge, contract the expanded Uterus, and prevent its falling down. The Consistence of these Pessaries must be somewhat thick and strigentitious. Then a Piece of Wool must be folded up in Form of a Tent, immersed in the Ingredients, and introduced into the Mouth of the Uterus, with a Thread fixed to it, that by this means the Pessary may be the more easily extracted, when it seems expedient. *Paul. Aeginet. Lib. 7. Cap. 24.*

The Moderns have too much neglected the Use of Pessaries of this Kind; but employ Pessaries of various Figures and Materials, many of which are represented in *Tab. LV.* They are principally serviceable in a *Prolapsus Uteri*, and Incontinence of Urine in Females. Their Uses are farther explained under the Articles of the Disorders in which they are employ'd.

PESSOS. A Pessary. See PESSARIUM.

PESSULUS. A Pessary.

PESTICHLÆ. The same as PÉTÉCHLÆ.

PESTIS. The Plague.

The Plague is one of the most acute kind of Fevers, arising from a poisonous Miasma, brought from the Eastern Countries, and which proves mortal, unless, by the Vigour of the vital Motions, the Poison is soon carried off by means of Bubbles and Carbuncles.

The Plague differs from other Fevers of the contagious, malignant, and exanthematous Kind, in this, that it is of all others, the most acute, since it sometimes destroys the Patient on the first or second Day of its Attack. In *Europe* the Plague is neither epidemic, nor sporadic, arising from a preposterous Method of living, or an insalutary Constitution of the Air; but, in our healthy Parts of the World, draws its Origin from a Contagion derived from the sultry, and before infected Eastern Climes. A Plague, also, has this peculiar to it, that it is not, like other malignant and putrid Fevers, terminated by large Sweats, Fluxes, or other Excretions; but the Poison being in a critical and salutary manner, forced to the external glandular Parts, it is terminated by Tumors, which end in Abscesses. Besides, contrary to what happens in other contagious and petechial Fevers, such is the subtle Quality of the pestilential Poison, that it quickly adheres to porous Substances; and, without any Diminution of its Force, may be convey'd to Countries many thousand Miles distant from each other. It is, also, peculiar to this Contagion, that its malignant and spreading, Nature is not only check'd, but, also, totally extinguish'd, by intense Cold. Hence it happens, that in cold Weather, and cold Climates, a Plague is rarely or never observed, whereas it rages frequently and violently in hot and sultry Climates.

But, as, in all contagious and malignant Fevers, the poisonous Miasma, taken in with the Air, insinuates itself into the fer-

mentable Saliva, and exerts its baleful Influence on the Parts through which it passes; so this, in a particular manner, holds true, concerning the pestilential Contagion, which, immediately attacking the Head, Brain, Nerves, and nervous Fluid, excites a Torpor of the Head, a Sense of Weight, Drowsiness, an excessive Pain, a Stupor of the Senses, Forgetfulness of every thing, Restlessness, Watchings, and a Loss of Strength. When this pestilential Contagion is convey'd thro' the Fauces to the Stomach, it excites a Loathing of Food, Nauseas, Uneasiness of the Præcordia, a symptomatic Cardialgia, Efforts to vomit, and actual Vomiting. Then, being convey'd to the Membranes of the Spinal Marrow, and the nervous Coats of the Arteries, it not only produces an Horror, and a languid, small, contracted, and frequent Pulse, but, also, Deliquiums. All these are the ordinary Symptoms of a beginning Plague, and are so much the more violent and quick in their Operation, as the pestilential Poison exceeds that of other contagious and malignant Disorders.

The many violent and terrible Symptoms appearing under a Plague are no-where more fully and accurately described, than in the first Description of this Disorder given by *Thucydides* the Historian, when, in *Lib. 2. de Bello Peloponnes.* he gives an Account of the Plague of *Athens* in the following Words: "For my own part, being ill of it myself, and having seen others afflicted in the same manner, I shall give an Account of it, that, if it should happen again, the Person who reflects on it, may be able to form the better Judgment concerning it. The Year in which it began was universally agreed to be highly salutary, and free from other Diseases; and, if by chance any one was sick before, all his Indisposition terminated in this; and they who before were in perfect Health, were, without any apparent Cause, suddenly seized with a violent Heat in the Head, accompanied with Redness and Inflammations of the Eyes. Their Tongues, Throats, and internal Parts, became immediately bloody, whilst their Breath was fetid, and Respiration difficult. A Sneezing and Hoarseness ensued; and, in a short time, the Pain descended to the Breast, and was accompanied with a violent Cough. When this Pain was once settled in the Stomach, a Vomiting of bilious Matter, of as various Kinds as ever were specified by Physicians, succeeded, but not without the greatest Anxiety and Uneasiness. Many were seized with an Hiccup, that brought up nothing, but occasioned a violent Convulsion, which, in some, went off presently; but in others, continued much longer. The Surface of the Body was neither very hot, nor pale, but redish, livid, and full of small Pustules and Ulcers: But, internally, the Heat was so intensely great, that they could not endure the slightest Covering, though of the finest Linen; but could only be satisfied with absolute Nakedness. It was, also, an infinite Pleasure to them to plunge themselves into cold Water; and many of those who were not well attended, did so, running to Wells, in order to quench their insatiable Thirst, which still remain'd, whether they drank much or little; a great Uneasiness and Restlessness attending them, together with a continual Watching. Whilst this Plague was advancing to its Height, the Patient's Body did not fall away, but resisted the Violence of the Disorder beyond Expectation; so that many died on the ninth and seventh Days, of the internal Burning, some Strength yet remaining; or, if they held out longer, many of them afterwards died of Weakness; the Distemper descending to the Belly, and there producing violent Exulcerations and Diarrhœas: For the Disease went through the whole Body, beginning first in the Head; and, if any one surmounted these terrible Symptoms, violent Disorders of the Extremities succeeded; for the Plague broke out upon the private Parts, the Fingers, and the Toes; and many sustained the Loss of these Parts: Some, also, lost their Eyes; whilst others, immediately upon getting up, were seized with a total Forgetfulness of every thing, neither knowing themselves, nor their most intimate Acquaintances." And, a little after, he adds these Words: "The Disease, therefore, to pass over many surprising Circumstances, which differed in different Persons, was in general such as I have described it. And, as for other usual Distempers, they either did not then appear, or, if they did, they all terminated in this, as Lines do in a common Centre. Some of the Patients died for want of Care; and others, notwithstanding all the Care that could possibly be taken of them: Nor could it be affirm'd, that there was any certain Remedy, which, when used, proved universally beneficial, since, if it did Good to one, it did Harm to another. Nor was there any Difference in different Constitutions, as to Strength or Weakness, to enable them to resist the Violence of this Plague, which swept all away, whatever Care was taken, or whatever Regimen they used. But the most terrible Circumstance of all was the Dejection of Mind in those who found themselves beginning

"beginning to be ill; for, growing immediately desperate, they gave themselves up for lost, without making any Efforts for their own Relief; and one being infected by another, whilst they endeavoured to take care of each other, they died like Sheep. And this Circumstance, of all others, contributed most considerably to the surprising Mortality."

In a Plague, however, the Symptoms are not always of the same Nature, but very considerably different according to different Constitutions; and this Diversity is carefully to be investigated by the Physician. Now, 'tis universally agreed upon by all Authors who have wrote concerning the Plague, that those who are of a spongy, rare, and porous Habit of Body, as, also, those who are fat, of sanguineous and phlegmatic Temperaments, Women, young Persons, and Infants, those of timid and abject Dispositions, those accustomed to poor or unwholesome Diet, those addicted to Surfeits, and who protract their Entertainments till late at Night, are much more readily seized, and more terribly afflicted, with the Plague, than those of bold and resolute Minds, lean Habits, nervous Constitutions, Persons of large Vessels, Adults, those advanced in Years, those obnoxious to the hæmorrhoidal Discharge, and those who have Fontanels, or open Ulcers. 'Tis equally certain from Experience, that nothing lays a better Foundation for receiving or heightening the pestilential Miasma, than Dread, the Fear of Death, and Consternation: So that 'tis certain, that some have not only been seized with the Plague, but, also, died of it, purely through the Influence of Terror; for those Passions of the Mind are the most considerable, which lessen and destroy the vital Motion of the Heart and Arteries, and, consequently, the Circulation of the Blood, whilst, at the same time, they impair the vital, natural, and animal Force, since, by the Benefit of these Motions, the Contagion received is to be exterminated.

'Tis an hard Task to determine the specific Nature of the pestilential Poison *à priori*, because it is hardly subjected to our Senses. But, in as far as we are able to form a Judgment of it *à posteriori*, and an Induction of Facts, it seems to consist partly of a sulphureous, putrid, and multiplicative Nature, like Leaven, and partly of an highly subtle, acrid, and caustic, though, at the same time, more alkaline than acid, Nature. Its putrid and highly foreign sulphureous Nature appears from this, that all malignant Disorders derive their Origins from the putrid Vapours arising from unburied Carcases, putrid stagnant Lakes, and other fetid and excrementitious Sordes; and that this Miasma immediately contaminates the nervous Fluid, stops the systolic Motion of the Solids, and induces a sphacelous Corruption of the Juices. But that this Miasma is, also, possessed of a caustic and subtle Acrimony, is certain from this, that the Ingress of contagious Disorders is not only generally preceded by Swarms of Insects abounding with a caustic Salt, and generated from Putrefaction; but, also, from this, that, by vellicating and corroding the nervous Fibres, it produces a Pain, Tumor, and Inflammation, sufficiently conspicuous in the Buboes and Carbuncles.

This pestilential Poison, as we have above observed, when received into the Body, totally disturbs and perverts its Functions; and, unless suddenly forced from the internal to the external Parts, proves infallibly mortal: Nor is this Effect, as in other malignant Disorders, produced by profuse Sweats, Discharges of the Fæces and Urine, the Hæmorrhoids, or Meneses, nor by Discharges of Blood from the Nose, whether spontaneous, or excited by Art; since these Excretions, especially when profuse, rather prognosticate the Death of the Patient. But the salutary and critical Excretion, by which the Plague is perfectly terminated, is brought on by Tumors appearing on the Surface of the Body: So that, as in an Erysipelas, this happens within the third and fourth Days; and the sooner and more copiously they appear, the Violence of the Disorder is so much the more mitigated; for that these Tumors contain and eliminate a formal Poison, is certain from this, that if the Surgeon opens the Vein of a sound Person with a Lancet, which has been employed in opening one of these Tumors, the sound Person is forthwith seized with the Plague.

These pestilential Tumors are of two Kinds: The one is by the Greeks called *Bubo*, a Name common to all Tumors. These Buboes appear principally on the glandulous Parts, and most frequently on the Groins, under the Arm-pits, on the Parotid, Mammary, and inferior Axillary Glands, under the Chin, as, also, on the Glands adjacent to the Aspera Arteria; and discover themselves by an hard painful tense Tumor of the Glands, accompanied with Heat; and, if they are of a good Kind, they become humid, soft, and are suppurated. The other Kind is far worse than the former, and is by the Greeks called *Anthrax*, which signifies a live Coal, from which the Latins derive the Word *Carbunculus*. Celsus, in Lib. 5. Cap. 28. describes a Carbuncle in the following manner: "It is a Redness of the Part with Pustules not rising far above it;

and these Pustules are generally black, tho' sometimes they are livid, or pale. There seems to be a Sanies in these; and the Bottom is of a black Colour. The Body of them is more hard and dry, than it ought to be naturally; and is surrounded with a Crust, attended with an Inflammation: Nor in the Part affected can the Skin be raised, but adheres to the subjacent Flesh."

Mindererus, who lived where the Plague raged, and has wrote excellently concerning it, describes Carbuncles in the following manner: "When a Carbuncle, of the Bulk of a Mustard or Hemp-seed, happens, it contracts round about it a burning Disk, or Halo, as large as a Trencher, according to the Part affected: The Flesh affected is separated from the sound Parts, and, like an Eschar, or putrid Flesh, falls off; so that the Cavity gapes, as if it had been corroded by that Species of Cancer called *Lupus*." No Part of the Body is free from these Carbuncles; but they most commonly possess the Membranes of the Muscles, and the nervous and fibrous Substance of the Skin, especially in the Back, the Arms, and the Thighs. In the Part affected, the Patients first perceive an exquisite Itching; and, if they scratch, Pustules of a red, livid, whitish, purple, or black Colour appear. These Pustules are very thick, and appear full of Pus; and, under some of them, a cineritious Crust is form'd, which being taken away, the subjacent Flesh appears corrupted and spongy, with an intolerable Pain and Heat of the adjacent Flesh. Then a total Mortification or Sphacelation of the Part ensues.

But, among those to whom the Plague proves mortal, some die, on the first or second Day, of a Syncope, which, no doubt, proceeds from the Terror with which they are struck. But in many, when the Poison either is not expelled, or when expelled, suddenly it returns, and, lodging in the Coats of the nobler Parts, such as the Pleura, Oesophagus, Stomach, Intestines, and Meninges, a Sphacelus is induced, which quickly spreads to the Viscera and Blood; by which it happens, that the Carcases of such Patients immediately become surprisingly fetid, tumefied, and are quickly putrefied. Sometimes, also, when there is too large a Quantity of pestilential Tumors, the Patients, just as in the Small-pox, die of a symptomatic Fever, on account of the Inflammation, Pain, and intolerable Heat.

The C U R E.

Since 'tis certain, that the Plague is not originally generated in Europe, but is imported from other Countries, there can be no more safe and infallible Advice given, than to fly from the Contagion. It is the Advice of *Celsus*, that the Person, who is as yet safe, but cannot long be sure of being so, sail, and travel, which in the Italian Plague, in the Year 1625. were of singular Service, as we are told, by *Natalis Comes, Hist. Lib. 27.* And *Sanctarius, in Med. Stat. Sect. Aph. 138.* informs us, "That they, who, in order to avoid the Plague, advise any other thing than flying from it, are either ignorant themselves, or intend to impose upon others." For the same Reason, those Princes excellently consult the Welfare of their Subjects, who, in the Time of the Plague, use all Methods to prevent its Importation; and, if an House is infected, forbid sound Persons to enter it, and forthwith burn all the Furniture, lest, with it, the Contagion should be propagated to others: But all Persons, when the Plague rages, ought to live very temperately, and every Degree of Excess is to be avoided in the Non-naturals, especially with respect to the Passions of the Mind; and all those things are to be abstained from, which impair the Strength, disturb Perspiration, and generate Crudities in the Primæ Viæ. In a particular manner, the Mind is to be fortified, and Terror, Dread, and Cowardice, are to be banished, since 'tis certain, that these Passions, during a Plague, destroy more than the Contagion itself.

Those whose Business obliges them to live among the Infected, ought to take care, that the Miasma do not enter the vital Juices, nor convert to its own Nature the salival Humours lodged in the Primæ Viæ, which easily happens. For this Purpose, we recommend frequent Vomiting, and Washings of the Mouth, with Wine-vinegar or Wine, or the Drawing these Liquors up the Nostrils; and these are still more efficacious, if they are impregnated with Scordium, Rue, or Citron-peel; for an Acid seems to be the genuine Antidote against a Poison of a putrid and sulphureous Nature, because from Chymistry it is certain, that an Acid fixes and enervates Sulphur and volatile Salts. For this Reason it is far safer to use Acids gently, or contain them in the Mouth, than to chew alexipharmic Roots, such as those of Zedoary, Angelica, and Masterwort. Hence, 'tis, also, expedient to drink *Rhenish* Wine, or to take a few Spoonfuls of bezoardic Vinegar, diluted with Water, or Wine. Thus *Forestus* informs us, "That, when the Plague was raging, he used, when called to his Fellow-citizens, to fortify himself by these Medicines, especially by chewing Citron-peels." The Turks, according to

Cile, Lib. de Morb. Acut. when the Plague rages, frequently use Lemon-juice, large Quantities of which they squeeze into all Kinds of Broths.

Among the external Remedies for this Disorder, many recommend Fontanels; because it has been observed, that those who had chronical and scorbutic Ulcers in their Limbs, remained free from the Plague, and other contagious Diseases. *Hildanus* greatly commends Fontanels for this Purpose; and, in *Cent. 4. Obs. 23.* has these Words: "I do not remember, that any of those who had Fontanels in their Legs and Arms, died of the Plague, except one or two, who were highly cacochymic; and I have found Fontanels to be an efficacious Preservative against the Plague, both in myself and others." I remember the same was, also, told me by the Physicians who were Witnesses to the Plague of *Erfurt*. The Reason of so surprising a prophylactic Effect seems to be this, that the Matter of the received Miasma, which generally firmly adheres to the ferous Parts of the Blood, will, by the Vigour of Nature, be conveyed to the Part where the Fontanel is, and thence eliminated as being weaker. Hence an unusual Pain and Tumor are observ'd about Fontanels. Perhaps, also, the Confidence of the Efficacy of Fontanels may remove the Fear, rouse the Spirits, and work like a kind of Amulet.

In the Cure of a Plague, the following Intentions are to be pursued:

1. To promote the Expulsion of the received Miasma in a proper manner, especially by these critical Tumors, which are to be duly manag'd: And,
2. To rouse and support the languid Strength, which is of so great Importance to Life; and to remove, or relieve, the most urgent Symptoms: But, since I am not experimentally acquainted with the Methods of answering these Intentions, I shall deliver the Method of curing a violent Plague, described by *Johannes Langius, Lib. 1. Epist. 18.* and then subjoin my own Opinion, and such Observations as are most agreeable to Reason and Experience. "You know, says this celebrated Author, that I have cured many of the Plague, whose Recovery was despair'd of, by the following Method: First, if, for some Days before the Beginning of the Disease, little or no Fæces were discharg'd, then I rendered the Body soluble by a Suppository, or a gentle Clyster: Then I exhibited a sudorific Alexipharmic, which, according to the Age and Strength of the Patient, is to promote a Sweat for two or three, or more Hours: Then I applied an Epithem to the Heart. Six or seven Hours after the Sweat, supporting the Patient's Strength mean time, by some proper Broth, I open'd a proper Vein; and, immediately after the Use of the Alexipharmic, exhibited, every Morning and Evening, alterative Draughts, which by their Quality resisted the Poison, and were, at the same time, cordial; such as Decoctions prepared of the Juices of Citrons, Lemons, Oranges, Sorrel, and Bugle, with a little Vinegar and Sugar. In the Decline of the Disease, if the Appetite is languid, in order to carry off the Remains of the Disease, I exhibited a Medicine prepared of Rhubarb, Agaric, Cassia, or *Eleomeli*, or Manna, and Tamarinds. Then I order'd the Surgeons not to precipitate the Consolidation of the Carbuncles and Ulcers; and those who had the Care of the Patients, to exhibit proper Aliments and Liquors at the Time prescribed: By which Method, a large Number of Patients were restored to perfect Health." A little after, he goes on in the following manner: But if Buboes and Carbuncles appear about the Emunctories near the Ears, if Abscesses are formed under the Axillæ, if Buboes are formed in the Glands of the Groin, or if Carbuncles appear in the Arms or Legs, then, as in poisonous Wounds, we are, with all Expedition, to apply to the Part such Medicines as extract the Poison, or Cupping-glasses, or a Plaster of Leaven, Treacle, Meal, Mustard, and Onions, roasted under the Ashes, adding *Opopanax* and *Galbanum* dissolved in strong Vinegar: Then scarify the Abscess before its Maturation, or lay it open, or cauterize it. But, if the Patient dreads the actual Cautery, we may use one of the potential Kind, prepared of Cantharides and Leaven, or the Roots of the *Plammula* bruised in Oil; which, by their heating and burning Quality, not only attract the noxious Humours, but, also, frequently open the Collections made of them."

This Method of curing the Plague is highly congruous to Reason; for, in the Cure of all Diseases, it is to be laid down as a Maxim, that if, for some of the first Days of the Disorder, few or no Fæces are eliminated, the Body is to be rendered soluble by a gentle Clyster, that, by this means, the Intestines may be freed from the Excrements, lest otherwise the Symptoms should be increased, and the Efficacy of the Medicines obtunded. *Langius* is, also, greatly to be commended, for using an Alexipharmic, in order to excite a Sweat for some Hours, since, by this means, the Poison is more expeditiously

exhaled and dissipated. The Application of an Epithem to the Heart is, also, a Circumstance of great Importance; for tho' it does not immediately touch and affect the Heart, but only the Right Orifice of the Stomach, and its nervous and muscular Coats, yet it is of the last Importance, that the Stomach, which is an highly nervous Part, of exquisite Sensation, has an intimate Communication with the nervous Parts of the whole Body, and in which the Poison first exerts its virulent Influence, should be well defended; which Intention is answer'd by such Medicines as are antispasmodic, and, at the same time, corroborative and balsamic; for which Purpose I generally recommend such as are prepared of Treacle, expressed Oil of Nutmegs, Camphire, Saffron, Castor, and *Peruvian Balfam*. After the Use of Alexipharmics, the Opening of a Vein is, also, highly beneficial: For to begin the Cure with Venesection, is dangerous, because, one or two Days after it, the Motion of the Blood to the Surface of the Body, and consequently the Perspiration, is diminished, and the Poison retain'd. Besides, the Dread and Terror with which those who are seiz'd with the Plague are struck, forthwith recal the Blood from the Circumference of the Body; so that Venesection, which produces the same Effect, must, of course, prove prejudicial. But, after the Use of Sudorifics, Venesection may be admitted, if Custom, a Redundance of Blood, a luxurious Diet, or an excessive Use of Wine, requires it, because, the Redundance of the Blood being removed, the Propulsion of the virulent Matter to the Glands is facilitated and promoted; and this is so much the more effectually done, if afterwards the Flux of the Blood to the external Parts is now-and-then assisted by gentle Diaphoretics: Acids, such as Vinegar, the Juice of Lemons and Citrons are, also, justly recommended, since they resist the Poison, prevent the Putrefaction of the Humours, and the Dissolution of the Blood; for which Reason they are preferable to all other alexipharmic and antipestilential Medicines.

When the Disease is on the Decline, *Langius* purges the Patient by gentle Laxatives, which, as in the Beginning of the Plague, and other contagious Disorders, it proves hurtful, by retarding the Motion of the Humours to the external Parts, so it is highly beneficial in the Decline of these Disorders: For, by this means, the Sordes generated during the Disease are eliminated; whereas, if they were retain'd, the Appetite would be destroy'd, slow and purple Fevers induced, the Strength render'd languid, slow Heat brought on, and a new and violent Disorder of the same Kind frequently produced again. Then he orders the Poison, in the pestilential Tumors, to be extracted by Cupping-glasses, Scarification, and Vesicatories; in which he is, also, seconded by the best Authors: For *Riverius*, in *Observat. Cent. 2. Obs. 19.* greatly recommends Cantharides made up with Leaven and Vinegar, and applied behind the Ears, or to the other usual Emunctories; after this, the Patient is to be ordered to Bed; and, in twenty-four Hours, a black and ferous Humour is discharged, by which means the Plague is in a few Days removed. *Langius*, also, justly advises, not to consolidate the Ulcers too soon: But, the Matter being solicited to the external Parts, and a Suppuration brought on, the Tumor is rather to be open'd, and the Ulcer cleansed with the usual Digestives; but it is to be kept long open with a Tent, that the Poison may be sufficiently eliminated, and the Ulcer, at last, brought to a Cicatrix.

Sanctorius, in *Aph. 139. Medicin. Stat.* affirms, "That few of the Nobility are cured even by the Use of Medicines, whereas many of the common People are cured without them." For 'tis certain from Experience, that common People deprived of all the means of Relief, and who use a temperate Regimen, and large Draughts of light Liquors, sooner recover in pestilential and other contagious Disorders, than those in opulent Circumstances, who are ruined by a Redundance of Medicines, and a Variety of Advice; for, in the former, Nature is robust and vigorous, to whom if the Cure is committed, it succeeds far better, than when attempted by Art, which sometimes hinders and disturbs it. But, in Persons of opulent Fortunes, Nature is often disturbed in her Operations, and the Disease terminates unluckily, on account of their irregular Method of Life, and their too liberal Use of Medicines, which are sometimes highly improper.

In the Cure of a Plague, nothing is more prejudicial, than a liberal Use of the alexipharmic Roots turgid with an hot volatile Oil; such as those of the *Carline Thistle*, *Angelica*, *Butterbur*, *Zedoary*, *Virginia Snake-root*, *Masterwort*, *Swallowwort*, *Burnet*; the Essences and Elixirs prepared of these, Treacle, and Mithridate. But still more prejudicial are the so much commended urinous and volatile Spirits; such as those of *Hartshorn*, *Vipers*, and *Soot*, as, also, volatile Salts, and Balfam of Sulphur. For the pestilential Miasma is so far from being expelled by these means, that it is rather retained, and more deeply rooted in the Constitution: For it is a constant Law in the animal Economy, that the Secretions which

which precede the Excretion of the recrementitious Parts, succeed better, when the Humours are moderately and freely convey'd to the Emunctories, than when they are thrown into violent Commotions. Hot Medicines rather increase the Uneasiness about the Præcordia, augment the Heat, promote the Dissolution of the Blood, and easily force the malignant Miasma from the Stomach, and nervous Parts; in consequence of which, they cannot fail to prove prejudicial. This is sufficiently certain from all the Authors, who have liv'd where the Plague raged, and especially from *Hildanus*, *Chald. de Heredia*, and from *Thenerus*, who informs us, "That those who used hot Alexipharmics, died of the Plague."

Nor are we, in a Plague, absolutely to condemn the Use of alexipharmic Roots and Herbs; for they are by no means prejudicial, when corrected with Acids and Nitre. Thus I have been informed, that in the Plague, which in the Year 1682. raged at *Hall*, nothing was more beneficial than a Mixture of the Water of *Carduus Benedictus* with four Spoonfuls of Wine-vinegar, and of Crabs-eyes and Treacle, each a Dram, frequently exhibited. In that Plague, also, which in the Year 1576. raged almost all over *Lombardy*, many, and especially the Inhabitants of *Milan*, were said to be cured by the Juice of Goats-rue mixed with Vinegar, *Carduus*-water, and a little Treacle, covering their Bodies afterwards, in order to sweat. *Thenerus*, in *Observat.* informs us, that in the Beginning of a Plague nothing prov'd so beneficial, as Treacle-vinegar, exhibited in order to provoke a Sweat; and that in the Year 1543. when a malignant Fever raged among the Soldiers, a whole Regiment of them was preserved by this Vinegar, every one recovering who used it, except a few, to whom it was exhibited too late. *Kircher*, also, in his Treatise *de Peste*, informs us, that in the *Roman* Plague so happy Effects were produced by an Infusion of Vinegar with Rue, the Root of Burnet, Betony, Garlick, and Juniper-berries, with the Addition of a little Camphire, that whoever used it, even tho' they liv'd among the infected, escaped the Plague. Besides, in malignant Disorders, as well as in the Plague, the Aqua Prophylactica Sylvii has been always greatly esteemed, because the principal Ingredient of it is Vinegar: For this Reason, *Gesner*, in *Lib. 3. Epist.* 27. advises to exhibit all Alexipharmics in Wine mixed with Vinegar. But these Alexipharmics mixed with Acids are principally proper on the first Day of the Disorder, where Resolution and Sweat are necessary; for *Mindererus* asserts for a Truth, that, unless, twenty-four Hours after the Invasion of the Disease, alexiterial Medicines are exhibited, all Attempts to cure the Patient afterwards prove fruitless.

But 'tis universally allow'd by all who have wrote on this Disorder, that the most present and efficacious Medicines for a Plague, are those of the acid and earthy Kind. Thus *Fracastorius*, in *Lib. 3. de Morb. Contag.* both for preventing and curing the Plague, orders the following Medicine:

Take of the Juice of Wood-forrel, two Ounces; of the Juice of Citrons, one Ounce; of *Diafcoridium* one Dram; of the Cordial Spices, two Scruples; and of Vinegar, one Ounce.

Mindererus, *de Peste*, *Cap. 15.* has these Words: "There is no Putrefaction, no Infection, no Depravation of the Juices, which cannot be subdued by Acids; and, to speak the Truth, if I was debarred the Use of vitriolic Medicines, I should be but ill qualified for the Cure of a Plague." *Fonseca*, *de vera Rat.-curand. Pest.* affirms the same: "For," says he, *Johannes Crato*, *Augenius de Monte Sancto*, *Martinus Rulandus*, and others, affirm, that in pestilential Fevers the Spirit of Vitriol is highly beneficial; and I can from my own Experience affirm, that I have with great Success exhibited it not only with Syrups, but, also, with Conserve of Roses." Among earthy Substances, and those of the fixed bezoardic Kind, the most considerable are, diaphoretic Antimony, the Bezoardicum Minerale, Crabs-eyes, Hartshorn calcin'd, and philosophically prepared, Amber, Seal'd Earth, *Armenian Bole*, and *Cinnabar*. Of these various Medicines may be prepared, and used either alone, or in Conjunction with Acids. But, with respect to these, the Curious may satisfy themselves in *Antonius Schneberg*, in *Catal. Med. Simpl. advers. Pest.* *Henricius*, a *Bra. Unzerus*, *Lib. 2. Antid. Pestil.* and *Mindererus de Peste*, *Cap. 15.*

Among the Medicines conducive to the Cure of a Plague, none are more considerable than Analeptics; for in this Disorder the Strength is greatly impaired, not only by the Constriction and Terror of Mind, but, also, by the Malignity of the Disease. Hence the Physician is carefully to remove every thing, whether of a moral or natural Kind, which is prejudicial to the Strength; and, in the Cure, he must diligently avoid Anodynes, as, also, highly vaporious and fetid Substances. For recruiting the Strength, nothing is better than a Cordial Water, which is prepared in the following manner:

Take of *Turkish Baum*, four Handfuls; of Rose-leaves bruised with Salt, and of the Flowers of Lilies of the Valley, each one Handful; of recent Citron-peel, half an Ounce; of Cinnamon, one Ounce; and of Mace, half a Dram. Pour upon these, of *Rhenish Wine*, one Quart; of common Water, three Quarts; and, by a gentle Fire, draw off two Quarts and an half.

This Water, mixed with an equal Quantity of that of *Carduus Benedictus*, may either serve as a Vehicle for the other Medicines, or it may be exhibited alone with Syrup of Citron-juice, and acidulated with Spirit of Salt.

Nor are Emetics less beneficial in a Plague, since the first Intention of Cure is, with the utmost Expedition, to eliminate the received Poison from the Body. Now the contagious Miasma is first of all mixed with the Saliva, when it descends to the Stomach; whence it is convey'd to the Mass of Blood. Hence 'tis proper, with all Expedition, to eliminate the Poison by the same way it enter'd, and, at the same time, to evacuate, by Vomit, the Crudities of the Primæ Viæ, which greatly heighten its deleterious Quality. But this must be done as soon as any Person finds himself infected, and perceives a Languor and Cardialgia. Thus 'tis certain from Experience, that by these means, and the subsequent Use of Sudorifics, the Plague, and other malignant Disorders, may be checked in their Beginning. To this Purpose, there is a curious and memorable Observation in *Riverius*, concerning a certain Man, who, as soon as he found from the Symptoms, such as a Pain of the Head, and Nausea, that he was seized with the Plague, thrust the End of a Feather, immersed in Oil, into his Fauces; upon drawing which out, he evacuated, by Vomit, a Matter at first serous, then yellow, and at last porraceous. Then, betaking himself to his Bed, he took Broth, sweated, and was forthwith recovered.

The Use of Venesection is not equally agreed upon by all, since some condemn, whilst others approve of it. *Celsus*, in *Lib. 3. Cap. 4.* gives the following excellent Advice: "Pestilential Fevers, says he, require a particular Consideration, since, in these, Hunger, Medicines, or Purges, are by no means useful. But, if the Strength of the Patient permits, Venesection is highly beneficial, especially when the Disorder is accompanied with Pain." *Riverius*, also, affirms, that in a pestilential parotid Tumor, which destroy'd considerable Numbers, he preserved many by moderate and repeated Venesection; a few Ounces, for Instance, being only taken away. Venesection, however, is never to be used in the Beginning, or immediately after the Invasion, when the Patient is rack'd with Terror and Dread. But if there is a Plethora, and the Patient has sufficient Strength, it may be moderately used on the second or third Day. [Other Authors, however, recommend copious Bleeding in the very Beginning, as it should seem, upon very good Grounds.]

Neither are Physicians agreed about the Use of Nitre in a Plague: Those who condemn it think, that it refrigerates too much, and, for that Reason, resists the Expulsion of the Poison; and that the pestilential Poison is stupefactive and putridous, and therefore fatal Diarrhoeas are to be expected from its Use. Those, on the contrary, who approve of it, maintain, that, in Conjunction with Diaphoretics, it must be as beneficial in a Plague, as in other exanthematous, malignant, and inflammatory Fevers: But the Contest is easily decided; for the individual Nature and Constitution of the Patients are to be regarded, and the Symptoms of the Disease duly consider'd. If the Patient is plethoric, the Temperament choleric or sanguineous, the Heat violent, and the Fever intense, accompanied with Thirst, and an Head-ach, nitrous Substances exhibited in small Doses, with the bezoardic Powders, are highly beneficial. But where a Torpor and Drowsiness, a weak Pulse, a Coldness of the Extremities, and an excessive Fear, have preceded, Reason informs us, that nitrous Preparations are to be abstain'd from. But 'tis always safer to associate the Nitre with Camphire, by which Union the vaporious Nature of the Camphire, and the refrigerating Quality of the Nitre, are mutually corrected; by which means a Medicine is produced, which is not only alexipharmic, but, also, effectually resists Inflammation. I remember, when at *London*, to have heard an old Surgeon, who was at *Vienna* when the Plague raged in it, say, that he, with great Success, used what he called *The black Elestuary*, composed of Elder-rob, and Honey, each half a Pound; of Gunpowder and Camphire, each a Dram. The Dose is one or two Drams. And, *Giselerus* affirms, that, in the Plague of *Brunswick*, he, also, with great Success, used Gunpowder.

Besides these, critical Tumors, which terminate a Plague, are to be skilfully treated. Buboes are a good Sign, when they soon appear, and are quickly matured: But, when they immediately recede, Death is either to be dreaded, or, at least, a Train of terrible Symptoms. Thus, if inguinal Buboes disperse,

a Palsy, or a Gangrene of the Side, ensues: If Tumors under the Chin recede, an intercepted Deglutition, both of solid and fluid Aliments, follows, with a Quinsy, which generally proves mortal. Tumors behind the Ears are dangerous; those with Carbuncles on them, still worse; and those surrounded with a livid Circle, mortal. Carbuncles are always worse than Buboës, but they are the more dangerous, the larger, the blacker, and the nearer the Heart they are. In both, Sudorifics, and such Medicines as force the Humours to the Circumference of the Body, are most proper. When Buboës come slowly forward, attracting Medicines, Cupping-glasses, and Vescicatories, are ordered to be applied. If the Buboës are protuberant, the Suppuration is to be promoted by Cataplasms of Figs, white Lily-root, Onions roasted under the Ashes, Meal of Linseed, Honey, and Saffron; or we are to apply suppurating and discutient Medicines at the same time, such as the simple Diachylon-plaster, or that made up with the Gums, the Mucilage-plaster, and the Melilo-plaster. When the Buboës are suppurated, they are to be laid open, and cleansed with the Liniment of *Arcaus*, sometimes mixed with Basilicon; then they are to be consolidated, but not too soon, since 'tis better the sanious Matter should be suffered to flow for a considerable time. To Carbuncles, because the Humour is already subject to Corruption, we are not to apply Suppurants; but we are to endeavour to procure the falling off of the Crust: For which Purpose, the Authors who write on the Plague, order the adjacent Parts to be anointed with a Digestive, and some acrid Plaster, to be laid upon the Carbuncle. When the Crust is fallen off, the Carbuncles are to be treated with the Unguentum *Ægyptiacum*, or the Unguentum *Fuscum Wurtzii*, with Honey of Roses. But if a sphacelous Corruption is present, and seems to spread, it is to be checked by a sufficient Scarification, and the Application of some Liquor which powerfully resists Inflammation and Putrefaction. A Liquor of this Kind, much recommended as highly effectual, may be prepared in the following manner:

Take of rectified Spirit of Wine, four Ounces; of Camphire, two Drams; of Saffron, one Dram; and a Dram of artificial Nitre, which is prepared of urinous Spirit of Sal Ammoniac, and Spirit of Nitre: And let this be perfectly dissolved in Spirit of Wine.

As to the Regimen, it is to be observed, that, as in all exanthematous Disorders, so, much more in a Plague, excessive Heat, both of the Bed and Room, is to be avoided, as highly prejudicial. On the contrary, Cold is to be guarded against; lest, by its means, the Eruption of the Tumors, and the Exhalation of the poisonous Matter through the Pores of the Skin, should be prevented. In this Disorder, all things ought to be temperate, since Danger attends both Extremes. *Hoffman*.

PETALA. Petals; that is, the Flower-leaves of Plants. See the Explication of Botanic Terms, under the Article BOTANY.

PETALODES, *πεταλόδης*. An Epithet for the Sediment of Urine, importing scaly, or resembling Leaves; which is a Sign of an unequal Colliquation of the Parts of the Body, and sometimes of an Erosion, or Exulceration, of the Bladder. In Botany *Petalodes* is an Epithet for those Plants, which are furnished with Flower-leaves, or Petals; whereas those, which have none, are called *Apetalous*, that is, without Petals.

PETASITES.

The Characters are;

The Root is large and perennial; the Leaves are grey, large, and orbicular. The Calyx is cylindrical, multifid, squamous, and contains many Floscules collected into a Flower. The Flowers are disposed in a Thyrsus, and appear before the Leaves; and the Ovaries are furnished with a Tube, which has a clavated, bifid Apex.

Boerhaave mentions four Species of *Petasites*; which are,

1. *Petasites*; major; & vulgaris. C. B. P. 197. *Tourn. Inst.* 451. *Boerb. Ind. A.* 118. *Petasites*. *Offic. Ger.* 667. *Emac.* 813. *Raii Hist.* 1. 260. *Synop.* 78. *Petasites vulgaris*. *Park.* 419. *Petasites vulgaris rubens rotundiori folio*. J. B. 3. 566. **BUTTER-BUR.**

The Roots of Butter-bur are about a Finger thick, long, smooth-branched, and creeping in the upper Part of the Earth, having but few Fibres; they have a strong Smell, and an hot, aromatic, bitterish Taste; from these, early in the Spring, arise thick, hollow, downy Stalks, a Span high, clothed with small purplish Flowers, which consist only of a fistular Thrum, without any Border of Petala, which turn into Down: When these are past, the Leaves appear, which are very large, and roundish, but hollowed in next the Stalks, indented about the Edges, whitish and woody underneath, and green above; it grows by River-sides, and in marshy Grounds. The Flowers appear in the Beginning of *March*.

The Roots of Butter-bur are sudorific, alexipharmic, and good for all kinds of Fevers, and malignant, infectious, and pestilential Distempers; they are cordial, prevent Fainting; and

Shortness of Breath; they likewise provoke Urine, and are accounted good to destroy Joint-worms. They are outwardly applied, in the Form of a Cataplasm, to pestilential Buboës, and Plague-sores; a great Quantity of them are put into the *Aqua Theriacalis*. *Miller's Bot. Off.*

The Plant is extraordinary bitter, but not with an equal Degree of Acrimony. The *Germans* commonly call it the *pestilential Root*, because it is found, by Experience, to be of excellent Service in pestilential Fevers. They put the Roots, stripped of their Bark, in Vinegar, till it be sufficiently impregnated with their Virtues, and then exhibit it with the Juice of Rue and Theriaca; it is, also, recommended for an uterine Lipothymy, Difficulty of Breathing, Cough, and Asthma; and is effectual against the broad Worm, and provokes Urine, and the Menfes. Used outwardly, it is said to be good for Buboës, and malignant Ulcers. *Raii H. P.*

2. *Petasites*; minor. C. B. P. 197.

3. *Petasites*; minor, alter; *Tussilaginis folio*. H. R. Par.

4. *Petasites*; Africanus; *Calthæ palustris folio*. H. L. 488. *Blitum Africanum, Calthæ palustris folio, caule nudo, cubitali spicam pedalem et amplius sustinente*. *Plukn. Phytog.* 182. *Almag.* 68. *Boerb. Ind. alt. Plant.*

The Name *Petasites* is from *πέταος* (*petao*) to extend, because of the Largeness of its Leaves; or from *πέταος* (*petasos*) an Hat, or Bonnet, because the Leaves have a sort of Cavity in the Middle, and have their Margin expanded horizontally round it.

The first Species, in particular, and, also, the second, are officinal. The Root, Leaves, Pedicles, Stalks, and Flowers, have a singular Taste, not to be found any-where else. *Petasites* is heating, aromatic, and balsamic, by which its Virtues are understood. It is aperitive, and, in Cases where a Poison is very moveable, expels it by means of Sweat; whence it cures the Pestilence, and, in all *European* Languages, has a Name from that Disorder. They infuse a Dram, or half an Ounce, of the Root in Water, or Vinegar, and sweeten it with Honey; this procures a profuse Sweat, and so expels the Poison. This Property principally belongs to the Root, which is, also, esteemed an Alexipharmic. The Leaves, stripped of their outer thin Membranes, and applied to the Feet of hydropic or leucophlegmatic Patients, dissipate the watry Matter; for, being of an attenuant, aperient, and resolvent Quality, they excite Sweat, increase Perspiration, and, by that means expelling every thing that is volatile, discuss putrid, alkaline Matter, and exterminate them out of the Body. Preparations of the *Petasites* are, a Powder, Syrup, and Decoction. The Leaves and Flowers have the same Virtues as the Root, which later is to be taken up, before the Leaves come forth, or when the Flowers begin to appear; otherwise its Virtues are exhausted. They scrape off the Bark of the Root, and infuse the Shavings of the rest; then mixing this Infusion with the Juice of Rue, and a little Theriaca, they exhibit it as a most effectual Remedy against the Plague. The Leaves, outwardly applied, discuss Contusions. The Roots are, also, proper in the Pleurisy, when the Pus is concocted, and in Disorders of the Breast. *Hist. Plant. adscript. Boerhaav.*

PETECHIÆ. Red, or purple Eruptions, resembling Marks excited by the Bites of Gnats, or Fleas, which frequently appear in Fevers, and the Small-pox; and are always of very bad Prognosis. *Sydenham*, with great Reason, apprehends, they are very often excited, and exasperated, by too warm Medicines, and an over-heating Regimen.

PETECHIALIS FEBRIS. A Petechial Fever.

Petechial Fevers of the genuine Kind are of an highly malignant and contagious Nature, greatly prejudicial to the Head and Strength, accompany'd with Spots of various Colours appearing on the Skin; they arise from a Corruption of the vital Juices, and, in consequence of their subsequent putrid Dissolution, prove mortal.

These exanthematous Fevers are justly call'd *malignant*, or *poisonous*, since, for the most part, they are produced and propagated by an highly subtle Vapour, or Miasma, of an active and virulent Nature, exhaling from the Bodies of those afflicted with them. Besides, they are not to be cured without the greatest Difficulty; and, in a short time, prove mortal to many. They, also, quickly and greatly impair and destroy that Strength, on which the Motions, which sustain and support Life, depend. And lastly, they at first appear to be of a mild and gentle Nature, and often impose so far upon Physicians and By-standers, as to be mistaken for catarrhal Fevers; but afterwards exert their pernicious Effects with so much the greater Violence.

But the deleterious Nature of Petechial Fevers may be known from the following Signs: At first the Patients generally complain of so great a Weakness, and Loss of Strength, that they can hardly stand upright, or walk, but immediately faint away; whereas such a Weakness is only to be observed in the Vigour and Height of other continued and acute Disorders. The Head is, also, in the Beginning of this Disorder, afflicted with Pain,

Pain, Heat, and a Torpor; the Mind is dejected, anxious, uneasy, loses all Hopes of Recovery, and prognosticates the worst. A continual Watching torments the Patient, nor does he ever enjoy a refreshing Sleep; his Appetite is lost, and his Countenance dejected; his Pulse is languid, small, and unequal; his manner of lying in Bed is preternatural and irregular, since with his Limbs folded, as it were, together, he tosses his Body perpetually. His Breast is oppressed, and this Oppression is sometimes accompany'd with a dry Cough; the Fibres of the Muscles are convulsed by a kind of undulatory and tremulous Motion, whilst the Tendons are contracted, and are affected with Twitchings. Many Patients, labouring under Petechial Fevers, neither complain of Thirst, Heat, Pain, nor Anxiety; but rather affirm, that they are sensible of no Indisposition, except an unusual Languor, and want of Sleep. The Urine is, at first, thin, like that of sound Persons. On the fourth, fifth, or even the seventh Day, appear Spots, frequently of various Colours, especially on the Back and Loins, sometimes more, and sometimes fewer in Number; but, for the most part, without affording any Relief to the Patient; for which Reason they are rather to be esteemed symptomatic than critical.

The Antients gave these Spots the general Denomination of *Exanthemata*; but the Italian Writers have since called them *Petechia*, from the Word *Pedecchio*, because they resemble the Bites of Fleas. The French Authors have call'd them *Purpurata*, from their purple Colour; the Spaniards, *Tabardillo*, from their redish-yellow Colour; and the Germans, *Puncticulæ*, or *Lenticulæ*, because in Figure and Colour they resemble a Lentil; whilst the Hungarians denominate this Disease from the Pain and Delirium which attend it. But, besides the Figure of the Spots, Petechial Fevers differ from other exanthematous Disorders in this, that the Spots in the former not only appear without any Degree of Heat, Itching, Elevation, Asperity, and Exulceration of the Skin, but, also, for the most part, without affording any Relief to the Patient, because the Matter of them is not of a saline and caustic, but rather of a putrid and corrupted Nature.

These Spots are so far from affording any Hopes of Recovery, that, on the contrary, the more numerous they are, the greater Degree of Corruption they discover; and when they are of a livid, leaden, or blackish-green Colour, they are plain Proofs of a sphacelous Corruption. It is, also, to be observed, that those, who escape the Fury of this Disease, are recovered, not by any cutaneous Eruptions, but either by profuse Sweats, of a fetid, acrimonious Smell, or by critical Fluxes. But such an happy Event only happens by the Strength and friendly Concurrence of Nature in those Persons, whose Juices are not as yet greatly corrupted, but are as yet temperate, and retain something of an alexipharmic Quality. Many Patients, labouring under Petechial Fevers, rather die, either of a sphacelous Corruption in the Stomach, Intestines, and other Viscera, or of a Phrenitis, or, which happens more frequently, of an anginous Inflammation of the Fauces and Oesophagus; the Carcases, in the mean time, of such Patients diffusing a most intolerable Stench immediately after their Death. This fatal and unlucky Event is prognosticated by the following Signs: If the Patient's Thirst is either none at all, or insatiable; if the Tongue is dry, furrowed, and blackish; if the Fauces are inflamed, and covered with *Sordes*, and the Deglutition is difficult; if, after the Eruption of the Spots, the Respiration becomes difficult, and the Uneasiness of the Breast not only continues, but is increased; if, after Sweat, or a Flux, the Delirium, and other Symptoms, are augmented, whilst the Urine is neither turbid, nor deposits a Sediment; if the Eyes become dim, the Mind totally delirious, and the Patient pick the Knaps of the Bedcloaths; if there is a subfultory Motion of the Tendons; if the Excrements are involuntarily discharged; if the Patient is covered with a cold Sweat; and, lastly, if Convulsions come on, which put an End to Respiration and Life.

The formal Cause of these pernicious Fevers consists in a putrid Dissolution or Colliquation of the Blood, and vital Juices, and especially in the Contamination, and totally peccant State, of that most subtle, elastic, and lymphatic Fluid, which, being originally contained in the Blood, secreted in the Brain and spinal Marrow, and distributed through the Nerves to the whole Body, conveys Sensation, and a Power of Motion, to all its Parts; for that this poisonous Vapour, by which even sound Bodies are infected, is of such a Nature and Power, as not gradually to induce a putrid Fermentation on the Blood, and other Humours of the Body, but, also, penetrate immediately to the interior Recesses of the Brain, and nervous Parts, and there to corrupt the subtle nervous Fluid, is obvious from this; that, as soon as such a poisonous Vapour is received into the Body, the natural, vital, and animal Strength begins to languish, even in perfectly sound Habits, whilst the Crasis of

the Blood and Humours as yet remains entire, and free from Corruption.

This virulent and contagious Miasma principally enters the Body by the Nostrils, Fauces, and Bronchia; for in no Part of the Body are there more open and less defended Nerves, than those in the Nostrils distributed from the *first and second Pairs*. Whilst, therefore, this deleterious Vapour parties with the Air through these Nerves, it is not surprising, that it should immediately reach the Nerves and Brain, and that the Persons, who have this Misfortune, should be immediately seized with a kind of Intoxication, a Torpor of the Head, a Languor of Strength, and a Vertigo. But this contagious Miasma, most of all, mixes itself with the Saliva, and, with it, descends to the Stomach; which, as being, also, a nervous Part, is generally the first Seat of these contagious Fevers. Hence the first bad Symptoms, for the most part, discover themselves first in the Stomach and Præcordia; such as a Nausea, accompanied with an Inclination to vomit; frequent Stools, accompanied with Gripes; or violent Costiveness; Loathing of the Food; Anxieties of the Præcordia, a Cardialgia, and frequent and copious Eructations of Lymph from the Stomach. And it is evinced by Anatomical Observations, that, in Persons who have died of Petechial Fevers, the Stomach has, beyond all other Parts, been found affected with a sphacelous Corruption. But whilst this Miasma is mixed, not only with the Saliva in the Mouth, but, also, with the Gastric Liqueur, and the Pancreatic Juice in the Stomach, its contagious and propagating Force is much augmented; for it is universally agreed upon, that these salival Juices, subservient to the intimate Digestion of the Aliments, are of so subtle, spirituous, aerial, elastic, and fermentable a Nature, that sweet Substances, with which they are mixed, are forthwith put into a fermentative Motion. Hence these Juices, already in an intestine fermentative Motion, readily conspire with the subtle and putrid Miasma, when conveyed to them; so that the latter propagates itself, and is increased, exactly in the same manner, as a small Piece of Leaven ferments a large Mass of Dough.

Hence the Reason is sufficiently obvious, why, in order to avoid the Contagion of Petechial Fevers, nothing has, by the most skilful Physicians, been observed to prove more effectual, than avoiding the Breath of the Infected, especially when the Disorder is at its Height, and the Putrefaction greatest; frequently discharging the Saliva, and holding such Substances in the Mouth, as have a Tendency to evacuate it; chewing the Roots of Angelica, Zedoary, Masterwort, and Burnet; or smoking Tobacco. Hence, also, the Reason is obvious, why this deleterious Miasma is far most easily received, and soonest exerts its pernicious Force, in a Stomach that is loaded with a large Quantity of Crudities, and pituitous or salival *Sordes*. Hence, also, the Reason appears, why gentle Emetics, in Conjunction with Alexipharmics, in Persons recently infected, are the most effectual Means of checking a Petechial Fever in its Beginning.

I am of Opinion, with *Hippocrates*, that these contagious Fevers derive their first Origin from some common and prevalent Intemperature of the Air; such as a long-continued, moist, rainy, cloudy, as also a close, hot, and moist State of the Atmosphere; which, by reason of the large Quantity of aqueous Vapours, obtund and depress the brisk, elastic, and expansive Force of the Air, which sustains such a Motion of the Solids and Fluids, as is necessary to Life. Hence the salutary Excretions, especially Perspiration, become languid and disturbed; whilst the useless, superfluous, and corrupted Parts are retained in the Habit; which, being accumulated in the Blood and Juices, must necessarily generate a strong Tendency to Corruption and Dissolution. Besides, under such a Constitution of the Weather, Vegetables and Grain acquire a kind of foreign Nature, which is unfriendly to the human Constitution; for it is certain from Experience, that, during a long Tract of moist and rainy Weather, there is found, especially in Rye, a large Quantity of the Darnel, which is of a noxious and almost poisonous Nature. Nor does Rye, produced in such rainy Seasons, yield so large a Quantity of Spirit, nor prove so salutary and nourishing Bread, as that which grows during dry and hot Weather; so that it is not surprising, that such unsalutary and corrupted Aliments should dispose the Body to Putrefaction.

Besides, the Air is rendered insalutary, and unfit for generating putrid Disorders, by frequent and long-continued Inundations; for, in this Case, the Water stagnating, especially by means of the Heat of the Sun, begins to grow putrid, and sends up many noxious Effluvia into the Atmosphere. Large Quantities, also, of various kinds of Insects are generated about stagnant Waters, from which a large Portion of caustic, saline, deleterious, and subtle Matter is exhaled into the Air. Now, that these things are highly prejudicial to Health, is certain from various Observations, which evince, that, after large Inundations,

dations, contagious and almost pestilential Fevers have been produced. See *Hoffman, de Temp. Ann. insalub.* Of the same offensive and insalutary Nature is the Air, when impregnated with Exhalations arising from uninterred and putrefying human Carcases, or from the Excrements of Animals; and especially when such an Air is confined, and deprived of the Access of a more pure Atmosphere.

Not only an impure and insalutary Air, but, also, the particular Habit and Disposition of the Body, contributes to the Generation of Putrefaction, and, consequently, to the Production of Petechial Fevers. Thus it is certain from Experience, that phlegmatic and sanguineous Persons, those of lax and spongy Habits, those of timorous and anxious Minds, and those whose Strength is exhausted by Luxury, the excessive Use of improper Aliments, Drunkenness, Venery, Hunger, protracted Sorrow, Watchings, Fatigue, or Hæmorrhages, are not only easily and frequently seized with Petechial Fevers, but also with Difficulty recover from them; for no other Reason, than that their impure and weak Bodies have a strong Disposition to Putrefaction and Corruption. Cachectic Women, also, and those affected with a Suppression of the Menstrues, those labouring under a Lues Venerea, and such as have the dire Remains of it in their Habits, are not only readily seized with Petechial Fevers, but, also, escape with great Difficulty.

Hence we may easily judge, why these contagious Fevers rage so frequently in Camps, where all the Causes productive of this Disorder generally concur; for the Soldiers are sometimes exposed to a dry and hot Air, and, immediately after, to a moist and cold Atmosphere. They sleep in the open Air, and often in moist and marshy Places. The Excrements of Men and Animals are every-where to be found. Nor, on account of the Intrenchments, is there any Access to the Wind, in order to dissipate the fetid Exhalations. They eat improper, and sometimes absolutely corrupted, or half-boiled Aliments. They drink stagnant and putrid Waters, and have their Strength impaired by Hunger and Watchings. Hence, when, from this laborious and hard Course of Life, they retire to their Winter-quarters, indulge themselves in Ease, and eat copiously, the internal Corruption, gradually contracted, at last increases so far, as to appear in a Petechial Fever; for which Reason Disorders of this Kind are more frequently observed in the Winter-quarters, than in the Camps of Soldiers. For the same Reason these malignant and contagious Diseases are more incident to poor Persons, who live in Filth, and are confined, in small Cottages, to a vapid and impure Air, than to opulent Persons, who have better Opportunities of observing the Rules of Health, with respect to Air and Regimen. These Fevers, also, frequently happen in Hospitals, Nurseries for Orphans, and public Prisons, where many are kept together, and lead a miserable Life, which poses the Body for receiving the Contagion.

The CURE.

In order to preserve ourselves from Petechial Fevers, nothing is of greater Importance, than that, during insalutary Seasons of the Year, fit for generating malignant Disorders, we should carefully avoid an Air impregnated with noxious Vapours and Exhalations, and destitute of a brisk and elastic Expansion. Besides, since, under such a Constitution of the Air, the Bodies of People are weak, and disposed for contracting Diseases, it is highly expedient, that, at such Seasons, we should abstain from every thing, which can either impair the Strength, or render the Excretions more languid; such as violent Commotions of Mind, Grief, Terror, Care, intense Meditation, protracted Watchings, and exposing the Body to Cold, especially in the Night-time, or with thin Cloaths in cold Weather. Besides, the Increase of Crudities in the Primæ Viæ is to be prevented; for which Reason we are to abstain from eating excessively; especially of insalutary Substances, from Surfeits, the continual Smoking of Tobacco, and the profuse Use of Coffee, which, as it is unfriendly to the Stomach, so it is much more the nervous Parts, and the Mixture of the vital Fluids. We are to take care to breathe a salutary and pure Air; for which Reason we are to avoid low Places, in which the Air readily becomes vapid; as, also, Houses, which are not exposed to a free and open Air. The excessive Humidity of the Air is, also, to be corrected by Fires, and Fumigations by Mastich, Amber, and Juniper-berries.

But, among all the Preservatives against Petechial Fevers, I know none more effectual, than the moderate Use of good Wine, especially of the *Rhenish* Kind; for this, drank moderately in the Morning, or even at Meals, surprisingly sustains and recruits the Strength; promotes the Circulation of the Blood, and the several Excretions; assists the Digestion of the Aliments; and excellently resists Putrefaction, especially when moderate Exercise, and some other diluting Liquor, are used in Conjunction with it. I can, from long Experience, affirm, that in epidemic Disorders, arising from a moist Constitution

of the Air, those who observed a good Regimen, and daily drank a moderate Quantity of laudable Wine, escaped: Those, also, who have written concerning the Plague, affirm, that Wine is one of the best Preservatives against that Disorder. And I venture to assert, that, after a Crisis happens in Petechial Fevers, there is no better Medicine, than Wine, for reinforcing the languid Strength, and promoting cutaneous Excretion.

In the Beginning of Petechial Fevers no Medicines are more beneficial than Acids, especially Citron-juice put into Pisans to be drank, in order to extinguish the Heat; and remove the Putrefaction, as, also, Wine-vinegar either simple or distilled, joined with Mixtures of proper Waters, and fixed diaphoretic Powders. Besides these, such Medicines are, also, proper, as, without impairing the Strength, colliquate the Saliva, and free the Breast from Infections; for, with the celebrated *Cramerus*, I have often observed, that hardly any Persons, who had a copious Discharge of Saliva and Spit, died of Petechial Fevers. For this Reason, the Physician now mentioned, in these Disorders, made frequent Use of alexipharmic Mixtures, composed of distilled Vinegar, or Vinegar of Scordium and Cinna-bar, and sometimes of bezoardic Mineral, and Oxymel of Squills. But it is an horrid Practice, in the Beginning of Petechial Fevers, to exhibit volatile bezoardic and sudorific Medicines, with an hot Regimen, and boiling-hot Infusions; for by these means the intestine putrid Motion is increased; an Orgasm brought on; and a greater Loss of Strength produced.

In the Decline of a Petechial Fever, no Excretion is more salutary, than that made by Stool coming on at a proper time: I have found from a Series of more than fifty Years Experience, that Fevers of this kind were rarely terminated by Sweats and Hæmorrhages alone, but more frequently by a Diarrhoea appearing on the seventh, the ninth, or the eleventh Day; and that nothing was more prejudicial, than stopping a violent Diarrhoea, or a critical Flux, in the Beginning. I have, also, found from Experience, that, in Cases where catarrhal, malignant, and exanthematous Disorders have been terminated by Fluxes, the Patients have escaped the white Purple Fevers, which, in the Decline of a Petechial Fever, when the Pulse is become equal, frequently supervenes about the eleventh Day, not without great Danger to the Patient. The most skilful Physicians have long ago adverted to the Salubrity of Fluxes in Disorders of this Nature. Thus *Hippocrates*, in his *Epidemics*, informs us, that those who labour under acute Fevers of this kind, were cured by Fluxes. *Galen*, also, in his *Treatise de atra Bile*, Cap. 4. informs us, that, in a certain pestilential Constitution, a Diarrhoea proved highly salutary. *Gerardus Columbus*, also, in his *Treatise de Pestil. Febr.* highly extols the beneficial Effects of Fluxes, in these Words: "All, who had copious Fluxes, though with the Signs of Crudity, were at last cured; for, as the Flux proceeded, the Signs of Concoction appeared, the Disease became milder, and, the Flux still continuing, the Patients were totally and entirely cured." This Doctrine is, also, confirmed by *Valleriola*, in *Obs. Lib. 6. de Febr. Schenkii*, *Observat. Lib. 6. de Febr. Riverii*, *Observat. Cent. 1. Observat. 47 & 48. and Cent. 2. Obs. 34 & 87. Horstius*, in *Observat. 10. Johannes Rhodius* in *Cent. 2. Obs. 85. Secreta, de Febre castrensi maligna*, Cap. 4. and *Bonetus* in *Thes. Pract. de Febr. putr.* as, also, in his *Treatise de Causo*, Cap. 2.

This is, therefore, the Method of Nature, with which the Physician ought to act in Concert, and which he ought to assist, if weak and defective. I am convinced from Experience, that whatever is to be expected in the Cure of putrid, malignant, pestilential, and Petechial Fevers, consists in a seasonable Use of such Medicines, as, with Safety, render the Body soluble; but these ought principally to be exhibited about the critical Days, that is, from the seventh to the fourteenth; for, if they are used in the Beginning, they do but little Service, because the Matter is not then concocted, and fit for Excretion; but as, in order to render the Body soluble through the whole Course of Petechial Fevers, there is nothing more prejudicial, than those Medicines, which act by a certain caustic Acrimony, Senaleaves not excepted; so nothing is more proper for this Purpose, than such Substances, as have nothing in their Contexture capable of impairing the Strength, but render the Body soluble in a mild and gentle Manner. The most considerable of these is a due Dose of Manna, mixed with a sufficient Quantity of Cream of Tartar, which, on account of its grateful Acidity, is, also, beneficial in these Disorders. This Intention is, also, answered by solutive Syrup of Roses, mixed with a saline Stimulus, prepared of Cream of Tartar, Sal Polychrest. or antimoniated Nitre; and exhibited in a due Dose, at a proper Season, and with some diluting Vehicle, such as Whey duly prepared; or temperate mineral Waters, such as the *Antonian* and *Wildungensian* Springs. No less excellent for the same Purpose is the Pulp of Tamarinds, or Decoctions of them prepared with

with Manna, or Rhubarb. How excellent Effects are, in Petechial and malignant Fevers, produced by Laxatives, we are informed by *Moræus*, in his *Treatise de Malign. Febr.* where he gives us more than twenty Instances, in which he, with great Success, used Pulp of Tamarinds, and an Infusion of Rhubarb, Sena-leaves, Cream of Tartar, and Manna, in the Water of Wood-sorrel.

But, in the Cure of Petechial Fevers, Physicians are not agreed with respect to the Propriety of Venesection; and, indeed, it must be owned, that there is so great a Difference between malignant Fevers, that the most skilful Physicians are often lost and bewildered in investigating their Natures; but it is certainly true, that, when such Fevers afflict plethoric or plethorico-cachochymical Patients, Venesection is highly proper, as a Preservative; as, also, in those accustomed to Venesection, high and luxurious Living, or a sedentary Life; for I have found from Experience, that those, from whom Blood has been previously taken away, either were not seized with those Disorders at all, or were less affected, and more easily recovered, than those who had not the Advantage of Venesection.

But it is carefully to be observed, that both during Petechial Fevers, and in their Decline, the languid Stomach is not to be overloaded with Aliments, much less with those of an insalutary kind, and especially with large Quantities of Flesh. It is a vulgar Error, especially among the common People, to believe, that the Strength is restored by Aliments. But this is one of the principal Causes, why Patients, who sometimes think themselves past Danger, yet find themselves miserably mistaken; since, by this means, the former Disorder returns, and more effectually endangers Life; or a new Disease supervenes. *Hoffman*.

PETIA. A Rag formed into a *Nodulus*, or Bag, in order to contain Medicinal Ingredients. *Petia Oculi* is an Hæmorrhage from the Eye. *Costellus*.

PETICULÆ. The same as **PETECHIÆ**.

PETIGO; the same as *Impetigo*. See **LEPRA**.

PETIOLUS. The Pedicle, or Stalk, of a Fruit.

PETIVERIA. Guinea Henweed.

The Characters are;

It hath a Flower consisting of four Leaves, which are placed almost in the Form of a Cross, from whose Cup rises the Pointal, which afterwards becomes the Fruit, which is bordered and cut at the Top, resembling an inverted Shield, containing oblong Seeds.

Miller mentions but one Species of this Plant;

Petiveria folani foliis, loculis spinosis. Pluk. Nov. Gen.

This Name was given to this Plant by Father *Plumier*, who discovered it in *America*, in Honour to Mr. *James Petiver*, an Apothecary, who was a curious Botanist.

It is a very common Plant in *Jamaica, Barbadoes*, and most of the other Islands in the *West Indies*, where it grows in shady Woods, and all the *Savannas*, in such Plenty, as to become a very troublesome Weed; and, as this Plant will endure a great deal of Drought, so it remains green, when other Plants are burnt up, which occasions the Cattle to browse on it; and, having a most unfavourable strong Scent, somewhat like wild Garlic, it gives the Cows Milk the same Flavour; and the Cattle, which are killed soon after feeding upon this Plant, have a most intolerable Scent, so that their Flesh is good for little. *Miller's Dictionary*.

PETRÆ OLEUM. See **NAPHTHA** and **PETROLÆUM**.

PETRACORIUS LAPIS. Geoff. *Prælect. Angl. Edit.* 179.

THE PERIGORD STONE.
This is a fossil ferruginous Substance, black, hard, and heavy, seeming to contain some Particles of Iron. It is dug in the Mountains of *Dauphiny*, and used only in painting earthen Vessels, and by the Enamellers. *Geoffroy*.

PETRELÆUM. See **PETROLÆUM**.

PETRIFICATIO. See **ANCUBITUS**.

PETROLÆUM. See **NAPHTHA**.

In *Brofely, Bently, Pitchford*, and other Places adjacent in *Shropshire*, there lies over most of the Coal-pits, or Mines, a Stratum, or Layer, of a blackish Rock, or Stone, of some Thickness, which is porous, and contains great Quantities of bituminous Matter.

This Stone, being brought to the Workhouse, is ground small by Horse-mills, such as are used for grinding Flints, to make Glass of; the Powder is thrown into great Coppers of Water, where, by Boiling, the bituminous Matter is separated from the stony, or gritty, this last sinking to the Bottom, the other swimming at the Top.

This bituminous Substance, being gathered together and evaporated, comes to the Consistence of Pitch, and, with the Help of an Oil distilled from the same Stone, and mixed with the Pitch, comes to be thinner, or like Tar; the Uses of both which Materials, either for Shipping, or otherwise, these Substances

are said to supply, and even to excel. This has been tried on several Boats, and it does not crack, like the ordinary Pitch or Tar, but always keeps black, or soft; and therefore is proposed to hinder the Worms from getting into the Ships pitched with it.

There is, likewise, distilled from this Stone an Oil, which may be used for Oil of Petre, or Turpentine, and has been tried in Akes and Pains. *Philosophical Transactions*.

This Oil has lately been advertised as a secret and excellent Topic for Pains, by the Name of *Oil distilled from a flinty Rock*.

PETROMARULA. A Name of a *Cretan* Species of *Rapunculus*. *Raii Hist. Plant.*

PETROSELINUM. See **APIUM**.

PETROSUM OS. The hard Part of the Temporal Bone. See **CAPUT**.

PETUM. Tobacco. See **NICOTIANA**.

PEUCE. The Pine-tree, or *Larix*.

PEUCEDANUM.

The Characters are;

The Root is perennial, deeply sunk, and hairy. The Leaves are winged, narrow, grassy, and divided into three Parts. The Seed is flat, almost oval, slightly striated, and marginated.

Boerhaave mentions three Species of this Plant; which are,

1. *Peucedanum majus*; *Italicum*. *C. B. P.* 149. *M. U.* 36. *Tab. 9.*

2. *Peucedanum majus*; *Italicum foliis longis, angustis. An ferula Orientalis, Peucedani folio?* *T. Cor.* 22.

3. *Peucedanum Germanicum*. *C. B. P.* 149. *Tourn. Inst.* 318. *Boerb. Ind. A.* 66. *Peucedanum*. *Offic. Ger.* 896. *Emac.* 1054. *Raii Hist.* 1. 416. *Synop.* 3. 206. *Peucedanum vulgare*. *Park. Theat.* 880. *Peucedanum minus Germanicum*. *J. B.* 3. 36. *Peucedanum, Pinastrilla, Fœniculum porcinum*. *Merc. Bot.* 1. 58. **HOGS-FENNEL**.

The Leaves of this Plant are large and winged, observing a tripartite Division, and having three Leaves upon one Stalk, which are much broader and flatter than common Fennel. The Stalk grows to be about two Feet high, divided toward the Top, hollow and striated, on which grow broad flat Umbels of five-leav'd yellow small Flowers, which are succeeded by larger and flatter Seed, than that of Fennel. The Root is thick and long, of a dark-brown Colour, being somewhat hairy, or beset with small setaceous Villi on the Top, of a very strong sulphureous Smell: It grows in several Places by the Seashore, and flowers in *July*. The Root is the only Part used, and that not often.

Hog-fennel is accounted good to clear the Lungs of tough viscid Phlegm, and thereby to help old Coughs, and Shortness of Breath; it, likewise, opens Obstructions of the Liver and Spleen, and helps the Jaundice; it, likewise, provokes the Menes, and gives Ease in Labour-pains; the Juice, snuffed up the Head, is commended by the Antients, against the Lethargy, Apoplexy, Epilepsy, and other Disorders of the Head and Nerves. *Miller's Bot. Off.*

The Root, and the other Parts, of the *Peucedanum* are endowed with a cathartic Virtue, as we are inform'd by the Antients; but, on account of its fetid and rank Smell, were not much used.

Peucedanum expectorates tartareous Mucus, and extracts Bile; it provokes Urine, and is said to be good for the Stone. Outwardly it is of Service in the Hemicrania, and other Pains incident to the Head, and proceeding from Catarrhs; in renitent Tumors; and for cleansing old Ulcers. *Raii Hist. Plant.*

The Name *Peucedanum*, is from *Πεύκεν*, (*Peuce*) a Pine-tree, which it resembles in its Leaves.

It is commended by the Antients for discussing inflammatory Diseases; for which Purpose, they prescribe a Decoction of the Root in Water, sweetened with Honey, and drank warm. Hence it is very proper for resolving a Pleurisy and Peripneumony, when they may be remov'd by an Anacatharsis, or Expectoration. They prescribe it, also, for Bloody Urine, and the Stone or Gravel in the Kidneys. It provokes Urine, is an excellent Resolver of Phlegm, and cleanses the Kidneys of every thing which adheres to them; for which Purpose the Root is boiled in Wine. It is commended as of Service in the Beginning of a Cataract, and in a Redundance of Phlegm, and as an excellent Resolver and Dissolver of all Obstructions. The Root is very good for the hysteric Passion; and is possessed of a balsamic, deterging, and gently heating Virtue; and is of extraordinary Use for cleansing Wounds and Ulcers. *Hist. Plant. adscript. Boerhaav.*

PEVETI. *H. M. Baccifera Indica, Floribus ad Foliorum Exortus, Fructu sulcato decapryeno Solanum somniferum Antiquorum.* *Alpin. Exot. forte.* A bacciferous Tree growing in *Malabar*, of whose Leaves they prepare a vulnerary Ointment. *Raii Hist. Plant.*

PEXIS, πῆξις. Congelation, or Concretion.

PEZA,

PEZA, *πέζα*. The Malleolus, or Sole of the Foot; and, according to some, the very Bottom of the Sole. *Pollux* says, that the Part under the Tibia is called *Sphurion*, and *Peza*. In *Galen's* Exegetis, under *Πέζα*, we read as follows: "In the second Book *de Morb. Mul.* it is written, *ἡ ὑπὸ τοῦ ὀστέου πλάτης, ἡ πέζα πρήσσει* [and the Feet swell, and especially the *Peza*]. *Zenodotus*, in his *Gentilia Vocabula*, [Words proper to certain Countries] says, that the *Arcadians* and *Dorians* call the Foot *Peza*; but *Hippocrates* seems to call by that Name, either the Bottom of the Sole, called *Pedion*, or the *Malleoli*." *Cornarius*, in his *Hippocrates*, renders it by *Pedum Extremitates*; and *Celsus*, by *Tali*.

PHACE, *φακή* or **PHACOS**, *φακός*. A Lentil.

PHACODES, *φακίδες*. Of the Colour of a Lentil.

PHACOIDES, *φακοειδής*. Of the Form of a Lentil; an Epithet for the Crystalline Humour of the Eye.

PHACOPTISSANA, *φακοπτισσάνη*. A sort of Aliment prepared of Ptisan and Lentils. *Galen, de Aliment. Facultat.*

PHACOSIS, *φακώσις*. A black Spot, in the Eye, resembling a Lentil.

PHÆNOMENA. Appearances. Whatever happens to Bodies, and falls under the Cognizance of the Senses, either according, or contrary to Nature, is called *A Phenomenon*.

PHÆON COLLYRIUM. The Name of a *Collyrium*, described by *Scribonius Largus*.

PHAGEDÆNA, *φάγεδαινα*, from *φαγεῖν*, to eat, feed upon, is taken sometimes in a general Sense, as signifying all Kinds of Ulcers, which corrode the sound Parts adjacent to it; and grow still worse as they spread; sometimes it means only a particular Sort of Ulcer, as distinguished from other Kinds, as an *Herpes*, *Noma*, and the rest, in which Sense it is defined to be a tumid and deep Ulcer corroding the subjacent Flesh, and the Parts around it. This is the Substance of what *Galen* says on the Subject, in his Comment on 6 *Aph.* 45. The same Author, in his Book of *preternatural Tumors*, makes the characteristic Difference between an *Herpes* and a *Phagedæna*, to consist in this; that the former spreads itself only by Corrosion and Exulceration of the Skin, but a *Phagedæna* by corroding, also, the subjacent Parts. *Celsus, Lib. 6. Cap. 18.* makes a *Phagedæna* in the Penis, a Species of *Cancer*.

Phagedæna is, also, used, in a kind of metaphorical Sense, to signify an Affection of the Stomach, much the same with the *Caninus Appetitus*, as appears by the Definition given of it, by the Author of the *Definitiones Medicæ*. *Pliny, also, Lib. 26. Cap. 11.* makes *Phagedæna* to signify sometimes a Disorder, under which the Patient eats immoderately, and sometimes a sort of Ulcer; and *Helychius* gives the same double Exposition of the Term.

PHAGOS. A Name for the *Quercus*; *parva*; five *Phagus Græcorum*, & *Esculus Plinii*.

PHAGRUS, or **PAGRUS**. The Name of a Sea Fish, about a Foot long, not unlike a Roach, but larger, and thicker.

The Stones found in the Head of this Fish, when reduced to a Powder, and exhibited internally, are of an aperient Quality, and proper for removing the Stone of the Kidneys, rendering the Body soluble, and correcting the acid and acrid Humours of the Stomach. The Dose of this Powder is from half a Scruple to half a Dram. *Lemery des Drogues.*

PHALACRA, *φαλακρά οὐδένηα*, in *Hippocrates*, are blunt and smooth iron surgical Instruments, as a Probe, or any other, with a Button at the End.

PHALACROCORAX. The Cormorant. The Skin is said to be good to fortify and warm a weak Stomach, if apply'd thereto. *Lemery des Drogues.*

PHALACROSIS, *φαλακρωσις*. Baldness.

PHALÆNA. The same as *Balæna*, the Whale.

PHALAIA. A barbarous Term introduced by *Basil Valentine*, importing an universal internal Medicine; or *Panacea*; But *Roslinkius* uses this Word to express a Tincture of Jalap.

PHALANGIA. A very large Sort of Spider, common in hot Countries, as *Italy*, *Spain*, and the *Indies*. They are said to cure an intermittent Fever, if they are bruised, and applied to the Wrists, a little before the Fit. *Lemery des Drogues.*

PHALANGITES, *φαλαγγίτις*. A Name for the *Liliastrum*; *Alpinum*; *minus*. It is thus called by *Paulus Ægineta*.

PHALANGIUM. A sort of Insect, of the Spider-kind, whose Bite is said to be venomous.

They who have written of venomous and noxious Animals, have described several Species of the *Phalangium*, as the *Rhagium*, *Lupus*, *Formicarium*, *Granocolaptes*, *Sclerocephalus*, and *Scolecium*, in all six. The *Rhagium* is round and black, resembling the Stone of a black Grape, whence it has its Name; [*ράγιον*, *Rhagium*, signifying a Grape-stone]. Its Mouth is situated near the Middle of its Belly, and its Legs are very short on each Side. The *Lupus* kills Flies, and feeds on them; it has a broad and voluble Body; the Parts about its Neck are in-

dent, and its Mouth has three Eminences. The third Species, called *Myrmecium*, or *Formicarium*, very much resembles an Ant; it is of a sooty Colour, and its Body is marked with a sort of Stars, especially about the Back. The fourth, or *Cranocolaptes*, is somewhat long and green, and has a Bristle near its Neck, and, in its Attack, aims at the Head. The fifth, called *Sclerocephalus*, has an hard and stony Head, and all the Lineaments of those Animals, which fly about lighted Candles by Night. The last, which is *Scolecium*, or *Vermicarium*, is somewhat long and spotted, especially about the Head.

The Bite of these Animals is so small, as hardly to be discerned; but is followed by a livid, and sometimes a red Tumor, attended by a Coldness about the Knees, Loins, and Scapulæ. Sometimes the whole Body is oppressed with a Sense of Weight; accompanied with a continual Pain, Trembling, Paleness, and Want of Sleep. In some there is an Erection of the Penis, and an Itching about the Head, and sometimes about the Calves of the Legs; the Eyes are hollow, watery, and shed Tears; the Belly is unequally swelled, and the whole Body and Face are tumefied, especially the Parts about the Tongue, so as to cause an Impediment in the Speech. Sometimes the Patients are afflicted with a Dysury, accompanied with an Erection of the Pudendum, and a Pain. If they make Water, their Urine is aqueous, and contains something like Spiders Webs; and their Vomit, and sometimes their Stools, are of the same Nature. By bathing in warm Water, they fancy themselves eased of their Pain; but afterwards it returns with more Violence; and a painful Erection of the Penis; but, in old Persons, far from being erected, that Part suffers a great Relaxation. These are the Symptoms in general, which are common to the Bites of all those Creatures. Those which proceed in particular from the Bite of the *Cranocolaptes*, are an extraordinary Pain of the Head, Vertigo, a continual Coldness, Delirium, Restlessness, and a pungent Pain of the Stomach. They, who are bit by these Animals, are relieved by bathing every Day, and washing the Wound with the Decoction of *Trifolium bituminosum*, mixed with Oil. It is good, also, to foment the Wound often with Sponges dipt in warm Vinegar, and to anoint the Body all over with the most liquid Kind of Cerate. Proper Cataplasms are prepared of Bulbs, Sanguinaria, Leeks, Bran boiled in Vinegar, Barley-meal boiled with Bay-leaves in Wine of Honey, Rue, unripe Figs, Goats-dung in Wine, *Sampsuchus* with Vinegar; also, *Cyperus*. *Asclepiades* advises the following Cataplasim, which he much commends:

Take of the Seeds of Wild-rue, Rocket, Stavesacre, Cenchrys, and the Vitex, the Fruit or Leaves of the Cypress; of each equal Parts; bruise them in Vinegar, and make them into a Cataplasim with Honey: The same is good taken inwardly.

Another celebrated Receipt, to be used either inwardly or outwardly, is as follows:

Take of native Sulphur, Galbanum, each four Drains; Succus Cyrenæicus, two Drains; or, for want of it, four Drains of Laser; of bitter Almonds blanched, two Drains; Steep them in Wine, and make them up with Honey.

Eating of Garlick, Bathing, and Wine, are, also, proper Remedies. *Aetius, Tetrab. 4. Serm. 1. Cap. 18.*

PHALANGIUM.

The Characters are;

The Flower is naked, hexapetalous, furnished with six Stamina, and contains a roundish Ovary, full of angular Seeds; the Root is fibrous.

Boerhaave mentions six Species of *Phalangium*; which are,

1. *Phalangium*; parvo flore; non ramosum. *C. B. P.* 29. *M. H.* 2. 333.

2. *Phalangium*; parvo flore; ramosum. *C. B. P.* 29. *M. H.* 2. 333.

3. *Phalangium*; Africanum; floribus luteis, parvis. *Raii Hist.* 3. 564.

4. *Phalangium*; parvo flore; ramosum; foliis fistulosis; annuum. *H. L. Asphodelus, foliis fistulosis.* *C. B. P.* 29. *T.* 344.

5. *Phalangium*; Africanum; foliis cepaceis; floribus spicatis aureis.

6. *Phalangium*; Africanum; foliis Ficoidis; floribus spicatis, aureis. *Boerh. Ind. alt. Plant.*

PHALANGIUM is, also, a Name for several Sorts of **EPHEMERUM**.

PHALANGIUM ALLOBROGICUM. A Name for the *Liliastrum*; *Alpinum*; *minus*.

PHALANGOSIS, *φαλαγγώσις*. A Disease of the Eye, when the Margin of the Eye-lid turns inwards; so that the Hairs stimulate the Eye. See **OCULUS**. *Paul. Ægineta, Lib. 6. Cap. 8.*

PHALANX. The Bones of the Fingers are called *Phalanges*.

See **BRACHIUM**.

PHALARIS.

The Characters are;

It has a thick Spike, which is compos'd of a squamous Congeries of Husks, containing Seeds; Pairs of these hollow, carinated Husks, containing in the middle between them a Seed involv'd in a Hull, have the Appearance of Scales.

Boerhaave mentions eight Species of *Phalaris*; which are,

1. *Phalaris*; major; femine albo. C. B. P. 28. *Theat.* 534.
- Boerb. Ind. A. 2.* 158. *Raii Synop.* 3. *Phalaris*. Offic. Ger. 80.
- Emac.* 86. J. B. 2. 442. *Raii Hist.* 2. 1248. *Phalaris vulgaris*.
- Park. Theat.* 1163. *Gramen spicatum femine miliaceo albo*. *Tourn. Inst.* 518. **CANARY GRASS.**

It grows not only in the *Canary Islands*, but in *Tuscany*, among the Corn, and in *Spain*, and in *Languedoc* about *Montpellier*.

The Antients commend the Seed of *Phalaris*, the Juice of the Herb, and the Leaves, to be used inwardly under tormenting Pains of the Bladder. And we are inform'd by *Lobel*, that some have Bread made of it, which they frequently eat, in order to cleanse the Bladder from Stones, and all other Things which might incommode the free Discharge of the Urine. *Raii Hist. Plant.*

2. *Phalaris*; major; femine nigro. C. B. P. 28. *Theat.* 536.
- M. H. 3.* 186. *J. B. 2.* 443. *Gramen, spicatum, femine miliaceo, nigro*. T. 528.

3. *Phalaris*; alter; femine griseo. H. R. *Par. Gramen spicatum, femine miliaceo, griseo*. T. 519.

4. *Gramen*; tremulum; majus. C. B. P. 2. *Theat.* 22.
5. *Gramen*; tremulum; majus perenne. H. L. 196.
6. *Gramen*; tremulum; maximum. C. B. P. 2. *Prodr.* 5.
- Theat.* 24. *J. B. 2.* 470.

7. *Gramen*; paniculis elegantissimis; five *epiypensis*. C. B. P. 2. *Theat.* 26.

8. *Gramen*; tremulum; minus, panicula parva. *Boerb. Ind. alt. Plant. Vol.* 2.

The Seeds are highly aperitive; for which Reason they are of Service in the Stone of the Kidneys and Bladder. *Hist. Plant. adscript. Boerhaav.*

PHALERÆ, φάλαρα. A sort of Bandage for the Nose, describ'd by *Galen*, in his Treatise of Bandages.

PHANION, φανιον. A Name of two compound Medicines, describ'd by *Galen*, de C. M. S. L. Lib. 4. C. 7.

PHANLEC. Iron. *Rulandus*.

PHARICUM. The Name of an excessive poisonous Medicine, which, by great good Fortune, is unknown to the Moderns. *Scribonius Largus*, N° 195. informs us, that it was said to be compounded of many Ingredients; but not one of them is known.

PHARMACEIA, φαρμακεία. Purgation of the Belly by the Exhibition of a Cathartic. *Hippocrates*.

PHARMACEUTICA, φαρμακευτική. Pharmaceutics, that Part of Medicine, which gives the Description of Remedies, and teaches the Method of rightly exhibiting them. *Gorræus*.

PHARMACIA. Pharmacy.

PHARMACITES, φαρμακίτης, see **AMPELITES TERRA**.

PHARMACOCHYMIA, that Part of the Chymical Art, which teaches the Preparation of Chymical Medicines, by way of Distinction from the Spagirical Part, which treats of the Transmutation of Metals. *Castellus*.

PHARMACON, φάρμακον, signifies Poison, Medicine, and Colours in Painting. It is one of those Terms which *Aulus Gellius*, Lib. 12. Cap. 9. calls *vox media*, a middle Word between two Contraries, which may indifferently signify either of them.

PHARMACOPOEUS, φαρμακοποιός, from φάρμακον, a Medicine; and ποίω, to make, or prepare; is one well vers'd in the Art of preparing Medicines. *Castellus*.

PHARMACOPOLA, φαρμακοπόλης, from φάρμακον, a Medicine, and πωλείω, to sell, is properly one who sells Medicines. To illustrate the three preceding Articles, it may be proper to observe, with *Le Clerc*, that those who addicted themselves to Pharmaceutics, or Medicamentary Medicine, were called *Pharmaceutæ*, as says *Galen ad Thrasjib*. The Name *Pharmacopœus* was taken in an ill Sense, and signify'd a *Poisoner*, who was, also, called *Pharmacos* and *Pharmaceus*, from the Word *Pharmacum*, which signify'd indifferently all sorts of Drugs or Compositions, both good and bad, every Medicine or Poison, both simple and compounded. The *Latins*, in Conformity hereto used the Word *Medicamentum* for *Poison*, and *Medicamentarius* for *Poisoner*, tho' the last Word signify'd, also, an Apothecary, as the first did a Medicine. The Word *Pharmacopola*, among the Antients, signify'd one of another kind of Profession, whose Business was to sell Medicines; particularly it belong'd to such as are now called Mountebanks.

PHARMACOPOLIUM. An Apothecary's or Druggist's Shop.

PHARMACOPOSIA, φαρμακοποσία, from φάρμακον, a Medicine, and πείω, a Poison, is either any liquid Medicine in gene-

ral, or a liquid Cathartic in particular; in which latter Sense this Term; and *æquaxein*, are commonly used by *Hippocrates*, as *Galen* observes, *Com. ad 7 Aph.* 25. And thus are the Words used; 4 *Aph.* 19. and *Coac.* 251.

PHARMACOTA *Medicamenta*. Medicines which have a Mixture of Poison. *Castellus*.

PHARMACOTHECA, a Box, or Chest, for the Reception of Medicines. *Castellus*.

PHARMACUM. See **PHARMACON**.

PHARMACUM AD AURES. See **ÆGYPTIUM PHARMACUM AD AURES**.

PHARMIANUM. A Malagma so called. *Galen, Lib. 7. de C. M. P. G. Cap.* 6.

PHARYNGETHRON, φαρυγγέθρον, in *Hippocrates*, Lib. de Diffect. is the Pharynx, or Fauces.

PHARYNGÆUM SAL. An artificial Salt, of Use in the Quinsey, when the Pharynx, or Fauces, are incommode with a Defluxion of impure and serous Humours; it is prepared of Cream of Tartar, and Nitre, each one Ounce, with half an Ounce of bunt Alum, dissolved in distilled Vinegar, which Solution is afterwards coagulated according to Art. This Salt, mixed with two Drams of Honey, and dissolved in five Ounces of Plantain-water, makes an excellent Gargarism for the Quinsey. *Frederic Hoffman* from *Lobelius*.

PHARYNX, φαρυγξ. See **ŒSOPHAGUS**.

PHASEOLUS.

The Characters are;

It has a long Pod, full of Kidney-shap'd or oval Seed; the Plant, as to its Habit, or outward Appearance, is flexible, scandent, and, for the most part, trifoliated, or has its Leaves growing by Threes.

Boerhaave mentions twenty-five Species of *Phaseolus*; which are,

1. *Phaseolus*; vulgaris. *Park. Parad.* 521. *Tourn. Inst.* 412.
- Boerb. Ind. A. 2.* 28. *Smilax hortensis*. Offic. J. B. 2. 255. *Raii Hist.* 1. 884. *Smilax hortensis* five *Phaseolus*. C. B. P. 339. *Phaseolus albus*. Ger. 1038. *Emac.* 1212. **KIDNEY-BEANS.**

It is cultivated in Gardens, and flowers in *July*. The Pods, which are the Parts in Use, are opening, digestive, and provoke Urine, and the Menfes. *Dale*.

2. *Phaseolus*; vulgaris; fructu nigro.
3. *Phaseolus*; vulgaris; fructu rubro.
4. *Phaseolus*; vulgaris; fructu pallido.
5. *Phaseolus*; vulgaris; fructu luteo.
6. *Phaseolus*; hortensis; minor. T. 415. *Smilax hortensis minor*. C. B. P. 359.
7. *Phaseolus*; hortensis; filiquâ longissimâ.
8. *Phaseolus*; hortensis; filiquâ longissima, & latissima.
9. *Phaseolus*; peregrinus; hortensi similis; fructu timidiore, minore niveo. C. B. P. 340.
10. *Phaseolus*; hortensis; fructu albo, minore oviformi; Veneris dictus. *Hoffm. Cat. Altorf.*
11. *Phaseolus*; hortensis; minor; fructu incano, cujus hilum limbo fusco cingitur.
12. *Phaseolus*; puniceo flore. *Corn.* 184.
13. Idem (12); fructu ex nigro & Coloffino variegato.
14. *Phaseolus*; Indicus; floribus, & fructu, candidissimis. *Flor. Nor. Volk.*
15. *Phaseolus Americanus*; perennis; flore cochleato odorato; seminibus fuscis orbiculatis; Caracalla dictus. H. L. *Phaseolus Indicus*, cochleato flore. *Triumphett. Observ.* 92.
16. *Phaseolus*; octocaulis; Mungo Persarum; Turcarum Masc; Hispanorum Max. Tab. Col. Annot. & Addit. in *Nard. Ant. Rech. Ic. & Defcr. Raii*.

It is a Plant with an erect Stalk, three Feet in Height, with Leaves and Flowers like those of our *Phaseolus*, and Pods containing Seeds the Size of dry Coriander-seeds.

The People of the Eastern Countries commonly eat the Seeds boiled, with Butter, as they do other leguminous Foods; and esteem it a Delicacy much preferable to the rest.

Garcias tells us, that the Seed, when ripe, is black, and is Food for Horses, and is sometimes eaten by Men: He gives us, also, the Method of using it, by the Inhabitants of *Guzarate* and *Decan*, in the Cure of a Fever. The Patient in this Case abstains from Food ten, and sometimes fifteen Days; after which they give him the Decoction of this Fruit, in which they have left some of the Pulp remaining; then they give him *Mungo* decorticated and boiled, like Rice, and suffer him to eat no Bread made of Wheat for many Days. *Raii H. P.*

17. Idem; femine albo.
18. *Phaseolus*; tenerrimus; suprà & infrâ, terram fructus gerens, sicque perennans.

19. *Phaseolus*; Ægyptiacus; nigro femine. C. B. P. 341. *Phaseolus, niger Lablab vocatus*, *Alpin. Ægypt.* 39.

It is a farmentous Tree, of the Bigness of the Vines, and spreads its Branches and Leaves after the same Manner. In Appearance, it is altogether like the common *Phaseolus*; bears Flowers twice in a Year, that is, in Spring and Autumn; these Flowers are somewhat like those of our *Phaseolus*, and are succeeded

ceeded by long Pods, as those of Beans, and containing Seeds some black, some redish, exactly like our Kidney-beans. The Tree lives an hundred Years, and more, and is always green. The Egyptians commonly eat the Seeds or Beans, which are as well tasted as ours. The Women use the Decoction with Saffron, to provoke the Menfes; the same is good, also, for the Cough, a Dyspnoea, and a Suppression of Urine. *Prosper Alpinus de Plantis Egypti.*

20. Phaseolus; Ægyptiacus; semine rufo. C. B. P. 341.
21. Phaseolus; Ægyptiacus; semine albo.
22. Phaseolus; Zeylanicus; folio longo; filiquâ tenui; semine parvo, pallido.
23. Phaseolus; Asiaticus; filiquâ albâ, longissimâ, articulata; semine rubro.
24. Phaseolus; Zeylanicus; folio longo; filiquâ tenui; semine violaceo, parvo.
25. Phaseolus; Indicus; minimus; folio magno; flore cœrulescente. *Boerb. Ind. alt. Plant. Vol. 2.*

The Pods of the Kidney-bean are esculent, but the Seeds yield a gross Nutriment; whence they are good for those who use much Exercise, but are prejudicial to Students, and sedentary Persons. *Hist. Plant. adscript. Boerhaav.*

Besides the foregoing Species of *Phaseolus*, Dale mentions the four following;

1. *Phaseolus*. Offic. *Phaseolus vulgaris Italicus humilis, seu minor, albus cum orbita nigricante.* J. B. 2. 358. Raii Hist. 1. 885. *Phaseolus erectus*. Park. Theat. 1057. *Phaseolus peregrinus fructu minore albo.* Ger. Emac. 1213. *Phaseolus minor filiqua sursum rigente, fructu albo.* Tourn. Inst. 413. *Smilax filiqua sursum rigente, vel Phaseolus parvus Italicus.* C. B. P. 339. ITALIAN KIDNEY-BEANS.

It is cultivated in Gardens, and flowers in July. The Pod is used, which, as *Dioscorides* says, if boiled, whilst green, and eaten, is good to mollify the Belly, and proper to provoke Vomiting.

2. *SOIA*. Offic. *Phaseolus Japonicus, ex quo Japonensium Soia, qui intinctus Species est, conficitur.* Herm.

This Species is a small, white Kidney-bean, brought from Japan, of which they make the Pickle called Ketchup; of this there are two Kinds, the liquid and the solid. Dale.

3. *Phaseolus erectus* filiquis Lupini, fructu Pisi majoris candido. *Kemph. Aman. Exot. 837.*

We owe the Knowledge of this Species, says Dale, to the late learned Paul Herman, who communicated it, under the Title above said, to the learned William Sherrard, LL. D. from whom we borrowed it.

4. The fourth sort of *PHASEOLUS* is the COUHAGE; which see. *PHASGANIUM, φαργάνιον.* A Name in *P. Ægineta* and *Aetius* for the LAPP.

PHAULUS, φαῦλος, according to *Galen, Com. in Lib. de Fract.* with the Antients, signify'd not only vitious and depraved, but plain and simple, in Opposition to ἀκριβής, "exquisite;" in which Sense it is apply'd by *Hippocrates* to Diet; and *Hypophaulus, ὑποφαυλός*, in the same Author, is expounded in *Galen* by μέτριος (*Metrios*) moderate, or a Mean between simple and exquisite.

PHAUSINGES, φαούγγες, in *Galen's* Exegetis, are said properly to signify red Circles in the Legs, excited by the Fire; but, by an Abuse of the Word, it signifies other sorts of Spots. Some, who read σπῖλοι, Spots, for κῆλοι, Circles, will have it to be red Spots, of any kind, excited by the Fire. Other Senses of the Word may be found in *Hesychius*, which are not material.

PHAUSTIANOS, φαυστιανός. The Name of a very acrimonious and corroding Pastil, described by *Aetius, Tetr. 3. Serm. 1. Cap. 49.*

PHAZALA. The Name of a Disease incident to Horses which wash in the Red Sea. *Castellus.*

PHEGOPYRUM. See *FAGOPYRUM.*

PHELLANDRIUM.

The Characters are;

The Root is fibrous, the Stalk very thick, the Leaves very large, and very finely jagged: the Perals of the Flowers are shaped like an Heart; and the Seeds are small, gibbous, and slightly striated.

Boerhaave mentions three Species of *Phellandrium*; which are, 1. *Phellandrium*. Offic. *Tourn. Inst. 306. Boerb. Ind. a. 56. Phellandrium vel Cicutaria aquatica quorundam.* J. B. 3. 183. *Phellandrium.* Raii Synop. 3. 215. *Cicutaria palustris.* Ger. 905. Emac. 1063. Raii Hist. 1. 452. *Cicutaria palustris tenuifolia,* Park. Theat. 933. C. B. P. 161. WATER HEMLOCK.

The Leaves are commended by *Blancard* in virulent Inflammations of the Penis; internally it is an Emetic.

This Hemlock has a thick, hollow, striated, and jointed Stalk, which arises not so high as the ordinary Hemlock; it is divided into several Branches, having large winged Leaves, much finer and tenderer than Hemlock; the Flowers grow in Umbels, which are but small in proportion to the Bigness of the Plant: They are white, with a Cast of Red. The Seed is small, and of a dark-brown Colour. The Root is compos'd of a great Number of white Strings, which shoot out from the Joints at

the Bottom of the Stalk: It grows in Ditches and Ponds, and flowers in June.

It is suppos'd to be much like common Hemlock in its Nature and Qualities; but it is believ'd to be more poisonous, and therefore is very seldom made use of in the Shops.

Webber has wrote a whole Treatise concerning this Plant. *Miller's Bot. Off.*

2. *Phellandrium*; folio Thysselin; caule rotundo. *Ind. 2.*
3. *Phellandrium*; Thysselin folio; caule sulcato. *Ind. 2. Cicutaria Cassubica, Thysselin folio.* Breyn. Prodr. 1. Raii H. 1868. *Boerb. Ind. alt. Plant. Vol. 1.*

It is said to possess the Virtues of Hemlock; but is sweet-scented and aromatic, and of excellent Service, where a gentle Dissipation of Humours is required. The first Species is of Use in Surgery, for discussing inflammatory and cold Tumors; and is said to resist a Gangrene; and nothing can be more safely apply'd to scirrhus and cancerous Tumors; it is, also, commended for Diseases of the Breast, being apply'd in the Form of a Cataplasm. *Hist. Plant. adscript. Boerhaav.*

PHELLODRYS. Offic. *Phellodrys alba latifolia & angustifolia.* Park. Theat. 1399. *Phellodrys candicans latifolia, molliter aculeata & candicans, angustifolia, serrata.* C. B. P. 423. *Phellodrys Matthioli.* J. B. 1. 2. 100. *Phellodrys sive Cerrô.* *Sugaro Matthioli.* Raii Hist. 2. 1391. THE LAUREL-OAK.

It grows in Dalmatia, and, as some say, in Greece; the Leaves, Bark, and Acorns, which are the Parts used in Medicine, agree in Virtues with those of the *Quercus*, or common Oak. Dale. The *Phellodrys* of *Theophrastus*, which *J. Bauhine* proves to be the same with what he, also, calls *Aria*, *Pliny* seems to have taken for the *Suber*, called *Pbellos*; for he ascribes to that Tree all the Properties which *Theophrastus* ascribes to the *Phellodrys*.

The *Phellodrys nigra* is distinguish'd by the Smoothness and Blackness of its Bark; the Leaves differ from those of the *Ilex*, as being rounder and broader; from those of the *Smilax*, as being much shorter in respect of their Breadth; and from those of the *Suber* just mention'd, as being harder, and more prickly. Raii H. P.

PHELLOS. A Name for the *Suber*; *latifolium*; *perpetuô virens.*

PHEMOS, φῆμος, the Name of a Medicine against the Dysentery, compos'd by *Martianus*, and described by *Aetius, Tetr. 3. Serm. 1.*

PHENGITES, φηνγίτης, a luminous Stone, capable of acquiring Light, and dispensing it again.

PHENULE, φένουλα, in *Myrepsus, Antidot. 77.* as *Fuchsius* observes in his Notes, is corruptly written for *Enula, ένουλα*; for *Phenula*, he says, is the same as *Feniculum*.

PHESÆ. A kind of broad Fish, mention'd by *Oribasius, Med. Coll. Lib. 2. Cap. 58.* from *Xenocrates*, among Fishes whose Flesh is hard and difficult of Digestion.

PHIALA, a glass Vessel, with a big Belly, and long Neck, of frequent Use in Coagulations and Solutions. *Castellus.*

PHIBALIOS, φιβάλιος, in *Galen's* Exegetis, is expounded a Species of Fig; some take it for the *Carica*, or dry'd Fig. *Phibalean* Figs are commended by *Athenæus, Lib. 3.* Now *Phibaleos* is a Place in Attica.

PHIBIT, rapax. Rapacious. *Rulandus.* Perhaps Amber.

PHILADELPHUS. A Name for the APARINE. *Blancard.*

PHILADYNAMOS, φιλαδύναμος, in *Hippocrates de R. V. I. A.* is an Epithet of Water; expressing that Property of it, by which it diminishes the Strength.

PHILAGRIANON, φιλαγγριανόν. The Name of a Malagma, described by *Ægineta, Lib. 7. Cap. 18.*

PHILALYSTES, φιλαλυστής, in *Hippocrates's* Book of Precepts, means one who is of an anxious and perplexed Mind.

PHILANTHROPOS. The Name of a compound antinephritic Medicine, in *Nicol. Antidot. Oper. Mésua. Castellus.*

PHILETÆRIUM, φιλεταίριον. A Name in *Dioscorides, Lib. 4. Cap. 8.* for the POLEMONIUM.

PHILETIS COLLYRIUM. The Name of a compound Medicine for the Eye, in *Celsus, Lib. 6. Cap. 6.*

PHILIPENDULA, the same as *FILIPENDULA.* *Blancard.* The Term occurs in *Myrepsus, Antidot. 40.*

PHILIPPI Trochiscus, the Name of a Troche, described by *Paulus Ægineta, Lib. 7. Cap. 12.*

PHILISTÆA. An obscure spagirc Term in *Basil. Valent. in Repetit. Lap. Philos. C. de Antim.* where he says, that, if Antimony should pass into *Philistæa*, it would of itself become Glass. *Castellus.*

PHILLYREA.

The Characters are;

The Leaves are conjugated, and always green. The Flower is monopetalous, Bell-shap'd, divided into four Parts, and contained in a quadrifid Calyx. The Ovary in the Bottom of the Calyx becomes a globular Fruit, full of round Seeds.

Boerhaave mentions eight Species of *Phillyrea*; which are,

1. *Phillyrea*; crasso; latissimo, atroviridi folio quasi Bicis.
2. *Phil.*

2. Phillyrea; latifolia; levis. C. B. P. 476. Phillyrea, *Mahaleb Serapionis*. Lugd. 154.
3. Phillyrea; latifolia, spinosa. C. B. P. 416. Phillyrea, folio *Illicis*. J. B. 1. 541.
4. Phillyrea; latifolia; spinosa. C. B. P. Longiori folio *Alaterni*. Ind. 248.
5. Phillyrea; folio leviter serrato. C. B. P. 476.
6. Phillyrea; folio magis serrato, subrotundiori. Ind. 248.
7. Phillyrea; folio Ligustri. C. B. P. 476. Tourn. Inf. 596. Boerb. Ind. a. 2. 215. Phillyrea. Offic. Phillyrea latiusculo folio. J. B. 1. 539. Raii Hist. 2. 1585. Phillyrea latiore folio. Ger. 1209. Emac. 1395. Phillyrea latifolia foliis fere non serratis. Park. Theat. 1443. **MOCK PRIVET.**

The Leaves are drying and astringent, and are very much commended for Ulcers in the Mouth. Dale.

8. Phillyrea; angustifolia; prima. C. B. P. 476. Boerb. Ind. alt. Plant. Vol. 2.

Many confound the Phillyrea of Dioscorides with the Philyra of Theophrastus; others, rightly in my Opinion, distinguish them. *J. Baubine* proves the *Mahaleb* of the *Arabians* to be the Phillyrea of Dioscorides. But whether the *Mahaleb*, or Phillyrea, be the same Tree which is now commonly known by that Name, is a Question. *Ranwolffius* writes, that he saw at *Aleppo*, in the Spicery-shops, small white Seeds, which they call *Mahaleb*, surrounded with an hard Cortex, somewhat long, and acuminate, and cover'd with a thin Membrane, after the manner of Pistaches; these Seeds they use in the Composition of their sweet-scented Soap. And the Monks who have commented on *Mesue*, write that *Mahaleb* is a very common Shrub in *Syria*, thorny, and with Leaves like the Olive-tree; that it bears Fruit in Clusters on the Branches, like the Lentisk, but somewhat bigger; from whence the *Syrians* express a very fragrant Oil, of which they prepare their sweet-scented Soaps, and several other Things. But how all this can agree with the common Phillyrea, says *Ray*, I am at a Loss to understand.

The Leaves of the Phillyrea, according to Dioscorides, are astringent, like those of the wild Olive-tree; and are therefore proper in those Cases, which require Astringent. Being chewed in the Mouth, they are very good for Ulcers therein; and a Collution of the Mouth with the Decoction has the same Effect. The Decoction drank provokes Urine, and the Menstrues. What the *Arabians* write of the Virtues of the *Mahaleb*, which *J. Baubine* supposes to be the Phillyrea of Dioscorides, may be found in *Baubine*. At present the Phillyrea is not used in Medicine, but, on account of its evergreen Leaves, is of good Ornament in Gardens, being disposed in clipt Hedges, Plots of Evergreen, and by the Sides of Walks. *Raii H. P.*

PHILOCHYMICUS. A Lover of Chymistry.

PHILOCOTYCHE. The Name of a Plaster, in *Myrepsus*, Cap. 136.

PHILOCRATIS Emplastrum. A Plaster described by *Celsus*, Lib. 5. Cap. 19.

PHILOLAGNOS, φιλόλαγνος, in *Hippocrates de R. V. I. A.* means one addicted to Venery.

PHILOLUTROS, φιλόλουτρος, from φίλος, a Friend, and λούτρον, a Bath. A Lover of Bathing. *Hippocrates de R. V. I. A.*

PHILOMEDICA. The Name of a Potion, prescribed in burning Fevers, for allaying the Thirst; and described in *Collectedan. Chymic. Leidenf. Cap. 332.*

PHILOMELA, the Nightingale. See *LUSCINIA*.

PHILONIUM. A kind of somniferous, anodyne Opiate; taking its Name from *Philo*, the Inventor. *Galen, de C. M. S. L. Lib. 9. Cap. 4.* says, that the Antidote of *Philo*, or *Philonium*, was in great Reputation for a long time past; and that this Medicine was one of the first and most ancient of its Kind. By Medicines of this Kind, we can understand no other than Antidotes, such as *Mithridate*, *Theriaca*, *Hiera*, and the like. I do not believe this Composition of *Philo* to be quite so ancient as *Mithridate*; but it was, doubtless, coeval with the simple *Hiera*, invented by *Themison*, who lived under the Reign of *Augustus*. The *Theriaca* was of later Invention, and not begun to be composed till the Time of *Nero*. What makes me think, that *Philonium* was somewhat later than *Mithridate*, is, that, among the Virtues which *Philo* ascribes to his Composition, he says, it is proper for the Colic. Now this Disease was not known by that Name, long before the Reign of *Dionysius*. I imagine then, that *Philo* lived under *Augustus*, near about the Time of *Themison*, and the first Disciples of *Asclepiades*. *Galen* may, however, speak of the *Philonium*, as an ancient Medicine, because he did not write till about two hundred Years after the Time in which I suppose it to be invented.

Philo wrote it in Greek Elegiacs, and after an enigmatic Manner; so that it required to be well versed in Mythology, or Fable, to be able to conjecture at his Meaning. "Take, says he, red and odorous Hairs of the Youth whose Blood is still fresh in the Fields of *Mercury*; as many Drams as we have of Senes [five]; of *Euboic Naupium*, one Dram; as much of the Killer of the Son of *Menatius*, as is contained within the Bellies of the Ewes. Add thereto twenty Drams of white Flame, and the same Weight of Beans of the *Arcadian Swine*; with one Dram

of the Plant falsely call'd a Root, and which comes from the Country celebrated on account of *Jupiter Pisseus*. Write *Philonium*, and, to the Head of that Word, add the masculine Article of the Greeks. Take ten Drams of this last Ingredient, and carefully mix the Whole with the Works of the Daughters of the Bull of *Athens*." You may see, in *Galen*, an Explication of this Jargon, which amounts to this: Take of Saffron, Pyrethrum, white Pepper, Henbane, Spikenard, and Opium, the Weight assign'd to each Ingredient; and incorporate the Whole with Attic Honey. Not only *Galen*, but *Aretaeus*, *P. Aegineta*, *Aetius*, *Oribasius*, and other Authors, mention this Medicine, which is still common at this Day. *Celsus*, also, quotes *Philo*, but it is only for a Collyrium, and says nothing of his Antidote; tho' it is probable, that it was this *Philo* of *Tarsus*, from whom he borrow'd that Collyrium. *Le Clerc Hist. de la Medecine*.

Philonium Persicum is thus prepared. Take of white Pepper, and white Henbane, each ten Drams; of Opium, Terar Sigillata, each five Drams; Lapis Hæmatites, Saffron, each two Drams and an half; Castor, Indian Spikenard, Pyrethrum, Pearls, Amber, Zedoary, Doronicum, or else Elecampane, Troches of Ramich, each half a Dram; Camphire, a Scruple; Honey of Roses, fifteen Ounces. Mix them together for an Opiate.

The Roots, the Seeds, the Castor, the Spikenard, the Saffron, and the Troches of Ramich, are to be reduced to a Powder together. Then the Seal'd Earth, and the Camphire, are to be pounded together; and the Blood-stone, the Pearls, and the Amber, are to be levigated on a Marble, till they are reduced to an impalpable Powder. The Opium must be of the best Kind, and cut down into small Portions; after which, it is to be beat in a brazen Mortar, with a little Honey of Roses, till it is reduced to a kind of liquid Paste. Then boil Honey of Roses to the Consistence of a thick Syrup; with fifteen Ounces of which intimately mix the Opium, and the Powders, for an Opiate, to be kept for Use in a close-stopt Vessel.

This Preparation is proper for stopping Hæmorrhages and Fluxes; as, also, for preventing Abortion. The Dose of it is from one Scruple to one Dram.

A Scruple of this Opiate contains Two-thirds of a Grain of Opium; and One-third of a Grain of the Seeds of white Henbane.

Half a Dram of the Opiate contains a Grain and half a quarter of a Grain of Opium, and two Grains and an half of the white Henbane-seeds.

Two Scruples of the Opiate contain a Grain and an half of Opium, and three Grains of the Henbane-seeds.

One Dram of the Opiate contains two Grains and a quarter of a Grain of Opium, and four Grains and an half of the Henbane-seeds.

The *Philonium Romanum* is thus prepared.

Take of white Pepper, and white Henbane-seeds, each five Drams; Opium, two Drams and an half; Cassia-bark, one Dram and an half; Smallage-seed, one Dram; the Seeds of *Macedonian Parsley*, Fennel, and Candy Carrots, each two Scruples five Grains; Saffron, one Scruple and an half; Spikenard, Pellitory of Spain, and Zedoary, each fifteen Grains; Cinnamon, a Dram and an half; Myrrh and Castor, each a Dram; Syrup of white Poppies, a sufficient Quantity, to make the Whole into an Electuary.

This is a Prescription, originally, of *Nicolaus Myrepsus*; but the first Dispensatory of the College received it with Euphorbium, as does the *Augustan*, which the College has now rejected, it being an Ingredient too hot, and irritating, for inward Use. There are several other Compositions of this Denomination taken by the Dispensatory-writers from *Mesue*, *Galen*, and others; but they all nearly agree. *Zwelfer*, however, prefers the *Confectio Archigenis* to them all, as a warm Opiate, which is their main Intention. The former Prescriptions of this were all with Honey, in three times the Quantity of the other Ingredients; but the *Syrupus de Meconio*, as here ordered, is vastly preferable, as agreeing so much better with the Intention of the Whole. It is a powerful Opiate, and given from ten Grains to two Scruples, to ease violent Pains, and procure Sleep. *Quincy*. But, perhaps, this Medicine, and all of this Class, may be much better, if prepar'd with Honey.

PHILOPARABOLOS, φιλοπαράβολος. An Epithet, apply'd by *Asclepiades* to one of the two Methods used by him in the Cure of a Phrensy, and signifying violent and dangerous, in Opposition to his other Method, which was safer, or, in the Language of *Cælius Aurelianus*, non merulofus, and proper for most Patients. This dangerous and violent Method (for that Reason called *Philoparabolos*, which is used, by *Plutarch*, to signify one who desperately throws himself into the midst of Dangers) consisted in exhibiting, at the first Visit, a large Draught of pure or undiluted Wine, mix'd with Sea-water; for, says *Asclepiades*, giving a Reason for this Practice, all those Helps and Benefits which accrue to the Sick, in a weak and slow Manner, from the Use of Mulsim, and forbile Liquors, are much more readily and plentifully procured by Wine; for the Exhibition thereof is succeeded by a vast Fervor, with a Lowering of the Pulse, and a Repression of the colliquative Sweats, the Wine performing the Office of an univer-

universal Caustery. *Galienus Aurelianus, Acut. Morb. Lib. 1. Cap.*

15. **PHILOXENIAS ANTIDOTUS.** The Name of an Antidote, described by *Nicolaus Myrepsus, Sect. 1. C. 239.*

PHILTRON, φίλτρον. A Love Potion, or Medicine to excite Love. It, also, imports that Cavity, or Depressure, in the upper Lip, which is situated immediately under the Septum of the Nose.

PHILUMENI MEDICAMENTUM. The Name of a Medicine for the Eyes, described by *Oribasius, Collect. Medicinal. L. 8. C. 45.*

PHILYPOSTROPHA, φιλυπείστροφα. Whatever cause, or threaten, a Relapse, are thus call'd by *Hippocrates, Prorrhēt. and Coac. Prænot.*

PHIMOSIS. Sometimes the Præputium, or Foreskin, is so contracted by a violent Inflammation, that it cannot be drawn backward behind the Glans. This Disorder is call'd Phimosis by the *Greeks*, and produces many dangerous Consequences; especially if a virulent Venereal Matter be lodged between the Glans and the Skin; for, by the Contraction of the Skin, those little Ulcers of the Glans, called Chancres, which proceed from impure Copulation, cannot be conveniently cleansed or healed. Nor is it surprising, as *Verduc* observed, that a Gangrene, or Cancer, or, at least, a violent Inflammation of the Glans and Foreskin should arise from this Cause; and, upon account of these Mischiefs, the Penis must either be consumed by the Ulcers, or removed by the Knife. The Patient, generally, cannot void his Urine without extreme Pain, because of the Corrosion of the Skin and Glans. The general Cause of a Phimosis is, by Physicians, rightly ascribed to impure Coition. For whilst the virulent Matter, which had been lodged in the Sinuses of the Vagina, continues between the Skin and Glans, the Foreskin, especially if it should be naturally long, or tight, can hardly escape being swell'd with an Inflammation, and a Phimosis must be induced. Some, however, have the Foreskin naturally so long, and so straiten'd, that the Glans can either be not at all, or very little uncover'd; but as this neither occasions Trouble in discharging the Urine, nor any Impediment in Procreation, it requires no Aid from the Surgeons, unless it be attended with an Inflammation, violent Pain, or any remarkable Inconvenience in Coition. Those who have their Foreskin naturally very long, are much more easily infected by impure Embraces, than others, as we learn both from Reason and Experience.

If this Disorder is occasion'd by no Venereal Taint, it is cured by bathing the Penis, a sufficient Time, in warm Water: But, if it proceeds from a Venereal Infection, proper internal Medicines must be exhibited; and the Pain may be alleviated, and the Ulcers heal'd, by the following Method. In order to wash out the acrimonious morbid Humours lodged under the Skin, let warm Water, or rather, a Decoction of Barley, mix'd with Honey of Roses, be frequently injected with a Syringe, between the Skin and the Glans. To discuss the Tumor, apply, externally, an emollient and digestive Fomentation, or Cataplasm, round the tumefied Part of the Penis; and, if the Inflammation be severe, Bleeding should not be omitted. After these Measures are duly taken, we may endeavour to draw back the Prepuce. But if the Tumor, and violent Exulceration, of the Glans render this Attempt impracticable, if the Disorder increases, or, lastly, if the Prepuce was naturally long, and could not be drawn back before the Infection, Recourse must be had to the Knife.

In this Case, there are two Methods of Operation. 1. Let the End of the Prepuce be drawn as far forwards as possible, and let an Assistant hold the cover'd Glans in his Fingers. Let the Operator, with his Left Thumb, press back the Glans cover'd with the Skin, and then, with a Knife, or Scissars, let him extirpate all that Part of the Skin which projects beyond his Thumb, much in the same manner with the *Jerusalem* Circumcision. Thus may the most straiten'd Part of the Skin be easily drawn back; and, the Glans being uncover'd, the Ulcer may more expeditiously be cleansed and heal'd.

2. The other Method is thus perform'd. The superior Part of the Prepuce must be drawn up by the Fingers, and a Pair of Probe-scissars introduced; then an Incision must be made so far in the contracted Skin, as may be sufficient for uncovering the Glans. *Guillemeau, Palfyn*, and others, prefer a particular Knife for this Use, represented *Tab. XLVII. Fig. 4.* But why this Knife should be crooked, or why a strait Knife may not as well serve the Purpose, I cannot understand. After this longitudinal Incision, some Surgeons cut off, with the Scissars, as much of the End of the Prepuce, as appears superfluous. A copious Discharge of Blood succeeds this Operation; nor should it be suddenly stopped, but rather suffer'd to flow, as long as the Strength of the Patient will permit, in order to prevent an Inflammation. Then dress with dry Lint, and apply a proper Compress and Bandage; and proceed, afterwards, as in the Cure of other Wounds. Besides the Cautions to be observed in the first Method of Cure, particular Care must be taken, that, in healing the Wound, the Extremity of the Prepuce be not too much contracted; by which means the Patient would be again exposed to the same Disorder. Sometimes, by dividing the Prepuce, the Glans is drawn back by the Frenum, and the Penis be-

comes incurvated; in which Case, the Frenum must be cut with the Knife, or Scissars. If a Gangrene affects the Glans, as in an Instance related by *Verduc*, it is necessary to penetrate to the sound Parts by frequent Scarification, and to apply a Fomentation of *Unguentum Ægyptiacum*, and Treacle, dissolved in camphorated Spirit of Wine, till the Gangrene disappears. But the stubborn Ulcers, or Chancres, can scarcely be removed without the Use of internal mercurial Medicines; and, sometimes, not without a slight Salivation. Nor must I omit to mention an Instrument contrived by my Friend, Dr. *Trew*, for this Purpose, and represented in *Tab. XLVII. Fig. 5.* whose Plates A A, being introduced under the Skin, and gradually diffended by the Screw B, they, by their Elasticity, gently dilate the contracted Skin; and thus may the Glans be denuded, without the Help of a Knife. But I question whether this Instrument will always answer the Intention.

PHLASMA, φλάσμα. A Contusion, or Collision.

PHLEBION, φλεβίον. A small Vein.

PHLEBODONODEA, φλεβοδονώδεια; an odd, and sort of foreign, and, for that Reason, obscure Term in *Hippocrates*, 1 *Prorrhēt. 101.* and *Coac. 20.* *Galen* explains it of the Veins or Arteries, agitated by the excessive Heat of the Blood; which happens under a great Effervescence of the Humours, or violent Pains of the Head, when the Veins and Arteries at the Temples, as well as the Jugulars, are subject to a sort of Concussion and Subfultus; so that the Word, by Etymology, imports as much as φλέβες δονώμεναι (*Phlebes donomenoi*) Veins agitated. Some, he says, read φλεβιδονώδεια (*Phlebotonodea*), understanding thereby a Distention of the Veins. Others, to avoid all Ambiguity, write it φλεδονώδεια (*Phledonodea*), deriving it from φλεδίνες (*Phledones*), expounding the Word by παράληψις (*paralerunta*), and apply it to Persons in a Delirium: For φλεδόνες are expounded in the *Exegesis*, by φλυαρία (*phluaria*), Trifles, Follies, and λησι (Leri), idle Amusements of delirious Persons. In 4 *Epid.* we read, that *The Hypochondrium appeared distended, φλεδονώδεια τερπνόν.* But we ought, says *Foesius*, to read the Word φλεβοδονώδεια, or φλεβιδονώδεια, or φλεδονώδεια, and to understand it of a Distention of the Hypochondrium, after the manner of the Veins and Arteries, when under a Distention and Agitation, or Concussion from the Heat and Effervescence of the Blood.

PHLEBOPALIE, φλεβοπαλίη. The Vibration, or Pulsation, of an Artery.

PHLEBORRHAGIA, φλεβορραγία, from φλέψ, a Vein; and ῥήγνυμι, to break. A Rupture of a Vein.

PHLEBOTOMIA, φλεβοτομία; from φλέψ, a Vein; and τέμνω, to cut. Phlebotomy.

There is not a more excellent, instantaneous, and efficacious Remedy for removing various Diseases, both of the acute and chronical Kind, than Venesection, prudently and cautiously used; for some violent Disorders, of the most dangerous Nature, arise from a Redundance of Blood; from a Suppression of its critical Evacuations from the Uterus in Women; and a Defect or Interruption of the hæmorrhoidal Discharge in Men. A Phlethora, by retarding and stopping the free and equable Circulation, lays a Foundation for Impurities of the Humours, Stagnations, Infarctions, Obstructions, Extravasations, and Ruptures of the Vessels: For whilst the Blood, by its too great Quantity, strongly resists the contractile and elastic Force of the Heart, Arteries, and other Vessels, its progressive Motion through the whole Body is not only retarded, so that it becomes thick, and fit for generating Infarctions, and Obstructions, the fruitful Sources of chronical Disorders, but, also, in delicate Patients, and highly nervous Parts, by exciting spasmodic Strictures, it induces an Inequality in the Circulation of the Humours, and violent and impetuous Congestions, to some of the nobler Parts, which lay a Foundation for terrible Disorders in the Head, Breast, and Præcordia: These dangerous Disorders are not only prevented, but presently relieved, by Venesection seasonably and duly instituted, especially in Patients who abound with Blood, have large and full Vessels, or who labour under a Suppression of the Menes, or Hæmorrhoids: When in the Spring, and about the Equinox, the Air, on account of the Nearness of the Sun to our Climate, becoming thin and rare, produces a violent Expansion in the Blood, there is great Danger of those Diseases which arise from a Phlethora, as *Hippocrates* justly observes; so that, before these Seasons come on, it is expedient to lessen the Redundance of the Blood by Venesection, and by that means prevent the approaching Disorders: Nor is it absolutely necessary we should always accurately observe these equinoctial Seasons; for, when the Quantity of congested Blood requires a more speedy and expeditious Evacuation, or when, about the End of *February*, and Beginning of *March*, the serene and tepid State of the Atmosphere produces an Expansion and Turgescence of the Blood, which prove injurious to its progressive Motion, we are not to wait for, but, without Hesitation, to anticipate, the Equinox. I have known some, who from an ill-tim'd Adherence to their usual Custom, have delay'd Venesection till the Equinox, whilst in the mean time, the Phlethora increasing, they died of an apoplectic Fit before that time: Nor are we to listen to those who affirm, that Venesection is only proper at certain Periods of the Moon, or when certain Conjunctions of the Stars happen: But we are boldly,

boldly, and without any Scruple, to take Blood from phlethoric Patients, under all Phases of the Moon, and every Conjunction of the Stars, especially if the Atmosphere is serene and calm: Those, also, who abound with Blood, ought to use Venesection about the autumnal Equinox, lest the Blood should, by the Winter Cold, be inspissated, and become sordid, the Excretions being disturbed by the Inclemency and Variation of the Weather; by which means a Foundation is laid for those Disorders which proceed from an Impurity and Stagnation of the Humours. Some, who greatly abound in Blood, ought to preserve themselves from Disorders, by using Venesection thrice a Year, that is, in the Beginning of *March*, and in the Ends of *May* and *September*.

As a Redundance of Blood indicates Venesection, a Penury of it, and a Defect of Strength, contra-indicate this Operation. A Redundance of Blood is sufficiently known, from the Repletion of the Vessels, the Largeness of the Pulse, the luxurious Diet, the quiet and calm Method of Life, and the Intermision of any critical, natural, or artificial Evacuation; for, when all these Circumstances concur, we may safely and boldly use Venesection. On the contrary, when the Body is infirm and emaciated, and the Pulse weak, in consequence of a Want of Blood and Strength, Venesection is absolutely to be condemn'd, unless we intend to do an immediate Mischief to the Patient; for the Strength of the Pulse depends upon the large and brisk Impetus, with which the Blood is convey'd from the Left Ventricle of the Heart into the large arterial Tube: Now the Strength of the Heart to perform this Expulsion, depends upon the free and sufficient Motion of the Blood through the Coronary Vessels into the Substance of the Heart, as, also, on the Influx of the nervous Fluid into the Fibres of the Heart: When, therefore, the Pulse is weak, small, and languid, from too scanty an Influx of the nervous Fluid, and a laudable Blood, and too weak an Impulse of the Blood into the Arteries, it is highly prejudicial to open a Vein in any Patient, or in any Disorder, because it more exhausts the Blood and Strength, which are already too much impaired.

Those Physicians, therefore, err, who order Venesection either in the Decline of the Disease, or in Cases where one Disease succeeds another, as it happens, sometimes, in Fevers; or violent Hemorrhages. Nothing is more frequent in Practice, than to observe a Suppression of the Menes in Women, who surmount any Disorder which consumes their Blood and Strength. But, in this Case, we are not, in order to provoke the Menes, to prescribe Emmenagogues, or Evacuations of Blood; but we are rather by Analeptics, and a rich Diet, to generate a fresh Stock of laudable Blood and Humours.

A Defect of Strength, sometimes, arises not from a Petury, but from a Redundance, of Blood: We often perceive a Slowness and Weakness in phlethoric young Persons and Adults, who were before brisk and active. In phlethoric Patients we, also, observe an unusual Languor, both of Body and Mind, a Defect of Sleep, and a preternatural Expansion of the Arteries: In this Case, it is expedient to remove the superfluous Mass of Blood, which, by its Quantity, hinders the systaltic Motion of the Arteries, immediately after which the Pulse becomes more frequent and strong. But the skilful Physician must distinguish such an Oppression of the Strength, when present, and arising from a Redundance of Blood, from that Weakness which draws its Origin from a Penury thereof.

After Venesection, the salutary Excretions of Blood, and the Evacuations by Stool, Sweat, and Urine, succeed better, and more freely, than they did before; as all the salutary Excretions depend upon the quick or slow, the brisk or languid, Circulation of the Blood: Hence it is obvious, that if, by a Redundance of the Blood, its progressive Motion, together with the Excretions, is retarded, the diminishing the Plenitude of the Vessels must increase its Circulation, render it more fluid, free the Passages of the excretory Ducts, and convey the Blood more freely and copiously to the Emunctories, that thus the Excretions may be the better carried on.

Hence I have often observed, that a Suppression of the Menes has soon been removed, by opening a Vein in the Foot. I, also, know several Instances, in which the hemorrhoidal Discharge, after having been a long time stop'd, has been happily restored by Venesection.

It is certain, from Experience, that in plethoric Patients, and those labouring under spasmodic Disorders, an aqueous and limpid Urine is discharged with Difficulty; but, immediately after Venesection, it is evacuated more copiously, and more deeply tinged. *Hippocrates*, also, in *Self. 6. Aph. 36.* informs us, that "Phlebotomy removes a Difficulty of Urine; and, for that Purpose, opens the Veins of the inferior Parts of the Body." *Riverius*, also, in *Cent. 1. Obs. 1. & 48. & 49.* affirms, that, by Venesection, aqueous Urine has been render'd of a deeper Colour.

I have, also, frequently found, that in hypochondriac Patients, who are generally costive, the Body has been render'd soluble by Venesection: The Reason of which is certainly this; that in the hypochondriac Disorder, by reason of the difficult Passage of the Blood through the Mesentery and Liver, the Vessels are too copiously filled with Blood; and, by reason of their preternatural

Distention, Spasms are produced in their Coats, and their peristaltic Motion is injured; in consequence of which, neither the Faeces, nor the Flatulencies, are duly evacuated by the Anus: But, by seasonably opening a Vein in the Foot, or, as I have often observed, by recalling the hemorrhoidal Discharge, by the Application of Leeches to the Veins of the Anus, the Circulation of the Blood through the Vessels of the intestinal Coats is render'd free; a due Strength and Motion is restored to the Intestines themselves; and the Faeces are more regularly and naturally discharged.

Venesection is not only often useful to old Persons; but, also, powerfully contributes to Longevity, or the Protraction of their Lives: For it is a common, though a palpable Error, to affirm, that Venesection is absolutely improper in Old-age; as if Persons at this Period of Life were so far from labouring under a Redundance of Blood, that they were rather afflicted by a Deficiency of that Fluid, and a Want of Strength. We may indeed readily grant, that all old Persons are not phlethoric, and, consequently, do not stand in need of Venesection; nor does Age of itself contribute to the Repletion of the Vessels: But, at the same time, there are some vigorous, robust, and sound old Persons, furnished with capacious Vessels, who not only eat heartily, but are, also, capable of duly concocting and digesting the heaviest Aliments; in consequence of which, it is not to be doubted but a copious Chyle and Blood will be generated from well-concocted Aliments; and such a State is sufficiently apparent from the florid Colour of the Countenance, and the Turgescence of the Vessels with Blood: It, also, frequently happens, that not only Adults, but, also, Persons extremely old, discharge large Quantities of Blood from the hemorrhoidal Veins, without any remarkable Loss of Strength: And I myself have known some Persons of eighty Years of Age, who have evacuated large Quantities of bloody Urine, without a perceptible Decrease of Strength. Besides, Age is not very fit for Motion and Exercise; and, for this Reason, the Excretions cannot bear a due Proportion to the Quantity of Aliments taken; and, as the Blood is little consumed by Heat and Motion, there must, necessarily, be produced a Redundance of Humours, and an Infarction and Plenitude of the Vessels, which, unless seasonably removed, lay a Foundation for those Disorders which are most familiar to old Persons, such as Wasting of the Flesh, Coughs, Coryzas, Hoarseness, Pains of the Joints, Palsies, a Difficulty of Urine, Stones of the Kidneys and Bladder, Itchings, and the dry Itch: Which Disorders do not proceed immediately from a Redundance of the Blood, but, rather, from an Impurity of the Serum; but, at the same time, this Impurity of the Serum derives its Origin from the Redundance of the Juices, by which the Excretion of the Sordes is prevented.

I know many Instances of old Persons who have lived sound, robust, and free from the ordinary Diseases incident to Old-age, by no other means than Venesection, used twice a Year. And that Venesection is not unfriendly to Old-age, is sufficiently obvious from this, that almost all the *Swiss*, even when eighty or ninety Years of Age, use Venesection every Year. See *Wepfer, Lib. de Apoplexia. Primrose, also, Lib. 4. de Vul. Error. Cap. 23.* evinces from three Instances, that Persons of eighty Years of Age may commodiously bear Venesection in the most violent Distempers, whether arising from internal or external Causes: This I have, also, found confirmed by frequent Experience. But we are by no means from this to conclude, that Venesection is proper in old Persons, who are weak and languid, whose Appetite is lost, or who labour under a Weakness of the Stomach and Intestines, and, especially, in those who have previously struggled with some long and chronic Disorder.

In continued and acute Fevers, Venesection is generally not only useful, but absolutely necessary: It is surprising, that some eminent Physicians, in other Cases remarkable Patrons of Venesection, should yet maintain, that in all acute Fevers, whether of the benign or malignant Kind, as, also, in exanthematous Fevers, and those that are not such, it is so far from being necessary, that it is rather pernicious, except in the Synocha, in which they do not think it absolutely necessary; but only when it is accompanied with a Phlethora, and an Orgasm: They assert, that it has been frequently observed, that Venesection, in the Beginning of such a Fever, has, about its State or Height, produced dangerous Translations and Congestions of Blood to the Head, which induce Convulsions, and a mortal Phrenitis: They are, also, of Opinion, that Nature, which always wisely governs the animal Oeconomy, does not in these Fevers intend an Evacuation of the redundant Blood; but only a Resolution of it into an excrementitious Serum, with a Secretion of the noxious Matter, by means of an intense Heat; and that, for this Reason, Venesection is, in these Cases, contrary to the Intention of Nature, since, by it, the salutary Work of Secretion is disturbed. But this Doctrine is overthrown, both by Reason and Experience: For I have known many robust Persons; both young and full-grown, who, being full of Blood, and seized with these Fevers, in consequence of the Omision of Venesection, have, in a few Days, died of a Phrenitis, an Inflammation of the Stomach or Fauces, or a Peripneumony. In such Cases, after Death, the whole

whole Body has been found surprisingly tumid, and the sanguineous Ichor has been copiously discharged from the Nostrils: A prodigious Stench, also, accompanied with Putrefaction, has immediately succeeded; for no other Reason but the inflammatory Stagnation of the Blood. On the contrary, I have, from many Observations, found, that Venesection, only once performed, in Patients labouring under acute Fevers, has not only diminished, or absolutely removed, the Anxieties of the Patients, but, also, a Train of other terrible Symptoms. This Doctrine is, also, confirmed by the Practice of the *French*, who, in all Fevers, with great Success, use Venesection, not only once, but twice, or oftener, if the Condition of the Patient indicates its Propriety: But that Venesection, about critical Times, produces Translations of Blood to the Head, is an egregious Mistake; for though Phrenesies and Convulsions frequently happen, in those who labour under acute Fevers, yet the same Misfortunes happen, and that too more frequently, when Venesection is omitted, than when it is used: And since almost all who die of acute Fevers, are seized with a Phrenitis and Convulsions, certainly, if Venesection is the Cause of these Symptoms, a Person labouring under an acute Fever, cannot readily die, if that Operation is neglected.

I, on the contrary, do not hesitate to affirm, that, in acute Fevers, Venesection is often not only useful, but necessary; for Persons seized with acute Disorders have always rather a Redundance, than a Penury, of Blood and Humours: Now it is certain, that the very Essence of a Fever consists in an Augmentation of the Tone, and a certain spasmodic Stricture, of all the Vessels and Fibres, upon which both the Circulation of the Blood, and the Increase of the Heat, depend: It is, also, known, that by Spasms the Diameters of the Vessels are lessened; and that, by Heat, the Humours are expanded, and possess a larger Space: For which Reason the redundant and raging Blood, being denied a free Passage through the Blood-vessels, is impetuously agitated higher and thither, and forced, as to improper Parts, thro' Vessels whose Diameters are naturally too small for the Admission of the Blood, where it remains, becomes stagnant, and lays a Foundation for dangerous Inflammations, which are most effectually prevented by seasonable Venesection. This is sufficiently confirmed by the Authorities of the most skilful Physicians; for *Hippocrates* himself, in his *Treatise de Ration. Viſſ. in Acut.* warmly recommends Venesection, in acute Disorders: Besides, the Antients, in these dangerous Diseases, used Venesection till a Deliquium was brought on, as we are informed by *Galen*, in *Lib. 1. de Rat. Viſſ.* where he tells us, that such Venesection as brings on a Deliquium is only to be used in the most acute Diseases, and in those Patients who are robust and vigorous, in the Flower of their Age, and abound in Blood, as, also, where the Climate, the Air, and the Season of the Year, are very temperate. The Diseases of this Kind are highly burning Fevers, intense Pains, considerable Inflammations of the Viscera, Carbuncles, a Synochus, an inflammatory Lassitude, and violent Pains of the Joints: For, in all these Disorders, when a large Quantity of Blood is evacuated, the Heat is immediately abated; in some of them the Body is render'd soluble, or Sweats are excited; by which means the Disease is either terminated, or at least diminished, according to *Hollerius*, in *Comment. ad Aphor. 3. Sect. 1. Hippocr.*

In Exanthematous Fevers, also, those of the Petechial and Purple Kind, the Measles, and Small-pox, and even the Plague, Venesection is so far from being unsafe, that, when prudently used, it proves highly beneficial. It is a Dispute of great Importance among Physicians, whether in those Disorders, in which the peccant Matter is forced to the Surface of the Body, Venesection may be properly and successfully used: Some espouse the Affirmative, and others the Negative, whilst both appeal to Experience: But a due Distinction is to be made, and Venesection is to be accommodated to the Nature and Variety of Circumstances: Thus, for Instance, when the Humours are defective; when, in the Beginning of a Disorder, the Strength is impaired; when the Pulse is weak, hard, and small, the Vessels numerous, but narrow; when the Strength is diminished by any Affliction of Mind, or by a Flux; in a Word, where-ever there is a Malignity of the Humours; Venesection is rather prejudicial than salutary: For, in order to eliminate a Matter which offends, not so much by its Redundance, as by its caustic, subtle, and virulent Quality, so prejudicial to the nervous Parts, a strong moving Force of the Heart and Arteries is required, which can only be expected from a sufficient Influx of the Blood, and nervous Fluid. Besides, this peccant Matter to be expelled can only be convey'd to the Surface of the Body, by the Assistance of the Blood and Humours; since, when the Diameters of the Vessels are small, they easily collapse, and are only filled by a brisk and lively Impulse of the Fluids: If, therefore, a Physician, by Venesection, diminishes the already defective Blood, Humours, and Strength, he does a terrible Injury to the Patient; since, by this means, the peccant Matter remaining within, like a Poison, perverts the Motion of the Solids and Fluids, and proves mortal.

But quite different Measures are to be taken, when, in consequence of the Redundance of the Blood, and its Rarefaction by the febrile Heat, the Coats of the Heart and Arteries are so distended, that their Systole is diminished, and almost suppressed;

in consequence of which, the Blood is not freely convey'd to the small curaneous Tubes, that the peccant Matter may be duly secreted and eliminated; for, in such a Case, Reason informs us, that, when a certain Quantity of the Blood is evacuated, the remaining Part circulates more briskly, the equable Resistance of the Coats to the Impulse of the Fluids, and the systolic and diastolic Motion, are restored, by which the Secretion and Evacuation of the peccant Matter is excellently carried on: This most frequently happens in young and phlethoric Persons of sanguineous Constitutions, who live high, or are accustomed to an indolent Course of Life; as, also, in those Constitutions, in which an immoderate Indulgence of boundless Passion has diminished the Excretions, and, consequently, generated a Redundance of Humours. Patients of this kind, when labouring under a purple, petechial, a catarrhus, benign, or malignant Fever, or the Small-pox, are exposed to the most certain and infallible Danger, by an Omission of Venesection; whilst, on the contrary, those Disorders are happily removed, when, by diminishing the Phlethora, the free Circulation of the Blood is restored.

In Exanthematous Fevers already appearing on the Skin, Venesection is so far from being prejudicial, that it is sometimes highly beneficial. It is a common Opinion, that upon the Efflorescence of Petechial and Purple Fevers, the Measles, and Small-pox, it is neither proper to use Venesection, nor Purgatives, lest the malignant Matter, being by these means recalled into the Habit, should produce an irreparable Loss. But though it is an Observation of great Importance, and supported by Experience, that Venesection is not to be used, when Nature is employ'd in the Work of Excretion, and when the exanthematous Eruptions have not had a long and fixed Seat in the Skin; yet there are Cases, in which, after the Appearance of the Efflorescences, Venesection is both useful and necessary: For I have observed, in those who have died of a Purple Fever, whether of the primary or secondary Kind, or of the Measles, or Small-pox, violent Spasms, not only of the Joints and Extremities, but, also, of the Abdomen, which, in consequence of the Contraction of the Skin, were succeeded, not only with a Retrocession of the Efflorescences, but, also, with a violent Anxiety, a Tossing of the Body, and frequently a Delirium, accompanied with a Deliquium; all which mortal Symptoms are not, as is commonly believed, so much produced by the Retrocession of the exanthematous Matter to the internal Parts, as by the Impetus and Congestion of the Blood to the Heart and Brain: Hence, induced by the Reason of the Thing alone, in one Year's Time, I, by Venesection in the Arm, saved four Childbed Women labouring under so violent Purple Fevers, that their Lives were despair'd of; for, as soon as a Vent was given to the Blood, the Anxiety about the Præcordia, and the Deliquiums, were removed, and the Patients forthwith became better, to the great Surprise of the Surgeon and By-standers, who predicted the Death of the Patients, under the very Operation which could only afford them Relief. In a young Man, also, dangerously ill of the Small-pox, when an imminent Delirium, and a violent Anxiety about the Præcordia, threaten'd Death, I successfully order'd Venesection in the Arm. Nor does this Piece of Practice want the Authority of some of the most celebrated Physicians to support it: Thus *Botallus*, that noted Patron of Venesection, in *Lib. de Venæsect.* informs us, that, with great Success and Advantage, he order'd Venesection in pestilential Buboes, and other exanthematous Disorders, if the Fever did not remit. *Muraltus*, also, not to mention others, in *M. N. C. Dec. 2. An. 7. Obs. 115.* observes, that Venesection proved salutary in an epidemical Fever, in which a large Number of Papulæ appeared on the Body.

In the Paroxysms and Exacerbations of Fevers, and other Diseases, Venesection is dangerous; but is beneficially used on the intervening Days: In the Paroxysms of intermittent Fevers, under an immediate Fit of an Epilepsy, or the hysterical or hypochondriac Disorders, and in Cases where the Extremities are cold, or internal Heat and Anxieties rack the Patient, Venesection not only augments the Violence of the Symptoms, but, also, endangers the Life of the Patient. The Reason of this is obvious; for the Exacerbation of Symptoms and Diseases is accompanied with Spasms, especially of the external Parts, as, also, of the Stomach and Intestines; by which the free Circulation of the Blood is intercepted, and the Blood itself forced, with a greater Impetus, to the large Vessels, and especially to the Breast and Heart: If, therefore, any one attempts Venesection in the Arms or Feet, when all the Parts are spasmodically constricted, he will in these Parts infallibly augment the Spasms; for the larger Quantity of Blood is taken from these Parts, the more the spasmodic Contraction of the Fibres is increased; since nothing more powerfully resists this spasmodic Stricture, and the Regurgitation of the Blood to the internal Parts, than a strong Impulse of the Heart and Arteries, and a liberal Afflux of the resisting Blood to the Parts: Hence it is expedient to delay Venesection till the Day of Intermission or Remission, when the Spasms are remitted, and the free Afflux of the Blood to the Parts is restored.

But there are some Cases, in which it is expedient, even under the spasmodic Paroxysms, though not in the Parts spasmodically affected, but in those to which the Blood is conveyed with the greatest

greatest Impetus: Thus it often happens, that, in consequence of Spasms of the Parts of the Abdomen, or of the Legs and Feet, which are extremely cold, either on account of a Frigidity, or any other Cause, the Blood is impetuously convey'd to the Breast and Head, and threatens an Apoplexy, or a Suffocation; in which Case, a Vein opened, not in the inferior, but superior Parts, is highly useful, and affords present Relief.

There is, therefore, a slight Species of Apoplexy, which may be removed by Venesection alone, when, either by the Violence of some Passion, especially a Frigidity, or by terrible Spasms of the inferior Parts, the Blood being with such an Impetus convey'd to the Head, as, by its Quantity, to distend the Vessels of the Membranes of the Brain, their systolic Motion is checked, and a slight Species of Apoplexy produced. This Species of Apoplexy is very familiar to hysteric Women, to Persons of plethoric Habits, and those of delicate Constitutions and Minds; and is, by the unskilful and unthinking Part of Mankind, taken for a Delirium; from which, however, it is widely different; For, in a Delirium, there is no Pulsation of the Heart and Arteries, the Face is pale, and the Breathing imperceptible; but, in this slight apoplectic Paroxysm, the Use of all the Senses, whether external or internal, is totally destroyed, the Limbs remain immovable, there is a violent Palpitation of the Heart, the Pulse is large and quick, and the Face tumid and red: Nor does this slight Apoplexy arise from a Rupture of the Vessels, which is an incurable Disorder; nor from a Secretion of the Serum, which terminates in a Palsy; but only from a Stagnation of Blood in the Cavities of the preternaturally distended Vessels; for it is certain from anatomical Discoveries, that the carotid and vertebral Arteries, as soon as they enter the Cranium, and run through the Membranes of the Brain, lay aside their thicker Coats, with which all their other Parts are covered: For which Reason it is not to be wonder'd at, if, by the Quantity and Impetus of the Blood convey'd to the Brain, their contractile and elastic Force, by the Assistance of which the Blood is farther protruded into the venous Sinuses of the Head, is diminished or destroyed; by which means the Systole of the Carotids being destroyed, the Blood stagnates in the too much distended Vessels of the Membranes of the Brain, and in the Plexus Choroides: Hence the Secretion and Influx of the nervous Fluid, on which Sensation and Motion depend, are intercepted and destroyed: Hence it is obvious, that, in order to restore the due Systole of the Vessels, the free Circulation of the Blood through the Head, and the Influx of the nervous Fluid into the Nerves, there can be no more proper and efficacious Remedy, than taking a sufficient Quantity of Blood from a large Orifice made in one of the Veins of the Arm; for, by this means, in a short time, Reason, Sensation, and Motion, are restored.

But those Physicians ill consult the Safety of their Patients, who, for want of a sufficient Knowledge of the Causes of this Misfortune, order Venesection in the inferior Parts, because these are, in such a Paroxysm, generally spasmodically constricted, cold, and too remote from the Part affected, by which Circumstances the Derivation of the Blood is rendered less expeditious and commodious. Besides, I have often observed, in Patients whose whole nervous Systems were disposed to spasmodic Contractions, and whose Extremities were always cold, that by Venesection, even when scanty, the Violence of the Spasms in the inferior Parts has been in a few Hours increased: In consequence of which, the Blood, being afterwards impetuously convey'd to the Brain, produces the apoplectic Fit above described, and which, in Process of Time, becomes so violent, as to cut off the Patient, or, at least, leave behind it a Palsy, or Loss of Memory, unless removed by a speedy and seasonable Venesection.

Disorders of the Head arising from a Congestion of Blood, and a Distention of the Vessels, require a Venesection, which, however, is to be performed in the adjacent Parts. A violent and obstinate Head-ach, a frequent Hæmorrhage from the Nose, melancholic Madness, a Vertigo, an Ophthalmia, an Erysipelas of the Head, and Inflammations of the Larynx and Pharynx, very frequently draw their Origins from Spasms, too great a Congestion of Blood to the superior Parts, and a violent Distention of the Vessels; especially in hypochondriacal Patients, and in Cases where the Stomach and Intestines are turgid with Flatulencies and Sordes, or are spasmodically constricted; as, also, in Cases where the free and equable Circulation of the Blood is so intercepted, that, rushing copiously and impetuously to other Parts; especially the Head, it there produces these Disorders. In such Cases, for preventing Danger, and deriving the Impetus of the Blood elsewhere, it is expedient to open a Vein, either in the Forehead, the Temples, under the Tongue, or in the Neck.

In violent Cephalalgias, Ophthalmias, and Quinsies, Venesection under the Tongue is always highly beneficial; but, in a Phrenitis, Melancholy, and an Head-ach, arising from internal Causes, it is most expedient to open the external Jugular Vein; and, if this cannot be found, the Vein which runs longitudinally along the Forehead, and is a Ramification of the external Jugular, is to be open'd; the Neck being previously tied with a Ligature under the Chin, and the Breath retain'd. The Opening of this frontal Vein was very common among the Antients. Thus Hippocrates, in

Señ. 3. Aph. 68. informs us, "that a Pain in the posterior Part of the Head is relieved by opening the Vein running along the Forehead." And Hollerius, in his Commentary on this Aphorism, tells us, "that 'tis certain from Experience, that many have been instantaneously freed from Head-achs, by opening the same Vein." Alexander Trallian, in Lib. 1. Cap. 13. greatly recommends the opening of the frontal Vein in a Phrenitis; and affirms, that he suddenly cured a phrenetic Patient by that Means; and in the 16th Chapter of the same Book, de Melancholia, he has these Words: "If a sanguineous Matter is impacted in the Brain, we are boldly to open the frontal Vein; for, in consequence of the Evacuation of the whole other Parts of the Body, there is no Harm produced by immediate Applications to the Part affected."

Tho' we are certain from Experience, that in violent Disorders of the Head, opening the frontal Vein, those behind the Ears, the external Jugulars, and the sublingual Vein, are of great Service, yet this Practice is not to be universally recommended; nor is it proper in all Cases, since we are to have a particular Regard to the State and Constitution of the Patient; for if such Disorders of the Head are accompanied with a Plenitude of the Vessels, or if violent Spasms of the inferior Parts convey the Blood copiously and impetuously to the Head, it is to be dreaded, lest opening a Vein in the Head should invite a larger Quantity of Blood to it. For this Reason the most skilful of the Antients unanimously advise, that, at the same time, a Vein should be open'd in the Arm, or in the Foot. Thus Alexander Trallian, in Lib. 1. Cap. 16. tells us, "that if we attempt any Cure on the Head, before the Body is freed from its recrementitious Juices, we do Harm rather than Good; since by that means a larger Quantity of Humours is attracted to the Part affected." Hollerius, also, in Comment. in Aph. 68. Señ. 5. of Hippocrates, informs us, "that, if a Pain of the Head is accompanied with a Plethora, we must first open a Vein in the Cubit, and then the frontal Vein; but, if there is no Plethora, we may forthwith safely open the frontal Vein; and if the Pain of the Head is produced by Constriction, if, for Instance, it arises from a Suppression of the Menstrues, we are first to open the Vein in the Ankle, then that of the Cubit, and then the frontal Vein. If the Head-ach arises from some Disorder of the Diaphragm, or Liver, we are first to open the cubital, and then the frontal Vein."

With respect to opening the sublingual Veins, in an Angina, it is, also, to be observed, that in a plethoric Habit, this Practice is dangerous, unless the Plethora is previously removed, by opening a Vein in the Arm. We are, therefore, to follow the Directions of Alexander Trallian, who, in Lib. 4. Cap. 1. de Angina, uses these Words: "In Cases of Necessity, I have, in the Morning, open'd the cubital Veins, and then the frontal; after which, by exhibiting Cream of Pissan in the Evening, I have perfectly cured a Quinsy. I have, also, with great Success, open'd the jugular, when I could not find the sublingual Veins."

In Disorders of the Breast, such as a genuine Pleurisy, and a Peripneumony, Venesection in the Arm is often highly necessary. Tho' a spurious Pleurisy, which is a Species of Rheumatism, or arthritic Pain, and which arises from an acrid Serum contain'd within the Pleura, and surrounding the Ribs, does not always require Venesection, but is often happily remov'd by a Diaphoretic; yet quite different Measures are to be taken, in a true Pleurisy and Peripneumony, the former of which is only a slight, and the latter a more profound Inflammation of the Lungs, arising from a Stagnation of Blood, firmly impacted in their Vessels; for, in these, Venesection is not only necessary, but, if there is a Plethora, must be repeated, in order to prevent the Increase of the Inflammation; which End is obtained, when the Blood, which is too copiously congested in the Vessels, stagnates, and incapable of a free Circulation, is, for the sake of a better Derivation, drawn from the most contiguous Part, making a large Incision in the Vein, that thus the Blood may be the more quickly and impetuously deriv'd from the Lungs.

Venesection is of singular Use for the Purposes of Evacuation, Revulsion, and Derivation: The evacuating Use of Venesection is to diminish the Quantity of the Blood; and, when this Intention alone is pursued, it is of no Importance, from what Part of the Body the Blood is taken. The derivatory Use of Venesection is to attract the Flux of the Blood from any Part affected to other Parts, from which it may be more commodiously evacuated. Thus, in violent spasmodic and flatulent Disorders of the Abdomen, and in Diseases arising from a Suppression, or retarded Discharge, of the Menstrues or Hæmorrhoids, 'tis safer for the Purposes of Derivation to open a Vein in the Foot, rather than in the Arm. Hence Hippocrates, in Lib. de Nat. Hum. justly informs us, "that, in Pains of the Back and Coxendices, we are to use Venesection in the Hams and Ancles." And Severinus, in his Treatise de efficaci Medic. Cap. 26. informs us, that, for preventing nephritic Pains, promoting the hæmorrhoidal and lochial Discharges, as, also, in Inflammations and Fallings down of the Anus, in Vomitings of Blood, and Schiatic Pains, a Vein is with great Success opened in the Foot: On the contrary, in Disorders of the Head, such as an Apoplexy, a Lethargy, Madness, Melancholy, a Phrenitis,

a Phrenitis, a suffocative Catarrh, a sanguineous Asthma, a Spitting of Blood, a Pleurisy, a Peripneumony, a spurious Inflammation of the Liver, the too great Quantity and Influx of the Blood, which ought speedily to be deriv'd to other Parts, are more happily remov'd by opening a Vein in the Arm; which is far nearer the Part affected: But Revulsion, or rather Avulsion, is made, when the Impetus of the Blood is recal'd, or, as it were, drawn upwards, from the inferior to the superior Parts. Thus, in too profuse a Discharge of the Menfes or Hæmorrhoids, a Vein is successfully open'd in the Arm. The same Practice is, also, expedient in pregnant Women, in order to prevent Abortion, if the Vessels of the Uterus are so much infarcted and distended with Blood, that the Weight of the Uterus, pressing downwards, becomes burdensome and uneasy to the inferior Parts.

Venefection is to be prudently us'd for the Purposes of Derivation and Revulsion; for, if Obstructions of the Vessels arising from impacted Blood are to be remov'd, it is expedient not to take a large, but a moderate Quantity from the most contiguous Part; because, by this means, the Remainder of the Blood is more imperiously convey'd to the Part affected, and carries off the stagnant Blood lodg'd in the small Vessels, since moderate Venefection accelerates the too languid Motion of the Fluids in the Vessels. Hence, opening the Vena Saphena often instantaneously restores the menstrual Discharge; and the hæmorrhoidal Discharge, when too slow, is happily promoted and accelerated by opening a Vein in the Foot; whereas these Effects are often not produc'd, by taking a large Quantity of Blood from the Arm, or the Foot; but, if the Disorder is inveterate, and the Obstructions of the Vessels so great, that it cannot be remov'd, in such a Case, if the Patient is plethoric, opening of the Vena Saphena is more hurtful than beneficial; because it invites the Blood more copiously to the Uterus, by which means a greater Obstruction of the Vessels is produc'd. Nor in an Hemiplegia, or obstinate Head-ach, in a chronic Vertigo, or in Melancholy, does Venefection in the frontal Vein afford any Relief; because by that means a greater Afflux of Blood to the Head is produc'd, and the obstructed Vessels of the Membranes of the Brain more infarcted. 'Tis, therefore, better, in such Cases, to take Blood from the inferior Parts: In recent Ichthiac Pains, Venefection in the Foot often affords immediate Relief; whereas, when the Disorder is inveterate, it rather increases it. In Bodies, therefore, full of Blood and Juices, 'tis far more safe, according to the Advice of *Hallerius*, in *Comment. in Sect. 4. Aphor. 36.* first to open a Vein in the Arm, and then the Schiatic Vein, that there thus may be a Revulsion of the Blood in various Places, at one and the same time. The same Author, also, justly informs us, that in Dysurics proceeding from Infarctions of the Kidneys with Blood, as, also, in Inflammations of the Bladder, we are first to open a Vein in the Arm, and then the Vena Saphena, in the Ham or Ankle. From what has been said, 'tis sufficiently obvious, that Venefection may be us'd in a Part very contiguous to that affected, if the Disease is recent, its Cause moveable, and the Plenitude of the Vessels not very great; but when the Disease is of a long Standing, and the Body abounds with too much Blood, we are first to use Venefection in the more remote, and then in the more contiguous Parts of the Body.

It is of great Importance to take away only a due and proper Quantity of Blood; and sometimes there is a necessity for reiterated Venefection. Young Persons, those of tender Habits, such as have small Vessels, and Women who readily fall into *Deliquiums* by means of large and copious Venefection, ought to abstain from it, if possible; but, if it should be absolutely necessary, the Orifice should in such Persons be made small, and the Blood but gradually evacuated, compressing the Incision at proper Intervals with the Finger. But Women, after fifty Years of Age, when their Menfes generally cease, require a larger Extraction of Blood, which, also, holds in robust Men with large Vessels, and in Persons, who, being accusom'd to rich and delicate Living, begin to have the hæmorrhoidal Discharge cease. In the Spring, especially in *May*, People can bear larger Evacuations of Blood, than in the Summer, or Autumn; but a moderate Quantity of Blood is only to be taken away in excessive Hæmorrhages, such as spitting of Blood; as, also, enormous Discharges of the Menfes, and Hæmorrhoids: Nor is it expedient to deprive the Body of a large Quantity of Blood, before the ordinary Time of the Menfes, lest the subsequent Discharge should either totally cease, or be considerably diminished.

In all inflammatory and exanthematous Fevers, if, in consequence of a Plethora, there is a Necessity for Venefection, we are to be very careful, that only a due Quantity of Blood be taken away; for, if, in case of a Redundance of Blood, too small a Quantity of it, such as an Ounce or two, is taken away, the organic Expansion of the Blood is often augmented; so that it is so far from being beneficial, that it rather does Injury by increasing the Inflammation, and preventing the Eruption of the exanthematous Matter. In like manner, if too large a Quantity of Blood is taken away, more Harm than Good is

done, since by this means the Expulsion of the exanthematous Matter, which ought to be conveyed to the Skin by the Blood, is hinder'd, and the peccant matter, to the great Detriment of the Patient, retain'd in the Habit. In a Peripneumony and Pleurisy, too copious Venefection hinders the Expectoration and Diffusion of the inflammatory Matter, which ought, also, to be evacuated, and carried off, by means of the Blood. In Rheumatisms, an Erysipelas, and arthritic Pains, both of the fix'd and wandering Kind, it is, also, necessary to leave a Quantity of Blood sufficient for the Cure of these Disorders; that is, we are neither to take away too large, nor too small a Quantity.

If a Plethora not only oppresses the Vessels, but, also, impairs the Strength, a large Quantity of Blood, such as a Medical Pound, for Instance, is to be taken away; for, if only a small and inconsiderable Portion is evacuated, the Blood finding a greater Space, its Elasticity is more increas'd, it becomes more expanded, and often acts with a greater Impetus on the Part affected. I have known Instances, says *Hoffman*, where, in considerable Plethoras, the Extraction of a small Quantity of Blood, an Ounce or two, for Instance, has a few Hours after been succeeded by an apoplectic Fit, which has been happily remov'd by liberal Venefection in the Arm, from which eight Ounces, for Instance, have been taken. I, also, remember, says he, that, in a certain plethoric Person, violent Anxieties of the Præcordia were produc'd by a Suppression of the hæmorrhoidal Discharge, arising from Cold. Upon opening a Vein in his Foot, and taking away only four Ounces of Blood, all the Symptoms were augmented, such as the Anxiety of the Præcordia, the Watchings, the Inquietudes, and Difficulties of Breathing, which, however, forthwith ceas'd upon taking seven Ounces of Blood from his other Foot.

Rheumatisms, Catarrhs, Coryzas, and Coughs, are often generated by a preposterous and unskilful Venefection, which, however, when seasonably us'd, proves an excellent Means for preventing and removing these Disorders. I have frequently observ'd, says *Hoffman*, in the Course of my Practice, that a few Days after Venefection, especially in the Spring and Autumn, when the Weather is not calm and serene, many have fallen into violent Catarrhs, Coryzas, Coughs, rheumatic Disorders, and catarrhal Fevers; and this happens very frequently, especially when Persons, not sufficiently clothed, expose themselves to the cold and moist Air, particularly in the Evenings; for it almost always happens, that the Perspiration is diminish'd by a pretty copious Venefection, in consequence of which, the Humours usually carried off thro' the Pores of the Skin, in the Form of Vapours, are, in some measure, retain'd in the internal Parts; and this happens most frequently in Persons of spongy Habits, and small Vessels. Nor is this Phenomenon hard to be accounted for: When a large Quantity of Blood is taken away, the Vessels, especially such as are small and near the Extremities, being before distended with Blood, begin to be flaccid and empty. And as there is an exquisite and highly sensible Tone in the subcutaneous Inguements, hence it happens, that, on the Access of a cold Air, the elastic Fibres of the Skin are contracted, and the sudoriferous Ducts by that means block'd up; in consequence of which, recrementitious Sweat not only remains in the Habit, but, also, is forced from the external to the internal Parts, especially to the glandulous Parts of the Fauces and Bronchia, or to the mucilaginous Glands of the Joints, or to their glandular Ligaments, where an highly acrid, saline, and stagnant Serum, exciting violent Irritations and Constrictions of the Vessels, hinders the free Circulation of the Humours; by which means, Secretions of Serum, Pains, intense Heats, and a copious Afflux of Humours, are excited.

But as an unskilful, or too copious, Venefection lays a Foundation for Catarrhs, so it is frequently observed in Practice, that Venefection prudently us'd in the Spring and Autumn, and repeated every Year, has freed many of Coryzas, Stuffings of the Head, and annual Coughs, and especially, those who before abounded in Blood, and have never had a Vein opened before. In the Spring, in consequence of the Rarefaction and Expansion of the Air, the Vessels are turgid, on account of the Expansion of the Blood, by the Access of a subtle Ether: If therefore, an Evacuation of Blood, either natural or artificial, is not made, Stagnations of Blood, and Humours, and Secretions, and Depositions of Serum, readily happen in the most lax, soft, and glandular Parts: all which Misfortunes may be happily prevented by seasonable and prudent Venefection.

As the flatulent Colic is sometimes augmented by Venefection, so those of the convulsive and hæmorrhoidal Kind are often alleviated, and totally remov'd, by it. Those Flatulencies which violently distend the Intestines, most frequently depend upon a want of due Tone in them, or a Weakness of their peristaltic Motion; for since, by the Force of this Motion, not only the Flatulencies, but, also, the other Contents, of the Intestines are carried downwards, so when it is either diminish'd, or totally destroy'd, Flatulencies are copiously generated, and become stagnant, especially in the Flexures of the Colon about the Hypochondria; but this want of Tone in the Intestines principally arises from the Defect of a laudable Blood, and nervous

vous Fluid; for which Reason old Persons, People after Recovery from a Disease, those weaken'd by any long-protracted Disorder, or Indisposition of Mind, those abounding in Phlegm, or who feed upon very refrigerating Aliments, are frequently subject to a particular Species of Colic, which is happily cur'd, not by Venesection, or diminishing the Quantity of Blood, but by carminative Medicines, possess'd of a balsamic and aromatic Principle. But other Measures are to be taken with the spasmodic or convulsive Colic, which arises from Blood lodg'd in the intestinal Coats, and violently distending them; for seasonably opening a Vein in the Foot not only proves a Preservative against this terrible Misfortune, but, also, affords present Relief under it, as *Riverius*, in *Cent. 1. Obs. 44.* has justly observ'd.

Both before and after Venesection, some Cautions are to be observ'd as useful: For,

1. We are not, except in Cases of urgent Necessity, to open a Vein in the Equinox or Solstice themselves, at full or new Moon, or in a rainy and gloomy Day. But 'tis expedient, a few Days before these Seasons, and on a clear and serene Day, to use Venesection as a Preservative; because about these Seasons the Discharge of the Menes generally happens, and various Disorders of the spasmodic Kind, epileptic Paroxysms, and the Diseases familiar to hypochondriac and melancholic Patients, generally return; and before the Paroxysms of these Diseases it is expedient, by Venesection, to free the Body from its superfluous and redundant Blood.

2. It is always expedient, in Persons who readily faint, to constitute Venesections, not with an empty Stomach, but after taking a little Broth, making the Orifice at the same time but small.

3. After Venesection, it is highly improper to load the Stomach with Meat or Drink; and much more, to drink to Excess, or expose the Body to a cold or moist Air; for 'tis certain, from frequent Experience, that by these means many, especially in the Months of *March* and *October*, and particularly if they are of a spongy Habit of Body, fall into Coryzas, Coughs, Rheumatisms, catarrhus Fevers, and spurious Pleurisies; for by Venesection, especially when copious, the Perspiration is considerably diminish'd, because the exhausted Blood no longer keeps the subcutaneous and sudoriferous Ducts so open as they were before. Hence the cold Air, by closing them up, and repelling the Humours from the Surface of the Body to the interior Parts, produces the now-mention'd Disorders.

4. Before Venesection, it contributes to Health to free the Primæ Viæ and Stomach from Crudities and Sordes, not by a drastic Purgative, but by a gentle Laxative; for we are by no means to exhibit strong Purgatives to plethoric Persons, because, by exciting Spasms of the Intestines, they by that means disturb the free Circulation of the Blood, and produce prejudicial Congestions in various Parts of the Body.

5. In Women, on account of the menstrual Discharge, and in Men subject to the Hæmorrhoids, it is always expedient to open a Vein in the Foot, lest the Blood should be derived from these Emunctories. But Men free from the Hæmorrhoids ought not to accustom themselves to Venesection in the Foot; for I have by that means seen blind Hæmorrhoids, without any Discharge excited, for removing of which Venesection in the Arm ought to be instituted.

6. After Venesection, a careful Regimen is to be observ'd; nor must the Patient forthwith return to his former Diet, and Method of Life. Hence we cannot forbear condemning the Custom of the *Germans*, who never eat and drink more plentifully than after Venesection.

Cupping with Scarification is often us'd as a Succedaneum for Venesection. Thus *Celsus*, in *Lib. 2. Cap. 10.* informs us, "That the principal Use of Cupping-glasses is when any Fault is lodg'd, not in the Whole, but in some particular Part, of the Body, to which, for the Purposes of Health, they need only be applied: And this is a Proof, that, in order to relieve any Part, we are, with the Knife or Lancet, principally to take Blood from the Part affected, since no one applies Cupping-glasses to a distant Part, unless when he intends to derive the Blood from it, but to the Part affected, and which is to be reliev'd." For this Reason, in Rheumatisms, especially such as affect the Back, Scapulæ, and Arms, and in Pains of the Gout, a profound Scarification is with great Advantage made; as, also, in Parts affected with a puffy and constrictory Pain; but it is observable, that a smaller Quantity of Blood is always obtain'd from the injured, than from a sound Part. In order to prevent Gout-pains, some, every Month, with great Success, use Scarification, either on the Sole, or on the upper Part, of the Foot. In Efflorescences, and Defecations of the Face, Cupping with Scarification is, also, useful, in order to derive the Blood from that Part. In fat and spongy Habits, this Practice is, also, useful, for removing Itches, and cutaneous Deformities.

In acute Disorders, where the Strength does not admit of a quick and speedy Evacuation of Blood by Venesection; it is expedient, gently, and by degrees, to procure this Evacuation, if ne-

cessary, by Cupping, with Scarification. Thus *Celsus*, in *Lib. 2. Cap. 11.* informs us, "That Cupping, with Scarification, is to be used in some acute Disorders, when the Body is to be relieved, and the Strength does not admit of an Evacuation of Blood from the Veins. And this Practice is not only less violent, but more safe, and never dangerous, tho' used when the Fever is at its Height, and when the Crudities abound. For this Reason, when immediate Danger attends the opening of a Vein, or when the Disorder is lodged in some of the more noble Parts of the Body, we ought rather to have recourse to Cupping, with Scarification, especially when we know, that it is a safe and gentle Method, and that violent Disorders must only be cured by violent Remedies." I have found this Caution of *Celsus* to be founded on Experience; for I have observed, that Disorders of the Head, such as Epilepsies, Vertigoes, Madness, and Convulsions of the Joints, have been increased, and their Paroxysms rendered more frequent, especially in young Persons, and those of delicate Constitutions, by a quick and pretty copious Evacuation of Blood from a Vein; whereas they were very able to bear the Extraction of Blood by Cupping-glasses, which greatly alleviated their Disorders. The Reason of this seems to be, that, in the Parts affected, the Violence of the Spasms, to which the Blood in the Vessels greatly resists, is increased, if that Blood is suddenly taken from them. In acute Fevers, when, in consequence of a Congestion of Blood in the Head, a Phrenitis is to be dreaded, it is, also, more safe and expedient to lessen the Quantity of Blood, by applying Cupping-glasses to the Occiput, than by opening a Vein in the Cubit. *Prosper Alpinus*, in his *Treatise de Medicin. Egypt.* informs us, that it was a common Practice among the ancient Physicians of that Nation, in all acute Fevers, where, from a Redness of the Face, and continual Watchings, they dreaded a Phrenitis, to scarify the internal Veins of the Nostrils, and, by tepid Baths of sweet Water, procure an Evacuation of Blood from them. But when, in any Disorder, instantaneous Relief is necessary, and a speedy Derivation of the Blood from the Part affected, in an apoplectic Fit, for Instance, a Peripneumony, an Inflammation of the Uterus, or a cardiac Syncope, proceeding from an Infarction of the Blood in the Heart, or in Cases where there is Danger of a Suffocation, Cupping-glasses are but of little Service; for 'tis rather expedient to make quick and speedy Evacuation of Blood, by making a large Orifice in some proper Vein near the Part affected.

Cupping-glasses are to be used, when, in consequence of Blood or Serum, stagnating in some external Part, Pains, Tumors, Inflammations, or other Disorders, are produced. This Doctrine is confirmed by *Celsus*, in the former of the Passages before-quoted from him; for the Use of Scarification is either evacuator or derivatory; the former, in order to diminish the Plethora; and the latter, in order to extract the corrupted and impacted Matter. Many of the Antients, and especially among the *Egyptians*, denied, that Cupping was of any Service in order to remove a Plethora; and, for that Reason only, applied Cupping-glasses to certain Parts. But when these are applied to any Part of the Body, such as the Back, Arms, Thighs, or Legs, and the Incisions made frequent and deep, twelve Ounces of Blood are often evacuated, of the same Weight and Consistence with that which is taken from the Veins; for I have often convinced myself of this, by drying the Blood extracted by Cupping-glasses, and found three Parts fluid to one of the solid, as in the Blood taken from the Veins; so that it may justly be class'd among the vulgar Errors of Medicine, to affirm, that the Blood, extracted by Cupping-glasses, is thinner than that obtained from the Veins. However, in order to evacuate and divert the peccant Matter, Cupping is preferable to Venesection; for I remember some Instances, where, in violent Pains of the Scapulæ, Pains and acrid Defluxions of the Eyes, a Gutta Rosacea, erysipelatous Swellings of the Head, Venesection in the Feet or Arms, was of no manner of Service; but Scarification in the Neck, Occiput, and behind the Ears, and the Application of Cupping-glasses to the Back, afforded great Relief. *Prosper Alpinus*, in his *Treatise de Medicin. Egyptior.* informs us, that in Pains and Defluxions of the Head and Eyes, Ophthalmias, Lippitudes, and in order to procure Sleep, the *Egyptians* applied Cupping-glasses to the Occiput, Neck, and behind the Ears, and, by profound Scarifications, extracted the Blood, but first ordered a Vein in the Arm to be opened. This Advice is carefully to be followed in plethoric Patients, even where the Veins of the Face or Nostrils are to be scarified in violent Pains of the Head, or Madnes, lest Space being afforded, a greater Afflux of Blood to these Parts should be excited. In order to prevent Gout-pains, Scarification made in the Soles of the Feet, every Month, is of great Service. And *Cardan.* in *Lib. de Art. Parv.* recommends Scarification under the very Paroxysm of the Gout. And *Platerus*, *Lib. 2. Prax. Med.* confirms this Doctrine, by giving us some Instances of Persons cured by this means. Besides, *Severinus*, in his Book *de Efficac. Medic. Lib. 1.* greatly recommends the Use of Scarification, in order to prevent the spreading of a Sphacelus, and cure malignant Ulcers. *Galen*, also, in his *Treatise de Sang. Missio.* greatly recommends Scarifications of the Legs in Suppressions of the Menes and Hæmorrhoids, which may be, also, used in those who have an Aver-

tion to Venesection; who, from a languid Strength of the Heart, are subject to Faintings; or those who, on account of the Tenderness of their Age, cannot bear a sudden Extraction of Blood from an opened Vein.

Blood may be, also, extracted from the Body by Leeches, which are greatly commended by some Physicians. Tho' this Method seems to have been little known to the most antient Physicians; yet *Pliny*, in *Hist. Nat. Lib. 32. Cap. 10.* speaks of them thus: "The Uses of Leeches for extracting Blood are various, and the same with those of Cupping-glasses, which are to relieve the Body, when oppressed with a Redundance of Blood, and to open the Pores." Among the *Arabians*, *Rhazes* knew the Use of Leeches; and, among the Physicians of the last Age, *Zacutus Lusitanus*, *Amatus Lusitanus*, and *Mercatus*, greatly commend the Application of them, especially in those Disorders which are generally incident to the Head, such as the Guttæ Rosææ, Pustules of the Face; and Head-achs, especially of the rheumatic Kind; as, also, in Vertigoes, Melancholy, Quinseys, and Tooth-achs, in which these Physicians applied them to the Occiput, Neck, and behind the Ears. Tho' I do not at all doubt of the Salubrity of the Evacuation of Blood made by Leeches, yet I have good Reason to suspect, that no greater Advantage is to be obtained from them, than from the Evacuation procured by Cupping with Scarification.

The Application of Leeches to the Anus in a Suppression of the Hæmorrhoids, and Disorders arising thence, is generally greatly recommended. This Method of extracting Blood from the Veins of the Anus, by the Application of Leeches, is, by some, preferred to others, in Disorders arising from a Suppression of the Hæmorrhoids; such as hysteric Symptoms, and in those Disorders which, according to *Hippocrates*, are terminated by the hæmorrhoidal Discharge, such as phrenitic, melancholic, hypochondriac, nephritic, and ischiadic Disorders; because these Diseases arise from Blood stagnating in the Vessels of the Intestines, which terminate in the hæmorrhoidal Veins; in consequence of which, this Blood is more easily evacuated, and the Part affected relieved, by applying Leeches to the Veins of the Anus, than if Blood was extracted from any other Parts of the Body. I cannot deny, but, in these Disorders, Leeches may be of some Use, especially if we may believe the Observations of *Zacutus Lusitanus*, *Amatus Lusitanus*, and *Mercatus*. But, whether an happier Effect may be produced from them, than from opening a Vein in the Foot, or from profound Scarifications in the Legs, I cannot assert, since I have not Experience to authorize me: For, in violent and inveterate Spasms of the Hypochondria, I have often seen Leeches applied without any Effect; I have, on other Occasions, seen them afford Relief for a time; and, by their Application to blind Hæmorrhoids, I have seen malignant Ulcers and Fistulas produced. Besides, there is Reason to doubt, whether Leeches draw the Blood from the Part affected, because they suck it from the external hæmorrhoidal Veins, the internal being concealed. Now the internal hæmorrhoidal Veins have little or no Communication with the intestinal Vessels, the mesaraic Veins, and the Ramifications of the Vena Portæ, in which, however, the Seat of spasmodic and hypochondriac Disorders is placed. But, in an hæmorrhoidal Discharge, the internal hæmorrhoidal Veins evacuate the Blood; for which Reason, if the Hæmorrhoids flow duly, and at proper Times, they afford great Relief in the Disorders arising from a Stagnation of Blood in the Ramifications of the Vena Portæ. *Hoffman*.

Phlebotomy, used in such a Degree as not to impair the Strength, produces the following Effects.

1. It diminishes the Redundance of the arterial and venous Humours.
2. For this Reason it renders the Resistance of the Fluids to be moved less.
3. In consequence of this, it lessens not only the Plenitude of the Vessels, but, also, their mutual Compression on each other.
4. Hence it restores a due Degree of Contraction, or Elasticity, to the preternaturally distended Vessels.
5. It rarefies the Fluids.
6. It attenuates the Humours.
7. It resolves the Juices.
8. It removes Obstructions.
9. It promotes the Circulation of the Blood, together with the several Secretions and Excretions so necessary to Life and Health.
10. It produces a Revulsion.
11. It refrigerates and cools.

Hence it removes many Disorders of very different Natures, and induces surprising Changes on the State and Condition of the human Body.

Phlebotomy is indicated as expedient,

1. By a Redundance, or excessive Quantity, of Blood.
2. By too powerful a Resistance made to the Action of the Heart by the Humours.
3. By a suffocated Motion of the Heart, in consequence of too tumid a State of the Arteries, arising from a Redundance or Rarefaction of their Contents.
4. By the Motion of the Heart beginning to be suffocated, in

consequence of a preternatural Extension of the Vessels, by which their Elasticity is destroy'd.

5. By too great a Condensation of the Blood.
6. By too great a Concretion of the Parts of the Blood.
7. By too great an Inspissation of the Blood.
8. By the Signs of a violent and inflammatory Obstruction found every-where in the Body; the most considerable of which are Pain, Tumor, Redness, intense Heat, and Anxiety, accompanied with a Suppression of the Sweat, Spit, and Urine.
9. By too accelerated a Motion of the Humours through the Vessels; or, also, a too slow and languid Circulation of the Humours, arising from a Redundance of the Humours; a Plenitude, and preternatural Distention, of the Vessels; a Rarefaction, Attenuation, or Resolution, of the Humours; and Obstructions of the Vessels.
10. By too intense an Heat in all the Vessels.
11. By too violent an Imperus of the Blood forced into one particular Part, as in Hæmorrhages and Defluxions.
12. By epidemic Disorders, whose Natures are understood.
13. By the Age, the Sex, the Method of Life, and the Constitution, of the Patient.
14. By a Cacochymy: And,
15. Phlebotomy is indicated, when the Intention is to make Medicines enter the Vessels, to procure their due Mixture with the Fluids, and to augment their Efficacy in performing Cures of great Importance.

Phlebotomy is best and most advantageously performed,

1. By making a large Orifice with some cutting Instrument.
2. In a Vein that is disengaged, large, easily discovered, and remote from Arteries, Nerves, and Tendons.
3. By accelerating the Velocity of the Blood, whilst it flows, by means of a strong Respiration.
4. By the Motion of the Muscles contiguous to the opened Vein. And,
5. 'Tis most proper to perform Phlebotomy on Patients, whilst they lie in Bed.

That Phlebotomy may be the more happily and successfully performed, the Patient may be prepared for it,

1. By Frictions. And,
 2. By Fomentations.
- Phlebotomy is contra-indicated, and rendered improper,
1. By many chronical Disorders, in which there are many Obstructions, and only a very small Quantity of fluid Blood remaining in the Vessels.
 2. By Old-age.
 3. By particular Temperaments, or Habits, of Body.
 4. By the known Nature of any epidemic or endemic Disorder.
 5. By a Crisis already made in another manner.
 6. By the Deficiency of red Blood, and the consequent Weakness of the Patient. And,
 7. By recent Childbirth.

Hence 'tis obvious, that an irreparable Injury must be done to Mankind, by using Phlebotomy in all Cases, according to the Advice of *Leonhartus Botallus*; and by banishing it entirely from the Practice of Medicine, according to *Johannes Baptista Van Helmont*.

The Extraction or Evacuation of Blood from the hæmorrhoidal Veins is indicated,

1. By an arrabilarious Habit of Body.
2. By Diseases accompanied with irregular and disorderly Workings of the Fancy.
3. By a Suppression of the usual Discharge of Blood from these Veins.
4. By an Eruption of Blood from other Parts, which was before more happily evacuated from the hæmorrhoidal Veins.

Blood is evacuated from the hæmorrhoidal Veins,

1. By softening these Vessels by an emollient and warm Fomentation prepared of Water, Oil, Honey, and other emollient Ingredients; and applied by way of Clyster, Vapour, or Fomentation.
 2. By opening these Vessels by Friction, with rough Substances, or by means of Leeches. And,
 3. By the Use of Preparations of Aloes.
- Scarifications act by stimulating, and by evacuating. Hence we are enabled thoroughly to understand the Action of Leeches.
- But Serons and Fontanels stimulate with less Pain, agitate the nervous System, evacuate Serum, and procure a Vent, or Discharge, for preternatural Repletion.

Hence we may learn in what Parts, and on what Occasions, these are indicated.

Stimulating Medicines, or such as create Pain, Heat, and Redness, act by procuring Motion to the Nerves, and by determining Blood to particular designed Parts.

Hence they undoubtedly perform an unconceivable Number of happy Effects, by the known Necessity of which they are, also, indicated.

Stimulating Medicines are generally reduced;

1. To highly adhesive, and, at the same time penetrating Drops, applied warm in the Form of a Plaister, and torn off, repeating

peating this, till the Part affected becomes red, tumid, and hot. The Ingredients proper for these Dropaxes are, Pitch, Oil, Bitumen, the Ashes of Twigs of Vines, Galbanum, Pepper, Pellitory of Spain, Sal Gemme, and Sal Ammoniac.

2. To gentle Sinapisms, called *Phanigmi*, applied by way of Cataplasim, and left till Redness, Heat, Itching, and Tumor, appear in the Part. The Materials for these are Mustard, Bryony, Garlic, Onions, Water-cresses, Squills, Euphorbium, Crow-foot, and the deadly Carrot.

3. To Veficatories, which are only stronger Sinapisms used in the same Form, but producing more violent Effects. The Difference only consists in the augmented Quantity of the acrid Substances. Thus, for Instance, three Parts of Figs, mixed with one Part of acrid Substances, yield a *Phoenigmus*; one Part of Figs, mixed with one Part of acrid Substances, yields a Veficatory; and one Part of Figs, mixed with three Parts of acrid Substances, yields a strong Veficatory.

4. To the potential Caustic, applied either in the Form of a Poullice, or with Lint. The Materials for this are Crow-foot, the Efula, the Tithymalus, fixed alkaline Salt, alkaline volatile Spirits, and Salts. The Effects produced by this Species of Remedy are Inflammation, and an Eschar. And,

5. To the actual Caustery, which is ignited Iron. *Boerb. Inst.* Phlebotomy, or Bleeding, by the Veins, is performed by making an Incision in a Vein, with a fine sharp-pointed Instrument, or Lancet, by which as much Blood is taken away, as may be proper for restoring or preserving the Health of the Patient.

This Operation may not improperly be called Venesection, and is not only extremely beneficial, but of a very antient Date, having been commended and practised about three thousand Years, as we learn from the Writings of *Hippocrates*, *Celsus*, and other antient Authors upon Surgery. Yet some Physicians, both antient and modern, such as *Erasistratus*, *Paracelsus*, *Helmont*, *Portius*, *Bontekoe*, *Gebema*, and others, have asserted it to be a most pernicious and unlawful Operation, and have termed the Practisers of it no less than the Destroyers and Butchers of Mankind. But Experience shews us, that all their Objections are trifling and unjust; and that there is no Remedy in the whole Art of Medicine, more ready, or more serviceable, in curing or preventing the generality of Diseases, than Phlebotomy. Some relate, that Physicians took the Hint of this Operation from the *Hippopotamus*, or Sea-horse, who, at certain Seasons, used to open a Vein with a sharp-pointed Reed. See *Polydore Virgil de Rer. Inventor*.

Bleeding, according to the vulgar Opinion, is a very easy Operation. In some Persons I own that the Veins are so large and conspicuous, that they may be opened by Novices, without Danger or Difficulty. But, in others, they are so small, or so deeply seated, that they cannot be discovered by the most expert Surgeon without Difficulty; nor opened without Danger. For the Arteries, or the Nerves and Tendons adjacent to the Veins, are very liable to be wounded by the Lancet; a Misfortune which is generally attended with violent Pains, Convulsions, Inflammations, profuse Hemorrhages, Aneurisms, Gangrenes, and sometimes a most miserable Death; and, therefore, this Operation, as well as others, requires Caution and Attention, since the Reputation of young Surgeons, especially, may suffer as much by a timorous Introduction of the Lancet, so that the Blood follows not, as when, by affecting to perform easily and expeditiously, a Misfortune should ensue.

An expert Phlebotomist should have an active, gentle, and steady Hand, a clear Sight, and an intrepid Mind; for, without these Qualifications, he will be subject either to miss the Vein, or to occasion some Mischief, which may be fatal to the Patient. This is the Reason, why the Dexterity of Surgeons, in Bleeding, gradually declines, as they advance in Years; for, as Age increases, the Eyes become weak, and the Hands unsteady.

The Instrument now commonly used in opening a Vein, is called a Lancet, and is represented in *Tab. XXII. Lit. A.* and *Tab. XXXII. Fig. 5.* A Surgeon should always be provided with several of these Lancets, of different Sizes, and in good Order. Some Surgeons in Germany, particularly in *Francia*, *Bavaria*, and the *Lower Saxony*, bleed with a Fleam (see *Tab. XXXII. Fig. 3.*) in this manner: With the Fingers of one Hand, they hold the Part B, and place the Point A upon the Vein; with a Finger of the other Hand, they strike the Part C, by which means the Point pierces the Vein, as Farriers do in bleeding Horses. Others use a sort of elastic Fleam, called by the Germans, *Schnapper*, or *Schnapperlein*, (see *Fig. 4.*) thus: Having raised the Point A, they apply it to the Part; and, by pressing at B, force down the Point into the Vein: Others use an Instrument shaped like a Dart. But, as these Instruments cannot be always adapted to the different Position and Figure of the Veins of different People, the Lancet seems to be more proper; tho' many of the Germans are very expert in the Use of their *Schnapper*.

Tho' Phlebotomy is used in various Parts of the Body, as in the Arm, Hand, Foot, Forehead, Temples, Neck, Tongue, Penis, and others; yet, as it is most frequently performed in a Vein of the Arm, which is near the Joint of the Elbow, we shall, therefore, begin with this Operation, and enlarge a little upon it.

It is commonly known, that Bleeding in the Arm is performed on the Veins placed on the Inside of the Cubit. In this Operation several Circumstances are to be considered: 1. What is to be done preparatory to the Bleeding. 2. How the Operation itself is to be performed. 3. and lastly, What is necessary to be done, in consequence of it. With regard to the preparatory Circumstances, the Surgeon must necessarily have in Readiness a Linen Fillet, about an Ell in Length, and of the Breadth of two Fingers. 2. Two small square Compresses. 3. Porringers, or Vessels, proper for receiving the Blood. 4. A Sponge, with warm Water. 5. A small Quantity of Vinegar, Wine, or Hungary Water, for relieving the Patient, if he should be inclinable to faint. 6. Two Assistants, not fearful, one to hold the Porringer, and the other to bring what may be wanted. 7. A small Wax-candle, when this Operation is necessary to be performed in the Night, or in a dark Place. 8. The Patient should be placed in a Chair a little reclined, or, if timorous, in a Bed, that he may not be in Danger of dropping off his Seat in a Swoon. 9. Lastly, The Surgeon should take care, that no Cloaths, and the like, should lie in the Way. The Patient should banish all Concern, and be by no means apprehensive of any Danger from the Operation. The Operator should be as expert in performing with his Left, as with his Right Hand; for the Vein in the Right Arm must be opened with the Right Hand, and in the Left Arm, with the Left Hand. Some will insist on being bled in the Left Arm; and sometimes the Vein in the Right is not conspicuous, or proper to be opened.

With regard to the Operation itself, though it may be performed by a single Puncture, yet many Circumstances are necessary to be observed, for the better Execution of it. The Surgeon should narrowly inspect the Arm whence Blood is to be taken, in order to observe the Veins; then he must take hold of the Arm, and extend it towards his Breast. The Sleeve being tucked about an Hand's-breadth above the Elbow, he should make a tight Ligature about three Fingers-breadth above the Elbow, with a Fillet of the Breadth of a Thumb and a Yard in Length, rolling it twice, and fastening it with a Knot (See *Tab. XXXII. Fig. 1. D*); by which means the Veins, being compressed, and the Reflux of the Blood obstructed, are swelled, and rendered more conspicuous. This Fillet is generally made of a Piece of thin scarlet Cloth, though any other Colour may do. The Surgeon may now let go the Arm, and, taking out his Lancet, open it to an obtuse Angle, and hold it in his Teeth, at the Joint A, *Tab. XXXII. Fig. 5.* In the mean while the Veins grow more turgid, and more conspicuous. The Surgeon must now again lay hold of the Arm, and extend it towards his Breast, the Assistant being ready with the Porringer, and in the most convenient Situation, for receiving the Blood. The Surgeon must next examine, which Vein is most conspicuous, and, therefore, most proper for Incision. It is necessary to be observed here, that three principal Veins appear in the Arm: The first is called the *Vena Cephalica*, and lies towards the exterior Part of the Arm; the second is termed the *Basilica*, and is found towards the interior Part of the Arm; see *Tab. XXXII. Fig. 1. A*; it is, also, denominated, in the Right arm, *Hepatica*, and, in the Left, *Splenetica*, as at B; the third, being situated in the Middle, obliquely, between the other two, is named *Mediana*, as at C. The *Mediana* and *Basilica*, being larger, generally emit the Blood more copiously, than the *Cephalica*, but they are opened with greater Danger; for, under the *Basilica*, lie the great Artery of the Arm, and the Brachial Nerve; and, under the *Mediana* is a Tendon, of the *Musculus Biceps*. But, as these two are most conspicuous, they are most frequently opened; though it is safer, especially for young Surgeons, to make the Incision in the *Cephalic* Vein, or, at least, in the *Median*. But, when the Veins are so situated, that only one of them can be made to appear, then there is no Choice left, and there is nothing to be depended upon, but the Skill and Care of the Surgeon.

When the Vein is already pitched upon, the Incision must be made where it appears largest and conspicuous. If any Marks of former Wounds remain, it will be proper to open the Vein rather below, than above the Cicatrix; which generally straitens the superior Part. For this Reason, whenever you open a Vein for the first Time, begin as high as you can; by which means you may gradually descend in repeated Bleedings.

Before the Lancet be applied, if the Veins do not sufficiently rise, it will be proper to stroke the Arm from the Hand upwards, which will compress the Blood towards the Elbow, and make the Veins become more turgid. If the Incision is to be made in the Right Arm, the Surgeon is to hold the Arm in his Left Hand, in such a manner, that his Thumb may be placed upon the Vein which is to be opened, in order to prevent the Reflux of the Blood, and the Vein from sliding out of its Place.

The

The Vein being thus firmly held, the Surgeon must keep his Eyes fixed upon that Part, where he intends to introduce the Lancet. Then, taking the Lancet out of the Mouth with his Right Hand, he must hold it about the Middle of the Blade, between his fore Finger and Thumb, suffering the other Fingers to rest gently upon the Patient's Arm, that his Hand may not slip.

Then the Lancet must be softly and carefully pushed by the fore Finger and Thumb, till it penetrates the Coats of the Vein; and the Point must be immediately turned a little upwards, by which the Wound may be enlarged; and the Discharge of the Blood may soon be rendered plentiful. Those Orifices are reckoned most convenient, whose Length is equal to twice the Thickness of the Back of a small Knife. The Lancet must be introduced, not with Rashness, lest, by penetrating too deep, an Artery, a Nerve, or Tendon, should be wounded; nor with Timidity, lest you should only divide the common Integuments, without reaching the Vein. The Vein may be opened in three Directions: Some make the Wound lengthwise, as at *Tab. XXXII. Fig. 2. A*; others make it transverse, as at *B*; but most Surgeons make it oblique, as at *C* and *D*. If the Incision is to be made in the Left Arm, the Operator must hold the Arm in his Right Hand, and all must be done with the Left Hand, which was before proposed to be done with the Right. If the Fleam at *Fig. 3.* be used in this Operation, the Point *A* must be applied to the Vein; and, the End *B* being held in the Left Hand, the Point must be driven into the Vein by the Stroke of a Finger of the Right Hand. If the elastic Fleam is to be used, let the Point *A*, placed above the Vein, be raised towards the Hook *C*; by a slight Pressure at *B*, the Point is plunged into the Vein.

The Vein being thus opened, and the Instrument immediately drawn back, the Blood will either vigorously spring out, or flow gently. The Lancet must now be put into a Basin, and never thrown upon the Bed, lest it should be accidentally lost, or the Patient should wound himself by it. In the mean time, the Blood should be suffered to run, till a sufficient Quantity is discharged. But if it should stop too soon, as often happens from the Stricture of the Ligature above the Elbow, the Bandage may then be untied, or rather a little relaxed; by which means, the compressed Artery is again enlarged, and the Discharge of Blood is continued. If the Wound should be stopp'd by too great a Tension of the Skin, or by Fat, the Piece of Fat should be pressed back with the Finger, or a warm Sponge, or the Skin may be relaxed by bending the Arm. If the Orifice should be obstructed by thick coagulated Blood, that Impediment may be removed by wiping the Wound with a Sponge dipt in warm Water.

That the Patient's Arm may not tire by being long extended, the Surgeon ought to support it about the Elbow. A small Stick, or Cylinder, should be put into the Patient's Hand, which he should continually turn round, by this Method accelerating the Motion of the Blood towards the Wound; which will be further promoted, if the Patient urges a little voluntary Cough. The Attendants should be ready, with empty Vessels for receiving the Blood, to remove such as are filled, and to administer the Compresses, Bandages, Cordials, and other Necessaries.

The Quantity of Blood to be taken away must be regulated by the Physician, according to the Nature of the Disease, the Temperament, Strength, and other Circumstances, of the Patient. But, when the Surgeon attends his Patient without a Physician, he may determine the Quantity himself, according to the Nature of the Disease, the Strength, Age, Constitution, and other Circumstances, of the Patient. If the Patient retains his natural Complexion, and neither grows languid nor faint, the Blood may be suffered to flow longer, than in those who are soon affected with Paleness and Swooning.

When a sufficient Quantity of Blood is discharged, the Bandage above the Elbow must be removed; and the fore and middle Finger of the Left Hand must be gently drawn over the Orifice, stroking the Skin on each Side of the Wound; by which means the Lips of the divided Vein are more easily pressed together. Then let the Surgeon take the smaller Compress in his Right Hand, and apply it to the Wound, having first removed the Fingers of his Left Hand, that the Blood, between the Vein and the Skin, may be discharged, before the Compress be applied. Over this, lay another larger Compress, which must be retained with the Thumb, till the Whole be secured by the Bandage.

The Patient's Sleeve may now be drawn down over the Arm, which he should keep bent towards his Breast; and the Patient should be ordered not to use any Motion too soon, lest a new Hæmorrhage, Inflammation, or Suppuration, should be occasioned. If the Patient should faint away after the Operation, it will be proper to apply to the Nostrils and Face some Cordial Water, as *Hungary Water*, or *Vinegar*, or *Wine*; or cold Water may be sprinkled on the Face; or, if in the Summer-

time, the Window may be opened, and the Spirits and Strength of the Patient restored by the Admission of fresh Air. A small Glass of Cordial Water, or generous Wine, should, likewise, be given to the Patient.

It is customary for the Surgeon, or the Physician, if there is one present, to look at the Blood, and give his Opinion of it. In this Case, the Surgeon should never discourage the Patient, whether the Blood be good or bad, or whether he retains his Senses, or falls into Faintings. Favourable Accounts here greatly contribute to the Recovery of Health; but to dishearten the Patient by a severe Prognostic, may occasion very fatal Consequences. If, therefore, the Blood appear florid, the Surgeon should declare it a Sign of immediate or approaching Health; if the Blood be of a bad Colour, or vitiated, he must pronounce, that the Bleeding will be extremely serviceable. If the Patient should fall into a Swoon, the Surgeon intimates, that this Weakness is an Evidence of the speedy and salutary Effects of the Remedy. The Blood should be set by in a cool Place, till the Physician, or Surgeon, renews his Visit.

If, after Bleeding, the Patient should be affected with Thirst, he may be allowed to quench it, especially if he can drink small thin Liquors. It is a Custom among the *French*, immediately after Bleeding, especially if the Remedy is used to prevent Disorders arising from the Heat of the Blood, to take a Draught of cold fresh Water: Which Method, in hot Habits, may be very serviceable; but in cold, infirm Constitutions, very prejudicial; for whom a little warm Tea, or Coffee, would be much more proper. The Patient may either be forbid or allowed to sleep after the Operation, according to Circumstances. If the Patient used Bleeding only by way of Prevention, it would certainly be more proper for him to divert his Drowsiness by some agreeable Conversation, Amusement, or Exercise; for, if Sleep be indulged, the Bandage may slip, and a violent Hæmorrhage be occasioned. But those who are extremely weak, or labour under some Indisposition, should by no means be hindered from Sleep, especially if they have been troubled with tedious Watchings; for, by Sleep, the weak wearied Body is often wonderfully refreshed. In the mean time, an Attendant should carefully observe, that the Bandage continues fast, or, if it should slip, to stop the Flux of Blood, by compressing the Wound with the Fingers, till the Surgeon be called.

If, at the next Visit, the Blood, as is usual, should be again brought to the Surgeon, and his Opinion of it asked, he should, as we before observed, say nothing, but what may tend to encourage the Hopes of the Patient. The Surgeon should, likewise, inspect the Dressing; and, if the Bandage be relaxed, he should untie it, and apply it afresh; if the Compresses adhere to the Wound, they should not be removed; but, if they are loose, they should be again applied, and secured by the Bandage; which, being suffer'd to continue a Day or two, till the Wound be healed, may then be taken away. Some People, of an hot Constitution, will have the Blood run into cold Water, imagining, that by some secret Sympathy the Heat of the Blood may be by this means allayed. But, however trifling and false such a Notion may be, yet as it may be complied with without Danger, and as it may have some good Effect upon the Imagination of a credulous Person, it ought not to be rejected, but permitted.

OF BLEEDING AT THE HAND.

Phlebotomy is sometimes practised on two Veins of the Hand, one of which is called the *Salvatella*, and the other *Cephalica*. The *Salvatella* extends on the exterior Part of the Back of the Hand towards the little Finger, being sometimes named *Splenica* in the Left Hand, because many antient Physicians believed, that the Opening of it was beneficial in Diseases of the Spleen. The *Cephalica* runs between the fore Finger and Thumb, and was so denominated by the antient Physicians, because they fancied, that Bleeding from it was an excellent Remedy against Disorders of the Head. Although it is plain, that Bleeding at the Hand is more difficult than in the Arm, and that all these Notions of the Antients are without Foundation, yet, since the Effect is the same with that of Bleeding in the Arm, it may be sometimes proper for the Operation to be performed on the Hand; especially if the Patient be prepossessed with a good Opinion of that Operation; or if the Veins of the Hand are more conspicuous, than those of the Arm. Some Women, too, in the last Months of their Pregnancy, or near the Time of their Delivery, prefer Bleeding at the Hand, which, they imagine, does not so much debilitate the Fœtus, as in the Arm.

In this Operation, therefore, it is proper for the Patient to bathe and rub his Hand in warm Water, that the Veins may swell, and become conspicuous. The Bandage must be fix'd immediately about the Carpus, to keep the Veins turgid; then the Hand must be dried, and the Incision made in the most convenient Place, as was before directed. If the Blood flows but slowly, the Hand must be again dipped in warm Water, and continue

continue there, till a sufficient Quantity is discharged. Then the Hand may be dried, the Wound contracted by the Fingers, and the Compresses and Bandages applied as above directed.

OF BLEEDING IN THE FOOT.

Bleeding in the Foot is a very ancient Operation, which has been observed by Physicians to be a most efficacious Remedy for various Diseases of the Head and Breast, and, also, against those Disorders which proceed from an Obstruction of the Menfes, or Hæmorrhoids: Hence the Veins of the Feet have long ago been called *Cephalica*, and *Saphena*. The Vena Cephalica extends towards the great Toe; and the Saphena towards the lesser Toes. But, notwithstanding the Difference of the Names, in Bleeding, they have both the same Effect; and, therefore, I think, the more conspicuous of the two ought always to be preferred. However, when the Veins of the Feet do not sufficiently appear, it will be more proper to open a Vein about the Ancles, the Calf of the Leg, or the Knees, as I have frequently done, especially as the Nerves and Tendons of those Parts are not so liable to be wounded, as those of the Foot. But it is proper to advise the Surgeon here, to be cautious in bleeding single Women at the Feet, without the Advice of a Physician; for some, under the Pretence of an Obstruction of the Menfes, endeavour by this Method, to procure a Miscarriage.

In order to facilitate the Performance of this Operation, let the Patient bathe his Feet in warm Water, till the Veins become tumid; and the Surgeon should choose that Foot, in which the Veins are most conspicuous. The Bandage should be tied about the Breadth of two Fingers above the Ankle; and, whilst the Surgeon is taking out his Lancet, the Patient should keep his Foot in the warm Water, in order to increase the Raising of the Vein. Then the Surgeon, kneeling on one Knee, and having dried the Foot, lays it on the other Knee, or on a Stool, or on the Edge of the Vessel which holds the Water. He then takes the Foot in his Left Hand, and keeps the Vein fixed, as was directed for bleeding in the Arm. If the Veins appear not sufficiently below the Ancles, it will not be improper to open them above, or in the Calves; and then the Ligature must be made at the Distance of the Breadth of two Fingers above the Place of Incision, and the Veins may be rendered conspicuous by the Method already directed. We must, also, observe, with regard to the Surgeon's Posture, that he may place himself before the Patient on a low Seat, and put the Foot on either Knee. When the Spring-steam is used, as is often done in Germany, it will be then most convenient for the Patient to put his Foot on a low Stool.

The Vein being thus opened, the Blood may be received into proper Vessels; and, if the Blood does not flow freely, let the Foot be again put into the warm Water, which will, also, prevent the Blood from congealing and stagnating in the Wound; an Accident which frequently happens. When a sufficient Quantity of Blood has been thus discharged, which may be discovered, not only from the Time, but, also, from the Quickness or Slowness of the Evacuation, from the Redness of the Water, and especially from the Strength of the Patient, the Orifice is to be stopp'd by a proper Compress and Bandage. The Advantages resulting from this Operation may be seen in *Verduc*, *Caspar Cadera de Heredia*, a Spanish Physician, *Stahl*, and others. These Authors have been opposed by *Hecquet* of Paris, in his Book *sur la Saignée du Pied*, and again defended by *Jo. Bapt. Sylva*, also, a Physician of Paris, in his *Traité de l'Usage des différentes Sortes de Saignées*, Amsterdam, 1729. He was answered in 1730, by *Chevalier*, a Physician, and, also, by *Quesnay*, a Surgeon, both of Paris.

OF BLEEDING IN THE FOREHEAD, TEMPLES, AND OCCIPUT.

Some are of Opinion, that Bleeding at the Veins of the Forehead and Temples is more efficacious and expeditious in the Cure of violent Pains of the Head, of Vertigos, Melancholy, Madness, Deliriums, and the like obstinate Disorders of the Head, than the like Evacuation by Veins more remote from the Part affected; judging, that the morbid Matter may more readily be extracted by the Veins of the Forehead and Temples, by reason of their Vicinity. But, in my Opinion, the Situation of these Veins contributes very little towards hastening the Cure, because they have little or no Communication with the internal Parts of the Head, and they generally yield but a small Quantity of Blood. The Jugular Vein seems to me much better adapted to this Purpose, as it is situated very near the Veins of the Forehead and Temples, which terminate in it, as it is larger and more conspicuous, and as it communicates with the internal Parts. But if this Operation must be performed, either by Order of the Physician, or at the Request of the Patient, the following Directions are necessary to be observed. Let an Handkerchief or Napkin, be drawn tight

about the Neck; by which means the Jugular Vein being compressed, those Branches of it may become more conspicuous. The Vein being open'd, the Patient should incline his Head downwards, that the Blood, which is discharged slowly and gently, may not flow into his Eyes or Mouth. A sufficient Quantity of Blood being evacuated, unless it stops spontaneously, as is often the Case, let the Wound be compressed with the Fingers, the Forehead and Face be washed, and afterwards let one or two Compresses, with a Bandage, be properly applied.

Bleeding at the occipital Veins, which communicate with the lateral Sinuses of the Dura Mater, is proved, both by Reason and Experience, to be very beneficial in many Distempers of the Brain, especially when it is necessary to avert and evacuate the Blood from that Part. The celebrated *Morgagni* particularly recommends it in obstinate lethargic Disorders, by Cupping and Scarifications; and *Zacutus Lusitanus* gives an Instance of an desperate Apoplexy being cured by Cupping, and deep Scarification in the Occiput. *De Medic. Princip. Hist. Lib. 1. Hist. 33.* If the Incision is to be made with a Lancet, the same Method is to be used, as in opening the Veins of the Forehead and Temples.

OF BLEEDING AT THE GREATER CANTHUS OF THE EYE.

Anatomists have observed, between the Nose and the greater Canthus, on each Side of the Face, a Vein, proceeding partly from the Eye, and partly from the Forehead, which, like the Frontal Vein, descends to the external Jugular Vein. Bleeding in this Vein has been recommended by almost all Oculists, and particularly *Dionis*, as extremely serviceable in violent Inflammations of the Eye; tho', in my Opinion, with no better Reason than in the Veins of the Temple and Forehead. But, when this Operation is to be performed, let the Ligature be made about the Neck, as before directed, and let the Lancet be carefully introduced into the Vein. The Patient ought, likewise, to hold down his Head to prevent the Blood from flowing into his Mouth; and, as much Blood being discharged as may be necessary, apply a thick triangular Compress with proper Bandages. For Bleeding in the Eye itself, see *OCULUS*.

OF BLEEDING AT THE JUGULAR VEINS.

The Operation of Bleeding at the external Jugular Vein, in violent Inflammations of the Neck or Quinsy, in Inflammations of the Brain, in Madness and Melancholy, in Inflammations of the Eyes, in Apoplexies, Head-achs, lethargic Disorders, and violent Diseases of the Head, is very ancient; and many of the Moderns have recommended this Practice, because, by it, the violent Influx of the Blood into the Part affected, and the Collection and Stagnation of the Humours, may be most expeditiously prevented. Besides, there is no Danger in the Operation, as these Veins, extending on each Side of the Neck from the Head to the Clavicles, lie immediately under the Skin, and are sufficiently large and conspicuous. But, before the Incision, it will be proper, to make a Ligature tighter than ordinary about the lower Part of the Neck, which must be straitened by the Patient, or an Assistant, till the Veins become turgid; or, a loose Bandage being thrown about the Patient's Neck, it may be drawn down towards his Breast by himself, or an Assistant. By this means the Jugular Veins, being compressed on each Side, will become more turgid, without obstructing Respiration.

When the Veins are sufficiently tumid, that is to be chosen which is most conspicuous, when the whole Head or Fauces are affected; but when the Disease lies only on one Side of the Head, or in one of the Eyes, that Vein is, in my Opinion, to be preferred, which is situated on the morbid Side. A sufficient Quantity of Blood being drawn, the Ligature must be removed, the Wound compressed by the Finger, and Compresses with a circular Bandage must be applied; and thus the Bleeding is stopp'd without any Danger of a fresh Hæmorrhage, as I have often experienced. It is, indeed, true, that the Patient is very subject to faint in this Operation; but that Circumstance is attended with no bad Consequence. *Tralles*, a learned Physician of Breslaw, published in 1735. an excellent Treatise on the Usefulness of this Operation.

THE METHOD OF BLEEDING IN THE VENÆ RANINÆ.

Bleeding in those Veins, under the End of the Tongue, is by some esteemed beneficial in a Quinsy, or Inflammation of the Neck, especially if a Vein has been before opened several times in the Foot, Arm, or Neck; for, by these means, the inspissated and stagnant Blood is gradually discharged. The Operation may be thus performed: Make a Ligature about the Neck, as was already directed; then, raising the End of the Tongue with the Left Hand, carefully open both these Veins with the Lancet, one after another; for one of them will never discharge

discharge a sufficient Quantity of Blood. When it becomes necessary to stop the Hæmorrhage, unbind the Ligature, and it commonly ceases spontaneously; but, if it should still continue, let the Patient hold a little Vinegar, or *Pontac* Wine, in his Mouth; or, if necessary, apply to the Wound a little Vitriol, or Alum, or a Compress dipt in some astringent Medicines, till the Bleeding stops. But there is seldom any Danger of a violent Hæmorrhage here; and, unless the Discharge be copious, in Diseases of the Fauces, little Effect can be expected from it.

THE METHOD OF BLEEDING BY THE VEINS OF THE PENIS.

In some violent Inflammations of the Penis, this Operation has a wonderful Effect, and is sometimes more successful than almost every other Remedy. Introduce your Lancet about the Middle or back Part of that large Vein, which runs along the superior Side of the Penis, and is already sufficiently tumefied from the Nature of the Disorder; let the Evacuation be continued, till the Penis becomes flaccid, or till a Quantity is discharged proportionable to the Degree of the Disease. Then the Wound may be closed with the Finger, and Compresses are to be applied, with a Bandage proper for the Penis. Particular Care must be taken in this Operation, to avoid wounding the adjacent Nerves and Arteries, which might produce fatal Effects; and not to make the Bandage too tight, which might increase the Inflammation.

OF THE ACCIDENTS WHICH ARISE FROM BLEEDING.

THE METHOD OF TREATING AN ECCHYMOSIS.

An Ecchymosis is an Extravasation of the Blood, from the Vein, between the Flesh and the Skin. Of this Disorder there are different Degrees; as when a great Part of the Arm is so violently affected, that it not only becomes livid, black, and swelled, but is, likewise, affected with Inflammations, Pains, Suppurations, and a Gangrene.

This Disorder is produced, either when the Surgeon has cut the Vein entirely through, or, which is more frequently the Case, when the Patient has used some violent Exercises, especially of the wounded Arm, too soon after the Operation; for by these means it may very readily happen, that the Blood may be extravasated from the wounded Vein, between the Flesh and Skin, more or less in proportion to the Violence of the Exercise.

When the Quantity of extravasated Blood is but small, little Danger is to be apprehended; for the stagnant Blood may be easily discussed, by applying a Compress dipt in Vinegar and Salt, or in Spirit of Wine. Sometimes the Blood degenerates into Pus, and then the Suppuration should be promoted by a Diachylon-plaister; and when the Matter is once ripened, it will spontaneously make its Way by Degrees, without Incision. As long as any Pus appears to be discharged, it should be daily expressed with the Fingers, and the Wound may be healed with a Diachylon-plaister.

If the Quantity of stagnating Blood be very considerable, there is little or no Hope of a Discussion: For the vitiated Blood generally degenerates into a violent Inflammation and Suppuration, and sometimes into a Gangrene. In order to prevent these Consequences, let the Surgeon make frequent Incisions in the livid Part, for evacuating the stagnating Blood. He may then apply a Diachylon-plaister, or Fomentations proper for Contusions, or Phlegmons. But if, as often happens, a violent Inflammation, or even a Gangrene, affects the Arm, it ought to be frequently scarified, and digestive Fomentations, or Cataplasms, should be applied. But, in these Cases, it is often necessary to take a sufficient Quantity of Blood from another Part of the Body, and to exhibit resolvent Medicines internally, till the Violence of the Inflammation, or the Gangrene, abates; or till it entirely ceases.

THE METHOD OF TREATING A NERVE OR TENDON WOUNDED IN BLEEDING.

A Nerve or Tendon may be certainly known to be wounded in Bleeding, if the Patient, at the time of Incision, feels most acute Pains, so that he can scarcely refrain from a vehement Outcry; especially if the Pains continue, and are followed by Tumors, Inflammations, Spasms, or, likewise, a Rigor and Convulsions of the Limb: Which Symptoms, if not timely relieved, are succeeded by most dangerous Convulsions, a Gangrene, and Death itself.

Among the various Methods of remedying this Malady, that seems the most excellent, which was formerly performed by *Paré* on the French King *Charles IX.* No sooner had the King signified his Pain, by crying out at the Instant that the Vein was opened, than *Paré* justly suspected, that a Nerve had been wounded. Immediately the Arm began to swell, and grow rigid, with the Acuteness of the Pain. Hereupon the

King's Physicians, in Consultation with *Paré*, agreed upon the following Method: They first injected into the Wound, Oil of Turpentine with rectified Spirit of Wine; then they applied to the whole Arm the Emplastrum Diachalciteos, dissolved in Vinegar and Oil of Roses; then they used the expulsive Bandage, beginning at the Hand, and ascending gradually in continued spiral Turns to the Shoulder; by which means, the violent Impulse of the Blood, and the Inflammation, were not only abated, but the Pain, also, diminished by degrees. In order to complete the Cure, they applied to the Arm the following Cataplasma, till the Pain entirely ceased.

Take of the Meal of Barley, and Vetches, each two Ounces; of the Flowers of Chamomile, and Melilot, each two Handfuls; of fresh Butter, an Ounce and an half: Boil them in Soap-suds into a Cataplasma.

Thus, though the natural Activity of the Arm was impaired for three entire Months, yet it gradually recovered its former Strength.

However, it may not be improper, in this Method of Cure, to substitute, instead of the Oil of Turpentine, and Spirit of Wine, the *Peruvian* Balm, or *Hungary* Water, which may be for some Days instilled into the Wound, till the Pain diminishes. As the Emplastrum Diachalciteos is rarely to be found in the Shops, in room of it, the Emplastrum Diapompholygos, or the Plaister of red Lead, may be used. But great Care must be taken, whilst the Remedies are preparing, that the Wound be not exposed to the Air. It will, therefore, be proper, immediately to apply any Sort of Plaister, which is the readiest, to the Wound, and to wrap up the whole Arm in Linen Cloths moisten'd in Oxycrate, which will both lessen the Inflammation, and defend the Wound from the Injuries of the external Air. If the Patient be of a vigorous plethoric Habit, Bleeding in another Part may tend to prevent the Inflammation. *Scultetus*, in *Obs.* 87. gives a certain Ointment, which he commends as an excellent Remedy in Punctures of the Nerves; where he, also, informs us, that he has successfully divided entirely, or cut through, some of these wounded Nerves. *Heister's Surgery.*

PHLEBOTOMUS. A Lancet, or a Fleam: Instruments used for Bleeding.

PHLEDONODES, φλεδωνόδες. See **PHLEBODONODES**.

PHLEGMA, φλέγμα. Phlegm. Every Humour, says *Galen*, *Lib. 2. de Diff. Feb. Cap. 6.* which is both cold and humid, comes under the Denomination of *Phlegma*, "if we would speak in the Language of *Hippocrates*, and according to the usual Custom, not only of the antient, but modern *Greeks*; or," as he says a little after, "if you please, you may call it *Scindapsus*." Of Phlegm there are four Species, the vitreous, sweet, acid, and salt: These are reduced by *Galen*, *de Diff. Feb. Lib. 2. Cap. 6.* to three. But, in his *Book de Plenitud.* he makes five Species of it.

Phlegma, also, in *Hippocrates*, as *Galen* says in his *Exegesis*, signifies not only a white and cold Humour, but, also, an Inflammation [φλέσσις]. Instances to this Purpose are innumerable.

Phlegmasia, φλεγμασία, in the same Author, signifies not only an Inflammation in the common, but is sometimes to be understood of the violent Heat excited by a Fever; as *Lib. de R. V. I. A.* But φλεγμασίν τῇ ὕρῃ is a pituitous Sort of Urine, abounding with a gross and cold Humour.

Phlegmainon, φλεγμαίνων, signifies not only inflamed, but sometimes imports tumid, and increased in Bulk; as may be shewn from many Places in *Hippocrates*, in which ἐξυαίνειν, to extenuate, and φλεγμαίνειν, to induce a Tumor, are set in Opposition: Many Instances of this Sense of the Verb may be given from the *Book de Locis in Homine*. *Foesius*.

PHLEGMAGOGUS, φλεγμαγωγός, Phlegmagogue. An Epithet for such Cathartics as purge off Phlegm.

PHLEGMASIA, φλεγμασία. An Inflammation.

PHLEGMATIAE, φλεγματίαι. Persons abounding with Phlegm are thus called, by *Hippocrates*.

PHLEGMATORRHAGIA. *Salmuthus*, *Observat.* 37. *Cent. 1.* gives an Account of a Disorder, which he calls by this Name. This was a very considerable Flux of thin Phlegm from the Nostrils, which continued for three Days, and was cured by the Use of the Cephalic Pills.

PHLEGMONE, φλεγμαία. A Phlegmon, or Inflammation. See **INFLAMMATIO**.

PHLEGMONODES. Resembling an Inflammation.

PHLEPS, φλέψ. A Vein. But among the Antients it signified both the Arteries and Veins.

PHLIAE, φλῖαι, in the Scamnum of *Hippocrates*, or other Machines of that Kind, are the upright wooden Posts, which are bored to receive the Ends of the Axes, and in which they turn. *Oribasius de Machinamentis*, *Cap. 24.* Or, as *Galen* explains

Plains it, in his *Exegeſis*, ſtrait Pieces of Wood, fixed oppoſite to each other, like the Poſts of a Door.

PHLOGINON, φλοῖν. The Name of a liquid Collyrium, deſcribed by *Galen*, *Lib. 4. de C. M. S. L. Cap. 7.*

PHLOGISTOS, φλοῖστος. Inflammable. The Liquor called *Æther*, is called, alſo, *Phlogiſten*, on account of its great Inflammability.

PHLOGIUM. A Name for the *Viola*; *tricolor*; *bortenſis*; *repens*.

PHLOGODES, φλοῖδης. Of a Flame-colour, intenſely red, inflamed.

PHLOGOEIDES, φλοῖσσις. The ſame as **PHLOGODES**.

PHLOGOSIS, φλοῖσις. An Inflammation; or an Heat and Exeſtuation of any Part, without an inflammatory Tumor. *Willis* ſpeaks frequently of a Phlogos of the animal Spirits; but, I am afraid, no juſt Idea can be framed of ſuch a Phlogos, till ſuch time as we know, that animal Spirits really exiſt, and we are better acquainted with their Natures.

PHLOMIS.

The Characters are;

The Root is perennial; the Leaves thick; the Galea large, hollow, falcated; the Beard trifid, the middle Segment being large, broad, marginated, and extended beyond the Galea, which cloſely preſſes upon the Beard: The Calyx is a ſhort, wide, pentagonal Tube, ſometimes indented: The Seeds are oblong.

Boerhaave mentions eight Species of *Phlomis*; which are,

1. *Phlomis*; *Narbonenſis*; folio *Hormini*; flore purpureſcente. *T. 178.* *Marrubium*, *nigrum*, *longifolium*. *C. B. P. 230.* *Herba venti*, *Monſpelienſibus*. *J. B. 3. App. 854.*

2. *Phlomis*; fruticoſa; *Salviæ* folio latiore, & rotundiore. *Tourn. Inſt. 177.* *Boerh. Ind. A. 160.* *Phlomis*. *Offic. Salvia fruticoſa lutea latifolia*, ſive *Verbaſcum ſylveſtre quartum Matthioli*. *Park. Theat. 51.* *Raii Hiſt. 1. 511.* *Verbaſcum latis Salvia foliis*. *C. B. P. 240.* *Verbaſcum Matthioli*. *Ger. 625.* *Emac. 767.* **YELLOW SAGE.**

It is cultivated in Gardens, and flowers in *June*: It is aſtringent, and reckon'd among vulnerary Plants.

3. *Phlomis*; fruticoſa; *Salviæ* folio longiore, & anguſtiore. *T. 177.* *Verbaſcum ſylveſtre*. *Dod. Pſeudoſalvia*, fruticoſa, minor, lutea, *Verbaſci foliis incanis*. *M. H. 3. 397.*

4. *Phlomis*; fruticoſa; folio ſubrotundo, brevior, flore luteo. *Verbaſculum*, *ſalviſolium*. *Alpin. Exot. 109.* *Pſeudoſalvia*, minor, *Cretica*, lutea. *M. H. 3. 397.*

Dioſcorides ſays, that the Flowers are good to dye Hairs of a Gold-colour; and that the Leaves cure Ambuſſions. *Galen* writes, that the Leaves are moderately drying, and digeſtive. *Proſper Alpinus de Plantis exoticis.*

5. *Phlomis*; *Samia*; herbacea; folio *Lunariæ*. *T. Cor. 10.*

6. *Phlomis*; *Orientalis*; folis laciniatis. *T. Cor. 10.*

7. *Phlomis*; *Orientalis*; anguſto & longiori folio; flore luteo. *T. Cor. 10.* *Boerh. Ind. alt. Plant. Vol. 1.*

The *Phlomis fruticoſa* was called by the Antients *Verbaſcum*; for which Reaſon *Tournefort* makes it belong to that Kind. The medicinal Virtues are not known; only it is recommended with the *Lamium* and *Galeopsis*: The Juice, however, is emollient. *Hiſt. Plant. adſcript. Boerhaav.*

PHLUS, φλῦς. This Word occurs, *Lib. de intern. Affect.* where we read, ὅτι ἐν τῇ κεφαλῇ ὑπὸ τὰς τρίχας οὖν φλῦς ὑπάρχει. And on the Head, under the Hairs, there is, as it were, a Cortex. In this Paſſage φλῦς ſignifies the ſame as φλόα (phloos), or φλοῖς (phloios), that is, a Cortex, or ſcaly Skin, like the Exuvies or Slough of a Serpent: For which Reaſon *Calvus* renders the Word *squamulas*, “ſmall Scales.” *Heſychius*, alſo, expounds φλῦς by φλοῖς, λεπτοχάνον (*Lepychanon*), and λεπυρὸν (*Lepyron*); Words much of the ſame Import.

PHLYCTÆNÆ, φλυκταῖναι, from φλόζω, to boil. Small Eruptions on the Skin, ariſing from an hot or acrimonious Humour. *Hippocrates* ſometimes repreſents them, as reſembling thoſe Puſtules which appear after Ambuſſions.

PHLYCTENOIDES. An Epithet of Puſtules which reſemble *Phlyctænæ*. *Blancard.*

PHLYCTIDES, φλυκτίδες. The ſame as **PHLYCTÆNÆ**.

PHLYSIS. An Eruption on the Skin, from a Redundance of Humours. *Caſtellus* from *Galen*.

PHLYZACION, φλυζάκιον. A Puſtule, or Vefication on the Skin, excited by Fire or Heat. Sometimes it imports the ſame as **PHLYCTÆNÆ**.

PHOCA, or *Vitulus Marinus*. The Sea Calf. An amphibious Animal, which lives ſometimes in the Sea, and ſometimes on Shore, but moſt in the Sea. It is ſaid, that the Fins of this Animal, eſpecially thoſe taken from the Right Side, excite Sleep, when applied to the Head: Its Fat has an emollient Quality, and, if rubbed on the Region of the Uterus, is thought proper to provoke the Menſes, and remove Vapours: Shoes made of the Skin of it are, alſo, thought to be a good Prefervative againſt the Gout. *Lemery, Traité des Drogues.*

PHOCÆNA. A Species of Dolphin, ſomewhat thicker and ſhorter than the ordinary Kind; the Fat of which is eſteemed reſolutive, and good for the Nerves. *Lemery des Drogues.*

PHODES, or **PHOIDES**, φῶδες, or φῶιδες. The ſame as **PHRAUSINGES**.

PHOENICITES. A Name for the *Judaicus Lapis*.

PHOENICIUM EMPLASTRUM. The *Emplaſtrum Diachalcites*, or *Diapalma*.

PHOENICIUS MORBUS. The *Elephantiaſis*. See **LEPRA**.

PHOENICOPTERUS, φαινικοπτερος. The Name of a Bird, frequently mentioned by the Antients, whoſe Tongue and Brains were eſteem'd great Delicacies. I don't know, that it is certain what Bird this was; but, by the Derivation, it ſhould have red Wings.

Lemery deſcribes the *Phenicopterus*, as a Bird as large as an Heron, of an Aſh-colour, with a crooked Bill, and very long Neck, which lives upon ſmall Fiſh, and Shell-fiſh: He ſays it is eſteem'd aperitive, and good for the Epilepſy; and that the Fat is reſolutive, and good for the Nerves.

PHOENICURUS. The Name of a Bird called, alſo, *Rubecula*, *Ruticilla*, and *Erithacus*. *Lemery* ſays, it is about the Size of a Cuckow, and has a red Tail, as the Derivation of the Name imports. It is eſteem'd good for the Epilepſy, either eaten, or in Broth. The Fat is reſolutive, and anodyne.

PHOENIGMUS, φαινιγμός, from φῶνιξ, a red Colour. A Rubification, or Rubefaction, of the Skin; that is, an Excitement of a Redneſs of the Skin, by means of acrid Applications.

PHOENIX. A Name for the *Gramen*; *Loliaceum*; folio & *Spica anguſtiore*. See **LOLIUM**.

PHOLAS. The Name of a Sea Shell-fiſh, ſomewhat like a Muſſel, which grows to the Rocks at the Bottom of the Sea, and is ſaid to be good Food. The Shell, powder'd, and taken internally, is ſaid to be aperitive, and good for the Stone.

PHOLIS, φολις. A Scale of Metal.

PHOLLIDODES, φολλιδῶδες, *Lib. 4. Epid.* is apply'd to Tumors in the Legs, and ſignifies ſoft, lax, and fungous, as in thoſe who labour under an *Anaſarca*, and eſpecially, a *Leucophlegmatia*. All the Copies, indeed, read φολιδῶδες, which *Calvus* renders *squamous*, becauſe φολις is the ſame as λεπίς (*lepis*) a Scale like that of Fiſhes, or Serpents. Whence the Paſſage in *Hippocrates* above-mention'd, ſuppoſing this to be the true Reading, may be underſtood of ſuch Tumors in the Legs, as, by reaſon of the Drineſs and Corrugation of the Skin, and the want of Aliment, are cover'd with a ſcaly ſort of Subſtance, as with a Cortex, as is often obſervable in the Legs and Feet, and other Parts, under a Cachexy or Dropſy. But perhaps for φολιδῶδες we are to read φολλιδῶδες (*Phollicodes*) which ſignifies fungous, lax and empty like Huſks, void of Seeds, as *Galen* expounds the Word in his *Exegeſis*, with an Eye, it is probable, to the Place in *Lib. 4. Epid.* where it is ſaid, τὰ φολλιδῶδα φλυκταίνεμενα, “the puſtulous Eruptions were ſoft “and lax.” *Erotian* expounds φολλιδῶδη by ἐρηλῶδη and λεπτῶδη, ſquamous and ſcabrous, as if exaſperated by the *Lepros*; for the Antients, he ſays, called the Aſperities of the Skin, proceeding from the *Pſora*, and the like Affections, by the Name of φολλιδες, *Phollicides*. And this affixes a very different Idea to the Word, which muſt then be underſtood of thoſe Tumors, which are exaſperated with a ſort of ſquamous Cruſt, as is ſometimes obſervable in cachectic Bodies.

PHORACIODES, φερακιδῶδες, from φῶρες (*phoros*), which in the *Exegeſis* is expounded by εὐσπυλλεπτος (*eusphylliptos*), diſpoſed for Conception, *Lib. 2. γυναικ.* is ſpoken of the Orifice of the Uterus, as open and duly qualified in order for Conception. But *Foeſius* ſuſpects, that the Word ought to be read φερακιδῶδες (*pharacidodes*), which *Galen* and *Erotian* expound by ρυτιδῶδες (*rutidodes*) corrugated. But he ſhould rather like to read, he ſays, φεργανῶδες (*phorganodes*), becauſe φεργάνη (*Phorgane*) is expounded, in *Heſychius*, by ἀραιῆς (*Arætes*), as importing the Orifice of the Uterus to be lax, rare, and open; which, *Lib. de Muliebr. Nat.* and *Lib. de Morb. Mul.* on the ſame Occaſion, is expreſſed by εὐρύ (*eury*), wide, ex-
panded.

PHORIMOS, φερίμος. An Epithet for that Species of Alum, which is call'd in the Shops, *Roch-alum*.

PHORINE, φορίνη. The Skin of a Man or Beaſt, or, according to *Pollux*, an Hog's-skin. Thus, *Lib. de R. V. 1. A.* ſpeaking of Swines-fleſh, it is ſaid, that it ought to be eaten ἀνευ τῆς φορίνης, that is, as *Galen* ſays, in his Commentary, ἀνευ τῆς δερμάτος, “without the Skin.” *Φορίνη* is, alſo, ſpoken of the human Skin, which by ſome, too, is called πυρίνη (*Pyrine*), as *Heſychius* obſerves.

PHOS, φῶς. Light; but it, alſo, ſignifies the black Circle, which ſurrounds the Pupil of the Eye.

PHOSPHORUS, from *φῶς*, Light, and *φέρω*, to bring. The Name of a *Collyrium*, in *Galen, L. 4. de Comp. M. S. L. Cap. 7.* It is the same as the *DIACROCUS*.

There are several Chymical Preparations call'd by this Name, which shine in the Dark, some of which I have taken Notice of under the Article *ALUMEN*.

HISTORY OF PHOSPHORUS.

The *Phosphorus igneus* differs from other naturally shining Bodies, in this, that it is in reality nothing but a kind of concealed Fire, which discovers itself by its Light and Smoke; but, if you rub it harder, it will break out into a Flame. This Discovery appeared about the Year 1677; but was preceded by *Baldwin's Phosphorus*, which is an artificial Imitation of the natural *Bolognian Stone*. *Christopher Adolphus Baldwin*, Governor of a certain Place in *Misnia*, happened to dissolve Chalk in *Aqua Fortis*, or Spirit of Nitre, which last he again brought over by the Fire; and he found the remaining Body to imbibe the Light, when exposed thereto, and retain it for some time, and carry it along with it into a dark Place, as a Sponge does the Water it has imbibed. This Experiment did not a little startle the *Cartesians*, (very few of whom had seen the *Bolognian Stone*) that Light should of a sudden become a gross and portable Thing, whose Rays they supposed to consist in Pressure only, and to be propagated in an Instant of Time. *Baldwin*, in an obscure manner, described his Experiment in a Treatise intitled *Aurum Aurea*.

To this succeeded *Brand's* *Hamburg's* Invention, named the *Phosphorus igneus*, the *Pyropus*; and afterwards, by way of Eminence, the *Phosphorus*, which was discovered in this manner. *Brand* had fallen on a Chymical Process, extant in a printed Book, which taught how to prepare from Urine a Liquor fit to ripen a Particle of Silver into Gold; and in labouring on this he found out his *Phosphorus*. He had some Acquaintance with *Jo. Daniel Kraft*, of the Council of Commerce to the Elector of *Saxony*; and, by his means, with *Jo. Kunkel*, one of the said Prince's Bed-chamber; but who, under that Character, performed Chymical Processes. On persuading *Brand*, that this Arcanum might be sold to the Great at an high Price, and offering him their Assistance, they obtained the Composition from him. And, upon going from *Dresden* to *Hamburg*, they both saw and learned from him the Process of the *Phosphorus*. But *Kunkel*, upon his Return Home, had committed some Mistake in the Process, and for a long time could not hit upon the *Phosphorus*; and he sent a Letter to *Brand*, complaining that the Secret was not sincerely communicated to him. But *Brand*, repenting that he had been so easy in imparting the Secret, delayed to satisfy him. *Kunkel*, in the mean time, after various Trials, corrected the Error himself: Whence he pretended to be the Inventor; and of this *Brand* bitterly complained.

Kraft, who was a Man of a good Address, undertook to vend the Discovery among the Great; and, in his Way to *England*, he made me a visit at *Hanover*; and ingenuously mentioned to me, both the Matter of the Process, and its Author *Brand*; and he likewise shewed the Experiment of the *Phosphorus*, to the great Surprise of *Duke John Frederic*; and afterwards in *England* to *K. Charles II.* *Prince Rupert*, the illustrious *Mr. Boyle*, and others, of which there is an Account by *Dr. Hook*. But he never, as far as I know, mentioned himself as the Inventor. The *Phosphorus* was first sent into *France* by me to *Huygens*; and at length the Composition it self was, by the illustrious *Tschirnhausen*, upon his Return from *Germany* into *France*, communicated from me to the Royal Academy, to whom *Huygens* had already shewn the thing. That *Boyle* had got but an imperfect Description of it, appears from his Dissertation on *Phosphorus*; for his *Phosphorus* differs from *Brand's* only in this, that it is more imperfect.

But *Duke John Frederic*, as he was a magnificent and generous Prince, ordered that I should send for the Inventor: *Brand*, therefore, came to *Hanover*, and faithfully communicated to us the Process; for, whatever he did, I imitated in another Laboratory. Upon collecting a large Quantity of Urine, *Brand* came to us, and went through the Process. Upon *Brand's* Return to *Hamburg*, the Duke settled an annual Pension upon him, which was punctually paid him till the Duke's Death; and this probably was the only considerable Encouragement which he reaped from his *Phosphorus*.

I myself shewed to the same Prince, who was very curious in these Matters, another kind of *Phosphorus*, which we may call the *Thermophosphorus*, which does not acquire its shining Quality from Light, as the *Bolognian* and *Baldwin's* *Phosphorus*, but from Heat. There is a kind of Substance found in Mines, capable of being dissolved by Fire, with the Powder of which if you draw Letters and Figures on an iron Plate, and lay the Plate upon burning Coals, the

Strokes shine, though the Plate be not ignited; and though the Rays of Light cannot penetrate from the Coals to the Figures.

It is a thing commonly known, that hard Bodies acquire Heat, and at last take Fire, by Motion; and the Flame produced by the Attrition of two Pieces of Wood was, by the ancient *Saxons*, regarded as a religious Ceremony. But we are not so well acquainted with the Manner, in which Smiths at our Mines kindle the Fire extinguished in their Forges. They strike, with an Hammer, an iron Bar on its very Edge, and which is wont to come from the Mines, in the Form of a quadrangular Prism. This Bar they shift, that the Edge may be alternately struck, now on the Right, and again on the Left: Thus it immediately becomes hot, and, after repeated Blows, glowing hot, so as to set on Fire any inflammable Matter.

We have, besides, other kinds of *Phosphori*, in which there are no Traces of Fire, the principal of which we owe to *Job. Bernouilli*, who has improved the Observations of others on Mercury shining in Vacuo, and carried it so far, that now it may be produced at Pleasure; whereas before Mercury was rarely, and by chance, made to shine. It is credible, that this *Phosphorus* always retains its shining Quality, or, at least, for a long time; because it does not stand in need of the Free Air to make it shine, like the *Phosphorus igneus*, but emits a Light by only shaking it in a Glass, hermetically sealed; and with this the King of *Prussia* was so well pleased, that he rewarded the Inventor with a Gold Medallion. I understand, that *M. Dutal* at *Paris*, and others, have laboured with remarkable Success in establishing and promoting this *Phosphorus*. It would be worthy Inquiry, what Quantity of Light might be produced by many such *Phosphori*, continually shook; for a continued Shaking may easily be effected by means of a Machine, and the Light of many *Phosphori* may be collected either by Refraction or Reflexion, an Experiment which I wonder has not been hitherto attempted. *Leibnitz*, in the *Miscellanea Berolinensia*.

DR. SHAW'S ACCOUNT OF PHOSPHORUS.

We took half a Dram of Camphire, and ground it in a glass Mortar, with three Grains of the solid *Phosphorus* of Urine; then added as much essential Oil of Cloves, as served to reduce the Whole to a fluid Form. The Mixture thus made may be rubbed upon the Clothes, the Hair, or the Hands, without Danger of Burning.

The successful Method of making it is this: Evaporate any Quantity of fresh Urine over a gentle Fire, to a black, and almost dry Substance; then with two Pounds thereof thoroughly mix twice its Weight of fine Sand. Put the Mixture into a strong-coated Retort of Stone; and, having poured a Quart or two of clear Water into a large Receiver with a long Neck, join it to the Retort, and work in a naked Fire; let the Heat be small for the two first Hours; then increase it gradually to the utmost Violence, and continue thus for three or four Hours successively. At the Expiration of which Time, there will pass into the Receiver a little Phlegm, and volatile Salt, much black fetid Oil, and, lastly, the Matter of the *Phosphorus* in form of white Clouds; which either stick to the Sides of the Receiver, like a fine yellow Skin, or fall to the Bottom in form of a small Sand. Now let the Fire go out; but take not away the Receiver, before it is cold, for fear of setting the *Phosphorus* on Fire by admitting the Air. To reduce these small Grains into one Piece, put them into a little Tin Ingot-mould, along with Water; heat the Ingot to make the Grains melt together; then add cold Water, till the Matter is congealed into one solid Stick, like Bees-wax; which, being cut into little Pieces, fit to enter the Mouth of a Phial, may be preserved by Water, and keeping the Glass close stoppered. If the Glass were not to be stoppered, the *Phosphorus* would turn black on its Surface, and at length be spoiled.

The Cautions required to make the Process succeed are;
1. To evaporate the Urine, while it is recent. 2. To prevent its-boiling over, and so losing the most unctuous Part. 3. To let the Matter afterwards ferment in the Cold. 4. To mix the black Matter with Sand, to prevent its melting and running together. 5. To use a Stone Retort, those of Earth being too porous, and suffering the *Phosphorus* to transude sooner than pass into the Receiver. 6. To have the Receiver very large, and with a very long Neck, to prevent its breaking and over-heating; which would either evaporate the white Vapour, wherein the *Phosphorus* consists, or else prevent its coagulating. 7. To put Water into the Receiver for keeping it cool, and quenching the *Phosphorus*, as it falls to the Bottom. 8. To make the Fire small at first, that the Retort may be preserved, and the black Matter gradually dried; which would otherwise swell and come over in a black Froth. Lastly, it

It is found necessary, that the Urine for the Operation be of such use Malt Liquors, rather than Wine. All these Circumstances being required for obtaining the Phosphorus to Advantage, no wonder if so many of those who attempted it miscarried.

This Operation may be greatly shortened, by freezing and concentrating fresh Urine; afterwards evaporating it with Care; then digesting it *per se*, in the manner above-mentioned. When thoroughly digested, commit the Matter, in a large Quantity, to an iron Pot, with an earthen Head, as the Chymists usually do, for making Spirits of Hartshorn, or the Spirit and Salt of Urine. When thus all the Salt and Oil are obtained, let the *Caput Mortuum* be taken out, and mixed with twice its own Weight of Alum. The Matter may now be put into a well-coated long Neck, and worked with Care in a reverberatory Furnace, into very large Receivers filled with Water, and connected to the Necks by Adapters; the lower Ends whereof may enter the Water, as in distilling of Quicksilver; the Operation being continued for eight or ten Hours. And this we apprehend to be the best way hitherto known of procuring Phosphorus to Advantage. Dr. Wall informs us, that Mr. Boyle, being concern'd to find how small a Proportion of Phosphorus was afforded by Urine, desired him to look out for another Subject, that might afford it in greater Plenty. The Doctor afterwards causing a Piece of dry Matter to be dug up in the Fields, where Night-men emptied their Carts, he observed a great Number of small Particles of Phosphorus therein. This Matter the Doctor immediately carried to Mr. Boyle; who set Bilgar the Chymist to work upon it: But he could obtain very little Phosphorus from it, till another Material was added to it in Distillation; and then he procured Phosphorus in such Plenty, that, selling large Quantities at six Guineas the Ounce, he soon became rich, and left England. The Matter which thus fixes and increases the Phosphorus, we apprehend to be Alum; which is itself not only prepared from Urine, but appears to afford the same kind of Acid that Phosphorus yields by burning. For, upon its Analysis, Phosphorus appears to be a Composition of a strong acid and an inflammable Matter, exactly in the manner of common Brimstone; whence it may not improperly be called an animal Sulphur. Accordingly, like common Brimstone, it will burn under a Glass-bell, and afford Flowers, that become an acid Liquor, like *Oleum Sulphuris per Campanam*, by attracting the Moisture of the Air.

And in this manner it has been used, so as to produce extraordinary Changes upon Metals, especially in the philosophical View; the Acid itself, even without Heat, proving a Menstruum to perhaps all the Metals. But when this Acid is driven into the Pores of the Metal, by the Action of the Flame in burning the Phosphorus, it seems productive of much greater Effects; as is known to those acquainted with the sublimer Metallurgy. This Phosphorus, of all the kinds hitherto discovered, seems the most useful.

This Phosphorus has been several Ways disguised, so as to make it appear under various Forms; sometimes as a Solid, sometimes as a Liquid, sometimes as an Ointment, and sometimes as a running Mercury. There are, also, others of different Kinds; of which we shall only mention two, discovered by M. Homberg: The first is that usually called the *black Phosphorus*, now commonly prepared with Alum and Wheat-flour, by taking four or five Parts of Alum, to one of Wheat-flour, and calcining them together to a brown or blackish Mass; which being powder'd, and put into a Phial, loosely stopp'd with Paper, and set in a Sand-heat, so as to continue glowing hot for some time; then removing the Whole from the Fire, and suffering it to cool gradually, and at last stopp'd the Bottle close. A little of this Powder, being poured out of the Bottle, and expos'd to the open Air, immediately takes Fire, and appears like a glowing Coal. But the Powder must be fresh made, to have a strong Effect; for the Sun's Rays, or the Moisture of the Air, being gradually admitted to it, destroy its Virtue; whence it ought to be kept in a dark and dry Place. 'Tis remarkable of this Phosphorus, that it may be made almost from any animal or vegetable Substance, instead of Wheat-flour; but that no Salt whatever can be substituted instead of Alum.

M. Homberg's other Phosphorus is made of one Part Sal Ammoniac, and two Parts Lime slaked in the Air: These being mixed well together, a Crucible is to be filled with them, and set in a small Fire of Fusion; where, as soon as the Crucible becomes red-hot, the Mixture will melt, and should be stirred with an Iron Rod, to prevent its running over. When the Matter is entirely fused, it may be poured into a Brass Mortar; and, when cold, it will appear of a grey Colour, and almost as if it were vitrified. If now it be struck upon with any hard Body, it appears as on Fire, in the whole Extent of the Stroke: But, the Matter being brittle, it may be proper, for the Expe-

riment's Sake, to dip little Bars of Iron, or Copper, into the melted Matter in the Crucible; for thus they will be enamel'd, as it were, with the Matter, and these Bars may be struck upon, so as commodiously to repeat the Experiment several times before the Matter falls off. The Bars are to be kept in a dry Place, to prevent the Phosphorus upon them from running, by the Moisture of the Air.

Both these Phosphori were discover'd by Accident. The first was obtained by searching for a limpid Oil, from the common stercoraceous Matter, that should fix Quicksilver; and the second by endeavouring to calcine Sal Ammoniac with Lime, so as to render it fusible like Wax; which End was obtained, but not the other.

There have been no very considerable Uses of these two Phosphori hitherto discovered; but the Phosphorus of Urine has been employed for making many curious Experiments; a few whereof we shall here exhibit.

1. The Light of this Phosphorus appears greater in Vacuo, than in the open Air.

2. In hot Weather it is observed to dart Flashes of Light through the Water wherein it is contained, so as exactly to resemble Lightning; which thus darts unextinguished through watery Clouds and Vapours.

3. These Flashes are not liable to kindle or burn any combustible Matter, in which they resemble the harmless Kind of Lightning; but, in a condensed State, this Phosphorus burns very furiously, and with a most penetrating Fire, so as to melt and dissolve Metals: In which respect it again resembles the more destructive Kinds of Lightning, which are found to have the same Effects.

4. If a little Piece of this Phosphorus be view'd through a Microscope, the internal Parts appear in a constant Ebullition.

5. A little Piece of it being put into a Silver Spoon, and held over the Fire, it bursts out into a shining Flame, leaving a red Spot in the Spoon, of a corrosive acid Taste; and, being diluted with Water, the Mixture makes a Conflict with Oil of Tartar *per Deliquium*.

6. If a little of it be ground in a Glass Mortar, with twenty times its own Weight of Nitre, it does not take Flame, but only disperse a shining Property through the Body of the Nitre; but, if ground in the same manner, with Iron Filings reduced to Powder, a bright Flame immediately ensues.

7. Though this Phosphorus appears to be a kind of Sulphur, yet it does not dissolve in highly rectified Spirit of Wine, but communicates some sulphureous Parts thereto: For if this Spirit be poured to Water in the Dark, it yields a faint Degree of Light.

8. The Nature of this Phosphorus is considerably changed, by being long digested with Alcohol; for thus it becomes a kind of white transparent Oil, that does not coagulate without an extreme Degree of Cold, nor afford any manner of Light; and, when fresh Spirit of Wine is pour'd thereon, it does not, like other Oils, mix therewith, nor dissolve therein.

9. If this Phosphorus be separated from the Spirit of Wine, wherewith it was digested, and be afterwards well washed in common Water, it, by degrees, recovers its former Consistence, and coagulates into a transparent Matter whiter than before; but neither affords so much Light, nor recovers its primitive shining Virtue, nor its yellow Colour.

10. The Spirit of Wine so separated becomes yellowish, and smells strong of the Phosphorus; though it shines not, except when poured upon Water.

11. This Phosphorus, being mixed with a large Quantity of Pomatum, makes, as well as with Camphire, and the Oil of Cloves, a shining Unguent, that may be rubbed on the Hands and Face, without Danger of burning, so as to render them luminous in the Dark.

12. If a Piece of Paper, or Linen, be dipt at one End in Spirit of Wine, and a Bit of Phosphorus be crush'd on the other End that remains dry, the Spirit will be fired by the Phosphorus, without immediate Contact. But the same thing will not happen, if the Paper were dipt in Oil of Turpentine, nor if a Bit of Phosphorus were rubbed upon the End dipt in the Spirit of Wine; only, when the Spirit is entirely evaporated, the Phosphorus will burn, though with Difficulty; and slowly.

There are many of these odd kind of Experiments, that might be made with Phosphorus; which is a Substance that seems in Chymistry to be much such a thing, as the Load-stone in Natural Philosophy; and its Effects almost as odd, and difficult to be explain'd, for want of knowing the latent Properties of Bodies.

AXIOMS.

We learn from the preceding Experiments, that the Phosphorus of Urine is applicable to many extraordinary Purposes, particularly

particularly to the introducing of uncommon Changes in metalline Bodies.

That, as most Discoveries of chymical Explosions and Phosphori were accidental, greater Things may be expected from a sagacious Experience, and by a further Discovery of Causes and Axioms.

That the Phosphorus of Urine may be made in large Quantities, and with small Expence; so as to afford desirable Opportunities for the farther Improvement of Chymistry and Metallurgy.

PHOTEL, by some called *Ficus Pharaonis Thevet*, is a Tree nearly resembling the *Banana-tree*, growing in the Kingdom of *Catay*, according to *C. Baubine*; which is all we know of it.

PHOXINOS SQUAMOSUS. The Name of a River-fish, about half a Foot long, pretty thick, and covered with yellow and blue Scales, with a red Tail. It is esteem'd appetitive. *Lemery des Drogues*.

PHOXOS, *φοξος*. One with an acuminate or fastigiated Head, that is, sharpen'd towards the Top, the Eminences either of the Forehead or Occiput, or both, being depressed, or one or both of those Parts beyond measure prominent. Or, as *Galen* expresses it *Com. 1. in 6 Epid. η φοξή κεφαλή*, &c. "An acuminate Head, with one or both the Eminences [of the Forehead and Occiput] indelicately prominent, or "having one Eminence, and wanting the other." And again, "Acute Heads want either the Eminence of the Forehead, or "Occiput; or else have it produced beyond a just Degree." But *Phoxoi* are properly those who have the Top of their Head very much fastigiated and turbinated, and consequently deformed. *Therites* is described by *Homer* with such a Head. *φοξος*, in *Helychius* and *Erotian*, is expounded by *δξύκεφαλος*, "sharp-headed." The Word occurs twice *6 Epid.*

PHRAGMITES, *φραγμαίτις*. A Name in *Dioscorides*, for the common *Arundo*.

PHRAGMOS, *φραγμας*, from *φράσσω*, to inclose as with an Hedge. An Anatomical Term for the double Series, or Cage, of Teeth.

PHRASIMUM *viride*. Flos *Aëris Rulandus*.

PHRENES, *φρένες*, was the Name by which *Hippocrates*, and the antient Physicians, called the *Diaphragma*.

PHRENESIS, PHRENETIASIS. The same as PHRENITIS; which see.

PHRENITICI NERVI. The Nerves belonging to the Diaphragm. See PHRENES.

PHRENITIS, *φρενίτις*, from *φρήν*, the Mind. A Phrensy.

There is no Inflammation, or particular Fever, of so great Importance in Medicine, as that which is lodged in the Brain, the noblest of all the Parts; and not only totally destroys the Use of Reason, but, also, induces a sudden Danger of Death, and is, by the *Greeks*, call'd *Phrenitis*. Now this Disorder is an acute inflammatory Fever, arising from too great a Congestion of Blood, and its interrupted Circulation, especially thro' the most minute Arteries of the Membranes of the Brain; and accompanied with intense Heat, a Delirium, and Danger of Death.

The Signs of an approaching Phrenitis are, by *Alexander Trallian*, in *Lib. 1. Cap. 13.* accurately and compendiously described in the following manner: "An approaching Phrenitis, "says he, is preceded by intense and continual Watchings; or, if "the Patients sleep, their Rest is troubled and interrupted. They, "also, start, and are afflicted with terrible Dreams. They soon "forget what is said to them; and if, at any time, they return "an Answer to a Question, they appear more fierce and "angry, than just before they seem'd to be. Their Pulse is "hard and small, whilst they are frequently afflicted with a Pain "of the Occiput. When the Disorder increases, their Eyes become more fix'd and red; Tears, at the same time, flowing "from both of them." But the Signs and Symptoms of a present Phrenitis are by none of the Antients so well specified and characterized, as by *Calius Aurelianus*, in *Lib. 1. Cap. 2.* in the following manner: "In a Phrenitis, the Patient is afflicted "with an acute Fever; his Pulse is hardly perceptible on the "Surface of the Body; or, if it is, it is low and tense; his Face "is inflamed and full; the Blood drops from his Nostrils; he is "afflicted with continual Watchings; or, if he sleeps, his Rest is "disturb'd; he is seized with a kind of turbulent Madness, a "preternatural Solicitude of Mind, and a Privation of Reason; "he frequently changes his Posture in Bed, and his Head is in a "continual Commotion. He is sometimes cheerful, without "any apparent Cause; his Eyes are red; he weeps gently, and "tosses his Arms about him, but has no Pain in his Head. His "Joints are cold, but without any Tremor. His Urine is copious, yellow, aqueous, thin, and discharged by little and little. "Some phrenitic Patients are afflicted with a Noise in their "Heads, a Ringing of their Ears, and an incessant Head-ach. "Their Looks are, also, fix'd and stern, and their Eyes frequently "wink."

All these injured Functions of the Body, accompanying a Phrenitis, arise from too copious and impetuous a Conveyance of Blood to the Head; its interrupted Circulation thro' the minute Vessels of the Brain; its Stagnation; and its quick Conveyance thro' other unusual Ways. Hence Distentions of the Vessels of the Brain and Face happen; a serous Humour is secreted, and every-where obstructs the Vessels. The Brain is totally disturb'd, and especially in those Functions which are subservient to the Use of Reason; for *Hippocrates*, in his Book *de Flatibus*, and in many other Parts, justly observes, that Prudence and Reason depend upon a laudable State of the Blood in the Brain; or, in the modern Style, upon its equable Circulation thro' it; so that, when this is disturb'd, Prudence and Reason are destroy'd. And that the true Seat of a Phrenitis is in the Brain, is sufficiently evinced by dissecting those who have died of that Disorder; in whom, not only the Vessels of the Dura Mater, with its Sinuses, but, also, those of the Pia Mater, are infarcted with a thick and coagulated Blood; whilst these Membranes themselves are so dry and parch'd, that the Pia Mater can be easily separated from the cortical Substance of the Brain. Besides, the medullary Substance of the Brain appears cover'd with a large Quantity of a serous Humour. These Circumstances are confirm'd, in many Instances, by *Blancard*, in *Anatom. Pract. Obs. 3.* *Schenckius*, *Lib. 1.* and *M. N. C. Decad. 2. An. 5. Obs. 62.*

Among the antecedent Causes of a Phrenitis, *Calius Aurelianus*, in the Part before quoted, justly reckons, drinking Wine too copiously; Watchings; remaining long exposed to the Sun; a Mind naturally giddy and inconstant; Anger; a Weakness of the Head, brought on by Study; and Youth. Now 'tis certain, that all those Things dispose to a Phrenitis, which render the Head weak and infirm; in consequence of which, there may easily happen a Stagnation of the Blood, and a too long Continuance of the Humours in its Vessels. Those Things, also, dispose to a Phrenitis, which forcibly convey the Blood from the inferior Parts to the Head. Hence 'tis confirm'd by practical Observations, that a Phrenitis, and delirious Fevers, are highly incident to those afflicted with long Grief, or Care, who fatigue their Minds by profound Meditation and Study; to those who are strong and vigorous; who are of melancholic and choleric Constitutions; who are often under the Influences of Anger or Hatred; who are rack'd by violent Passions; who are afflicted with Watchings and Inquietudes; who surfeit themselves with strongly hop'd Malt-liquors; who are addicted to Wine and Women; to those who lead a sedentary Life, free from Motion and Exercise; and to such as, in consequence of a bad and preposterous Regimen, contain a large Quantity of impure Blood in their Veins. 'Tis, also, certain from Experience, that a Cessation, or speedy Suppression, of an usual hæmorrhoidal Discharge, of the Menstrues, or Lochia, in Child-bed Women, especially when such Patients are costive, lay a Foundation for a Phrenitis. For, in such a State, in consequence of the Stagnation of Blood in the abdominal Viscera, spasmodic Strictures are excited in the nervous Parts, which render the Circulation of the Blood unequal, and convey it impetuously to other Parts, where it is too copiously congested. A Phrenitis is, also, frequently induced by external Violence. This easily happens in Wounds and Contusions of the Head, especially in plethoric and cacochymic Habits; unless such a Misfortune is speedily prevented by Venesection and Discurients. In a Phrenitis, arising from such a Cause, the Event is generally fatal, according to *Hippocrates*, in *Secl. 7. Aph. 14.*

A Phrenitis is justly to be distinguish'd into that of the idiopathic, and that of the symptomatic Kind. In both of these, there is, indeed, an acute Fever, but with this Difference, that, in the latter, it precedes; whereas, in the former, it is the inseparable Concomitant of the Disorder. An idiopathic Phrenitis is rarely found in temperate Climates, but occurs more frequently in hot, dry, and southerly Countries; for which Reason the antient *Greek* Physicians, especially *Aërius*, and *Alexander Trallian*, have, in their Works, treated accurately and copiously concerning a Phrenitis. There are, however, in temperate Climates, Instances of a Phrenitis arising, without any previous Disorder, especially from Surfeits, continual Anger, and a Weakness of the Brain, produced by profound and continual Meditation, Watchings, and Fatigue; in sanguineous, or choleric and melancholic Persons; those addicted to a sedentary Life; hypochondriacal Persons; and those subject to the Hæmorrhoids, especially if that Evacuation is imprudently stop'd. But *Willis*, in *Pathol. Cerebri*, *Cap. 10.* justly informs us, from his own Experience, that unless this Species of Phrenitis is soon removed by proper Medicines, it degenerates into a Mania, or a furious Delirium. An idiopathic Phrenitis, which degenerates into a Mania, also, frequently happens after burning, purple, exanthematous, and catarrhus Fevers, improperly treated by a too hot Regimen; by volatile Medicines, which throw the Blood into too violent Commotions; by Opiates; by too forcible Repellents; by Refrigerants; and unseasonable Venesections. And this Disorder happens the more infallibly and violently, when the Patient is much and frequently subject to Anger.

A symptomatic Phrenitis is much more frequent in our Country; for it frequently happens, and proves mortal, in the Height

of malignant Fevers, acute exanthematous Fevers, petechial Fevers, the Small-pox, malignant catarrhus Fevers, especially such as rage in Camps, and most of all in the *Hungarian Fever*, particularly when the Disorders are ill treated; for in these Diseases a Phrenitis, of the symptomatic Kind, generally appears about the critical Days, and is attended with Rigor and Tremor of the Joints, a Tension of the Præcordia, a Refrigeration of the Extremities, and a Thinness of the Urine, which is discharged either in too small, or in too large a Quantity. But because, in consequence of the preceding Disease, and the continual Watchings, the Strength is almost totally lost, and the Tone of the Vessels distributed through the Membranes of the Brain too much weaken'd, irresolvable Stagnations of Blood happen in them, which generally prove mortal on the third Day.

But, though a Phrenitis frequently degenerates into a Mania, according to the Antients, especially *Hippocrates*, *Cælius Aurelianus*, and *Arætaus*, who for this Reason join, or rather confound, the one with the other, there is yet a great Difference between them; for in a Phrenitis there is always a Fever, accompanied with a quick, hard, and small Pulse. There is, also, a Delirium, not absolutely intermitting, but sometimes remitting, at which time every thing which happened under the Delirium, is forgotten. But a Mania is a chronical Disorder without an acute Fever, though accompanied with a preternaturally hard and unequal Pulse, which is sometimes small, and at others large and quick. A Mania has, also, its lucid Intervals, and is generally accompanied with great Pride, Anger, and Hatred to the Patient's Friends and Neighbours. And, when the Paroxysm ceases, the Maniacs have generally a surprising Remembrance of what happened under it. A Phrenitis is, also, different from that slight Alienation of Mind, which is frequently observed in acute Fevers, before the critical Expulsion of the exanthematous Matter; for such a slight Alienation of Mind goes more easily off, nor is it accompanied with thin and watery Urine, nor a Rigor and Refrigeration of the external Parts: Sometimes, also, after the Decline of an acute Fever, we observe, for some Days or Weeks, a certain Foolishness, or Inconstancy of Mind, which is different from a Phrenitis, arises from the Loss of the Strength, and Weakness of the Brain produced by the Disease; and, as the Strength returns, it either spontaneously ceases, or is easily removed by proper Medicines.

THE CURE.

Since the violent and terrible Symptoms, which accompany a Phrenitis, depend upon an Inflammation of the Meninges, which is their immediate Cause, the principal Intention of the Physician ought to be, either to prevent, or remove, such a Misfortune. But as the Cause of this Inflammation is a Stagnation of the Blood in the Vessels of the Meninges, and a sudden Conveyance of it to other Parts accompanied with Pain, a spasmodic Tension, and Heat, Reason informs us, that those Medicines are, of all others, the most proper, which check the fierce Impetus of the Blood to the Head, derive the congested Humours from it, disengage and discuss the stagnant Blood, and relax the spasmodically constricted Meninges.

Now, both in preventing and curing a Phrenitis, both antient and modern Physicians unanimously recommend Venesection, as near as possible to the Part affected. *Trallian*, and the *Arabians*, in a Phrenitis, often open'd the Jugular Vein; but this laudable Practice is too much neglected, since 'tis certain from Experience, that in all Disorders of the Head, arising from a Congestion and Stagnation of the Blood, opening this Vein is preferable to an Incision of any other, because both the external and internal Jugular Veins derive the Blood from the Carotid and Vertebral Arteries. Nor is the Incision of this Vein either so difficult, or dangerous, as 'tis commonly thought, since by applying a Ligature about the Neck, in such a manner, as to render the Vein turgid, it may be easily performed. Besides, opening the Sublingual Veins is a Practice highly esteemed by Physicians, not only in a Phrenitis, but, also, in other Disorders of the Head. Thus, *Ammannus*, in *Parien*. informs us, that in the Year 1664. among all the Soldiers who return'd from the *Hungarian Expedition*, and labour'd under the *Hungarian Fever* in the Hospitals, none of those died, who, in due Time, had the Venæ Raninæ open'd, whilst those were carried off by the Disorder, who had not that Advantage. I have, also, known the Opening of these Veins highly useful in acute Fevers, for preventing a Delirium, when performed on the sixth or seventh Day, whilst the Patient's Reason yet remained. But, if a Delirium is already present, it is with Difficulty performed. Besides, if the Incision is large, a terrible and fatal Hæmorrhage is to be dreaded, in consequence of the Impetus of the Blood to the Head. On the contrary, from too small an Orifice, but little Blood is evacuated; and, a

Space being there procured, the Blood is rather more solicited to the Brain. Others, after the proper Application of a Ligature to the Neck, recommend opening the Frontal Vein; and *Trallian* informs us, that by this means he cured a Person afflicted with a violent Phrenitis. Some prefer Arteriotomy in the Temples. Thus *Panacelus*, in *Pentec.* 1. *Obs.* 19. informs us, that in a violent Phrenitis he found this Practice so successful, that the Patients were immediately relieved by it. In a Phrenitis, *Cælius Aurelianus*, after shaving the Head, orders the Whole of it to be scarified. But the *Egyptian Method* of scarifying the Nostrils is far more commendable; and, if a proper Instrument for this Purpose cannot be had, the End may be obtained by thrusting a Straw, or any other thing of the like Nature, up the Nostrils, in such a manner, as to procure an Hæmorrhage, which I have often seen productive of immediate Relief. These Methods of Venesection in the Parts contiguous to that affected are to be used not only in the idiopathic, but, also, in the symptomatic Phrenitis. But, when, from a Retention or Suppression of the Menes; or Lochia, a Phrenitis is dreaded, a Vein is quickly to be open'd in the Foot, and a large Quantity of Blood must be taken away. If from any Fault, or Interception, of the Hæmorrhoids, a Delirium is dreaded, the best and most proper Method of affording Relief is, to open the hæmorrhoidal Veins by the Application of Leeches.

After a due Evacuation of Blood, the Body is to be render'd soluble; since, when the Patient is costive, the Afflux of the Humours is directed to the superior Parts, whereas, when his Body is sufficiently soluble, they are derived to the inferior Parts. *Hippocrates*, in *Lib. 3. de Morbis*, *Sec.* 9. justly advises, that, in the Cure of a Phrenitis, the Body is to be rendered soluble by moistening Potions, which relax the spasmodically constricted Coats of the Intestines, because Spasms of the Primæ Viæ are frequently the Causes of Deliriums. But, for answering this Intention, I, above all other Medicines, recommend Potions prepared with Manna. Thus,

Take four Ounces of Manna; dissolve it in a Pint of Whey; and add one Dram of Cream of Tartar, half a Dram of Nitre, and one Ounce of the Oil of sweet Almonds.

Bagliui, in *Prax. Lib. 1.* recommends the Pulvis Cornachini in the following manner: "Since, says he, it has often been observed, that Deliriums are terminated by Fluxes, I have therefore, in Imitation of the Method pointed out by Nature, found the Pulvis Cornachini effectual for this Purpose; drinking after it diluting Decoctions prepared of Barley, Sal Prunellæ, and other Ingredients calculated for sweetening the Humours, especially if there is a preternatural Heat of the Viscera, and an internal Inflammation." But, if the Case calls for speedy Relief, the Body is to be rendered soluble by a lenient, pargoric, and domestic Clyster.

Among the internal Medicines against a Phrenitis, we must, also, class diluent, demulcent, and moistening Potions drank in large Quantities, if the Patient is very thirsty, which, according to *Arætaus*, rarely happens. But, among all other Drinks, none is more proper and expedient than Whey, either acidulated with Citron-juice, and prepared with Julap of Roses, or edulcorated with Syrup of white Poppies. In a Quart of this Whey, we may, with Advantage, dissolve a Dram of depurated Nitre, or Sal Prunellæ. Phrenitic Patients, also, with Advantage, use Emulsions prepared of Decoctions of Barley, Shavings of Hartshorn, and the Four cold Seeds, with Julap of Roses; especially if to a Quart of such an Emulsion two Scruples of Nitre are added. Piti-fans, and Milk mixed with the *Selteran* or *Antonian Waters*, are very proper for those who labour under this Disorder; for the more copiously these Liquors are drank, the more efficacious they are in diluting the Humours, relaxing the constricted Vessels, removing Obstructions, and extinguishing the Heat. The diaphoretic and discutient Mixture, described under the Article ANGINA, is, also, of singular Service, not only in a Phrenitis, but, also, in all other Inflammations.

Among the external Means of freeing the Head from the Afflux of Humours, we may justly reckon bathing the Feet, or wrapping them up in a moist and warm Linen Cloth, or, which is still better, temperate Baths of fresh Water. The remarkable Use of these is not only confirmed by daily Experience, but, also, supported by the best Authorities. Thus *Alexander Trallian*, in *Lib. 1.* tells us, "That those who have sufficient Evacuations made, whilst the Quantity of the Humours is prejudicial to no Part of the Body, but are afflicted with a Driness of the Body, and an obstinate Watching, ought to bathe and anoint; and, even if the Patient is feverish, it will do him no Harm to bathe in this manner, especially if the Bath is tepid, and neither the Air, nor the Bathing-tub, too hot. But those who do not bathe for Fear

“ of the Fever, are greatly mistaken, since, by abstaining from
 “ the Bath, the Patients have their Watching, and Perturbation
 “ of Mind, increased. Such Patients are, therefore, to be
 “ bathed in the manner directed, since by this means they are
 “ restored to a due Temperament, and freed from their De-
 “ lirium, and the Disorder which excited the Fever.” The
 Antients, also, and especially *Alexander Trallian*, and *Aretæus*,
 after Venesection and Purgation, fomented the Head with
 an *Oxyrrhodinum* of Vinegar of Roses, left, as they said, the
 Head should attract a large Quantity of Humours, and be
 filled with them. Nor is this Piece of Practice to be con-
 temn'd. In all Deliriums, however, I with great Success order
 the Head to be shaved, and fomented with the following tem-
 perate Epithem :

Take of Rose-vinegar, two Ounces ; of the Spirit of Roses,
 in which ten Grains of Camphire are dissolv'd ; two
 Drams ; of pure Nitre, two Scruples ; and of the Oil of
 Rosewood, twenty Drops. Mix all together for Use.

This Method of curing not only an idiopathic, but, also,
 a symptomatic Phrenitis, and especially that inveterate Species
 of the Disorder, which seems to degenerate into a Mania, is
 founded upon my own Experience ; nor can any other Measures
 be well invented, or found out : But the Use of these must be
 for a considerable time persisted in. *Alexander Trallian*, in *Lib.*
1. gives an accurate Account of the Regimen proper for phre-
 nitic Patients, in the following manner : “ The Place, says he,
 “ in which the Patient lives, is to be duly consider'd, since he
 “ ought to be expos'd to an Air, which is neither too thick, too
 “ moist, nor too cold, lest the Pores of his Head should be by
 “ that means obstructed, or a Repletion of it produced. But
 “ let the Atmosphere be temperate, that by its laudable Qua-
 “ lity the animal Spirits may be revived and relaxed. Let
 “ his Chamber be rather light than dark, that by this means
 “ he may gradually arrive at the Perception and Remembrance
 “ of such Objects as he was formerly accustomed to. For
 “ this Reason, let some intimate Acquaintances attend him,
 “ and reprove him for what he does, and exert a due Autho-
 “ rity over him. Nor ought any Servant or Friend, on whose
 “ account he is sometimes grieved, or at whom he is angry,
 “ to enter the Room ; for this generally irritates the phrenitic
 “ Patient, and lays a Foundation for his greater and more
 “ manifest Perturbation. Nor ought great Numbers of his
 “ Friends and Acquaintances to enter his Chamber, since
 “ they not only form a Croud about him, but, also, render
 “ the Air thick by their Breaths. He is not to be re-
 “ moved in Bed with Violence, but gently, lest, in conse-
 “ quence of his Weakness, he should be hurt ; for this, above
 “ all things, irritates the Patient, and prevents Sleep. Let
 “ the By-standers hold all his Limbs without Violence, and
 “ gently rub them, especially the inferior Members : And his
 “ Limbs are to be secured with Cords, principally when his
 “ Convulsions seize him ; for this solicits the Matter to the
 “ inferior Parts, and allays the Convulsions. It is, also, ex-
 “ pedient, when the inferior Parts are rub'd, to foment
 “ them, and apply Ligatures to them in such a manner, that
 “ the Matter by Fomentation and Friction convey'd to them,
 “ may be derived still farther downwards.”

With respect to Venesection, we are to observe, that phre-
 nitic Patients often absolutely refuse to submit to it : In which
 Case, I know no more expeditious and effectual Method of Re-
 lief, than suddenly and unexpectedly to thrust a Quill or Straw
 into the Nostrils ; by which means a large Quantity of Blood
 is sometimes commodiously evacuated. But, if the Phrenitis is
 idiopathic and chronical, we are not to open the Frontal Vein,
 especially in plethoric Habits, till we have previously opened a
 Vein either in the Arm or Foot, lest the Impetus of the Blood
 to the Head should be augmented. Neither, in performing this
 Operation, are we to use too sharp an Instrument, lest, passing
 it through the Vein, we should wound the Pericranium.

A Phrenitis arising from any Disorder of the Menfes and
 Hæmorrhoids, and the violent Spasms by that means produced,
 is best and most commodiously alleviated by Baths, drinking
 Mineral Waters, and the Application of Leeches to the Veins
 of the Arms, using, at the same time, a proper Regimen and
 Diet ; for I have known a long-continued Phrenitis happily re-
 moved by the Eruption of the menstrual or hæmorrhoidal
 Discharge. But when a Phrenitis does not so much proceed from
 a Redundance of Blood congested in the Vessels of the Brain,
 as from a subtle, acrid, and virulent Matter, which is either
 repel'd from the Surface of the Body, as in exanthematous Dis-
 orders, or, being, by too hot and volatile Medicines, too much
 exalted, is firmly impacted in the Dura Mater, which is a ner-
 vous Membrane, excites Spasms, hinders the free Circulation
 of the Blood, and intercepts its Return to the Heart, besides
 opening the Veins contiguous to the Head, we are to shave the

Head, and apply to it the warm Parts of Animals just
 killed, such as the Lungs, the Liver, and the Omentum,
 which, becoming cold, are to be immersed in warm Water, in
 order to heat them again.

In *Poland*, a melancholic and maniacal Phrenitis is very fre-
 quent, in consequence of a latent *Plica* ; and, when the latter
 appears, the former ceases. For this Reason, 'tis expedient to
 solicit and forward the Egress of the *Plica* ; for which Purpose,
 the Inhabitants of that Country generally use a Decoction of
 two Handfuls of Club-moss, prepared with two Quarts of Wa-
 ter. When with this Decoction they wash their Head and Hairs
 twice a Day, the *Plica* generally appears in a Week's time,
 and removes the Delirium. When in a *Plica Polonica* the Hairs
 are cut off, there frequently ensues a violent Head-ach, which is
 succeeded by a Phrenitis, a Fever, and sometimes a Mania ;
 which, however, are soon removed by using the Decoction of
 Club-moss, or the Liniment of Club-moss, described in *M.*
N. C. Dec. 1. An. 2. Obs. 54. by which means the *Plica* is
 recalled.

But as in all Inflammations, so, also, in a Phrenitis, we are
 carefully to abstain from acrid Substances, and such as put the
 Humours into a Commotion ; from spirituous Liquors ; from
 violent Exercise, both of Body and Mind ; and from all Ali-
 ments capable of putting the Blood into a preternatural Mo-
 tion. The Patients are by no means to be irritated and pro-
 voked to Anger : For which Reason, no Person who has in-
 jured them, or whom they cannot endure, is to be admitted to
 them. Opiates and Narcotics are by no means to be used in a
 Phrenitis, especially where the Strength is already impaired ;
 for 'tis certain from Experience, that, in Fevers, Deliriums are
 sometimes brought on by Opiates and Narcotics. Hence,
Alexander Trallian, in *Lib. 1.* justly advises, “ That in a
 “ Phrenitis, where the Strength is low, we are to exhibit
 “ nothing which induces Sleep, and a Torpor ; since, by such
 “ Medicines, a great Injury is done to the Patient.” Vefica-
 tories, also, by some much used in a Phrenitis, are to be con-
 demned ; for the *Cantharides*, by their acrid Stimulus, irritate
 the already tense and spasmodically constricted Fibres ; by which
 means they increase the Delirium, and bring on Convulsions,
 as *Baglivi*, in *Lib. 1. Prax.* informs us, in the following man-
 ner : “ In *Rome*, says he, I observe more Men killed than
 “ cured by Veficatories, which, however, are more benefi-
 “ cial, and less dangerous, to Women :” And, a little after,
 he subjoins, “ If Veficatories are applied to Patients labouring
 “ under a Delirium, accompanied with an acute Fever, a Dri-
 “ ness of the Tongue, and the Signs of a violent Inflamma-
 “ tion of the Viscera, all the Symptoms become worse, and
 “ the Patient, for the most part, dies of Convulsions.”

Frederic Hoffman.

When a violent and perpetual Delirium arises from a primary
 Disorder of the Brain, accompanied with a continual Fever, it
 is called *A true Phrenitis*.

When a Phrenitis arises from a Disorder communicated to
 the Brain from some other Parts, in Fevers and Inflammations,
 it is called *A symptomatic Phrenitis*, a Disorder which corre-
 sponds to the *Greek παροξυσμ*, and the *Latin Desipientia*.

A true Phrenitis is preceded by Heat ; a violent internal and
 inflammatory Pain of the Head ; a Redundance of Blood ; an
 inflammatory Disposition ; a Redness of the Eyes and Face ;
 turbulent Sleeps ; a slight Degree of Folly ; Youth ; the Use of
 hot Substances ; remaining in the Sun ; Haughtiness, or Fierce-
 ness ; sudden Forgetfulness ; a Driness of all the Parts ; and
 especially of the Brain ; and picking the Knaps of the Bed-
 cloaths.

A symptomatic Phrenitis is preceded by almost every acute
 Disease, accompanied with a Fever ; as a Pain of the Side, which
 is not pleuritic, but accompanied with a slight Perturbation of
 Mind, and Inflammation of the Pleura, Lungs, and Diaphragm,
 which is a very bad Sign : Such an Inflammation is prognosti-
 cated by a Blackness of the Tongue, a Suppression or White-
 ness of the Fæces, and a Retention of the Urine, which Sym-
 ptoms never fail to prove mortal : A thin, pale, and ill-colour'd
 Urine ; a Want of Thirst ; Redness ; Urine with black Mat-
 ter suspended in it ; and Watchings ; are Signs of an approach-
 ing Inflammation of the Head.

Both a true and symptomatic Phrenitis, have the following
 Symptoms :

1. A Depravation, not only of the sensible Ideas, but, also,
 of the internal Senses, of Reason, and of the Affections of the
 Mind.
2. An increased violent and restless Fierceness, or often tur-
 bulent Sleep.
3. An hard Pulse, and a rare and large Respiration.
4. A Countenance, for the most part, highly red, stern and
 ghastly ; fierce and protuberant Eyes ; and a slight Hæmorrhage
 of the Nose.

As for the Prognostic, a true Phrenitis generally carries off the Patient on the third, fourth, or seventh Day, which it rarely surpasses; and when it does, and happens to be violent, it degenerates into a Mania, or, when rising somewhat higher, it becomes intolerable. It, also, often terminates in a Lethargy, a Coma, and a Catache.

An æruginous Vomiting, in consequence of an inflamed Brain; a frequent and indecent Spitting; a Tremor; the Fæces and Urine intercepted, or white; crude Urine; Convulsions; catching at flying Flakes; muddy Eyes; a Gnashing of the Teeth; a Want of Thirst, the general Forerunner of Convulsions; a perpetual Change of Symptoms; and the Subsiding of a tumid Ulcer; are frequent Prefages of great Danger, and of Death.

A true Phrenitis is mortal after a Peripneumony, and the Iliac Passion; and very bad after the Small-pox.

An Inflammation somewhat fixed, and a Roughness of the Fauces tending to the superior Parts, produce a mortal Phrenitis; and the Patients labouring under it grope for Objects which have no Existence, and are greatly oppressed.

That Phrenitis is the worst, which prevents the Patient from submitting to what is necessary for him.

Upon laying open the Bodies of such as have died of a Phrenitis, the Meninges have been found inflamed. Gangrenes, Abscesses, and a Sphacelus of the Brain, are, also, found; or acrid and corroding Ichors are discovered.

From what has been said, 'tis obvious, that the immediate Cause of a true Phrenitis is a primary Inflammation of the Pia and Dura Mater; whereas the Cause of a symptomatic Phrenitis is a like Inflammation arising from the Conveyance of an hot and phlogistic Matter to the Meninges of the Brain.

Whatever is capable of producing such Inflammations, may be considered as immediate Causes of a Phrenitis.

Hence the true Diagnosticks, both of a true and symptomatic Phrenitis, are to be taken.

In the Cure of a Phrenitis, the following Circumstances ought to be adverted to:

Varices, and hæmorrhoidal Discharges, are beneficial to phrenitic Patients; as is, also, a Diarrhœa. A Pain of the Breast and Feet, or a violent Cough supervening, often terminate a Phrenitis; as does, also, an Hæmorrhage.

A true Phrenitis requires the speedy Use of the strongest Medicines, calculated for removing the Inflammation in the Arteries of the Brain, which are found under the Article INFLAMMATIO: Only it is to be observed, that Venesection is to be copiously instituted, either making one very large Orifice, or opening, at one time, a Vein in the Foot, and the Jugular and Frontal Vein. Diluting, antiphlogistic, and nitrous Decoctions are copiously to be exhibited: Then antiphlogistic Purgatives are to be used, in Conjunction with a large Quantity of a diluting nitrous Drink. Clysters of the like Nature, with an Addition of proper laxative Ingredients, are to be used: The Anus is to be fomented, and the hæmorrhoidal Veins either rubbed with Fig-leaves, or evacuated by the Application of Leeches. Gentle Collutions and Gargarisms for the Mouth are to be frequently used: The Nostrils, Eyes, and Ears, are to be fomented; and the Head is to be shaved. If these Measures are taken without removing the Disorder, we are to use Opiates, wash the Feet, and apply gentle Epispastics and Cupping-glasses to the inferior Parts. The Patient is to be refresh'd in a moderately cool Air, and held in an erect Posture.

But if a Phrenitis is of the symptomatic Kind, and arises from some other inflammatory Disorder, we are carefully to consider, whether the Nature of this primary Disorder will admit of the Measures now recommended: If not, it is to be cured by the Manner usually appropriated to itself; taking care always to use deriving and topical Medicines. *Boerhaav. Aph.*

PHRICE, *φρις*. See HORROR.

PHRICODES *Febris, φρικδης πυρεσος*. A Fever attended with an Horror, or Shivering, not only in the Beginning of a Fit, but during a good Part of it; of which Nature is a semitertian Fever. *Galen, de Diff. Febr. Lib. 2. Cap. 9.* The Author of the *Definitiones medicæ* describes it as attended with an Heat, mixed with a Rigor, and a remarkable Lowness of the Pulse, which is insensible to the Touch, and recedes, as it were, inwards: The Belly, in this Case, is tumefy'd, and a Rumbling is heard: The Tongue is extremely tumid, and irrigated with an acrid Humour, as with the Saliva. *Foessus.*

PHRONTIS, *φροντις*, properly signifies intense Cogitation, or painful Exercise of the Mind: But in *Hippocrates, Lib. 1. de Morb.* it is taken in a particular Sense for a Disease, where he says, *φροντις νοςος χαλεπη*, *Phrontis is a troublesome Disorder*; in which, as he describes it, the Patient feels, as it were, a Thorn pricking the abdominal Bowels; is extremely restless; avoids the Light and Company; is only pleased in Obscurity; and is afraid of every thing: The Membrane, which separates the Abdomen from the Thorax, swells outwards; the Patient

is very fearful of being touched, and suffers greatly thereby: He is molested with terrible Dreams; and imagines that he sees frequently frightful Objects, or dead Persons. This Disorder may be reduced to the Class of melancholy Affections. *Le Clerc. Hist. de la Med.*

PHRYCTE, *φρυκτη*, in Latin, *Frieta*, simply, or without its proper Substantive, is *Resina Colophonia*, black Resin, so called by way of Distinction from the liquid Sort, named *υγρη*. *Hygra*: It is called *φρυκτη*, from *φρυγω*, to torrefy, because it is burnt, or torrefy'd, as *Dioscorides* shews, *Lib. 1. Cap. 93.*

PHRYGANON, *φρυγανον*. A dry Twig, or Branch fit for Burning. *Varinus.* A Bundle of these dry Sticks, or *Phrygana*, is directed by *Hippocrates, Lib. 1. de Morb. Mul.* to be placed under the Bed of a Woman in Travail, in order to prevent its Feet from coming to the Ground, when it was let fall backwards, from the erect Posture to which it was before raised. This kind of Operation was called *σεισμος* (*Seismos*), *Concussion*, and order'd to be used for the Promotion of Delivery in difficult Cases.

PHRYGIUS LAPIS. *Offic. Boet. 406. De Laet. 134. Matth. 1380. Aldrov. Mus. Metall. 689. Calc. Mus. 385.* THE PHRYGIAN STONE.

The *Phrygian Stone*, so called, because it is used by the Dyers in *Phrygia*, is produced in *Cappadocia*. The best is pale, moderately ponderous, of no solid Contexture, and distinguished by white Lines, like the *Cadmia*: They burn it in the following manner; they first wash it over with the best Wine, then cover it with live Coals, and blow them continually; when they perceive it has changed its Colour, and is become redder, they take it out, and extinguish it in the same Wine; they put it under the Coals a second time, and do as before; and even burn it a third time, but take care, that it does not crumble away, nor pass into Soot.

The *Phrygius Lapis*, whether crude or burnt, is an efficacious Astringent: It moderately cleanses, also, and has an escharotic Virtue, and with Cerate cures Ambustions: It is wash'd like the *Cadmia*. *Dioscorides, Lib. 5. Cap. 141.*

It is good in Diseases of the Eyes, and for Ulcers, and other Purposes. *Galen.* It is at present unknown in the *English Shops.* *Dale.*

PHRYMION. A Name in *Oribasius, Collect. Medicinal. Lib. 12.* for the *Poterium* of *Dioscorides*. See POTERIUM.

PHTHARTICOS, *φθασις*, from *φθειρω*, to corrupt. Deleterious, deadly; an Epithet applied to Poisons, and their Qualities. *Galen, de S. F. Lib. 5. Cap. 18.* It is opposed to *αλεξιηριος*, *alexiterius*. See ALEXITERIA.

PHTHEINAS, *φθεινας*, from *φθισιν*, to corrupt, signifies tabific: Thus *φθεινας αι νοςος* are Diseases causing a Tabes, by a Defluxion from the Head upon the Lungs. *Lib. απει αδιναν*. Again, *φθεινας* put substantively, with the Epithet *ξηρα* (*xera*), signify dry Consumptions, which owe their Original to Tophi, or a Concretion and Induration of Humours in the Lungs, and seem to be opposed to *φθινδεις* (*phthinodes*); which means those who are in a Consumption, proceeding from a Suppuration, or Collection of Pus in the Lungs. See PHTHINODES.

PHTHEIRIASIS. See PHTHIRIASIS.

PHTHEIROCTONON. A Name for the Staveacre, so called from *φθισ*, a Louse, and *κτενω*, to kill, because it destroys Lice.

PHTHINICE, *φθινικη*. *Hippocrates, 2 Prorrh.* mentions a Disease called *νκος φθινικη*. The *Phthinic Disease*. The near Affinity between *phthinc* and *phthisic* has induced some Interpreters to believe that he there speaks of a Phthisis: But the most learned are convinced, that there is a Fault in the Text, and that, instead of *φθινικη*, we are to read *φθινικη* (*Phænicie*), *A Disease of Phœnicia*: They found their Opinion on their meeting with the Word *Phænicie*, in the ancient Glossaries on *Hippocrates*, where it is added, that *By this Word is to be understood a Disease common in Phœnicia, and other Eastern Countries, and probably the very same with the Elephantiasis*. What confirms this Explication is, that *Hippocrates*, in the same Place, treats of the Impetigo, Lepra, and Leuce. I shall only observe, that *Galen*, who is the Author of the Glossary above cited, might be mistaken in that respect, so far only as in supposing the Disease of *Phœnicia* to be what they called the *Elephantiasis*, whereas it is possible, that it might have no more than a bare Relation to it; and that, by this *Disease of Phœnicia*, *Hippocrates* might mean the Leprosy of the *Jews*, which was a Sort of Leuce, and might have something in common with the *Elephantiasis*, without being exactly the same Distemper. *Le Clerc, Hist. de la Med.*

PHTHINODES, *φθινωδης*. Tabid, or consumptive. An Epithet for Diseases, and Persons labouring under such Diseases. In *Hippocrates*, it sometimes signifies a Tendency to a Consumption.

PHTHINOPORON, *φθινωπορον*. The Autumn.

PHTHI-

PHTHIRIASIS. The lousy Evil, from *εθσιε*, a Louse.

The Phthiriasis is a lousy Distemper, to which Children are particularly subject, and sometimes Adults. *Swammerdam*, in his History of the Generation of Insects, tells us, that what we commonly call the *Nit*, is the true Egg from which the Louse is hatched; this Egg requires a moist and warm Place for its Matrix, and then its Multiplication is incredible, in a short Space; and some even suggest, that, in twenty-four Hours, a Louse is not only *Abavus* but *Tritavus*, that is, not only Great Grandfather's Father, but Great Grandfather's Great Grandfather. But if they miss this kindly Repository for their Eggs, as being exposed to the cold Air but for one Day, they are kill'd before they are hatched.

There are reckon'd four Kinds of Lice which molest human Bodies. 1. The *Pediculi*, so called, says *Isidore*, because they are more troublesome by the Motion of their Feet, than their Bite. These generally breed in the Heads of Children, especially if fore or scabby, and often in those of Adults, who are slothful and nasty.

2. *Crab-lice*, so called from their Resemblance to the Crab-fish, which lodge in the Arm-pits, Eye-lids, Eye-brows, and Pudenda of grown Persons. See *MORPIONES*.

3. *Body-lice*, which infest the Bodies, and breed in the Cloaths, of the Slothful and the Nasty: These are of a large Size, oblong, thick, and ending with an acute Point towards the Head.

4. Those generated, according to some, under the Cuticle, being found in the Hands and Feet, of a round Form, like the small Eggs of Butterflies; some of them so minute as to escape the Sight: By their creeping under the Scarf-skin, they excite an intolerable Itching; and sometimes, bursting the Skin, they discover themselves in Clusters; but they generally keep themselves concealed: They are named by some Authors, *Acari*, *Cyrones*, and *Pedecelli*.

The Cause of their Production is, by some, ascribed to the plentiful eating of Figs. *Galen* says, that the Flesh of Vipers breeds them; but, undoubtedly, Slovenliness and Nastiness are the chief Promoters of their Propagation, as affording fit Matrices for hatching their Eggs, and, also, proper Food for their Nourishment.

The lousy Evil is best prevented by wholesome Food, keeping the Body clean, and the Head carefully combed.

When they breed in the Head, let it be well combed, and washed with the following Lixivium.

Take of Wormwood, Stavesacre, Rue, and Horehound, each an Handful; lesser Centaury, half an Handful; Oak-ashes, five Ounces: Make them into a Lixivium, with Spring-water; in which dissolve, of common Salt, two Ounces; Salt of Wormwood, one Ounce: With which let the Head be washed.

Or anoint it with the following Ointment.

Take of the Oils of bitter Almonds, Rue, and Bays, each an Ounce; the Powders of Stavesacre, and Myrrh, each two Drams; Powder of Aloes, one Dram; salted Lard, two Ounces: Mix them with a little Vinegar. Or,

Take of Hogs-lard, Oil of Bays, and black Soap, each half an Ounce; Quick-silver, extinguished with Spittle, a Scruple; Myrrh, and Aloes, each half a Dram; Stavesacre, two Scruples; French Soap, two Drams: Reduce them, in a Mortar, to the Form of an Ointment.

For Body-lice, the wiping the Body with Gilders Cloths is reckon'd an efficacious Remedy, on account of the Quicksilver which they contain. Or,

Take of Stavesacre, and the Powder of red Arsenic, each an Ounce; common Salt, Olive-oil, and Vinegar, each a sufficient Quantity: Mix them together: Or,

Take of Stavesacre, and Powders of Nitre, and white Hellebore, each equal Parts; Oil of bitter Almonds, a sufficient Quantity: Mix them.

Take of Wormwood, and lesser Centaury, each an Handful; Lupins, one Ounce; Stavesacre, and Birthwort, each half a Pound: Boil them in a Lixivium, to which add two Ounces of Salt.

Take of Oil of bitter Almonds, one Ounce; Oils of Rue, and Stavesacre, each half an Ounce; the Powders of lesser Centaury, Myrrh, and Aloes, each a Dram; Quick-silver, half a Dram; rancid salt Lard, two Drams: Make them, with a little Vinegar, into a Liniment.

The following Lotions and Ointments are taken from *Sennertus*.

Take of long Birthwort, Lupins, and the Leaves of the Pine and Cypress, each equal Parts: Boil them in a sufficient Quantity of Spring-water, for a Lotion for the Head.

Take of the Root of Elecampane, two Ounces; of Bryony, half an Ounce; Beet, and Mercurial Soap, each an Handful; Lupins, an Ounce; Nitre, half an Ounce: Boil them for a Lotion for the Head.

Take of the Powder of Stavesacre, three Drams; Meal of Lupins, half an Ounce; white Agaric, three Drams; native Sulphur, two Drams; of the Gall of a Bull, half an Ounce; Oil of Wormwood, enough to make them into a Liniment.

Take of Stavesacre, an Ounce; Wormwood, and Rue, each half an Ounce; Sulphur, and Nitre, each two Drams: Mix and make them into a Powder, which reduce to the Form of a Liniment, with Oil of Bays.

Much stronger is this;

Take of the Powder of the Seeds of Stavesacre, an Ounce; white Hellebore, three Drams; Quicksilver, extinguish'd with Spittle, two Drams; Hogs-lard, and Oil of Bays, each a sufficient Quantity to make them into an Ointment.

In Infants and Children the Quicksilver must be omitted, as too hazardous, since milder Medicines will answer the Intention.

All the Bitters, four, and salt Things are here recommended, as, also, Mercury, which, by a singular Property, is said to destroy these Vermin, beyond all other Medicines; but it must be used with very great Caution. *Turner de Morbis Cutaneis*.

Ettmuller advises the Head to be wash'd with a Lixivium, in which have been boiled the Seeds of Stavesacre; and anointed with the following Ointment:

Take of the Oil of Spike, two Drams; the Oil of bitter Almonds, half an Ounce; the Ointment of Tobacco, six Drams: Mix and make them into a Liniment.

This will destroy all those Animals in one Night's time.

The Powder of the *Indian Berries*, sprinkled on the Head, infallibly destroys them. *Codrœchius* (who has wrote a particular Treatise of these Animals) says, he has a thousand times experienced the Use of this Powder; and that, in small Quantities, mix'd with Hogs-lard, a boiled Apple, or the like, applied to the Head, it miraculously destroys Lice, more effectually than the Stavesacre, and more safely than Quicksilver.

To destroy the Crab-lice lodging in the Groins of Adults, the anointing the Parts with black Soap is an infallible Remedy, neither is there Occasion to seek for any other. *Turner* proposes Lac Sublimatum; but that is a Medicine not so safe to be used about the Genital Parts. See *MORPIONES*.

Sennertus says, that the Loufiness of the Eye-lids is no contemptible Disorder; for it occasions sharp Fluxions, and the Eyes are at last much prejudiced by it: The same Author enumerates a great many Medicines for it; but there is no Occasion to mention them here; for these and all other Sorts of Lice are easily killed by anointing with black Soap.

Those who would see more relating to this Subject, may consult the following Writers; *Mercurialis, Lib. 1. Cap. 7. Lufitan. Cent. 3. Cur. 58. Zwinger. Theatrum Vit. Hum. Fol. 525. Tulp. Obs. Lib. 3. Cap. 40. Forest. Schol. Lib. 8. Obs. 15. Curdan. Lib. de Subtilitate, 9. Scaliger, Exercit. 94.*

PHTHIRION. The same as *PHTHIROCTONON*. *Blancard*.

PHTHISICUS. The same as *PHTHINODES*.

PHTHISIS.

Except the Heart, no Part of the human Body is so useful and necessary for the Preservation of Life, as the Lungs, the genuine Instrument of Sanguification, in which the chylous and nutritive Lymph is intimately mixed with the Blood, and assimilated to it: It is, also, by means of the Lungs we draw that vital Air, or ethereal and elastic Fluid, which communicates Strength to the solid Parts, and a due systaltic Motion to the Heart: But, as the Lungs are of more Use and Importance, than most other Parts of the human Body, so they are subject to more terrible Disorders, which we shall endeavour to account for, from their Fabric and Texture. The Lungs, then, consist of membranaceous Vesicles, which receive the Air; of Nerves, which contain an highly subtle Fluid; and of various Kinds of Vessels,

Vessels, appropriated for the Blood and Lymph; so that, in consequence of so many small Vessels, it is not to be wondered at, if there should happen frequent Congestions, Stagnations, and Obstructions of the Blood in them, which lay a Foundation for various Disorders, among which one of the most considerable is a Phthisis, which is a Consumption or Wasting of the Body, accompanied with a slow Fever, a Difficulty of Breathing, a troublesome and continual Cough, and a copious Expectoration of corrupted and purulent Phlegm and Matter. This Disorder arises from an injured State of the Lungs, by means of an Abscess, or a scirrhous or ulcerous Corruption.

There are various Species of Consumptions accompanied with a Fever, an uneasy Cough, and an Expectoration of peccant and corrupted Matter, which, with respect to their Prognostics and Cure, are widely different from a Phthisis, and ought not, by the Physician, to be confounded with it, since they happen without any considerable Injury to the Lungs. Thus it is certain from Experience, that a Consumption frequently arises from a simple Gonorrhoea, or nocturnal Pollutions long-continued, as we are informed by *Hippocrates* in *L. 6. Ep. Sect. 8. 47.* Nor is it uncommon to observe a Consumption arising from excessive Venery, and a Cacochymy, or depraved State of the nutritious Juices in scorbutic Habits, whilst the Texture of the Lungs is as yet sound and entire. Almost the same thing may be observed in the Atrophy of Children, in which, on account of a scirrhous Induration of the mesaraic Glands, the Chyle cannot easily and freely pass to the Blood; in consequence of which, Nutrition is prevented; and, by this means, the superior Parts are consumed and wasted, the Belly inflated, the Patient afflicted with a slow Fever, a Difficulty of Breathing, a Cough, and a preternatural Solubility of Body. Nor is that Species of Consumption always to be accounted a Phthisis, in which there is an Extenuation of Body, a slow Fever, a Cough, and more or less sanious Stools; for it frequently happens, that, whilst the Compages of the Lungs is found, a Sanies is conveyed to the Breast from other Parts, such as the Mesentery, the Uterus, and Kidneys, when labouring under an Abscess, or Ulcer. A Phthisis is, also, to be accurately distinguished from a chronical Cough, accompanied by a copious Expectoration of Phlegm, and succeeded by a Consumption, Loss of Strength, and preternatural Heat, since this last Species of Consumption in the Autumn and Spring frequently seizes Persons subject to catarrhus Disorders, and afflicts them for a considerable time; but may be happily removed by the Force of Nature, and the Assistance of Art.

But, that there may remain no Mistake in distinguishing a Phthisis from other Disorders, we shall here give the Signs of it from *Caelius Aurelianus*, who, in *Lib. 2. Cap. 14.* has the following Passage: "A Phthisis is frequently produced by a previous Spitting of Blood, and sometimes by a gentle, but long-continued Catarrh, or Cough, by which the Lungs are, at first, gently lacerated, and then ulcerated. A Phthisis is accompanied with a latent Fever, which begins in the Evening, is alleviated in the Morning, and attended with a violent Cough at those times. At first a small, but afterwards a large Quantity of sanious Spit is expectorated. Those who fall into a Phthisis, in consequence of an Hæmorrhage, discharge, at first, a bloody Spit, which, afterwards, becomes feculent, and then livid, or green, and, last of all, white and purulent, sometimes salt, and, at others, sweet; whilst the Voice is hoarse, and shrill, the Breathing difficult, the Cheeks red, and the rest of the Body of a cineritious Colour. A Phthisis is, also, accompanied with a Loathing of Food, and a preternatural Thirst. Some Patients have, as it were, a Sense of a Wound in their Lungs, and even expectorate Fibres of them. The Pulse is weak, hard, and formicular. A Phthisis is, also, accompanied with an Inflation of the Feet. As the Disorder increases, a Flux is brought on; and the Phlegm discharged, when thrown upon live Coals, is of a fetid and disagreeable Smell." *Hippocrates*, in *Lib. de Morbis*, delivers the Signs of an approaching Phthisis in the following manner: "A Patient, says he, is rendered Phthisical, when the Phlegm falls down from the Head upon the Lungs; at first, for the most part, insensibly; and excites a gentle Cough: The Spit is, also, bitterer than usual, and sometimes there is a gentle Heat of the Body. But, in Process of Time, the Lungs, and especially their internal Parts, are exulcerated by putrid Phlegm; the Breast is oppressed by a Sense of Weight, and acute Pain is perceived both in the anterior and posterior Parts, and the Heat of the Body becomes more intense. The farther a Phthisis proceeds, the more unmixed Pus is discharged, the more intense the Fever becomes; the Cough is more violent and continued; the Patient is racked with a Sense of Hunger, and a Diarrhoea comes on."

Having thus specified the Marks and Characteristics of a Phthisis, we now come, from a Consideration of the Phenomena

observable in the Bodies of those who have died of that Disorder, to investigate the Causes of the several Symptoms with which it is accompanied. First, then, in all Persons, who have died of a Phthisis, either the Right, or Left, or both Lobes of the Lungs adhere so firmly to the Pleura and Ribs, or to the Vertebrae of the Back, that they cannot, without great Difficulty, be separated with the Knife; and the Part, in which they adhere, is generally full of a putrid Serum, or Ichor. In some Phthisical Patients, especially such as have been afflicted with an Empyema, I have observed one Lobe of the Lungs totally consumed by the previous long-continued Disorder of the Breast, and the other inflamed; which Circumstances prove the Cause of the Patient's Death. For the most part, there are, also, in one of the Lobes of the Lungs, Impostumations, or closed Ulcers, of different Bulks, and sometimes more, sometimes fewer in Number; which, when laid open, contain partly a thick, and partly a fluid Pus. When an Incision is made, especially in the superior Part of either of the Lobes of the Lungs, there are found pretty large Cavities filled with Pus and Phlegm, almost of the same Kind and Colour with that before evacuated by the Mouth. Sometimes, also, in the Lungs, when become knotty and scirrhous, there are found spreading and fistulous Ulcers, like Cancers, which prey upon the adjacent Parts, and contain a sanguineous and fetid Ichor. There are, also, Instances of scirrhous Tubercles, hard, like the Stones of Fruit, and containing a tophaceous, calculous, and putrid Matter, found in the Lungs. It is, also, to be observed, that, in Phthisical Patients, the Heart is, for the most part, flaccid, and its Vessels infarcted with polypous Concretions; a memorable Instance of which is found in *M. N. C. Decad. 2. Obs. 35.* In the Pericardium, also, and frequently in the Cavity of the Breast, there is a large Quantity of impure and fetid Serum. As for the Abdomen, and other Parts, the Vessels are generally without Blood, the Liver large and pale, the Glands of the Mesentery tumefied, the Omentum destroyed, and all the Fat, both of the internal and external Parts, appears to the View: Those, who desire a farther Knowledge of the Phenomena observed in dissecting Phthisical Patients, may consult *M. N. C. Decad. 1. An. 1. & 2. Decad. 2. An. 4. Obs. 45. 118. An. 8. & 9. Cent. 3. & 4. Obs. 118. Cent. 8. Obs. 105. Cent. 9. Obs. 16. & 26. Cent. 10. Obs. 143. Vorzsch. Obs. 100. Lessius, Obs. 11. Pawius, Obs. 22. Platerus, Lib. 3. Obs. 189. & 690. and Pexoldus, Obs. 63, 64, 74. and 92.*

Hence it is sufficiently obvious, how violent the Injury done to the Lungs must be in a Phthisis, in order to induce Death. We now come to inquire into the Causes productive of such an Injury; among which the most considerable are scirrhous Stagnations in the vascular, vesicular, and membranous Substance of the Lungs; which, if considerable, are not, without the greatest Difficulty, to be removed, on account of the continual and reciprocal Passage of the Air. *Hippocrates*, in *Lib. de intern. Affect. Cap. 4.* speaks concerning this in the following manner: "When the Lungs receive Blood, or a salt Phlegm, without again discharging them, but retain them impacted in them, Tubercles are formed, and come to a Suppuration in the Lungs. From the Beginning of the Disorder, through its whole Course, there is an acute, dry Cough, a Rigor and Fever, a Pain in the Back and Breast; and sometimes in the Sides. The Breathing, also, is so violent, as to force the Patient to sit in an erect Posture. Then the Pus is corrupted, and expectorated in large Quantities." *Aretæus*, also, in *Chron. L. 1. Cap. 8.* has given us nearly the same Description of Phthisical Patients: "Before, says he, Phthisical Patients can discover their Disorder by manifest Signs, especially by putrid and purulent Spit, they have Tubercles, or scirrhous Knots, formed of a viscous and tough Matter, which gradually becomes hard in their Lungs. Thus they live in a consumptive State for several Years before these Tubercles are corrupted, and formed into Abscesses. If there are such Tubercles in the Lungs, the Patient is afflicted with a dry, strong, and sonorous Cough, an acute and pungent Pain of the Breast, a Difficulty of Breathing, and a kind of Uneasiness and Resistance in the Breast, from the profound Attraction and Inspiration of the Air. Then the Cough becomes more violent, especially after strong Exercise."

Though this Doctrine of *Hippocrates* and *Aretæus* is strictly agreeable to Truth, yet we shall, for the better Illustration of the Subject, add some Observations. These Tubercles, filled with a viscid Matter, constitute the Beginning of the Abscesses, which are nothing else, but Ulcers of different Bulks, surrounded in a peculiar Membrane. These Impostumations, when small, are sometimes expectorated by Cough; but when they become large, and break internally, Abscesses and Cavities are formed; a purulent copious Spit, mixed with Phlegm, is expectorated; and then a true Phthisis is present. Sometimes, also, these scirrhous Knots, which are long

long so latent, as to produce only a dry Cough, in consequence of their acrid Matter retained and pent up, degenerate into cancerous, fistulous, spreading, and fetid Ulcers; which so consume and putrefy the adjacent Parts, that, according to *Forestus*, in *Lib. 16. Obs. 14. and 53.* Portions of the *Aspera Arteria* have been spit up; and, according to *Sylvius*, in *Obs. Lib. 2. Cap. 12.* Ramifications of the Pulmonary Vein have been evacuated in Coughing.

There are, also, other Beginnings of a Phthisis, especially an *Hæmoptysis*, when ill-treated, or when a large Quantity of Blood is lost; for then the Blood is easily extravasated from the small Vessels of the Lungs into their Air-bladders; and, becoming stagnant, it putrefies, corrodes the adjacent Parts, forms Sinuses, or is reduced into Nodes and Tubercles: And I can, from my own Experience, affirm, that almost half of the Phthisical Patients, who have subjected themselves to my Care, received the Origin of their Disorder from a previous ill-cured Spitting of Blood. Among the Beginnings of a Phthisis we may, also, with the Antients, reckon a salt Catarrh for a long time affecting the Breast, and which is frequently succeeded by a Phthisis.

We now come to inquire into the Origin of these Causes. The Stagnation, then, of the Blood firmly impacted in the Vessels is the Origin, not only of a Phthisis, but, also, several other Disorders; for when the Fluids do not circulate, they lose their former temperate Nature, become impure, saline, and acrid; or, by filling the minute Vessels too full, produce Obstructions, Indurations, and Scirrhuses. Now these fatal Stagnations of Blood and Humours, in the minute Vessels of the Lungs, proceed from too impetuous and copious Congestions of the Humours to a Part already too faint and languid, so that the Veins cannot return so much as they received from the Arteries.

But there are various other Causes, which are capable of inducing such a fatal Stagnation of the Blood and Humours in the Lungs, and, consequently, contributing, in a remote manner, to the Production of a Phthisis. The most considerable of these Causes is, an hereditary Disposition, conveyed from Parents to Children; in consequence of which they readily fall into a Phthisis, when any slight Cause occurs. This is confirmed, not only by Experience, but; also, by the Authority of the most celebrated Physicians. Thus *Fernelius*, in *Patholog. Lib. 5. Cap. 10.* informs us, "That such as are sprung from consumptive Parents, by a kind of hereditary Right, become consumptive; and we often observe, that a Phthisis rages in such Families." The Reason of this is obvious; for since this Proclivity to Diseases received from the Parents principally consists in a bad Conformation of the solid Parts, or such a Laxity of the Fibres and Vessels, as is insufficient, with a proper Effort, to promote the Motion of the Fluids conveyed to them; the Reason is plain, why those, who have naturally weak and flaccid Lungs, should be more subject than others to Disorders of the Breast, and especially to a Phthisis. Among the Persons subject to this Disorder, we may, also, with *Hippocrates*, reckon those of narrow and depressed Chests, whose Scapulæ are prominent, like Wings; whose Ribs are protuberant, whose Necks are oblong, or who are gibbose.

It is, also, certain, not only from Experience, but, also, from the Authority of *Hippocrates*, in *Aph. 9. Sect. 15.* that Persons of slender and tender Habits, of tall Statures, and between the eighteenth and thirty-fifth Years of their Age, are highly subject, not only to a Spitting of Blood, but, also, to a Phthisis; for no other Reason, but because, at this Period of Life, the Vessels are more tender, and easily expanded; than in Persons farther advanced in Years. But generally a Spitting of Blood and Phthisis happen most readily to full-grown and young Persons, who, being of a sanguineous and choleric Habit, are easily subject to Commotions of Mind, and have had frequent *Hæmorrhages* from the Nose, in their Childhood, especially when they are over-heated by too violent Exercise; for then the Blood, being copiously and impetuously conveyed to the superior Parts and Breast, cannot return freely to the Heart through the minute Vessels of the Pulmonary Artery and Vein. Hence, in the larger Ramifications, the stagnant Blood must necessarily produce Expansions, Ruptures, and Extravasations.

This Disorder is, also, frequently produced by an unseasonable Drinking of spirituous Liquors. Nor is it difficult to prove this, since it is almost universally known, that, in the Countries productive of Wines, all the Disorders incident to the Breast, and especially a Spitting of Blood, and a Phthisis, are far more frequent, than in other Climates. Hence *Hoesferus*, in *Hercule Med. Lib. 1. Cap. 3.* justly concludes, that a Phthisis being so endemial, and destroying such Numbers in *Lower Austria*, is owing to nothing, but their excessive Use of generous Wine, especially in the Morning.

We now proceed to consider those Causes which produce the Defluxion of saltish Humours in the Breast. This Humour the Antients in general asserted to come from the Head, as if

all Humours conveyed to the Breast proceeded from it: But this Opinion is not sufficiently perspicuous, and founded on Experience. Too copious a Congestion of serous Blood to the Breast, and especially to the Fauces, and Whole of the *Aspera Arteria*, which is covered with an internal glandular Coat, is rather to be accused, especially in serous Patients, and those, who, during their whole Lives, have been subject to Stuffings of the Head, Coryzas, and frequent Catarrhs; for if more Blood and Serum is conveyed to the glandular Parts through the Arteries, than can return through the Veins, there is a great Secretion of the Serum, which, increasing in Quantity, is coagulated by the Admission of the free Air, and, at last, often expectorated in large Quantities. In Process of Time, when the Disorder continues, and other Causes concur, such as Crudities arising from a bad Diet, or Indigestion, an obstructed Perspiration, or profound Grief, the Serum acquires a saline and corrosive Nature; in consequence of which, in Process of Time, it corrodes the Vesicles and tender Vessels of the Lungs.

From what has been said, we may easily understand, how injurious cold and northerly Winds, rainy, cloudy, and cold Weather, which, by relaxing the Tone of the Pulmonary Vessels, accumulate the Sordes in them, must necessarily be to consumptive and phthisical Patients; so that, with *Hippocrates*, in *Aph. 10. Sect. 3.* we may justly affirm, that the Autumn is prejudicial to consumptive Patients. And, indeed, the Influence of the Air is not more considerable in producing any Disorders, than those of the Breast, and especially a Phthisis. Hence *Tulpius*, in *Obs. Med. Lib. 2. Cap. 10.* justly assigns the State of the Air; as the Cause why Impostumations, and Phthisical Indispositions, are so frequent in *Holland*, in marshy Places, and such as are exposed to an Air perpetually impregnated with putrid Vapours.

We now come to investigate those Disorders, which generally dispose to a Phthisis, among which we may justly reckon the Small-pox. I know many Children, and young Persons, who, after the Small-pox, have been subjected to various Disorders of the Breast, which have lasted for several Years, such as a dry Cough, an acute Sense of Pain, a Difficulty of Breathing, a Consumption, and a slow Fever, who, at last, upon the Formation of an Abscess, have died, among whom was the Prince of *Saxony*. Almost the same Misfortunes are produced after the Measles; for, in these exanthematous Disorders, the Serum is highly acrimonious; and, not only in the Beginning of these Disorders, remaining firmly in the nervous Membranes of the Lungs, excites a dry and uneasy Cough, but, also, leaves a considerable Weakness in the Lungs, an Expulsion of the peccant Matter being made to the Surface of the Body. Now, if the Patients, before the whole peccant Matter is carried off by Transpiration, expose themselves to the free Air, especially in the Spring or Autumn, it readily happens, that the Remains of the peccant Matter, receding to the internal Parts, acts upon, irritates, and exulcerates the weakened Lungs: See *Thomas Bartholine, Cent. 4. Inst. 43.* and *Michaeli, in Prax. Clin. Part. 1. Lib. 3. Cap. 5.*

It, also, frequently happens, that, after Effervescences of the Skin, such as the Itch, the Gutta Rosacea, scorbutic and purple Spots, are repelled, a Phthisis is often produced. The same Disorder is, also, frequently caused by the Suppression of copious Sweats, by the unseasonable Treatment of Ulcers of the Head and Feet; and by the too speedy Consolidation of Fontanels. Nor are there wanting Instances, in which a Phthisis has been produced by the Repression; or unskilful Treatment; of an Erysipelas, and Gout-pains; for since, by this means, the acrid and caustic Matter is retained in the Habit, and resorbed through the Veins by the Mass of Blood, hence it happens, that, being conveyed to the nervous and tender Membranes of the Lungs, it is firmly impacted in them, and, by irritating, constricts them. Hence the constricted Vessels must, at last, be obstructed and corroded. I, also, remember to have seen a Phthisis produced, in consequence of curing Tumors under the Axillæ, and behind the Ears; so, also we may readily, suppose a Phthisis frequently generated by a Suppression of the hæmorrhoidal and menstrual Discharges.

There are, also, other Instances, though not common, in which, besides a Spitting of Blood, a Phthisis may, in some Patients, be induced by other *Hæmorrhages*; and this principally happens in those Patients, who, either from hereditary Disposition, or from other Causes, having brought on a Want of due Tone in the Lungs; are disposed to this Disorder. This Doctrine is, also, confirmed by Experience, which informs us, that not only a Redundance; but, also, a Defect of Blood has a strong Tendency to produce Stagnations. Hence those, who place the proximate Cause of a Phthisis in a Plethora, only palpably contradict Reason and Experience.

It is disputed, among Physicians, whether a Phthisis is contagious: But I do not hesitate to affirm, that it is; or, at least, to assert, that, if the Miasma of this Disorder is not sufficient

to induce a Phthisis, it is, nevertheless, capable of promoting it, if there is already a Disposition to it; for all ulcerous and corrupted Matter is of so surprising and contagious a Nature, that many malignant and contagious Disorders, such as the Itch, the Leprosy, the Small-pox, old fordid Ulcers, pestilential Carbuncles, and Dysenteries, are to be accounted for from hence. Nor am I of Opinion, that the Nature of the Phthifical Miasma is so malignant, as suddenly, and, at a Distance, to prove infectious; but that it only does so to such as continually converse with Phthifical Patients. This Doctrine is confirmed to us by some of the most celebrated Physicians. Thus *Riverius*, in *Cent. 1. Obs. 99.* gives us an Instance of a Maid, who became Phthifical by attending her Mistress, who was in that State, Day and Night; and, in *Cent. 4. Obs. 92.* he mentions a Girl infected by her Sister, who had become Phthifical by giving the Breast to a Man in that Condition. *Schenckius*, also, in *Lib. 3. Obs. 133.* informs us, that the Spit of Persons labouring under a confirmed Phthisis is so contagious, that a Physician, only by smelling it, became Phthifical. A Phthisis, produced by Contagion, is, also, described in *M. N. C. Cent. 9. Obs. 26.*

As for the Prognostic of this Disorder, that a true Phthisis is a violent Disease, and not to be cured without the greatest Difficulty, is not only known to the Vulgar by many fatal Instances, but, also, confirmed by long Experience to the Physician. Thus *Hippocrates*, in *Lib. 1. de Morb.* informs us, "That when Consumptions happen, they necessarily prove mortal." He is seconded in this by *Galen*, in *Lib. de Locis affect. Cap. 8.* and 5 *Meth. Medend. Cap. 1. & 8.* *Celsus*, in *Lib. 3. Cap. 22.* informs us, "That a true Phthisis ought to have proper Measures taken with it in the Beginning, since, when it becomes inveterate, it is not easily cured." Among latter Authors, see, with respect to the Difficulty of curing a Phthisis, *Forestus*, in *Observ. 45. Lib. 16.* *Rodericus a Fonseca*, *Tom. 1. Consult. 58. Tom. 2. Consult. 48.* and *Timæus a Guldenkleer*, in *Epist. Lib. 3. Cap. 2.* where these Words occur: "I ingenuously confess, that, during the whole Course of my Practice for thirty-seven Years, I could never totally restore such as had their Lungs ulcerated; though I left no Means untried, which could in the least contribute to the Cure of this Disorder: Nor have I seen any one in this Condition totally recovered by the most celebrated Physicians."

But tho' the Cure of a Phthisis is very difficult, and even impossible, when the Disorder discovers itself by such manifest Signs, as to appear to the Vulgar, yet I would not affirm the like of every Phthisis, especially when as yet in its Beginning; for I know several Instances, in which, after Wounds of the Lungs, a Spitting of Blood, a Rupture of the Vessels, a Pleurisy, and Peripneumony, the Patients have laboured under an Abscess and Impostumation of the Breast, but have, nevertheless, been totally cured, by taking due Measures in time. Besides, I, and others, have frequently observed many sprung from Phthifical Parents, who have had their Breasts depressed, and their Scapulæ prominent, like Wings; who, being addicted to Anger, had in their Youth frequent Hæmorrhages from the Nose, without any external Cause; who have had saline Defluxions on the Breast and Fauces, accompanied with a dry and violent Cough, even in the Summer; who have surprisingly lost their Flesh, and perceived a Heat in the Palms of their Hands, whilst their Cheeks as yet remain florid; totally cured by proper Medicines, and a due Regimen. I have, also, seen Abscesses of the Lungs, where a large Quantity of white equal Pus, of one Colour, has been expectorated, but where the other Parts of the Lungs have not as yet been corrupted, nor spoiled, with scirrhus Indurations, and ulcerous Fistulas, and where the Vessels of the Heart and Lungs have not been infarcted with polypous Concretions, happily cured by proper Remedies, and a due Regimen.

But it may here be asked, by way of Objection to my Doctrine, Why is it, that even beginning Phthifical Disorders are so rarely cured? But this is frequently brought about by various Causes, the most considerable of which seems to be, that we are not always sufficiently ascertained of the Presence, Nature, and genuine Causes, of a true Phthisis, by evident diagnostic Signs. Thus *Fernelius*, in *Patholog. Lib. 5. Cap. 10.* informs us, "That a latent Abscess, at first, neither known to the Physician, nor Patient, is often the Cause of this Disorder; in consequence of which, the Patient neither desists from his usual Business, nor thinks himself afflicted with any Disease; but bears the secret Cause of his Death in his Breast, without knowing it. However, some have, in a Quarter of an Hour, died unexpectedly of this Disorder, in whom, when dissected, no other Cause of their Death could be discovered, than the sudden Breaking of an Impostumation in the Lungs; by which the Patient was suffocated. But all such Patients are, before the Rupture of the Abscess, afflicted with a Cough, a Spitting of Blood, an Heaviness of

"the Body, a slight Oppression of the Breast, and a Difficulty of Breathing, which rarely accompany a Consumption, but are Signs frequently common to other Disorders." Besides, we may be convinced of the difficult Diagnostics of a Phthisis by the frequent Errors committed, in this respect, by the most celebrated Physicians. Thus many are accounted Phthifical, who, labouring under a chronical Cough, accompanied with a catarrhal Defluxion, discharge a thick Matter of a whitish-green Colour; or who are afflicted with a stomachic, or hypochondriac Cough, arising from the Sordes of the Primæ Viæ falling upon the Lungs. A moist Asthma, especially, when it arises after a Suppression of the Menfes, or Hæmorrhoids, and a consequent Regurgitation and Congestion of the Humours to the Breast, is frequently taken for a Phthisis. It is, also, certain, that a slow Fever, accompanied with a Cough, a sudden Extenuation of the Body, and colliquative Sweats, which sometimes succeed Arthritic Pains, the Gout, or Scurvy, is, also, confounded with a Phthisis; whereas, in the former of these Disorders, there is no Solution of Continuity in the Lungs. Since, therefore, the Knowledge of a Pulmonary Consumption is so difficult, hence we may infer, how uncertain and precarious the Cure of this Disorder must be.

There is, also, another equally important Cause, which hinders the Cure of a Phthisis, and of an Hætic arising from it; which is, that there are few Physicians, who know, with due Caution and Circumspection, to use proper Medicines for this Disorder; for, if in any Disorder, certainly in a Phthisis, the Caution of the Physician is necessary, on account of the so great Contra-indication of Remedies; for a Phthisis requires laxative and moistening Medicines, gentle Traumaties and Astringents, and sometimes mild Anodynes, which, unless exhibited with due Caution, at a proper time, and with sufficient Regard to the Circumstances of the Patient, are so far from affording any Relief, that they rather increase the Disorder.

Having taken a general View of the Prognostics of a Phthisis, we now come to consider its Terminations or Events, whether salutary or fatal. First, then, 'tis a very bad Sign, when the hætic Heat is more and more increased; when, in the Morning, the Pulse is quicker than usual, and when the Flesh and Strength are consumed, without being in the least recruited by Sleep. Which Misfortunes generally the rather happen, if, when there is a large Quantity of Pus, there is only a small Portion of it expectorated; for then it becomes more acrid and filthy, and, when thrown on the Coals, diffuses a fetid Smell, the more the Fever is, also, increased. If, besides, there is a great Difficulty of Breathing, accompanied with a Dread of Suffocation; if the Patient cannot lie on that Side, where the injured Lobe of the Lungs is; if his Breath is of a cadaverous Smell, and his Voice hoarse; if he is afflicted with colliquative Sweats, a Diarrhoea, and a Swelling of his Feet, sometimes accompanied with Pain; 'tis certain that Death is not far off. If the Expectoration is totally suppressed, the Patients gradually, but especially in an erect Posture of the Head, die, retaining their Reason.

But greater Hopes are to be entertained, if there is still a considerable Degree of Strength, and the Respiration free, if the Appetite and Digestion are entire, if the Spit expectorated is white and equal, and if there is no hætic Fever. The Hopes of Recovery are still the greater, if the Patient is of a good Habit of Body; if he has a large Chest; has no hereditary Disposition to the Disorder; and if his Heat becomes more mild, and the Substance of his Stools is compact; for, by means of these Circumstances, Phthifical Patients, especially when they use a proper Regimen and Medicines, may often protract Life for a great many Years. Thus *Willis*, in *Lib. de Medicament. Operat. Sect. 1. Cap. 6. de Tabe seu Phthisi*, speaks in the following manner: "It sometimes happens, says he, that a Cavity, or, perhaps, two are formed in the Lungs with callous Sides every-where, so that the Matter collected in them is not convey'd to the Mass of Blood, but is every Day totally expectorated, tho' its Quantity should be very large. Persons in this Situation have only, as it were, a Fontanel in their Lungs; and, although they should every Morning expectorate a large Quantity of thick, or yellow, and even, as it were, purulent Spit, and a small Quantity of the same throughout the Day, yet in other respects, they enjoy sufficiently good Health, breathe freely and easily, eat and sleep well, have a due Quantity of Flesh, or, at least, are blessed with a good Habit of Body, and are frequently cured. Hence some are said to have laboured under a Phthisis for thirty or forty Years, and even not to have had their Lives shortened by this Disease." And, with respect to Ulcers of the Lungs, 'tis observable, that they may continue for several Years without any considerable Decay of the Body, whilst the other Viscera remain sound and entire. See *Kerkringius*, in *Specilegio Anatom. Obs. 72.* and *Bartbol. Cent. 2. Hist. 14.* Nor is this difficult to be conceived; for as Nature sometimes advantageously expels peccant and recrementitious Matter by an Ulcer of the Extremities, or by an artificial Ulcer, such as a Fontanel, so I see no Reason, why the same Circumstance should not sometimes happen in Ulcers of the Lungs.

The Physician ought, also, to be well acquainted with the particular Signs which manifest the Recovery of phthical Patients, which are, by *Aretæus*, in *Lib. 3. Cap. 1.* excellently enumerated in the following manner. "When phthical Patients begin to grow better, the Cough seizes less frequently, and at longer Intervals; a larger Quantity of sanious and more moist Spit is expectorated; much aqueous Matter is evacuated by Stool; the Urine is copiously discharged, tho' it has as yet no Sediment; the Voice becomes more clear and sonorous, the Sleeps are sufficiently long, the Præcordia relieved, and the Pain remitting is, sometimes, transferred to the Scapulæ; the Difficulty of Breathing is gentle and less frequent, but accompanied with an Asperity of the Voice; and, when these Things happen, the Patients recover."

The CURE.

The Application of proper Remedies, in a Phthisis, is widely different, according to the different State of the Patient, with respect to Strength, the Time and Causes of the Disorder. The Method of treating a Phthisis in general, may be divided into curative, mitigative, and preservative. The first is to be taken when there are such Causes, such Circumstances, and such a Condition of the Patient, as to lay a Foundation for expecting a Recovery, by means of proper Medicines. The mitigative Method is to be taken, when the Force of the Disease is so great, that it will not yield to the best Medicines; in which Case we are to mitigate the most urgent Symptoms, prevent such as are worse, and, by that means, protract Life as long as possible. And as the preservative Method is the best, the most easy and safe, against all terrible Disorders, so it is of the highest Importance in a beginning Phthisis.

As for the curative Method, it is principally to be used, when, in consequence of a broken Impostumation, an open Abscess is formed, and a large Quantity of Pus expectorated; which most generally happens after the unlucky Termination of a Pleurisy, or Peripneumony; after a Spitting of Blood; after Wounds of the Lungs, whilst the rest of their Substance is sound, and neither corroded, nor scirrhus. In this Case, the best and safest Cure is Milk duly used, by which I have known many phthical Patients brought from the Gates of Death, and restored to perfect Health; for no Medicine has longer, or more universally, been found efficacious in the Cure of a Phthisis, than Milk.

The most ancient Physicians warmly recommended Milk for the Cure of this Disorder, as is obvious from various Passages of *Hippocrates*. And *Galen*, who greatly extols Milk for a Phthisis, in *Lib. 5. Meth. Medend. Cap. 12.* mentions a Place called *Stabias*, to which, on account of the Purity of the Air, the fine Pasturage for Cattle, and the consequent salubrious Quality of the Milk, there was a great Conflux of phthical Patients, just as, in our Days, the Valerudinary and Infirmary resort to the medicinal Springs. This Method of Cure was known in *Italy* above an hundred Years ago; for the celebrated *Andreas Baccius*, in *Lib. 4. de Theriis*, informs us, "That the *Neapolitan* Physicians, as the last Resource, send phthical Patients, such as spit Blood, or those afflicted with any Ulcers of the Thorax to *Stabias*, with so great Success, that some remain in that healthful Part all their Lives."

Aretæus, also, one of the most skilful of the ancient Physicians, in *Lib. 6. de Morb. Chron.* does not hesitate to affirm, that phthical Patients stand in need of no other Thing for their Recovery, but the liberal Use of Milk. *Trallian*, also, who, in his *Work de Re Medica*, greatly extols Milk in all Disorders of the Breast, in *Lib. 7.* has the following remarkable Passages: "If the whole Body, not having Nourishment convey'd to it, begins to decay manifestly, and if there is not much Pus in the Thorax, Milk alone ought to be exhibited to them; and, for this Purpose, that of Asses is best, because it is an excellent Purgative." In another Place he speaks in the following manner: "I have frequently seen those afflicted with a Difficulty of Breathing, relieved by the due and proper Use of Milk, which removes the peccant Matter lodged in the Cavities of the Lungs." And, in the Part already quoted, when speaking of an Hæmoptysis, he says, "Let all those afflicted with a Spitting of Blood, use Milk; for no Medicine nor Aliment is so useful and beneficial to them as Milk; and those, who, in the Beginning of this Disorder, use Milk alone for a long time, are totally recovered. Thus, says that Author, I knew a certain Man, who, by using Milk for a whole Year, and abstaining from Wine, was totally freed from a Spitting of Blood, and Pus, so that he did not afterwards fall into a Phthisis."

It may, also, be shewn from Reason, without the Evidence of Experience, that Milk is an efficacious Remedy in Disorders of the Breast. But 'tis to be observed, that all Milks are not of the same Kind, and of the same Efficacy for all Purposes; since, according to the Diversity of Animals, and their respective Foods, they are possessed of different and peculiar Qualities, which are to be considered apart. First, then, Asses Milk, which was always greatly esteemed by the Antients, contains a great deal of sweet Serum, but a very small Quantity of earthy, caseous, and

pinguious Substance; for which Reason, it is not easily coagulated, and consequently but very unfit for Butter and Cheese. Its Whey is abstergent, laxative, moistening, and proper for correcting the Acrimony of the Humours. Goats Milk does not contain so large a Quantity of Whey, as that of Asses; nor is it of so laxative and abstergent a Nature, but of a thicker Consistence. And as Goats eat the Leaves of Trees, which contain something of a resinous Quality, their Milk is very efficacious for the Consolidation of suppurated Parts. Cows Milk is more pinguious, contains a large Quantity of Earth, but less Whey; for which Reason it generally yields a great deal of Butter and Cheese. This Species of Milk is of a tempering, nutritive, and consolidating Virtue. Womens Milk, for medicinal Purposes, is preferable to all others; for it is the sweetest of them all, and its nutritive Quality is sufficiently observable in Infants. The Virtues of Milk are, also, different, according to the Diversity of Herbs and Pasturage, which Animals eat. Hence Milk, in the Spring, is highly salutary, because, at that time, the Vegetables abound with temperate Juices; whereas Milk in the Winter is accounted less salutary, because then Animals feed on Hay and Straw.

Hence we may easily judge, that in all Disorders of the Breast, and an universal Decay or Wasting of the Body, Milk may be accounted a Medicine proper for answering all Intentions: For, first, we find nothing more efficacious than Milk, especially that of Cows, for correcting, mitigating, and allaying the Acrimony of the Humours, which is the principal Cause of the Irritation, the violent Cough, and the Corrosion; for as this Species of Milk is capable of breaking the noxious Force of corrosive arsenical Poison, so 'tis much more efficacious in sheathing up and obdounding the saline Spicula lodged in the Fluids of the human Body. But when the Intention is to deterge viscid Humours, to cleanse Ulcers, to render the Body soluble, to provoke Urine, and derive the Afflux of the Humours from the Part affected, Asses Milk is of all others the most efficacious, on account of the large Quantity of sweet abstergent Whey it contains. When wounded Parts are to be consolidated and conglutinated, Goats Milk is best for answering the Intention. For nourishing wasted Parts, and restoring Strength, nothing is more effectual than Womens Milk, especially when suck'd immediately from the Breasts, without any Access of the Air, by which its spirituous Principle is exhaled, and flies off. With respect to this Milk, the learned *Wepfer*, in *Epist. ad Verazscham*, speaks thus: "There is certainly a divine Quality both in Womens and in Asses Milk, which I could not have believed, if I had not had the Evidence of my Senses for it; for by their means I have, with my own Eyes, seen Persons rendered, as it were, entirely new; and, by a due Use of these two Species of Milk, many have acquired not only a sounder Habit, but, also, a better Colour, and more Strength."

Not only Milk, but, also, Whey, when duly prepared, is highly efficacious, and even sometimes more powerful than Milk, in curing the chronical Disorders of the Lungs, and the other Viscera: For if the Obstructions of the small Vessels of the Viscera, which generally lay a Foundation for chronical Disorders, are to be removed; if the viscid and tenacious Humours are to be dissolved; if the Emunctories are to be kept open, and the Heat of the Parts allay'd by proper Moisture; Whey, prepared of whatever Milk, is preferable to the Milk itself. See *LAC*.

Hence the Reason is obvious, why not only in the Cure of Disorders of the Breast, but, also, in that of the most terrible and obstinate Diseases, the most skilful Physicians, both among the Antients and Moderns, have always greatly recommended Milk. But the whole Secret consists in the due Use of it, both for mitigating and curing Diseases; for, if either Aliments or Medicines should be improperly used, they prove more detrimental than beneficial. This should be adverted to, especially by those of the Moderns, who strenuously endeavour to destroy and discredit the medicinal Use of Milk.

But tho' the Use of Milk and Whey is sufficient to answer many Intentions in the Cure of a Phthisis, yet 'tis equally certain, that its divine Energy, in producing different Effects, may be assisted and augmented by various means: For, first, the Efficacy of Milk is surprisingly increased, and rendered truly Medicinal, if the Animals, whose Milk we use, are fed with Substances accommodated to the Intention of Cure; for, from the different Aliments which Animals and Women use, the Milk they afford, also, acquires a different Quality, since 'tis certain from Experience, that a Purgative exhibited to the Nurse is, with the Milk, convey'd to the Child upon whom it operates. The Antients are, therefore, to be commended, who, in order to render their Milk more efficacious, gave their Asses and Goats, among their Food, such Herbs as were possessed of a specific Virtue against the Disease they intended to cure. Hence *Galen*, in the Part before-quoted, mentions the Herbs growing in *Stabia*, such as Grass, Knot-grass, Bastard-baum, the Bramble, Ivy, Shrub-trefoil, the Maltich-tree, and some others, by eating which the Milk of the Animals was rendered highly salutary. This Custom I have successfully used, when, in order to the Absterion and Depuration of any Part affected, I have ordered Barley, Scabious, Scordium, Chervil, *German* Leopard's-bane, Hyssop, Paul's Betony, and white Horehound,

to be mixed with the Food of the Animals, from which the Milk was to be taken. But, when the Intention was to consolidate, I have ordered their Food to be mixed with the several Species of Plantain, Ground-ivy, Agrimony, Yarrow, Sanicle, the greater Confound, and Lungwort.

But there are still other Methods of augmenting the medicinal Virtues of Milk, according to various Intentions; the most considerable of which is the mixing Milk with mineral Waters; a Practice, by me, first introduced in *Germany*; for when, upwards of thirty Years ago, I was, by a chymical Analysis, investigating the Principles of the mineral Waters in *Germany*, both hot and cold, and found no acid and truly vitriolic Salt in them, but rather one of an alkaline and neutral Kind, together with a subtile Earth, and fine Particles of Steel, I mixed Milk with these Waters, and that with such Success, as, in curing and alleviating many chronical Disorders, to find happy Effects, which could neither be obtained by Milk alone, nor by the Waters exhibited separately from Milk. Hence 'tis surprising, and even to be lamented, that there formerly were, and still are, Numbers of Physicians, who, in a Phthisis and Exulcerations of the Lungs, think cold mineral Waters highly prejudicial; and dare neither to prescribe them alone, nor in Conjunction with Milk. Before our Times, however, two celebrated Physicians recommended cold mineral Waters in Disorders of the Lungs. The most ancient of these is *Raymundus Joannes Fortis*, in *Cent. 2. Consil. 20, 27, 28, 30.* and especially in *Consil. 34.* where he speaks in the following manner: "At a proper Season of the Year, cold mineral Waters I have found to be highly useful in Ulcers of the Lungs; and to them I have ordered the Patients to have recourse, as the last and most effectual Expedient; since, if the Disorder did not yield to them, I could hardly think, that it could be removed by Decoctions, Milk, and other Things of a like Nature." And the celebrated *Morton*, a later Physician of the *English* Nation, in his *Phthisiologia*, recommends medicinal Waters in Disorders of the Lungs, and when they are afflicted with steatomatous Tumors, accompanied with a gentle hectic Heat, on which Occasion, he speaks in the following manner: "I have seen, during a Course of several Years, many Phthical Patients have their Appetites and Strength restored, their Cough and hectic Heat lessened, their Respiration rendered freer, and, at last, their Disorder totally removed, without any Relapse, by means of these Waters."

But though I would not prescribe strong mineral Waters in Disorders which arise from a Solution of Continuity in the Lungs, especially if very considerable, yet I can from Experience affirm, that mild mineral Waters, abounding with an alkaline Salt, such as the *Salteran* and *Caroline* Springs, mix'd either with the Milk of Ases, or that of Goats, afford surprising Relief, not only in a chronical and obstinate Cough, accompanied with an oppressive Pain of the Breast, a Difficulty of Breathing, a slow Hectic, and a Consumption, but, also, in a deep Suppuration of the Lungs, and a true Phthisis; for, by this Admixture of the mineral Waters, the Milk is rendered more efficacious and powerful in dissolving the tough and viscid Matter, removing the Obstructions of the capillary Vessels, and deterging and cleansing the Ulcers. But using this Mixture of Milk with medicinal Waters is still more indicated, when such Diseases of the Lungs are supported by hypochondriac, scorbutic, arthritic, or calculous Diseases, which frequently happens.

This Method of correcting Milk by various Admixtures was not only known, but, also, practised, by the ancient Physicians. Hence, in *Hippocrates*, *Trallian*, *Aetius*, and *Aretaeus*, there are several Instances in which they prescribed Milk mixed with Water, for Phthical Patients; or Hydromel, mixed with Milk; to which *Hippocrates*, in *Lib. 2. de Diata*, ascribes a surprising Efficacy, affirming, that it softens the Lungs, allays the Cough, procures an Expectoration of the Spit, and promotes a Discharge of the Urine. The celebrated *Sponius*, in *Aphorism. novis, Sect. 5. Aph. 99.* not only extols the external and vulnerary, and, also, the internal Use of Lime-water, in curing an Impetigo, and Leprosy; but, also, commends the Mixture of the same Water with Milk in the following manner: "Besides, says he, this Water, mixed with Milk or Whey, produces surprising Effects in internal Ulcers, Diarrhoeas, and Dysenteries, as I was informed by Mr. *Declasure*, a celebrated practical Physician in *Gascony*." Nor shall I condemn this Method, since in Dysenteries, accompanied with an Exulceration of the Intestines, I have always found Milk, mixed with the *Salteran* Waters, an incomparable and highly efficacious Medicine.

But let us inquire with what other Remedies Milk may be commodiously joined: For curing, therefore, violent Disorders of the Lungs, in a true Phthisis, Infusions and Decoctions, prepared of vulnerary and pectoral Herbs, have not only been highly esteemed by Physicians, but, also, by the common People. The Herbs most recommended for this Purpose, are the greater Confound with its Roots, *Sarcena* Confound, Coltsfoot,

sharp-pointed Plantain, spotted Lungwort, Sanicle, Spicewort, Scabious, Paul's Betony, Agrimony, Ground-ivy, white Horehound, Yarrow with its Tops, St. John's-wort with its Flowers, Rose-flowers, and others of a like Nature, which are to be boil'd either in Ale or Water, adding Figs, Honey, and the Seeds of Fennel, and stellated Anise. Nor are there wanting Instances of considerable Benefit done to Phthical Patients by these means; since when there is only a simple Abscess without a scirrhus Induration, or a polypose Concretion, they contribute much to the Consolidation of the affected Parts. It must, however, be own'd, that these Decoctions, in consequence of their astringent Quality, have produced very unhappy Effects; especially, when, in the Beginning of the Disorder, the Lungs are affected with hard Tubercles, or when they are unseasonably used to stop a Spitting of Blood; for by this means the extravasated Blood is easily coagulated, and the minute Vessels obstructed; so that there happens a far greater Stagnation of the Blood and Humours in the Lungs, a Circumstance which has the strongest Tendency to produce a Phthisis. But, in order to prevent these Dangers, such Infusions and Decoctions may properly be mixed with an equal Portion, or only half the Quantity, of Milk; by which their astringent Quality is, in some measure, destroy'd, and the Acrimony of the Humours corrected.

If the *Primæ Viæ* are to be cleansed of any Sordes, Senaleaves, Rhubarb, and Manna, may be commodiously infused, and gently boil'd either with Milk alone, Milk and Water, or Milk diluted with temperate mineral Waters; since, otherwise, Phthical Patients, especially of delicate Habits, are easily injured even by mild Purgatives. I have, also, observed, especially when there was a large Quantity of acid Sordes in the *Primæ Viæ*, that a Dram or two of the *Magnesia*, which is nothing else but an highly subtile Flour of Quick-lime elutriated, mixed with a few Ounces of Goats Milk, proved a safe and excellent Purgative.

In order to alleviate a violent Cough, which destroys the Strength and Sleep, to correct the Acrimony of the Humours, and relax the constricted Parts, the Antients, with great Success, used their various Diacodiums, the Principal of which are composed of the Juice and Seeds of the Poppy. But the Moderns, for the same Purposes, use the *Pilulæ de Cynoglossa*, and the *Pilulæ de Styrace*, which, when exhibited in a small Dose, are sufficiently efficacious: But all these Medicines are render'd still more efficacious, if they are exhibited about Bed-time, in a Draught of Milk. It is, also, sometimes expedient, when there is a great Afflux of the Humours to the Breast, and when, in protracted and phthical Coughs, a great Corruption is to be dreaded, to make moderate Use of such Remedies as provoke Urine, in order to derive the Impetus of the Humours from the Breast: For answering which Intention, we may use Milk and Whey, the diuretic Virtues of which are in some increased, by making them into an Infusion with Seeds of *Selleri*, Parsley, *Cretan* Daucus, Gromwell, and Violets, well bruised together.

Besides those already mentioned, there are still other Remedies highly beneficial, not only for the Depuration, but, also, for the Consolidation, of those Ulcers of the Lungs, which constitute a Phthisis. The most considerable and celebrated of these are, the pectoral and vulnerary Balsams, of which, tho' there are various Kinds in the Shops, yet we shall only mention those invented by the most celebrated Physicians. The best, then, is the justly celebrated Balsam of *Meibomius*, prepared in the following manner:

Take of the old Oil of St. John's-wort, two Ounces; of Sperma-ceti, six Drams; of the best *Venice* Turpentine, three Drams; of Dragon's-blood, one Dram; and of Laudanum Opiatum, six Grains: Mix all together, and let the Dose be from one to two Drams.

Nor have I found the following Balsam less efficacious:

Take of the Oil of sweet Almonds, two Ounces; and of the Flowers of Sulphur sublim'd by Quick-lime, two Drams: Boil over a gentle Fire: Then add, of the Balsam of Capivi, one Dram; of Sperma-ceti, and Bees-wax, each half an Ounce; of the Extract of Saffron, half a Dram; and of the Oils of Anise, Fennel, and Mace, each ten Drops.

Another Balsam for answering the same End may be prepared thus:

Take of the best *Prussian* Honey, and Mountain Diacodium, each one Ounce; of the aqueous Essence of Myrrh, inspissated, half an Ounce; of the Flowers of Sulphur, and the

the Extract of the Tops of Yarrow, each two Drams; of the Extract of Saffron, half a Dram; and of the Oils of Mace and Safafras-wood, each eight Drops.

These noble and efficacious Balsams, when their Use is indicated, cannot be exhibited in a better, or more proper Vehicle, than a sufficient Quantity of the Milk of Asses, Goats, or Cows.

Having considered the curative Method in a Phthisis, we now come to treat of the palliative, or mitigative Method, by which we endeavour to render Phthifical Patients free from the most terrible and deplorable Symptoms, and to protract their Lives as long as possible. This Method is principally to be used in those Patients, in whom there is an intense Heat, gradually consuming the Flesh and Strength, which is generally excited by a Mixture of the purulent Matter with the Blood, and by which the Blood, being contaminated, is put into an Effervescence, and becomes more acrid and saline. In order, therefore, to extinguish this preternatural Heat, and correct the Acrimony of the Humours, nothing is more effectual than due Doses, either of Asses, or Womens Milk, exhibited in Conjunction with a proper Regimen. For answering the same Intention, Emulsions of the Four cold Seeds, and white Poppies, Decoctions of Barley, or Hartshorn, the Waters of Roses, Lilies of the Valley, and black Cherries, and Julap of Roses, may be frequently exhibited. The Virtue of these is greatly increased, if they are exhibited with the temperate nitrous Powders, which are of great Efficacy in a beginning Hæctic. These Powders may be prepared in the following manner:

Take of Mother of Pearl, and Crabs-eyes, each two Drams; of purified Nitre, one Dram; and of the distilled Oil of Mace, four Drops: Mix all together, and exhibit one Dram for a Dose.

Nor, in order to allay the Violence of the Symptoms, are we to neglect Baths of sweet Water mixed with a sufficient Quantity of Cows Milk, and purified Nitre; by which means the constricted, tense, and dry Parts, are relaxed and moistened, the Cough allayed, the Heat lessened, and the Sleeps rendered more sweet and gentle; for which Reason such Baths are sometimes highly proper in the curative Method.

When the Lungs are affected with a callous and inveterate Ulcer, and a Spit, mixed with Pus, is daily expectorated, by which the Flesh and Strength are considerably impaired, the principal Intention is, by correcting the acrid and saline Dyscrasy of the Blood and Humours, to prevent the farther Exulceration of the Lungs: This End is excellently answered by temperate Infusions of Ground-ivy, the Herb Costus, Chervil, Paul's Betony, Scabious, Coltsfoot, and Lungwort. But such Infusions must be frequently, and for a long time, used. In ferous Persons, and such as are subject to Catarrhs, when the Disorder is brought on, and supported, by a large Quantity of impure Humours falling on the Lungs, in order to prevent the greater Congestion of the Humours to the Breast, for ordinary Drink the Patient may use a Decoction of China-root, and of Red-saunders prepared with Raisins, a Drink highly recommended by Authors for this Purpose.

In such a Condition of the Patient, we are, as much as possible, to endeavour to preserve the Tone of the Lungs. This Intention is excellently answered by Sugar of Roses frequently exhibited in the foregoing Decoction. This simple Remedy was not only known and commended by the *Arabians*, and especially *Avicenna*, but, also, some of the Moderns think, that this alone is sufficient to mitigate, and even to remove, a Phthisis. See *Zacutus Lusitanus*, in *Prax. Admir. Lib. 1. Obs. 139.* and *M. N. C. Decad. 2. Ann. Obs. 19.* and *Sylvaticus*, in *Consil.*

We are now come to consider the preservative Method of Cure, which consists in preventing a Phthisis in those who are subject to it by Nature, Age, Habit, or Errors in Regimen, by a seasonable Removal of its Causes, or in removing it, or preventing its further Progress, by proper Medicines, when it is already present. We have already sufficiently shewn, that in sanguineous, choleric, and slender Habits of Body, from the Age of eighteen to thirty-four, a Phthisis, or purulent Spitting, accompanied with a violent Cough, and a Difficulty of Breathing, is not only generally produced by a Spitting of Blood, but, also, frequently recurs; in which Case, the principal Intention of the Physician ought to be, to remove this Spitting of Blood, or, at least, so to mitigate it, as that it may not degenerate into a Phthisis.

In order, therefore, to remove a Spitting of Blood, besides the Efforts of Nature, there is no more safe and efficacious Remedy, than Venesection, duly repeated, till the End is obtained. This is confirmed, not only by Experience, but, also, by the Authorities of the greatest Physicians. Thus the cele-

brated *Boerhaave*, in his *Praxis Medica*, informs us, "That, if we intend to cure a Person naturally disposed to a Phthisis, we are carefully to prevent his having a Spitting of Blood; otherwise we cannot cure him. Hence, about the seventeenth Year of his Age, Venesection is to be twice or thrice used; Gestations are, also, to be used; and in this Method we are to continue till the twenty-fifth Year of his Age. I know a Family, the Father, Mother, and all the Children of which, died Phthifical, except one Son, whom I preserved by this Method, who is now above fifty Years of Age, has lived above the Time ascribed by *Hippocrates* for the Access of a Phthisis, and has no bad Symptoms attending him."

Besides Venesection, great Moderation, with respect to the Non-naturals, is to be used; for which Reason, 'tis necessary, that such Patients should carefully guard against violent Commotions, both of Body and Mind, and abstain from spirituous Liquors, and every thing which is capable of throwing the Blood into an Orgasm. And, since a Spitting of Blood, preposterously treated with strong Astringents, easily degenerates into a Phthisis, such Medicines are to be as carefully abstained from, as if they were as much Poison. In such a Case, it is rather expedient to use Milk and Water for Drink; gentle Laxatives of Manna and Sena-leaves; Powders, which allay the Ebullition of the Blood, prepared of Shells, Mother of Pearl, Crabs-eyes, and Nitre; with each of these we may commodiously join the Decoctions or Infusions above-mentioned.

But there is nothing so effectual either for preventing a Phthisis, or removing it, when begun, as a due Regimen and Method of living; which, among the Antients, *Celsus*, in *Lib. 3. Cap. 22.* has elegantly prescribed in the following manner: "A Phthisis is, in the very Beginning, to be attacked by proper Remedies: If the Patient's Strength admits, a long Voyage is to be made, and a Change from a rare, to a more dense, Atmosphere is highly beneficial; for which Reason it is expedient, phthifical Patients in *Italy* should sail to *Alexandria*. If any Circumstance forbids Sailing, the Patient is to be removed in a Bed, or some other manner. He must, also, abstain from Business, and every other thing which has a Tendency to discompose his Mind; he is, farther, to indulge himself in Sleep; Desluxions are to be carefully guarded against, lest, perhaps, being somewhat relieved, his Condition should again become worse. For this Reason Crudities, the Influence of the Sun, and the Access of Cold, are to be prevented. The Mouth and Fauces are to be covered, and the Cough removed by Medicines appropriated to that Purpose. In such a State Water is to be drank, and Milk may, also, be commodiously exhibited."

Celsus, in prescribing a dietetic Regimen proper for the Cure of a Phthisis, justly and principally recommends Exercise, and Choice of Air: Of almost the same Opinion is our justly celebrated *Sydenham*, who tells us, that he has prevented many Phthises, and cured many Phthifical Patients, by prescribing Riding. He, also, thinks, that 'tis of no small Importance what Air they breathe: "For, says he, Phthifical Patients are much more happily cured in the Country, than in the Town, since the Air of the former purges their Lungs, and contri- butes more to their Recovery, than any other Remedy." We are more effectually convinced of this, by considering by what Causes it principally happens, that in *Holland* and *England* so many die of a Phthisis; and that, in half of these, this Disorder is brought on by a Spitting of Blood. For, certainly, this is to be ascribed, not only to the gross Aliments, since these Nations use rich Food, eat much Flesh, and Sea-fish with high Sauces, by which is generated a crude Chyle and Blood, which, easily stagnating in the Lungs, dispose to a Phthisis; but this is rather principally to be ascribed to the Impurity of the Air, which is much impregnated with Smoke, by which the Bronchial Glands and Membranes, together with the minute Capillary Ramifications of the Pulmonary Artery, are dried; by which means a Consumption of the Lungs is, in Process of Time, brought on. The same Misfortune is, also, frequently produced by cold Weather, and Northerly Winds, which almost always prove offensive to the Lungs, especially of old Persons, and such as are disposed to a Phthisis; so that a considerable Number of Persons are destroyed by this means. But nothing is more prejudicial, than exercising the Body strongly by Walking or Running against such a Wind; for by this means, I have frequently known Abscesses produced in the Lungs both of Men and Horses.

If any Disorder requires not only an accurate dietetic Regimen, but, also, a cautious and circumspect Use of Medicines, 'tis certainly a Phthisis, of which there is so great a Contradiction of Remedies, that, unless they are all duly considered, the Physician may easily fall into an Error, and, instead of relieving, injure his Patient. Thus, in order to promote Ex- pectoration,

pectoration, sweet and pinguious pectoral Syrups, incrassating Substances, and Preparations of Honey, are requisite; by the immoderate Use of which, however, we destroy not only the Tone of the Lungs, but, also, that of the Stomach; and by that means produce a larger Quantity of Crudities, and a greater Congestion of Humours in the Breast. The slow, drying, hectic Heat requires Diluents, moistening Liquors, and Milk; which, however, in a moist Cough, increase the Afflux of the Humours to the Breast. The sordid putrid Ulcers require balsamic resinous Medicines, such as Myrrh, *Venice Turpentine*, Balsam of Capivi, *Peruvian Balsam*, and the other consolidating and vulnerary Balsams; which, however, by increasing the intestine Motion and Heat of the Fluids, generally produce bad Effects.

We find the same Difficulty in those uneasy, and almost convulsive Commotions of the Breast, which, in long and violent Coughs, are excited by the Acrimony of the Humours; for these require to be alleviated by Anodynes, Preparations of Poppies, oleous and somniferous Substances; which, however, when frequently exhibited, surprisingly destroy the Strength: The corroded, dissolved, and ulcerated vascular Substance of the Lungs requires consolidating and gently astringent Medicines; but since they retain in the Habit the extravasated Humours, which ought to be eliminated, and suppress Expectoration, they, by these means, increase the Corruption: Besides, if any one intends the Consolidation of Ulcers, he ought to prevent the Afflux of the Humours to the Part affected; which is obtain'd both by vulnerary Substances, and Decoctions of the Woods, and by Powders composed of *Armenian Bole*, Sealed Earth, and Blood-stone; but, when there are Tophi, Tubercles, and Indurations of the Lungs, these are enlarged by such Medicines. In order to extinguish the hectic Heat, nothing is more beneficial and efficacious, than the nitrous Powders: But even these do not at all times produce the desired Effect; since they readily prove purgative, and lessen the Sympathetic Force of the Stomach and Intestines. Milk is, also, of singular Efficacy in the Cure of these Disorders: Yet, in young and phlethoric Habits of Body, where there is a beginning Phthisis, and many acid Crudities, accompanied with a slow Fever, I have often observed it highly prejudicial.

As Venesection is highly useful, not only for the Cure of a beginning Phthisis, but, also, for preventing it in young Persons, so it is very improper, with a curative Intention, when the Strength is greatly exhausted by the Disease, and the Heat; unless, perhaps, we should take away an Ounce, or an Ounce and an half, of Blood, for the sake of Ventilation. Drastic Purgatives, such as Preparations of Aloes, Scammony, and Hellebore, but more especially Emetics, are highly prejudicial, not only by impairing the Strength, but, also, by carrying off the temperate Moisture of the Body: Hence, when the Humours are to be derived from the Breast, and gently evacuated by Stool, these Ends are most commodiously obtain'd by Laxatives prepared of Manna, Tamarinds, Rhubarb, Agaric, and Sena-leaves: But if, when exhibited in a small Dose, these should not be sufficient for diminishing the Redundance of Humours, or if the gross and viscid Humours, which obstruct the minute Vessels, are to be resolved and eliminated, we may, instead of these, substitute the Pilulæ de Succino Cratonis, or Pills prepared of Gum Ammoniac, Saffron, Mercurius Dulcis, Extract of Rhubarb, and Aloes.

Motion and Exercise, and especially Riding, is highly commended for the Cure of a Phthisis and Hectic, by the most skilful Physicians, both antient and modern. But in the Beginning of the Disorder, where the Patient is young, and the Habit plethoric, it often does more Harm than Good, by exciting a Spitting of Blood. Nor is it expedient, where the Lungs are violently injured, and a Vomica is suspected, since, by the brisk Motion of the Horse or Chariot, a fatal Inflammation may readily be brought on. But 'tis far otherwise in hypochondriac Consumptions, in which moderate and often repeated Exercise is highly beneficial.

The more temperate, pure, and serene the Air is, the more beneficial it is to Phthisical Patients; for a moist Intemperature of the Atmosphere is surprisingly injurious to the Lungs, which are already relaxed, tumid, and infarcted. 'Tis, also, highly expedient, to impregnate the Air surrounding the Patient, with the balsamic Particles arising from Fumigations of Mastich and Amber; or to render the Air drawn in balsamic, by holding a Piece of the best Myrrh in the Mouth, till it is dissolved by the Saliva.

Since the Beginning of a Phthisical Exulceration is frequently produced by a saline Catarrh, or a certain acrid caustic Matter, convey'd, by Translation, from other Parts to the Lungs, in order to derive this Afflux elsewhere, and evacuate the Humours, we may safely and advantageously use the actual Caustery; by the Application of which, between the Scapulæ, and

in the Neck, we read of an imminent Phthisis happily removed, in *Riverius*, in *Obs. Cent. 2. Obs. 67. 78. Cent. Obs. 92.* and in *Schenkius*, *Obs. 56.*

In order the more effectually to institute the Cure of a Phthisis by Milk, either alone, or mixed with mineral Waters, the following Cautions are to be observed:

1. We ought diligently to inquire, whether the Strength of the Stomach is sufficient to digest, and again expel, this Species of Medicine.

2. 'Tis expedient, that, before the Use of the Milk, the Primæ Viæ should be well cleansed from viscid and acid Humours; which Intention is most effectually answer'd by a laxative Infusion of Manna, whose Virtue is augmented by the Addition of a sufficient Quantity of Tartar.

3. On the first Days, it is expedient, every Morning about six or seven, and every Afternoon about five o'Clock, to drink six or eight Ounces of Womens, or Asses Milk, and afterwards gradually to increase the Quantity.

4. After the Patient has for six or eight Days, drank the Milk in this manner, a gently laxative Medicine, and such as has a Tendency to evacuate the Sordes, is to be interposed, and repeated every sixth Day.

5. He ought never to use Wine, nor Malt-liquors, for Drink, but rather Ptisans of Barley, Hartshorn, and Citron-peel. He must, also, carefully abstain from Aliments of hard Digestion, and such as generate bad Juices. On the contrary, Broths prepared of Tortoises, Cray-fish, Veal, Fowls, Lettuce, and Garden Succory, are of singular Service.

6. In order to augment the concoctive Force of the Stomach, which in a Phthisis is very languid, 'tis expedient, between Meals, to exhibit some balsamic, pectoral, and stomachic Elixir, such as that made of the best Myrrh, Saffron, Nutmegs, Orange-peel, Marsh-trefoil, and Liquorice-root.

In those excessive and colligative Sweats, which, in phthisical and hectic Disorders, exhaust the Strength, besides Whey and Emulsions, the Species de Hyacintho, mixed with a small Quantity of Nitre, and half a Grain of Laudanum Opiatum for a Dose, afford singular Relief. But, if, in consequence of the Violence of the Cough, by which the Mass of Blood and Humours is greatly exagitated, an excessive Profusion of Sweat should be produced, a gentle and corrected Opiate, such as the Pilulæ de Styraçe, or the Pilulæ Wildegansii, may be commodiously exhibited with some temperating Powder, since, by removing the Cough, it checks and lessens the Sweats. But, if, besides the Cough, a colligative Heat of the Blood should, also, prove the Cause of the Sweat, *Morton* and *Pitcairn* are not afraid to prescribe the *Peruvian Bark*, with one Grain of Laudanum Opiatum. *Hoffman*.

If an Ulcer has so corroded the Substance of the Lungs, that the whole Habit of the Body is by that means wasted and consumed, the Patient is said to labour under a Pulmonary Phthisis, or Consumption of the Lungs.

The Origin of such an Ulcer may be deduced from any Cause capable of so stopping and detaining the Blood in the Lungs, that it must necessarily degenerate into a purulent Matter.

These Causes may be reduced,

1. To that very Habit and Temperament of Body, in consequence of which, the Patients first begin to spit Blood, and are afterwards afflicted with an Erosion and Exulceration of the Lungs. This Habit or Temperament of Body consists, first, in the Tenderness of the arterial Vessels, and the Impulse of the Blood, when in any Degree acrimonious. Such a Constitution is known by the Sight of the small and tender Vessels, and of the whole Body; by the Length of the Neck; a flat and narrow Thorax; depressed Scapulæ; an highly red, thin, dissolved, acrid, and hot Blood; a very white, and sometimes a rosy blooming Complexion; a bright and shining Skin, Chearfulness of Temper, and an early Ripeness and Subtlety of Genius. Secondly, in such a Weakness of the Viscera, as to occasion those Aliments, which are in their own Nature too tenacious to create Obstructions, Putrefactions, and Acrimony; and in consequence of these unhappy Circumstances, to exulcerate the corroded Vessels after a previous Spitting of Blood. This Weakness of the Vessels is known by a slight Fever, a dry and gentle Cough, a preternatural Heat, an increased Redness of the Lips, Fauces, and Cheeks; appearing about the time the new Chyle enters the Mass of Blood; by a Propensity to Sweat, during Sleep; by a Weakness and great Difficulty of Breathing upon the smallest Motion. Thirdly, it appears at that Age, when the Vessels, having acquired their full Growth, resist the farther Efforts of the Fluids to lengthen them, whilst the Blood, in the mean time, is increased in Quantity, Acrimony, and Impetus; so that it appears between the sixteenth and thirty-sixth Year of the Patient's Age, and earlier in Girls than in Boys; because the former sooner arrive

at their full Growth, than the latter. Fourthly, in an hereditary Disposition to the Disorder: What is said under the Article *FIBRA*, compared with the Circumstances just now mentioned, are sufficient to explain, ascertain, and prognosticate the Nature, Causes, and Effects of Blood-spitting. Now, this Effect, or a Spitting of Blood, is brought on, and accelerated,

1. By an Interception of the usual Evacuations, especially of Blood, such as the Hæmorrhoids, Menfes, or Lochia; a Suppression of Hæmorrhages of the Nose, and Neglect of usual Venesection, especially in plethoric Habits, and those who have lost any of their Limbs.

2. By any great Violence or Force apply'd to the Lungs in Coughing, Crying, Singing, Running, violent Efforts of the Body, Anger, or any Wound inflicted, by whatever Cause or Instrument.

3. By acrid, saline, or aromatic Aliments; by Drink of the like Qualities; by a particular Manner of living, or by any other Disease, which have a Tendency to increase the Quantity, Acrimony, Velocity, Rarefaction, and Heat of the Blood. Hence it is, that this Symptom happens so frequently after acute Fevers, the Plague, the Small-pox, and Scurvy.

Hence it arises accompanied with a slight Pain, a moderate Heat, a Difficulty of Breathing, and an Oppression of the Thorax. The Blood discharged from the Lungs is generally florid, scarlet-coloured, and frothy, full of small Fibres, Membranes, arterial, venous, or bronchial Vessels; a Cough, a Noise, or Rattling of the Lungs, a soft, small, and undulating Pulse, a Difficulty of Breathing, and a saltish Taste in the Mouth, having preceded.

It is cured, first, by liberal Venesection, repeated every third Day, for four times, till the inflammatory Crust entirely disappears. Secondly, by refrigerating, inspissating, styptic, and lenient Medicines, long persisted in, and sometimes intermixed with very mild Balsamics. Thirdly, by managing the six Non-naturals in such a manner, as that they may be contrary to the Causes of the Disorder already enumerated; and especially by a moderate Regimen, and mild Aliments, continually persisted in, to which a Milk-diet peculiarly belongs. And, fourthly, by correcting the specific Nature of the Cause, or particular Disease, which has produced it.

When a Spitting of Blood has happen'd, and is removed, the Patient is to have Blood taken from him every six Months for some succeeding Years; but the Quantity is to be gradually lessen'd each time, that at last the Practice may be left off, without any Detriment.

But, if, in consequence of the Violence of the Disorder, the preposterous Use of Styptics, or a Neglect of the Method of Cure already prescribed, there should, after the Spitting of Blood, arise a continually increasing Difficulty of Breathing, a wandering Horror, an Heat and Redness of the Cheeks, a dry and gentle Cough, a slight hectic Fever, a preternatural Thirst, a Weakness and Sense of Weight in the Thorax; these Symptoms import, that the Wound from which the Blood was expectorated, has already begun to change the Matter collected about its Lips, and under the Crust of dried Blood, into Pus; and this Collection is degenerating into a conceal'd Vomica, which, breaking, terminates in an open Ulcer of the Lungs.

This Collection of Matter, besides the Causes already mentioned, also, arises from any Peripneumony terminating in an Apostem; which may be known from the Signs specified under the Article *PERIPNEUMONIA*.

Besides, an Empyema may corrode, waste, and consume the Lungs; in which Case, the same Disease is produced with that occasioned by an Ulcer primarily formed in their Substance. This is known to be the Case by the Signs specified under the Article *EMPYEMA*.

Hence 'tis obvious, what Signs discover an Ulcer of the Lungs, even of the conceal'd Kind; how many Causes and Sorts there are of such Ulcers; and consequently, how many different Kinds of Phthises, or Consumptions, there may be.

Now the Effects of an Ulcer of the Lungs already formed, but concealed, and commonly called a *Vomica*, are generally these following: The Acrimony, Quantity, and Putrefaction of the Pus, are daily increased; the Membrane containing it is dilated, corroded, and macerated; the Blood-vessels, and those of the Bronchia, are converted into Pus; the whole Substance of the Lungs, or at least, of one of their Lobes, is converted into a purulent Matter; the Patient is afflicted with a continual dry Cough, or such an one as, only by the Concussion in Coughing, produces an Abrasion and Expectoration of the Spit; the Blood convey'd into the Ulcer, is converted into Pus; the Vomica in the Lungs spreads, and is propagated; then it breaks at last into the Ducts of the Larynx. Sometimes there is a suffocating Secretion, and sometimes a daily and copious Expectoration, accompanied with a Cough of a Pus, which subsides in Water, is of a thick Consistence, sweet, pinguious, fetid, white, red, yellow, livid, cineritious, full of Strigments, and which, when put upon a live Coal,

smells like stale roasted Flesh. Then the Vomica breaks into the Cavity of the Thorax. Hence the Respiration becomes highly difficult, and the Symptoms of an Empyema appear. Then the Respiration is most difficult; the whole Blood and Chyle are converted into Pus; the Preparation of the nutritive Juice is totally destroy'd; the Solids are almost totally consumed; there is an hectic Fever, accompanied with a small and languid Pulse; an intense Heat of the superior Parts; an Hippocratic Face, and a Redness of the Cheeks. There is an unaccountable Uneasiness, especially towards the Evening, a preternatural Thirst, profuse Sweats in the Night, red Pustules on the Face, Neck, and Breast, cedematous Swellings of the Hands and Feet, great Weakness, Hoarseness of the Voice, a Falling of the Hairs, an Itching all over the Body, accompanied with watery Pustules, a Gripping, a frequent and weakening Diarrhoea, the Stools discharged in which are yellow, fetid, purulent, and cadaverous; a Suppression of the Spit; and at last, Death.

Hence we may draw the following Rules:

1. An hereditary Phthisis is the worst of all, and not to be cured, but by preventing a Spitting of Blood.

2. A Phthisis, arising from a Spitting of Blood, produced by external Causes, without any previous inward Defect, is, of all others, the mildest, if all other Circumstances are alike.

3. A Phthisis, in which the Vomica is suddenly broken, and the expectorated Pus white, well concocted, smooth, and in Quantity corresponding to the Largeness of the Ulcer, without Thirst, but with a good Appetite, due Digestion, laudable Secretion and Excretion, is curable, though with Difficulty.

4. A Phthisis, produced by an Empyema, is incurable: And,

5. A Phthisis, accompanied with an Expectoration of heavy, solid, fetid, sweet Spit, together with the Symptoms last enumerated, is to be despaired of.

When a Vomica is already formed in the Lungs, the Intention of the Physician ought to be, to mature and break it with all Expedition; which is done by a Milk-diet, Riding on Horseback, tepid Steams, and expectorating Medicines: And, when it is broken, it is requisite,

1. To guard and defend the Blood against the purulent Contagion.

2. As soon as possible, to evacuate the Pus from the Ulcer, and to cleanse and consolidate its Lips. And,

3. To use such Aliments as are of easy Digestion, that they may not only pass through, but, also, be changed and duly assimilated by the remaining Force of the Lungs. They ought, nevertheless, to be capable of nourishing the Body, and unfit for generating new Pus.

The first of these Intentions is answer'd by mild and grateful acid and saline Medicines, vulnerary Herbs, and mild Balsamics exhibited in all Forms, in large Doses, and long persisted in.

The second Intention is answered by liquid and diuretic Medicines; together with such as promote Coughing, whether internal or external; by Exercise, Riding, and the Country Air, which expel the Pus; by Abstersgents, and Balsamics, both internal and external, which depurate; and, lastly, by consolidatory Paregorics. And,

The third Intention is answer'd by Ptisans, Broths, and a Milk-diet.

The palliative Cure of a Phthisis principally regards the Cough, the Oppressions, and the Flux: And

These Symptoms are remov'd by a proper Regimen, Opiates cautiously exhibited, and proper warm Liquors.

As a Phthisis is most generally produced by an Ulcer of the Lungs, so it may sometimes arise from an Ulcer of some of the other Viscera, such as the Liver, Spleen, Pancreas, Mesentery, Kidneys, Uterus, and Bladder; the Knowledge, Prognostics, Effects, total and palliative Cures of which may easily be deduced from what has been said, by the Physician who knows the natural Effects of each particular Bowel. *Boerhaav. Institut.*

The following Observations of *Dr. Bennet*, relative to the Subject of this Article, are of Importance sufficient to deserve Notice.

Omitting all Consideration of that Moisture, which, when it superabounds in the Stomach, by the Assistance of the Oesophagus, and the Membrane common to that and the Tongue, flows into the Mouth without Coughing or Hacking; as, also, that Rheum which issues out of the capillary Arteries, and their Coats, from the Brain upon the Palate, and ejected with the same Ease, the Nature of that Expectoration is to be examined, which proves injurious to the Breast. This is nothing else than a Portion of Fluid derived from the Blood by Suffusion into the Cavity of the Thorax through the pectoral Arteries, and thrown up through the Trachea into the Mouth, in order to its final Ejection, by the contractile Motion of the Lungs, either

in Coughing or Hawking. As the Blood, therefore, is constituted in Conformity to its Aliment, so the Matter of this Excretion is as the Blood, from which it is derived. The Truth of this will appear, upon considering the Manner of this Excretion, and the Largeness of its Quantity, in those who are not troubled with a Defluxion from the Brain upon the Trachea.

Whoever shall use proper Medicines for purifying the Blood, although Pectorals be omitted, yet the Matter expectorated will become better, in proportion to the Rectification of the Mass of Blood. Thus, when the State and Colour of the Matter is bad, if such Sweats be promoted, as serve to clear the Blood from its Impurities, the Matter brought up will mend, in Conformity to the Blood's Depuration.

That the Pulmonary Artery, with its Ramifications, receives the Recrements of the Blood, and thence detaches them into the Branches of the Windpipe, is a matter beyond all Dispute. Some are more, and some less, affected with this Lodgment, according to its Nature and Quantity; and sooner or later discharge it by Expectoration; according to the Circumstances of its Adhesion. Every body has not the same Freedom in the Organs of Breathing: Some are fatigued with a severe Cough without any Expectoration; whilst others, with a slight Hawking or Coughing, discharge the irritating Matter. Some have it so much diluted with *Ichor* or *Serum*, that the Lungs endeavour in vain to bring it up; others have the Defluxion so hardened into Clots, that it yields with great Difficulty. Some, through a cold Laxity of the Breast, can evacuate but little Matter; while others, of a firmer and warmer Constitution in the same Parts, discharge it with little Uneasiness. Some, by the Freedom of the Motion of the Lungs, when they do not adhere to the adjacent Parts, easily expel the Matter, while others, either through Plenitude or Constriction, natural or adventitious, have such a Dislodgment either retarded, or rendered impracticable.

In Expectoration, the Matter that settles about the upper Parts of the Trachea, is evacuated with little Labour of Hawking and Coughing; but what is deeply situated is with great Difficulty expelled.

Matter of a moderate Consistence is easily expectorated; but when it is too thin, or formed into hard Clots, it is not dislodged without great Trouble and Difficulty.

Nature then carefully consults her own Security, when the Matter, in Phthical Patients of a more healthy Constitution, is supplied from the Blood, and when the Times of Formation and Expulsion are determined. For, when crude, it cannot be naturally or spontaneously discharged; but it is prepared for Evacuation, when it comes to Maturity, and is, as it were, shaped to the Capacity of the Vessels, through which it is to pass. Those who are accustomed to this sort of Expectoration, are under the salutary Directions of Nature, to which the Means are to be accommodated; but if the Matter be interrupted in its Course, so that it does not proceed according to the Inclinations of Nature, it occasions a Necessity for more vigorous Efforts. The Treatment, therefore, of such Patients is a Matter of great Importance.

Whoever attempts to hasten Expectoration by violent Exercise, or any voluntary Anticipations of Hawkings, extremely fatigues the Contents of the Thorax; when Nature at her appointed Time would easily have relieved them. Those who expectorate the Rheum freely and copiously, will soon find themselves eased of the Burden upon the Lungs. On the contrary, at the Beginning of a Cough, every thing is difficult and fatiguing; but in its Progress, as the Matter ripens, every thing becomes easier.

In my Opinion, the white frothy Spit is produced by a thin sort of Rheum, ouled out into the Lungs or Fauces, and there agitated. For a Defluxion, proceeding from a Coldness of the Brain, is thicker, and, unless it be retained and agitated some time in the Mouth, is not so white, is more mucous, and froths not up so much into Bubbles; whence it seldom or never hurts the Lungs; but, if it froths, I believe it proceeds from some Motion of the Parts, from Heat, and a Mixture of Air. Besides, if this Matter rises unmixed, it indicates no more, than that there is some internal Exsudation, occasioned by a more vigorous Action of the Parts than usual.

A frothy Spittle is increased by Exercise, in those especially who perspire but little; and that the Motion of the Mouth and Lungs conduces to it, is manifest, because it always happens to those who cough or talk much.

This Spittle is very light, consisting principally of a watery Pellicle inflated with Air.

Nature has given the same Laws to Plants, and to Animals; and, according to *Hippocrates*, implanted in both what is sour, bitter, sweet, salt, and of all Tastes. Nor does the Microcosm want its insipid Fluids, a moderate Proportion of which

is necessary to dilute the Blood; but, if a Superfluity be contained in the Vessels, it loads the Constitution, as does that which is extravasated, if it collects upon particular Parts, especially the Organs of Respiration. But at present it is of no great Importance, whether such insipid Humidities collect in their proper Vessels, or are thrown upon them after the Discharge of their proper Offices, so that they have been circulated with the Blood, and are found inspissated upon Protrusion into the large Cavities of the Body. The Excretions, however, which consist of a mild Humour, are more troublesome than dangerous; but those which do not readily pass into the Trachea, in a liquid Consistence, harden into a thick viscid Consistence, and are expectorated with great Difficulty.

A Lady of forty-seven Years of Age, fleshy, but valetudinary, who had all the Capillaries in the Liver, Spleen, and Mesentery, obstructed, was frequently affected with unequal Shiverings, attended with a Coldness, in one or other of the Parts, which seemed to her to resemble the pouring on of cold Water; which Symptoms, notwithstanding our Endeavours, continued; but when a Ptyalism, or Diarrhoea, arose, it then ceased. At last, after the Exhibition of some Cathartics, by sweating in dry Baths, and a sparing dry Diet, she was quite cured.

In many Persons, a thin Lymph arising from the Blood is at first copiously discharged upon the Trachea, upon which the Coldness will disappear; but the Spit will then grow thick, pellucid, and be evacuated with violent Reaching. With this Matter we have often observed the Breast to be extremely obstructed.

Pleuritic Patients, after the purulent Matter has been expectorated, cast up Spit of this kind for some Days; and the more the other Vessels are affected with it, the less will the Organs of Respiration be obstructed by it; and not at all, when it is translated upon the Bowels. I am of Opinion, that this Mucus, being unequally supplied from the Blood, serves in the place of Nourishment to those who have the Rickets; and I take it for granted, that the same, stagnating in the Ureters, and hindering the Passage of Urine, regurgitates into the Stomach and Bowels, and occasions Pains of the Back, Vomiting, Gripes, and a bastard Ischury. It is sometimes to be observed, that the like Viscosity hinders the Circulation of the Blood, by lodging in the greater Vessels. An Instance of this I once met with in a Child, who was taken off in the third Fit, it having obstructed the Pulmonary Artery, or that which is called the Arteria Venosa. Lastly, if these thick Rheums are unequally deposited upon some of the extreme Parts, they generate oedematous Swellings; but if upon the whole Habit, an universal Oedema or a Leucophlegmatia, and an Anasarca, very difficult to be cured.

This Mucosity, which is the Cause of obstinate Obstructions in the Bowels, increases in the Female Sex, or in Men of a cold Temperature; and even in a State of Recovery, where the natural Heat is defective, or is wasted, and grown languid, by the long Continuance of any Disease.

OF YELLOW-COLOURED SPIT.

Yellow Spit is probably derived from the bilious Juice, the Blood being so weakened before Secretion, that it is, at least, deprived of its Taste. Salts make Ulcers by Erosion, so putrefying Bodies by penetrating, inciting, and raising the Parts into a Tumor; but I have always been of Opinion, that saline Serosities prepare the way for Putrefaction, by too much relaxing and softening the Parts; but both together make an internal compound Ulcer, which cannot be cured without great Difficulty. It is not surprising, that a Fluid, otherwise thin, clear, and agreeable, while it flows in the Blood-vessels, should be changed into a yellow Colour; for, as the Blood, at its Source, and before it is distributed into its proper Vessels, is destitute of Tincture and Consistence, so the Spit, which is its Recrement, is changed by the Alteration of Heat in the Parts thro' which it passes, and retains no distinguishing Quality that it possessed, whilst it was carried about in the Circulation. It is still less surprising, that yellow Spit should lose its Taste, when it has not only been blended with the whole Mass of Blood, but strained, also, thro' the fleshy Substances of the Parts, and the Pores of the Membranes; for that Substance in which its Bitterness consists, may not be able to penetrate through such fine Strainers.

The whole Mass of Blood is impregnated with Bile, or bitter Particles, which serve to preserve it. However, no Part of that, or of any other Fluid of the Body, is so affected with Bitterness, as to communicate, by the Tongue and Palate, any considerable Sensation to the Nerves, except that Part secreted from the common Mass, which is of a remarkable bitter Taste, and is discharged in extreme Vomittings, when it is drained from its natural and appointed Receptacle.

In Phlebotomy, when the Blood happens to fall upon the Skin, it commonly feels hot; and yet the Heat of this Blood, whilst

whilst in the Vessels, might, as far as could be conjectured, be moderate and benign.

Once, in a dissected Subject, I saw the Neck of the Gall-bladder filled with Tophi; but the Bladder itself was filled with a pellucid Lymph, strained through those Tophi, as through a Filtré of a thick Contexture. These Tophi resembled candied Coriander-seeds; but the Lymph was insipid, and coagulated upon the Fire into a Mucilage like the White of an Egg.

These yellow Excretions are not produced, except by a continued Incalcescence of the Blood, or by an Heat concentrated by Cold, or from a Corruption or Redundance; which different Causes may be known by Physicians from the Nature of the Complaints of the Patient.

That some Portion of this yellow Humour penetrates through the Skin under the Arm-pits in sweating, appears from the Linen.

The consistent fleshy Substance of none of the Viscera could give the Blood its red Colour, without the Assistance of a proper Heat; but the Spir owes its Substance, and Variations of Colour, to the Blood, and Juices of the Viscera, and also, to the Aliments. The most remarkable Sorts of Spir, that frequently occur, are the bluish, the rust-coloured, and blackish; which, are not, as many imagine, produced by what is drawn in with the Breath, either by the Nostrils or Mouth; but from a Taint lodged in the Viscera and Vessels, and formed, perhaps, in the Spleen, its principal and peculiar Laboratory: This Taint, being received into the Blood, is expelled in the Course of Circulation. But I do not imagine, that it receives its deep Colour immediately, as it is discharged from the Vessels; but as it must distil from the fuscipient Viscera and Vessels, where it condenses, there it is endowed with its dark Tincture. However the Degrees of Heat, in themselves, are not the effectual Cause of the different Colours; yet, where they increase or diminish, the Spir is more or less coloured. But for these Diversities which I have enumerated, an Heat more gentle, but of longer Continuance, is requisite.

Expose to the intense Heat of the Sun, or of a culinary Fire, a Portion of bluish Spir, and it will immediately change to a white Colour; which would not happen; if the bluish Colour proceeded from any Mixture of extraneous Particles, drawn in with the Breath. This bluish kind of Spir has, I believe, never been observed to be of a thin Consistence, but always mucilaginous.

This Species of Expectoration is increased by exhibiting things that cool the Breast, as Barley and Apples; but is lessened by the Use of sudorific or mercurial Medicines. Those, also, spit but little, whose natural Heat has been much exhausted by long Sickness; those who are accustomed to slender Diets, Exercise, and Fasting; those who have the Breast of an hot Temperature, or who are much used to Smoking; and those who are agitated with frequent Coughing. Whence it appears, that the Matter of this sort of Expectoration is formed by a more gentle Heat, and longer Concoction, and by a Breast of a cold flaccid Temperature.

I remember an Instance of this kind, in a middle-aged Woman, under a violent Catarrh, whose Spleen so filled the Head with noxious Vapours, that every Morning she discharged a vast Quantity of a Rust-coloured Spir, which resembled the Threads of a Cobweb; a Portion of which was sometimes diverted, by the hot Catarrh, into the upper Part of the Aspera Arteria; but, upon opening and deterring the Vessels of the Spleen, both the Catarrh and Excretion ceased.

If the White of an Egg be long, though gently, kept warm, it will change its white into a bluish Colour.

At the End of a Fit of accidental Coughing, from Congestion, or of a thick periodical Expectoration, I have observed this sort of Spir to rise more white and depurated; and I have observed, that such Kinds generally proceed from Disorders of the Spleen or Womb; nor does the Mucus of the Nose become discoloured from any other Cause.

Though a salt Spir is produced by a salt Blood, and may give some Commotion to the Humours, yet I imagine, that it seldom bursts the Membranes and Coats of the Vessels by its incisive Quality; but, after the Blood has strained out its saline Serum, like a Dew, through the Membranes and Coats of the Breast, it occasions a Cough, by stimulating the contractive Motion of the Lungs. By this sudden Constriction and Contraction, the tender Parts, through which the saline Particles of the Blood are conveyed, being rendered weaker, are soon corroded. So that the saline Particle, lodged upon any of the Viscera, does not immediately, like a Needle, penetrate the Part itself; but, by remaining long upon it, it dissolves its Texture, and assimilates it to its own Nature; so that this Effect rather proceeds from a Power of Solution, than of Incision; for, by insinuating into the very Substance of the Part, it is mixed and united with its most intimate Combinations, and so changes its Substance into a kind of middle State between Mixture and Dissolution: When it has continued in this neutral State some time, it, at last, dissolves, and is, by an induc'd

Friability, entirely destroyed. Thus, if a saline Fluid be extravasated, perhaps, like a Vapour, and deposited upon a particular Part, by its penetrating Acrimony, it intimately unites with the Substance of the Part, and endangers its Corrosion and Dissolution. And if the acid and saline Particles should even be deposited on the extreme Parts, great Trouble and Danger are occasioned to the Patient.

Many whose pectoral Vessels have been burst by a turgescient Blood, perhaps of a saline Nature, have been cured by using Phlebotomy once or twice; but I have known none whose Lungs have been corroded, that could be recovered without an entire Edulcoration and Change of the Mass of Blood.

Some have been affected with Luxations of the Vertebrae, by an acrid Defluxion upon the Spine; and I have, also, seen the Joints of other Bones distorted by the same Means. But if the Qualities of the Fluxion are entirely offensive to Nature, as in the Venereal Disease, Protuberances will be raised on the Bones, especially the Tibia; and they will be entirely render'd friable, spongy, and soft. The same Case happens in the Elephantiasis. And, if we may believe some, the Bones are so dissolved, as to become flexible, like Wax.

I have seen many almost entirely emaciated, whose whole Mass of Blood abounded with Salt; and who used, periodically, to expectorate a briny Matter, discharged into the Breast from the pulmonary Veins, which, however, has not corroded the Lungs. Among these, I knew a Merchant of London almost reduced to a Skeleton, in whom the saline Matter was translated from the Lungs into the Palms of the Hands, Feet, and Anles, where it produced most malignant consuming Ulcers, whilst the Lungs continued entire.

I have, more than once, seen the constituent Substance of the Lungs so uniformly dissolved, that they seem'd reduced into a kind of purrid Mud.

I have, also, met with Patients, whose Lungs have been torn away in pieces, by a sharp and unequal Corrosion; and appear'd, upon Dissection, as if they had been gnaw'd by a Rat. A redundant Acrimony of the Blood, which is frequent in melancholic Habits, not only occasions a general Tenderness, but exposes the Parts to suffer by external Injuries, and destroys the Nourishment of the muscular Flesh. And the Rheumatism, which is nearly related to the Gout, both in its Causes and Seat, produce very intense Pains.

The constituent Matter of all Spir is different, and assumes various Appearances, according to the Part from which it derives its Source; for the Serum of the Blood is not the only Matter which is translated into the Cavity of the Thorax, but, sometimes, that dewy Substance, which is destined for Adhesion and Nourishment, rises into the Mouth. The Blood is first deprived of its thin Serum, and thereby becomes heated; and the Increase of this Heat throws its more glutinous Parts upon the Lungs, which have been already relax'd and weaken'd by the Translation of watery Humours; and Patients, in this Situation, are, I think, in the greatest Danger. For Nature greedily embraces this Juice, till her attractive and assimilating Qualities are entirely lost.

When I practised at Bristol, where Consumptions are very frequent, I met with some who easily expectorated a sweet Spir for three Months together, and were totally wasted and enervated: Some of these were seized with a violent Cough; and, having entirely lost their vital Moisture, they expired, pale, dry, and entirely emaciated. In one Instance of this Kind, who, for our Information, was open'd, and who, sometimes, expectorated Blood after the saline Excretions of Spir, the Lungs had entirely lost their Tone; and yet the other Organs of Respiration, and all the Viscera, were found to Appearance. Nor is this surprising to those who know how unfit Blood, that is too much attenuated, is for Nutrition; or who have observed too much, colliquated and rarefied by intense Heat, flow through the capillary Arteries, particularly of the Nose, and produce Fainting. For it is inevitable Destruction to the animal Oeconomy to deprive it of that tempering glutinous Juice, which, by a moderate Warmth, gives a due Smoothness and Consistence to the whole Mass.

This sweet Spir, in all the Patients that I remember to have seen, happens after a tedious and generally saline Pyralism.

This Spir, put upon the Fire, becomes of the Consistence of a white Gelly, like other nutritious Juices.

Of all sorts of Spir, the most vapid and seculent is of a cineritious dirty Colour, like moist Clay, which is, also, the least adhesive, that is excreted by consumptive Persons, and is a Symptom of the Defect of natural Heat, and of the Approach of Death. All the other Sorts are, in some measure, affected by Warmth, and from it derive their Figures and Consistences; this only stagnating in its Lodgments, can scarcely be expectorated unless forced up by the Greatness of its Quantity; it is produc'd by extreme Corruption, and natural Decay.

If you fill two Acorn Cups, of equal Bigness and Weight, one with the dirty Spir, and the other with any other Species, the dirty Spir will weigh down the other, as it is heavier than any of the other Sorts.

This Clay-like Spit happens only to those who are hastening to their latter End, and are out of all Hopes: Their Lungs, upon Dissection, have been found only a Mass of stinking Corruption. *Bennet. Theat. Tabid.*

OBSERVATIONS RELATING TO THE DIAGNOSTIC SIGNS.

The Approach of this Distemper may be discovered, when the saline Blood is carried towards the Breast with a slower or quicker Motion.

Its slower Afflux is discernible,

1. By bloody and saline Spittings, at stated Periods, about four, five, or six, in the Morning, or Afternoon, sooner or later, and more or less, according to the Irritations they occasion, or as they are determined by the Exercise of the Body. That which is inspissated out of the Vessels, is not excreted at the accustomed Periods, because they abound in the Body at those Times, as is the common Opinion of Physicians; but, because, in some measure, it transpires through the Skin, while the thicker Parts are deriv'd to the larger Vessels.

2. By more frequent Spitting and Hawking.

3. By an Interception of the cutaneous and other Excretions.

4. By Spit of a light unequal Substance.

5. By globular Spit convolved like Hail-stones, and expel'd at the above-mention'd Hours, by sudden Coughing or Hawking.

6. The Truth of these Symptoms is confirmed, when, from any Cause, there happens a Defluxion of a saline Matter upon the Joints or Extremities of the Body, and the Breath in that time gets Strength.

More violent and copious Affluxes are known,

1. By a more plentiful Expectoration of frothy Blood of a Clay-colour, with Hawking and Coughing, less painful, if from the Lungs; but of a blackish or redish Colour, if from the Cavity of the Thorax; if from the great Arteries, it is attended with regurgitating Replections of the Mouth at Intervals; but gradually, and with a Sense of Titillation, if from the Fibres.

2. By an heavy Pain in the Breast, which is periodically pungent.

3. By a periodical Difficulty of Breathing.

4. By a manifest Relief of the other Parts.

The Signs of a Phthisis from a thick and cold Phlegm, falling from the Head, and collecting in the Breast, is apparent, when the like Matter being secreted, in some manner, at the Extremities of the Carotid Arteries, and contaminated by a cold Brain, makes its Way into the Aspera Arteria, which is always accompanied with the Discharge of a similar Matter into the Thorax from the common Vessels; of which a distinguishing Symptom is an Erection or Opening of the Larynx, with its alternate Closure, or falling again, and causing a Sound like the Ticking of a Watch beating Seconds, to which daily are joined the following Symptoms.

1. A Torpor of the Spirits.

2. An Heaviness of the Head, with Pain, increasing periodically at the full Moon.

3. Longer Sleeps, with Dreams of Drowning.

4. A general Coldness of Temperature.

5. The Pores contracted with Cold.

6. A Flaccidity of the Lungs, and all the pectoral Muscles, and a slow Expectoration, which is known by a frequent Endeavour to hawk up something in vain.

7. A thicker Spit, which is easily evacuated after a good Meal, when the Breast has been warmed with suitable Food.

8. An heavy and oppressive Pain of the Breast.

9. A Cough which, at Intervals, threatens Suffocation, and is aggravated by Exercise, and drinking cold Liquors.

10. A frequent Difficulty of breathing.

11. A Catarrh slowly, but continually, moistening the Aspera Arteria.

12. Difficult Expectoration in a cold Air, but a Readiness to sweat.

13. The Flesh becomes flaccid and soft in a moist State of the Air, and hardens in dry Weather; which is a Symptom that almost always attends a consumptive Patient. Whence,

14. A Disposition to be affected with every Inclemency of Air or Wind; the moist, or cold, being most injurious.

The Signs of a Phthisical Consumption, from what Source soever derived, but deeply rooted, and eluding all the Art of Medicine, with regard to a perfect Cure, are,

1. A severe Cough, the Violence of which streaks the Spit with Blood; then a nasty Pus of a cineritious Colour, which, put into Water, easily mixes with it, and falls to the Bottom; there are, also, expectorated Fragments torn off from the Lungs themselves, the Vessels, and Membranes.

2. A fetid Breath, and the greatest Difficulty in Respiration.

3. A Pain of the Breast, and a pricking Soreness of the Nipples; especially in the time of Coughing.

4. A Defect in all the Functions.

5. A putrid Fever from the Blood, universally tainted by the Pus, and inducing preternatural Motions, as Fermentation: Whence the Fluids of the Body are discharged by colligative Sweats, especially in the Morning.

6. A Diarrhoea, and at last, a Lientery, occasioned by a weak State of the Liver, and all the Parts subservient to Nutrition.

These are necessarily attended with,

7. A Driness of the Flesh, from the Defect of a due Degree of Moisture.

8. A Scurf upon the Extremities, and whole Epidermis, from the same Cause.

9. A Pain accompanied with Tension, in lying down on the Right or Left Side, occasion'd by the Adhesion of the Lungs to one Side or other of the Pleura.

10. A weak, small, and frequent Pulse, from a languid Motion of the Blood to the extreme Parts.

11. A shedding of the Hair, and the Nails dead-coloured and hooked.

To which, lastly, may be added,

The *Facies Hippocratica*, or the very Image of Death; the Face ghastly, the Eyes sunk, the Nose pinch'd, the Cheeks hollow, the Temples collapsed, and the whole Body stiff, and resembling a Skeleton.

A Fluxion, of whatever kind, from the whole Body into the Breast, is more dangerous than one from any particular Part.

A Fluxion from a Stagnation of the Blood, or a Diminution of its Motion near the Heart, is more dangerous than one proceeding from a more distant Part.

There is less Danger from Blood gushing by fits into the Breast, than when it flows slowly and constantly; for though there is a greater Flux upon a periodical Bleeding, there is a time of Resection.

Extravasation of Blood from Redundance and Tension is much more easily cured, than one proceeding from its Distemperature and Acrimony.

There is greater Danger to the Lungs from the Pressure occasioned by an Obstruction in the Liver, than from a Regurgitation by the broken Vessels.

If a Spitting be critical, and from Translation, it often goes off with Safety and Advantage.

Those who have had the Pulmonary Vessels continually enlarged, by the Afflux of Blood, and Expressions of viscid Matter, accompanied with an Asthma admitting of no Remissions, have mostly, either, by a Rupture of the Lungs, thrown up Blood into the Trachea, mixed with sordid Matter; or have died with a sudden Aggravation of the Asthma.

In all Fluxions, if, upon the Use of Remedies, the Intervals are lengthened, and Paroxysms remitted, it promises Recovery, and *vice versa*.

A larger Intermission, between milder Fits, is still more encouraging.

Phthisical Patients bear long, and easily, the Afflux and Expectoration of mild watery Humours; but of bilious Excretions, with Difficulty, and for a short time; but by a Discharge of thick, saline, fetid Matter, they are immediately destroyed.

From a Suffusion there is the greatest Danger, but from an Infiltration the least.

Those who are crooked, and have had Limbs cut off, are most subject to Fluxions, and in greatest Danger from a Phthisis.

After the Spitting of Blood has ceased, if the Lungs are less sensible, or the torpid State of the Parts prevents a total Discharge, the Putrefaction of the retained Blood, and of the Lungs themselves, will endanger a Phthisis.

A free Respiration, a Cessation of Coughing, and a Continuance of Strength, after Bleeding, are good Symptoms, and *vice versa*.

If after Blood-spitting, a mucilaginous, blue, and light Spit succeeds, and if it continues, it foretels a Return of the Hemoptysis in young and hot Constitutions; but, if purulent, a Phthisis, both to Young and Old; if none at all, and other Circumstances be favourable also, it denotes Recovery.

Spitters of Blood are most uneasy in Snow, Hail, or Rain.

The Bronchia are least obstructed by an extravasated Blood; that putrefies; by a nutritious Juice, when it becomes mucilaginous, more; and mostly by Phlegm falling down the Trachea, if it be concocted into a tough Viscidity.

Lastly, if the Organs of Respiration retain Matter, of any Kind, long upon them, it forebodes a difficult Cure.

That Languor which slowly steals upon consumptive People, without any Decay of the Lungs, or other Bowels, is most dangerous to English Constitutions; and, unless Remedies immediately take Place, which they seldom do, is mortal.

A Phthisis which sinks a Person suddenly, when attended with Coldness of the Extremities, especially of the Feet, is most dangerous, although it does not so severely affect the Lungs; for it is a Symptom, that the nutritious Juice is very much vitiated, and the Strength exhausted.

Phthifical Patients are in a most desperate State, who have stony and offcious Concretions of unequal Surfaces lodged upon their Lungs.

In those who are accustomed to Intemperance, if they are seized with a Phthisis productive of Languor, they are in the last Extremity of Danger.

A copious and frequent Flux of Matter upon a corroded Part is dangerous; for internal Ulcers are seldom cured when they emit a plentiful Discharge of Sanies, as those externally are hardly ever healed.

Persons of lax Habits, though they sooner droop and languish, yet they soonest feel the Benefit of Medicines, if they be timely applied at the Beginning of the Disease.

Those who are phthificaly inclined, and frequently spit insipid Matter, are longer in wasting, although from the Beginning the Lungs were affected.

Those who labour under an hereditary Phthisis, though they are incurable, yet their Life may be of some Continuance.

The Lives of Phthifical Patients are prolong'd by frequent, but moderate, Hæmorrhages at the Nose.

The Danger of an Effusion of Blood from the Pulmonary Artery is lessened, when it is attended with an Hæmorrhage from the Nose.

If, after a protracted Phthisis, there appears a chylous Flux, it is a fatal Symptom.

If an Ephemera, or Hætic, often returns at unequal Periods, it indicates dismal Consequences.

When Phthifical Patients have a keen Appetite, and acquire no Strength from their Food, their Case is desperate; for it shews, that the vital Juice is degenerated to a corrosive Fluid.

When Virgins, who are pretty far advanced, but never had the menstrual Flux, are affected with a Phthisis from a Translocation of the menstrual Matter to the Breast, it produces a most dismal Alteration, and a sudden Wasting, which, are followed by Death.

If a Contraction of the Nostrils, a Straitness and Sinking in of the Breast, happen suddenly, they prognosticate immediate Death.

Oedematous Swellings of the Feet, in a Phthisis of long Duration, is a mortal Symptom.

Almost all Phthifical Patients perish, who are seized with a putrid or malignant Fever, occasioned by the Taint of the Matter lodged in the Breast.

When a freer Respiration is obtained by the Assistance of Remedies, and a Change of Air, then the Patient feels himself enlivened, his Strength is increas'd, and his Colour becomes florid; lastly, Health returns, and the vital Heat is rekindled all over the Body.

When, in Phthifical Patients, a copious Discharge of slimy and saline Sordes is procured by Cathartics, the Breast is greatly relieved, and there appear Hopes of a Recovery.

If Pectorals of a thin Substance, which stimulate, are exhibited in a long-continued Phthisis, without exciting a Cough, the Sign is fatal.

If, by the Assistance of Art, the Spit, which was variegated, be brought to one Colour; if from nasty it becomes depurated; if, from having an unequal Surface, it becomes smooth; from saline, insipid; from fetid, inodorous; and lastly, if it be easily expectorated; all these are Signs of Recovery. *Bennet Theat. Tabid.*

PHTHOE, *φθόν*. The same as **PHTHISIS**.

PHTHOIS, *φθίσις*. A Pastil, or Troche.

PHTHORA, *φθορά*. Corruption. In *Hippocrates*, it imports a Miscarriage.

PHTHORIAS. An Epithet of a Medicine producing Abortion.

PHTHOROPOEOS, *φθοροποιός*. Deleterious, or destructive.

PHU. A Name for several Species of *Valeriana*. It generally imports the Garden *Valerian*.

PHUSCA, *φύσκα*. The same as *Posca*. There are several compound *Poscas* describ'd by *Aetius*, *Tetrabib.* 1. *Serm.* 3. C. 80, 81. and by *Paulus Aegineta*, L. 7. C. 11.

PHYCIS, *Phycida*, *Fuca*, a Sea-fish resembling the Sea Perch, with a long sharp Snout, thick Head, large Teeth, and his Body covered with Scales. It is of several Species and Colours, and is taken among the Sea-weeds near the Shore, in the Sand and Mud, where it brings forth its Young; it is good to eat, and easy of Digestion; purifies the Blood, and provokes Urine. *Lemery des Drogues.*

PHYGETHLON, *φύγεθλον*, is a broad, but not much elevated Tumor, in which there is some Resemblance of a Pustule. The Pain and Distention with which it is attended, are violent, and greater than in proportion to the Bigness of the Tumor; and sometimes there is a small Fever. This Tumor is slow in ripening, and is not much converted into Pus; it generally rises in the Neck, in the Armpits, and in the Groins. Our Countrymen call it *Panus*, from some Similitude in its Figure [spoken with relation to *Panis*, a Loaf of Bread]. *Celsus*, Lib. 5. Cap. 28.

In the Account above given, *Celsus* describes a bilious Tumor, agreeably to what *Galen* says of it, Lib. 2. ad *Glauc.* "An in-

flammatory Erysipelas, or an erysipelatous Inflammation, is called a *Phygethlon*." The same Author, in other Places, reckons this Tumor among Inflammations and Affections of the Glands; and distinguishes it from other Tumors by its Heat, and speedy Generation; and says it arises in the Armpits, and in the Groins, from an Inflammation of the indurated Glands in those Parts. *Foefius.*

PHYTICA. A Name for the *ALATERNUS*.

PHYLLIREA. The same as *PHILLYREA*.

PHYLLITIS. A Name for several Sorts of *LINGUA CERVINA*.

PHYLLON. A Name for the *Mercurialis*; *fruticosa*; *incana*; *resiculata*.

PHYMA, *φύμα*, from *φύμα*, to grow, or be generated from, in its general Signification, comprehends all Kinds of preternatural Tumors, in whatever Part of the Body they appear; and especially such as affect the external Parts, and Superficies of the Skin, and arise without an external Cause, and are generated, increased, inflamed, and suppurated, in a short Period of Time. *Galen*, *Com. in 6 Epid.* Agreeably to this Description, those Eruptions of Tubercles, which are generated of vicious Juices, and excited by an heated Blood, are called *Phymata*, 2. *Aph.* 15. 3. *Aph.* 20. and *Lib. de Alim.* *Phymata*, *φύματα*, are, also, Inflammations of the Glands, which suddenly break forth, and hasten to a Suppuration, *Gal. Lib. 2. ad Glauc.* & *Paulus*, *Lib. 3. Cap. 22.* and are reckoned among Affections and Inflammations of the Glands; *Lib. de Tum. præternat.* differing from a *Furunculus* only in Hardness. In *Prorrhet.* 2. we also we meet with *τὰ χυρώδεις φύματα*, "scrophulous Tumors," incident to Children. *Φύμα* sometimes signifies an Abscess, or vitiated Juices lodged in some Part of the Body; as 4. *Aph.* 44, 45. & 7. *Aph.* 65. & *Coac.* 118. So *Celsus*, *Lib. 2. Cap. 7.* renders *φύματα*, from 4. *Aph.* 44. by *Abscessus*. *Φύμα*, also, takes the Signification of *εμπύημα*, and every Inflammation which is converted into Pus, as 7. *Aph.* 8. according to *Galen's* Comment on the Place. So we read of *φύματα εμπύμα*, *Prorrhet.* 2. And, *Coac.* 404. we read of *Phymata* in the Lungs discharging Pus, which are opposed to hard and undigested *Phymata*. *Celsus* renders *φύματα*, sometimes, *orientia Tubercula*, and sometimes *Tubercula*, as in *Lib. 5. Cap. 18.* & 28. *Seneca de Beneficiis* renders *φύμα* by *Tuber*, where he relates, that a Person had a *Tuber* opened by the Sword of a Tyrant, who aimed to take his Life. *Pliny*, relating the same Story, calls it *Vomica*.

PHYMATA, in *Celsus*, *Lib. 2. C. 8.* seems to imply a Caruncle in the Urethra.

PHYMOSIS. The same as **PHIMOSIS**; or as **PHYMA**. *Blancard.*

PHYMUS. The same as **PHYMA**. *Blancard.*

HYPELLA. The same as **PANUS**.

PHYRAMA, *φύραμα*, from *φύρα*, to mix, is a Species of Ammoniacum, so called from its being mixed with Earth, Sand, and Gravel. *Gorraeus*. See **AMMONIACUM**. But it signifies any Mass whatever, moistened with a Fluid, and worked.

PHYSA, **PHYSE**, *φύσα*, *φύση*, signifies a Flatus, or gross Wind in the Body, or the fetid Wind discharged by the Anus, according to *Erotian*, from several Places in the Aphorisms, and from 1. *Epid.* where we read of *φύσαι ορυώδεις* (*Physæ sigodees*) and *φύσας* (*psophodees*) Flatulences discharged with and without Noise; the Word bears the same Sense in the *Prognost.* and *Coac.* *Φύσα*, also, is very often used by *Hippocrates*, to signify a gross Wind, or Flatulence, collected in any Cavity of the Body. Thus, *Lib. περί παθών*, he says, that Meats, light of Digestion, generate no Flatulences (*φύσας*); and, *Lib. de Flatibus*, it is said, *πνεύματα ἢ τὰ μὲν ἐν τοῖσι σώμασι φύσαι καλῶνται, τὰ δὲ ἔξω τῶ σώματος ἀνέχονται*. "The Winds which are in Bodies, are called *Physæ*; those without the Body, Air."

PHYSALIS. The Hop, or rather its Flowers, which are boiled in Beer. It is, also, a Name for the *ALKEKENG*. *Blancard.*

PHYSALOS. The Toad. *Blancard.*

PHYSEMA, *φύσημα*. The same as **PHYSA**. It, also, signifies the Refin of the Fir.

PHYSESIS. The same as **PHYSA**; that is, an Inflation.

PHYSICA REMEDIA are Remedies which do Service without any manifest Reason.

PHYSINX, *φύσινξ*, is a little Bladder; but *ορυώδης φύσινξ*, in *Hippocrates*, *Lib. de Fistulis*, is the Stalk or Stem of Garlick, which he uses instead of a Probe for searching the Depth of a Fistula. *Galen*, in his Exegesis, where we read *φύσινξα* (*Physinga*) corruptly for *φύσινγα* (*Physinga*), as, also, in *Varinus*, makes the *Physinx* to be what we call the Stalk, and especially its Cavity. The Scholiast of *Aristophanes* makes the *Physinx* to be the outer Rind of Garlick; and so does *Erotian*, on *Hippocrates*, contrary to *Galen*; tho' with relation to the same Place. *Hesychius* makes the *Physinx* a Species of Garlick, or an Head of Garlick: Whence some, by *Physinx*, in *Hippocrates*, understand an Head or Clove of Garlick, and expound it by a Probe with a Button at the End of it, in the Figure of a Clove of Garlick; but *Hippocrates*, in that Place, directs the Use of a fresh Stalk of Garlick in the Search of a Fistula. Some, for *φύσινξα*, in the Exegesis, read *φύσινξα*, (*Physeta*) others *φύσινξα* (*Physitra*).

PHYSIOGNOMIA, φυσιογνωμία. The Art of judging of a Person's Nature, Fortune, or Disorders, by the Lineaments of his Face; from φύσις, Nature, and γινώσκειν, to know.

PHYSIOLOGIA, φυσιολογία, from φύσις, Nature, and λόγος, to treat of Physiology. That Branch of Medicine, which considers Nature, with respect to the Cure of Diseases, particularly the human Body, its Parts, Structure, Health, Life, Functions, and Oeconomy.

PHYSOCELE, from φύσα, a Flatus; and κύλη, a Tumor. A Wind-rupture.

PHYSTE, φύσιν. A Mals of Meal macerated, in a Vessel, in Wine, but not worked.

PHYTALIA, φυτάλια. The latter Part of the Winter. But it, also, signifies, a Place where Vines are planted.

PHYTEUMA. A Name for the *Reseda*; *minor*; *vulgaris*.

PHYTOLACCA.

The Characters are;

The Flower is roseous, polypetalous, and disposed in Bunches; the Berry is soft, globular, and full of Seeds disposed in orbicular Order.

Boerhaave mentions two Species of *Phytolacca*; which are, 1. *Phytolacca*; *Americana*; majori fructu. *Tourn. Inst.* 299. *Boerb. Ind. A.* 2. 70. *Phytolacca*. Offic. *Solanum racemosum Americanum*. *Raii Hist.* 1. 662. *Solanum magnum Virginianum rubrum*. *Park. Theat.* 347. *Solanum racemosum Indicum*. *Hort. Reg. Par.* 167. **PORK-PHYSIC**.

It was brought from *Virginia* and *New England*, and is cultivated with us in Gardens. The Leaves are used in Medicine, and esteemed an excellent Anodyne. *Dale*.

2. *Phytolacca*; *Americana*; fructu minori. *T.* 299. *Solanum Barbadosense, racemosum, minus, tinctorium, Circae foliis mollibus & incanis*. *Plukn. Alm.* 353. *Phytogr. T.* 112. *Fig.* 2. *M. H.* 3. 522. *Boerb. Ind. alt. Plant. Vol.* 2.

This Kind of Plant is called *Phytolacca*, from φυτὸν (*Phyton*), a Plant; and *Lacca*, because it gives a red Colour like *Lacca*. The Virtues are yet unknown. *Hist. Plant. adscript.* *Boerb.*

PHYTOLOGIA, φυτολογία, from φυτὸν, a Plant, and λόγος, to treat of. That Part of Pharmacy which treats of Plants.

PHYXIMOS, φύξιμος. An Epithet of Diseases in *Hippocrates*, importing salutary, or of which a Person is likely to recover.

PIA MATER. The thin Membrane which immediately involves the Brain. See **CAPUT**.

PIANTERIA, πιαστήρια. Aliments which increase Fatness, and Corpulence.

PIATTONES. Crab-lice.

PICA. Offic. *Schrod.* 5. 323. *Schw. A.* 333. *Mer. Pin.* 172. *Charlt. Exer.* 75. *Pica varia cordata*. *Will. Ornith.* 87. *Raii Ornith.* 127. *Ejusd. Synop. A.* 41. *Aldrov. Ornith.* 1. 784. *Gesn. de Avib.* 628. *Jonf. de Avib.* 27. **THE MAGPYE**, or **PIANET**.

This Bird is very much commended against Dimness, Redness, and Pains of the Eyes, being eaten, or incinerated, and the Ashes put into the Eyes, or any other way apply'd; the Ashes are, also, exhibited in the Mania, Epilepsy, and Melancholy. *Dale*.

PICA GLANDANA, or *Glandaria*, is another Species of Magpye, supposed to be the *Pica Græca*; to which the same Virtues are ascribed, as to the preceding.

PICA is, also, the Name of a Distemper, in *Greek*, κίτλα, (*Citta*) being a depraved Appetite principally incident to Women with Child, to the End of the second or third Month of their Pregnancy. They who are affected, have absurd Longings after sour, sharp, or acrimonious Things, and sometimes after Earth, Shells, Coals, old Rags, rotten Pieces of Leather, and other things abhorrent to Nature. Men are sometimes molested with the like vitiated Appetite, which is supposed to proceed from a Collection of depraved Humours in the Stomach.

The Disease is called *Pica*, either from the Variety of absurd Longings, which bears Analogy to the Variety of Feathers observed in the *Pica*, or *Pye*, or because, perhaps, that Bird is subject to the same Disorder. The Scholiast of *Aristophanes* gives another Reason; for he says, the *Pye* is a Bird of a voracious and universal Appetite, and difficult to be pleased; that he longs after Fruits, but is soon disgusted; and, when he has eaten of this or that kind of Apple or Berry, he is presently satiated with it, and flies from Tree to Tree in Search of new Varieties: So that Women are properly said to be affected with the *Pica*, when they long for this and that kind of Food, and, when they have tasted it, conceive an Aversion to it; which Kind of Loathing is called ἀψικία, *Hapsicoria*. But however κίτλα may signify the Bird *Pica*, as well as a Disease, we have no Authority for affixing that double Signification to the Word *Pica*; for none ever called a Disease, in proper *Latin*, *Pica*. *Pliny*, therefore, always calls this Disorder *Malacia Gravidarum*, in *Greek* μαλακία, from μαλαρός (*Malacos*), soft, languid. It is defined, like the κίτλα, or *Pica*, to be a languishing Disorder incident to pregnant Women, in which they long sometimes for one thing, sometimes for another; some desire to eat Earth, dead Coals, or Terra Cimolia, as *Paulus* says, *Lib.* 1. *Malacia* is, also, a Disorder or Weakness of the Stomach; in which Sense it is used by *Pliny*, *Lib.* 28. *Cap.* 7. *Lib.* 23. *Cap.* 6. *Malacia* (*Malacia*) are expounded in *Galen's Exegetis*, aqua-

tile Animals having no Spine, as the Polypus, Loligo, Sepia, and Urlica; these have neither Blood nor Viscera; and, *Lib.* 3. *de Alim. Fac.* he describes them as having no Scales, nor rough or testaceous Skin, but soft like the human. *Pliny*, *Lib.* 9. *Cap.* 18. calls them *Mollia*, by a literal Translation of the *Greek*, and gives the same Description of them. The Place in *Hippocrates*, to which *Galen*, in his Exegetis, had a respect, since we can only conjecture, in this Case, appears to me, says *Foessius*, without all doubt, to be that, *Lib.* περί γυναικ. εἶς. where we read, καὶ στίσις μαλθακώσι, καὶ τοῖσι πολύπυσι, καὶ τοῖσιν ἄλλοις μαλθακώσιν, "with soft Foods, as Polypuses, and other soft (aquatile Animals)."

The *Pica*, according to *Riverius*, in *Lib.* 9. *Cap.* 3. *Prax. Med.* is such a Depravation of the Appetite, as excites the Patients to an uncommon and preternatural Fondness for absurd, useless, and hurtful Aliments.

This Disorder is produced by depraved and corrupted Juices, either generated in the Stomach, in consequence of an undue Concoction, or convey'd to it from other Parts.

Humours of this Kind are, for the most part, generated in Persons of phlegmatic and melancholic Habits, and especially in Women, to whom this Disorder seems, in a manner, peculiar, tho' Children and Men are sometimes, tho' very rarely, afflicted with it. Humours of this Kind are principally generated by the Use of bad Aliments; a Suppression of some natural Evacuation, and especially of the Menes, Grief, Disorders, Obstructions, and Weakness of the Liver and Spleen, and various Diseases of the Uterus.

These corrupted Humours are of various Natures and Qualities, according to the various Degrees of their Corruption and Intemperature. Hence arise various Inclinations to various, absurd, and improper Aliments; for since some of these Humours are crude and unconcocted, and others of an hot and inflammatory Quality, so some are fond of acid, austere, bitter, and highly-cold Substances, such as unripe Fruits, Vinegar, Verjuice, the Juices of Oranges, Pomegranates, and Lemons, cold Water, Snow, and Ice; whilst others cover earthy, dry, and hot Substances, such as Cloves, Cinnamon, Nutmegs, and other Aromatics, Salt, Ashes, and Plaster.

This Disorder is familiar to young Women labouring under a Chlorosis, and to pregnant Women, on account of the Suppression of the Menes; which, by remaining long in the Body, assume a peccant Quality; and being convey'd to the superior Parts, load the Stomach with that corrupted Humour which depraves its Actions, and perverts the Appetite. Sometimes Children, especially those born of Mothers labouring under a Chlorosis, are subject to this Disorder. Nor are Men totally exempted from this Misfortune, tho' they are but rarely afflicted with it, and those Men are most subject to it, who are of a melancholic Habit, labour under Obstructions, or a Suppression of the hæmorrhoidal Discharge.

The Diagnostic of this Disorder is sufficiently easy; for by the bare Relation of the Patient, 'tis certain, that the Part principally affected is the Mouth of the Stomach, which may be said to be the Seat of Appetite. The Cause may, also, be conjectur'd at from their being fond of Substances of a similar Nature with the peccant Humours in the Stomach; for if they are fond of Coals, Salt, and other Things of a like Nature, we may conclude, that saline and hot Humours produce the Disorder. But this Conjecture will be converted into Certainty, if any Quantity of these Humours is thrown up by Vomit, or discharged by Stool; or if acid, or nidorous Eructations are present, or a bitter acid, or saline Taste perceived in the Mouth.

As for the Prognostic of this Disorder; it is of the chronical Kind, but not very dangerous; since, in Process of Time, the peccant Humour is removed by frequent Vomits, or other proper Medicines, and the Menes, or hæmorrhoidal Discharge, a Suppression of which, laid the Foundation of the Disorder, are at last restored. But if these are neglected till Nature is too much weakened, terrible Disorders may succeed; for when the first Concoction is vitiated, the second and third must necessarily be so too. Hence violent Obstructions, Cachexies, and Dropsies happen. Or if the Quantity of the peccant Humour, lodged in the Stomach, is very great, or its Quality highly malignant, it sometimes produces terrible Cardialgias, which terminate in Deliquiums, Syncopes, and sometimes in Death.

If Women, labouring under this Disorder, begin to abstain from the improper and absurd things they were fond of, and with less Reluctance use laudable and wholesome Aliments, it is an infallible Sign of a beginning Cure, and approaching Health.

Pregnant Women are generally freed from the *Malacia* about the fourth Month, because the Fœtus, becoming at that time larger, consumes a greater Quantity of the Humours, and the Mother, by frequent Vomiting, throws up the Sordes lodged in her Stomach. But if the Disorder continues any longer, it is dangerous; for 'tis a Sign, that the peccant Humours are deeply rooted, and cannot be eliminated without Difficulty.

'Tis better that Persons, labouring under this Disorder, should be fond of acid and sharp-tasted Substances, than of such as are directly unfriendly to Nature; as *Avicenna* informs us, in *Fen.* 13. *Lib.* 2. *Traft.* 2. *Cap.* 20. for a Fondness for the latter indicates a greater

greater Recess from a natural State, not to be cured without great Difficulty.

The Cure of this Disorder is to be varied according to the different Constitutions of the Patients.

In pregnant Women, very few Medicines are recommended as proper, for fear of Abortion. However, even in these, gentle Medicines may be used for evacuating and corroborating the Stomach. Nor is moderate Venection, frequently repeated, to be neglected, if there is a Necessity for it, since it is of great Efficacy in the Cure of this Disorder.

In young Women labouring under a Chlorosis, this Disorder is cured by the same Medicines which are proper for removing the Chlorosis.

As the Pica in Men, which, however, rarely happens, proceeds from Obstructions of the Liver and Spleen, it must of course be removed by every thing which removes these Obstructions.

According to Doctor Pittcairn, in his *Element. Med. Lib. 2. Cap. 18.* in this Disorder, such Things as obtund Acids, are to be prescribed; fixed Salts; mucilaginous, oleous, and pinguous Substances; the Effects of all which are to hinder the free Contact of the Coats of the Stomach with each other. For answering this Intention, he himself orders viscid Substances, and such as remain long in the Stomach.

Thus, for Aliments, he prescribes Gellies of Hartshorn, Broths of gelatinous Fleashes, and other things of a like Nature.

For Drink, he orders *Spanish* and *Canary* Wines, moderately drank; and especially *Brunswick* Mum, or *Dutch* Hydromel, prepared of one Part of Honey, and six Parts of Water.

PICACISMUS. The same as PICATIO.

PICANS. An Epithet for Wine, importing, that it is of a sweet delicious Flavour.

PICATIO. Pication. A Species of *Dropax*. For this Purpose, dry Pitch is melted with a very small Quantity of Oil, and applied to the Skin whilst warm. This Preparation adheres strongly to the Parts previously shav'd, and is to be pull'd off, before 'tis perfectly cold. Then it is to be warm'd at the Fire, applied in the same manner, and pull'd off, before 'tis entirely cold. This Method is to be repeated very often. This *Picatio*, or *Dropax*, is highly beneficial to Patients afflicted with continual Vomiting, Crudities of the Stomach, Indigestion, and the Cœliac Passion. It is, also, properly applied to Parts not duly nourished by the Aliments. When 'tis requisite this common *Dropax* should be heating, we add to it Pepper, Pellitory of Spain, Rosemary-seeds, and Bitumen: When we want it of a drying Quality, we add to it native Sulphur, Salt, and the Ashes of Vine-twigs. If we intend it should be of a stimulating Nature, we add *Limnestis*, commonly call'd *Ardate*, or *Euphorbium*. All these Ingredients, when triturated, are to be sprinkled into the melted Pitch and Oil. *Aetius, Tetr. 1. Sermon. 3. Cap. 180.*

PICATIO, also, implies the same as PICA.

PICATUM VINUM. See PISITES.

PICEA. See ABIES.

PICERION, *πικέριον*. Butter. *Hippocrates, Galen.*

PICINUM OLEUM. The same as PISSELEUM.

PICOTA. A Distemper, consisting of an Eruption of very minute red Pustules. *Castellus.*

PICRIS. A Name for the *Cichoreum Sylvestre*, five *Officinatum*.

PICHROCHOLOS, *πικρόχολος*, from *πικρός*, bitter; and *χολή*, Bile. A Person abounding with bitter Bile. *Hippocrates*. Sometimes it signifies a Person very subject to Anger.

PICTONUM COLICA, or COLICA PICTONIA, or PICTA-VINSIS. The Name of a nervous Colic, generally called, in the West-Indies, the dry Belly-ach. This is so popular a Disease in the Leeward Islands, that it may, very justly, be reckon'd an Endemic in them, most People there, at one time or other, having felt its Cruelty.

There is not, in the whole Compass of Infirmities, to which Flesh is liable, any one that afflicts human Nature in a more exquisite Degree, than this unmerciful Torture. The Belly is seized with an intolerable piercing Pain, sometimes in one Point only, and sometimes in several Parts of the Intestines. In a short time, the Affliction becomes more diffusive, and stretches itself from the Point where it was first felt, to a greater Distance; which is done in such a manner, that the Fibres of the Bowels seem to be contracted, and drawn up from the Anus, and the Pylorus, towards the Part primarily affected, as into the Centre of Misery: During this Scene of the Distemper, which sometimes lasts eight, ten, or fourteen Days, the Patient is upon a perpetual Rack, with scarce any Remission from Pain. He undergoes all the various Modifications of Torment; and the burning, lancing, and biting Pain, by turns afflict him with a Diversity of grievous Sensations. The Belly continues, all this time, obstinately costive; very little Urine is made; the Strength is greatly impair'd; the Habit exceedingly wasted; the extreme Parts are cold; and the Patient frequently falls into clammy Sweats and Deliquia. The Affections of the Mind are much disorder'd; Grief, Anger, Rage, and Despair, usurp the Place of Reason; the vital, natural, and animal Functions, are perverted; and the miserable Patient, at length, sinks under the Agony of his Affliction.

The principal Causes concurring to the Production of this Colic are, immature, austere, and astringent Fruits, eaten in too great Quantities; debauching in strong Punch, highly acidulated with the Juice of Lime; and travelling in the Night, after too free Ingestion of spirituous Liquors.

When the Extremity of the Pain begins to abate, the sick Person often observes a sort of tingling Uneasiness through the spinal Marrow; which propagates itself from thence to the Nerves of the Arms and Legs, which, at this time, are very weak and debilitated. This Weakness and Inability increases daily; till, in a short time, it terminates in a confirm'd Palsy of the Extremities. The sudden Transition from the Colic to a Palsy made Dr. Willis conjecture, that the Nerves of the Mesentery were principally affected in this Disease.

In order to subdue this dire Distemper, and prevent the paralytic Consequences of it, we must employ our utmost Endeavours to remove the Constipation of the Bowels, and solicit them to a Discharge. But this is not, upon any account, to be attempted by strong stimulating Cathartics, which, by their forcible and repeated Irritations, would vellicate and contract the Fibres of the Guts, enrage the Pain, create convulsive Motions of the Bowels, hasten on the Palsy, or change the Disease into a *Miserere Mei*. The mild, lenitive, detergent Purges are, therefore, to be relied on in this Exigency, and they ought to be given in liquid Forms, small Quantities, moderately warm, and frequently repeated, till they slide through the Intestines, and procure a Stool.

But it is almost impossible, that this should be effected, so long as the Bowels continue under such spasmodical Disorders as they are now in: We must, therefore, have a due Regard to the mitigating this Inconveniency. There is not any Preparation of Opium so effectual in this Case, as the *Pil. Matthæi*, which receives a prodigious Advantage from the aperient Quality of the *Sapo Tartareus*.

It has been a received Opinion, that Opiates, in this Distemper, have often proved the Occasion of the paralytic Consequences which have ensued; but I am fully convinced from undoubted Experience, that this Observation is erroneous, having always found the desired Success from the Administration of them, tho' given with a liberal Hand. However, it may not be improper, in these Cases, to add three or four Grains of Castor to each Dose of the *Pil. Matthæi*.

The Method by which I have relieved many in this dreadful Distemper, is as follows. As soon as I came to the Patient, I order'd eight or ten Grains of the *Pil. Matthæi* to be given him; and, about half an Hour after, half an Ounce of Manna, two Drams of Cream of Tartar, and one Ounce of solutive Syrup of Roses, in warm Water-gruel; and this is to be repeated every three Hours, allowing four Grains of *Pil. Matthæi* to be administered in the Intervals. But if the great Propension to vomit should render the Stomach incapable of retaining the laxative Draught, so that no Operation is to be expected from it, then it will be necessary to appease that Symptom with the following, or some other Mixture of the like Kind, before we proceed any farther.

Take of Salt of Wormwood, one Scruple; pure Opium, a Grain, or a Grain and half; strong Mint-water, an Ounce; Syrup of Lemons, a Spoonful. Mix them together.

A Clyster is, also, to be injected once in four Hours, till the Body becomes soluble. These Clysters should always admit of Balsamics in their Composition, and may be made in the following manner.

Take of common Decoction, eight Ounces; Balsam of Capivi, dissolved in Yolks of Eggs, two Drams; Soap of Tartar, one Dram; Oil of Anise, two Drams. Mix them together.

In the mean time, warm Fomentations are to be applied all over the Region of the Abdomen; with Flannel Cloths.

Take of Chamomile-flowers, three Ounces; Juniper and Bayberries, each an Ounce; boil them in five Pints of Spring-water, to three. At the End, add of Caraway, Fennel, and Anise-seed, each half an Ounce; dissolve in the strain'd Liquor, a Dram of Opium; and add a Pint of Rum.

A Semicupium, or Bath, made with the Leaves of wild Sage, Lavender, Rosemary, Chamomile, and other warm, nervous Plants, often help to alleviate the Pain, and afford considerable Relief to the distress'd Patient.

When the Pains begin to be mitigated, and the Body is somewhat open, it will be time to proceed to Purges of greater Efficacy; and chiefly, such as are compos'd with a Mixture of Mercurial Preparations.

Take of Calomel, a Scruple; the smaller *Pil. Cochizæ*, a Scruple; Opobalsamum, enough to make them into four Pills; to be taken in the Morning, and repeated every Day, till the Pain remits, and the Body becomes soluble.

Opiates

Opiates may now be laid aside, unless the Urgency of the Symptoms still require the Continuance of them; or, at least, their Quantity may be lessened; and, in their stead, the Patient is to take two Scruples of Balsam of *Peru*, with Loaf-sugar, or in any other convenient Form, every six Hours: This Medicine will rarely be found to fail, when given at a proper Time of the Disease, and in a sufficient Dose; which has been too long neglected in Practice.

There is another Production of Nature, which Providence has plentifully bestowed on this Island, I mean the *Pisselæum Indicum*, or the *Barbadoes Tar*, as it is commonly called: This indeed is not so elegant to the Taste and Smell, as the fore-mentioned Balsam; but, where the Stomach can comply with it, I am sure it is of much greater Efficacy in this Distemper. I need not, surely, use many Arguments, to prevail with any Person under these Circumstances, to divest himself of Prejudices to a Remedy, which will so powerfully conduce to his Ease and Safety; for a Man must be strangely Palate-ridden, who will endure the highest Aggravations of Torture, and run the Risk of disabled useless Limbs, for the Gratification of Taste. I would, therefore, advise, that two Drams of this *Pisselæum* be given three times a Day, till the Disease be totally vanquished.

Upon the first Apprehension of the tingling Uneasiness along the Spinal Marrow, or the Numbness and Inability of the Limbs, the whole Length of the Vertebrae, as well as the Limbs, ought to be well chafed with a Mixture of this Tar, in double-distilled Rum, which will (if any thing in Nature can) avert the impending Paralysis.

This is a Method which I have successfully used, in a Malady which was generally attended with such fatal Consequences, under a different Management; and I could not forbear making it public, for the Benefit of an Island which has laid me under the strongest Obligations of Gratitude.

When the Palsy has been actually formed, either from injudicious Treatment, or the Violence of the Distemper, I have not been able to discover any means effectual enough to remove it, unless the Patient would be prevailed upon to leave the Island, and repair to *England*, where *Bath Waters* taken inwardly, and applied to the affected Parts by Pumping, with other proper Remedies, have often perfected the Cure. *Towne's Diseases of the West-Indies*.

PICUS MARTIS. The Woodpecker: A Bird of which there are many Species, besides that commonly known in *England*. It has the Reputation of being good for the Eyes, and to preserve and improve Vision: For this Purpose it is eaten dressed, or boiled in Soup: It is, also, applied to the Eyes; and the Blood is dropped into them, with the same View.

PIERRE DE COLIQUE. See *UMBRA*.

PIESMA, *πῖσμα*, from *πίσσω*, to press. The *Magma*, or Residuum, which remains after the fluid Part is pressed out: Thus, in the Expression of Oils, the Cake, or what remains in the Bag, is called the *Piesma*; and in this Sense it is used by *Hippocrates*. But *Dioscorides*, *Lib. i. Cap. 106*. speaking of Bay-berries, calls their expressed Juice *Piesma*: And it is used by *Galen*, in the same Sense.

PIESTER, *πῖστης*, or *πῖστης*, a Press; from *πίσσω*, to press.

PIESTRON, *πῖστρον*, from *πίσσω*, to press. An Instrument recommended by *Hippocrates*, for breaking the Bones of the Head of a Fœtus, when too large to be otherwise extracted: It should seem to be a Sort of Forceps.

PIGMENTARIUS. A Vender of Ointments. *Rhodus ad Scribon. Largum*. An Apothecary, or Druggist.

PILA. A Ball. See *SPHÆRA*. It, also, signifies a Mortar, or a Pestle.

PILA MARINA. This is a Species of Alcyonium, or a round spherical Ball, found on the Sea-coast, among the Wrack. It is generally as large as a Person's Fist, but sometimes larger, and sometimes less: It is lanuginous, of a dark Colour, and formed by a Collection of Hairs, Sand, and other Impurities of the Sea, united by means of some glutinous Liqueur. It is said to be proper for killing Worms, and preserving the Hairs, when applied externally. *Lemery des Drogues*.

The *Pila Marina* cannot be reduced to a Powder; till it is thoroughly calcined. Authors are of Opinion, that this Substance is good against scrophulous and strumous Disorders, not only on account of its drying Nature, but, also, in consequence of some other latent Quality. Neither can I totally reject this Opinion, since it is a Substance, whose saline Quality is not destroyed by Calcination. *Zwelfer*.

PILARELLA. The same as *PELADA*.

PILARIS MORBUS. The same as *TRICHIASIS*.

PILATIO. A minute Fissure of the Cranium, not larger than an Hair.

PILEUS, or **PILIOLUS**. See *CUCUPHA*. In Anatomy, the Coif with which some Children are born, is called *Pileus*, *Pileulus*, *Galea*, and *Vitta*.

PILI ZENIL. The Hairs which grow about the Scut of an Hare. *Rulandus*.

PILIMICTIO. A Discharge of Substances resembling Hairs, with the Urine. See *TRICHIASIS*.

PILIPOC *Philippinarum Insularum*. *Nieremb*.

This Plant is of two Kinds, the Male, and the Female: The first is the greater, and has larger Leaves, and grows among Rocks; the other, or Female, is less, and grows in Plains: On the Roots of them both grow dark-coloured Tubercles, of the Bigness of a Man's Fist: The Trunks, which are of a dark-brown Colour, and without Joints, being cut athwart, are divided into a sort of Pellicles, like the Membranes or Coats of Onions: The Leaves are like those of Bay, and are remarkably acuminate; are produced in a moist and shady Situation, and roll themselves about the Trees. The Root is of Use for venomous Bites, and in Potions; but is slow in Operation. *Raii H. P.*

PILORIS. A very large Species of Rat, found in *Martinitico*, which smells like Musk. The Inhabitants eat them: But they are of no Use in Medicine.

PILULA. Pill.

The Form of Pills is principally designed for such Things as are too nauseous to be taken any other Way; or are most readily fitted, by their natural Texture, to this Kind of Management: Of the first Kind are the *Aloes*, *Colocynth*, and the like, which are thus best concealed from the Taste; and of the latter are most Gums, which, with very little Trouble, are reduced into Pills.

But this Form being generally the most troublesome to take, as few Things should be contrived into it as possible; that is, such only as, by their Irksomeness in going down any other Way, make it necessary to conceal them by this means. But this Reason ought to extend only to such Things, which are of sufficient Efficacy, not to make above four or five small Pills for a Dose. Thus, the Bark, in Powder, and all the lighter Species, which are given in the Quantity of half a Dram, or upwards, for a Dose. If, to avoid the Irksomeness of other Forms, Recourse should be had to this, a necessary Quantity of Moisture, to reduce them into it, would make one Dose into ten, twelve, or fifteen ordinary Pills, which are more than any one can be imagined well to get down; for half a Dram in the Mass makes five middle-sized Pills, and half a Dram of dry Powder will take up above double its Quantity of Syrup, to bring it into a Mass of due Consistence. The gummy Substances, indeed, are thus reducible by Liqueur, which will but little increase their Bulks; and for this Reason, also, they have a peculiar Fitness for this Form.

But there are some Things absolutely unfit for Pills, by reason of their natural Texture and Properties, except in small Quantities; and these are all the volatile Salts, and most of the fixed ones. The first heave and ferment them into unreasonable Bulks; and the last render a Mass so brittle and crumbly as make it almost impossible to be worked into Pills; though both these Inconveniencies may, in some measure, be avoided, by contriving to mix with either of these Salts other Things which are very tenacious, as some of the Extracts and Gums; and this makes the *Pilulæ Ecphrasticæ*, now directed in the Dispensatory, at first of a tolerable Consistence.

One very material Thing, likewise, to be considered in this Form, whether officinal or extemporaneous, is, that the Liqueur or Moisture, wanted to give a Consistence, have the most convenient Fitness to the Thing requiring it. Thus dry light Powders will not make up with any thing thinner than Syrup; and some of the heavy ones, as *Cinnabar*, and most of the Mercurials, will hardly do with any Moisture of a lower Consistence than Honey or Conserve. But the gummy Substances, especially those which most approach to an oily or resinous Texture, as *Galbanum*, *Opopanax*, *Myrrh*, and the like, will not so well make up with Syrups or Conserve, not only on account of increasing their Bulks too much, but because they will not so well incorporate with them, as with spirituous and more penetrating Liqueurs. As this Form, therefore, must have somewhat in it adhesive and tenacious, where it is not in the dry Substances, it must be sought for in a proper Moisture to hold them together; and where it is sufficiently already in those Substances, as in the Gums, the thinner Liqueurs are best, to give them a Consistence, or such as are better suited to incorporate with them, than aqueous Moistures, as the terebinthinous Balsams; for some fat Substances will refuse a Syrup, at the same time that they will readily take in Turpentine, or any thing of like Disposition.

Among the officinal Pills, there are but few that do not take in something purging, and those are as follow: The *Pilulæ Gummosæ* were never in the *London Dispensatory* before, tho' long ago in some others; so that it may not, perhaps, be yet much brought into the Shops; but it is a very uniform Composition; only the *Mithridate* will not so readily incorporate with

with such Materials as Spirit of Castor, or any terebinthinous Substance. Such things are, likewise, sooner brought into a Mass, with a Mortar a little warmed. The Storax-pill has stood long approved for an excellent Composition; by the frequent Prescription of it in Catarrhs, and such-like Defluxions; but the Texture of its Materials, though most of them gummy, partake so little of an oily Principle, that they readily make up with a Syrup into a very good Consistence. The Pilulæ de Cynoglossæ are calculated for the same Intentions, and hardly to be known from this in the Mass, the Ingredients being nearly the same in both; but the Storax-pill is generally preferred, as a shorter and more uniform Composition. The Laudanum is subject to grow brittle, and sometimes a little mouldy at the Top; both which are prevented by keeping it close from the Air. The Quantity of Opium is much better ascertained in this, than in any liquid Forms; and, with a little Trouble, this may be dissolved into Draughts for extemporaneous Uses, though it is the most ready for a Bolus, or Pills.

Among those which take in Cathartics, some do it so sparingly, that they ought rather to be deemed Alterants than Purgers; such as the Aloephanginæ Foetidæ, and Stomachicæ cum Gummi; all which so abound with Ingredients of other Intentions, that the purging-ones are almost lost in them. *Saxenius* finds great Fault with the first of these; but it is so very little used now, that it is hardly worth a critical Examination here; and especially as the Tinctura Sacra is a Medicine much better contrived for the same Intentions, on all Accounts, both for Taking and Efficacy. The Pilulæ Foetidæ cannot be justified for a very uniform Composition; but, in the main, it takes in so many Things which are efficacious in hypochondriacal, hysterical, and other nervous Disorders, that it is generally used with Success; but if so much of the Juice of Leeks be applied in dissolving the Gums, that it wants but little of the Syrup to bring it to a Consistence, it will be very subject to grow mouldy with keeping. In this, and all other Compositions which take in Ingredients so different in Textures, all that will powder, ought to be so reduced together; and, when the Gums are strained, after dissolving them with a moderate Heat, in the Liquor directed, they are put together in a Mortar, and beat into a due Consistence, with a proper Quantity of Syrup. The Oil of Amber, or any thing else of like Nature, is best rubbed first into the dry Powders. The Pilulæ Stomachicæ cum Gummi continue to be sometimes ordered; but they are not so much esteemed as they were formerly; the Tinctura Sacra, also, taking place of it to better Advantage. There are, likewise, some other Cathartics of weak Efficacy, from their Mixture with other Things, which are so little used, that they deserve not much Examination; as the Pilulæ de Agarico, de Aloe lota, de Ammoniaco Magistrales, Cochiae majores, Diambrae, and Mechocanna; all which are hardly ever made or prescribed. The Pilulæ Ecphracticæ, for the Reasons already given about Salts contained in Pills, are of so brittle a Consistence, that they, likewise, are seldom to be met with in the Shops, or in Prescription. The same Disadvantage, also, have the Pilulæ de Rhabarbaro, de Scammonio, and Tartaræ.

The Pilula Ruffi is the only one in this Rank, which is much approved in common Practice; and indeed its Ingredients are so few, and those so good in the Intention of a gently purging Stomachic, that they very well deserve this Preference. This, and the Elixir Proprietatis, take in the same Ingredients, and differ in little else than their respective Forms: This Pill, as to its Goodness, is so much judged of by its Colour, which is coveted of a bright yellow, that most, if not all, Compounders bring it to a Consistence with Syrup of Lemons, which much improves it in that respect, instead of Syrup of Wormwood, which would greatly hurt it.

Among the most efficacious Purges, and those most commonly in Use, are the Pilulæ Cochiae minores, e duobus, and Pilulæ Rudii. The two first differ in little else, than in one's having the Aloes, and the other not, which makes the latter stronger, the Colocynth and Scammony being most powerful Cathartics. The Goodness of both is judged by the strong Scent of the Oil of Cloves, which, being the most chargeable Ingredient, is most likely to be limited in its Quantity. The Pilula Rudii is of the same Contrivance as the Aloephanginæ; but is not so crowded with unnecessary Ingredients, and, therefore, takes in the efficacious ones in larger Quantities, so that its Operation is brisk enough in a Dose of half a Dram. But, in the common Way of making the Spirit, necessary to extract the Spices, and other hard Ingredients, most of it is drawn over before the Scammony and Aloes are put in; and after that it is distilled, so that the Remainder is near in the State of an Extract, or about the Consistence of a Syrup, the Aloes is melted in it, and the Scammony sifted in, when powder'd. The Pilulæ de Gutta Gamandra have nothing difficult in their Composition, but are of a more brittle Consistence, and more liable

to gripe in their Operation, upon account of the vitriolated Tartar, than they would be without it: Though this seems to be put into many of this Class, which abounds with resinous Ingredients, as a means to divide them; but it is extremely racking to the Stomach and Bowels, and seems to be well supplied by the common Salt of Tartar.

There is not much to be learned from Examples of occasional Prescription in this Form, besides what is common to every Form; for there is required nothing particular here, more than what hath been already taken notice of, concerning a proper Consistence, and the not exceeding a certain Number in a Dose.

PILULÆ DE AGARICO: Pills of Agaric.

Take of the Troches of Agaric, one Ounce; the Species of Hiera, half an Ounce; Myrrh, six Drams; Syrup of Buckthorn, a sufficient Quantity to make into a Mass for Pills: The Dose is from a Scruple to a Dram.

PILULÆ ALOEPHANGINÆ. See ALOEPHANGINÆ.

PILULÆ DE ALOE LOTA. See ALOE.

PILULÆ DE AMMONIACO MAGISTRALES. See AMMONIACUM.

PILULÆ BALSAMICÆ. See CYTISO-GENISTA.

PILULÆ COCHIAE MAJORES ET MINORES. See COCHIA.

PILULÆ DE CYNOGLOSSO. See CYNOGLOSSUM.

PILULÆ DIAMBRAE: Pill Diambra.

Take of new Gum Guaiacum, and the rosated Aloes, each three Drams; simple Hiera Picra, a Dram and half; Mastich, a Dram; the Species Diambrae, without the Perfumes, half a Dram: Let these all be reduced into a fine Powder; and, with a sufficient Quantity of Peruvian Balsam, be made into a Mass of a due Consistence for Pills.

PILULÆ E DUOBUS: Pills of two Things.

Take of Colocynth and Scammony, each an Ounce; Oil of Cloves, half a Dram; Syrup of Buckthorn, a sufficient Quantity to make into a Mass of a due Consistence for Pills. The Dose is from fifteen Grains to half a Dram.

PILULÆ ECPHRACTICÆ: Ecphractic Pills.

Take of Gentian, Rhubarb, Gum Guaiacum, Salt of Steel, and Salt of Wormwood, of each one Ounce; of the Pilulæ Aloephanginæ, two Ounces; Syrup of Buckthorn, a sufficient Quantity, to make all together into a Mass of a due Consistence for Pills. The Dose is from fifteen Grains to half a Dram.

PILULÆ FOETIDÆ: The fetid Pills.

Take of Aloes, Trochisci Alhandal, Opopanax, Ammoniacum, Sagapenum, Myrrh, and the Seeds of Rue, of each five Drams; of Scammony, and Asa-fœtida, of each three Drams; of Turpeth-root, half an Ounce; of the lesser Spurge prepared, and Hermodactyls, of each two Drams; of Ginger, one Dram and an half; of Spikenard, Cinnamon, Saffron, and Castor, of each one Dram; of Euphorbium prepared, one Scruple; of rectified Oil of Amber, half a Dram: Let the Gums be dissolved in the Juice of Leeks, and strained; then add the Powders, and mix them well together, and make into a Mass, with a sufficient Quantity of Syrup of Buckthorn.

These are the *Pilula fœtida majores* of *Mesue*, and which our College transcribed exactly into their first Dispensatory, as, also, it is in the *Augustan* in the same manner; but, on a Review, the Bdellium hath been expunged, as having no Virtues corresponding to the Intention of the Whole; the Euphorbium hath been, also, lessened by half its Quantity, because of its excessive Heat and Pungency. Some other small Alterations are, also, made, that are not of Moment enough for any particular Notice. *Quercetan* hath a Composition under the Title of *Pilula de Euphorbio*, not greatly unlike these, and which are transcribed by *Schröder*, who hath, in Book 4. taught many Ways how to correct the Euphorbium, as by baking it in a Citron or Lemon, or dissolving and washing it with various Acids; which Means are imagined to abate its caustic, fiery Nature. The *Augustan* Dispensatory, also, orders it, for the same End, to be reduced to a kind of Pulp, or Mass, with Oil of sweet Almonds, and then macerated warm in any acid Juices; but the Quantity it is here so reduced to, requires no such great Trouble. *Zwelfer* greatly recommends this Composition in arthritic Affections, and cutaneous Foulnesses, besides many other Cases;

Cases; and the present Practice gives some Reputation to its Virtues, by directing it sometimes in nervous and hysterical Disorders, to which last Intention the College seem to have had a particular Regard, by the Addition of *Asa-fœtida*, which was never in it before: But the Mafs is somewhat difficult to keep, without moulding; which seems owing to the Juice of Leeks used for dissolving the Gums, and not giving Body enough to keep it from drying: The best way is, to confine it in an oily Bladder, and a leaden Pot. This is a well-contrived Purge, of all kind of Humours which lay a Load upon the Nerves, and the principal Spring of the Animal Machine; for it is full of hot and penetrating Parts; and, as the Scammony acts as a Cathartic in the more open Passages, others carry the same Quality into the remotest Recesses, and clear away watry and pituitous Humours from all the Glands and Capillaries; but particularly those mucous Foulnesses, which frequently disorder the Womb. For these Reasons this is a notable Purge in all Disorders of the Head, as Apoplexies, Epilepsies, Palsies, and the like, for hypochondriacal and splenic Affections; and promotes the uterine Cleasings, so as to assist in the Cure of most Complaints from that Quarter. Rheumatisms, Schrophulas, and the Gout, it is calculated for; and the most extreme Parts will be drained of their Superfluities by it. But, for these extraordinary Purposes, it is to be frequently repeated, and to be given in small Doses, that it may not run off too fast by Stool; for the more such things are brought to the Operation of Alteratives, the more effectual are they to answer any Intentions of Moment; an Alterative in the Blood-vessels operating by the same Means as a Cathartic in the Bowels: The general Dose is from one Scruple to four Scruples.

PILULÆ GUMMOSÆ: The Gum-pill.

Take of Opopanax, an Ounce; of Gum Ammoniacum, Galbanum, and Sagapenum, of each half an Ounce; of Myrrh, two Drams; of *Asa-fœtida* and Castor, of each three Drams; of Oil of Amber, one Scruple; of Mithridate, a sufficient Quantity to make into a Mafs of a due Consistence for Pills: The Dose is from fifteen Grains to half a Dram every Night, or oftener.

PILULÆ DE GUTTA GAMANDRA: The Gamboge-pill.

Take of Rosin of Jalap, Scammony, Gamboge, and Calomel, of each half an Ounce; of Gum Ammoniacum, dissolved in the Juice of the English Orrice, three Drams; of vitriolated Tartar, two Drams; of Mastich, one Dram; of Saffron, one Scruple; of the Spirit of Turpentine, forty Drops: And make the Whole into a Mafs of a fit Consistence for Pills, with a sufficient Quantity of Syrup of Buckthorn.

This is a very rough Purge, and cannot safely be given from above ten Grains to half a Dram. It is reckoned a great Purger of Water, and is therefore principally given in Dropsies, and such-like Cachexies, that are attended with too great an Excess of Bulk; in which Case it is a powerful Medicine, but is not often prescribed.

PILULÆ MECHOCANNAE: Pills of Mechoacan.

Take of Mechoacan-root, half an Ounce; of Turpeth, two Drams; of the Leaves of Mesereon, macerated in Vinegar, and dried, of Dwarf-elder-seed, and the Troches of Agaric, of each two Drams; of the Spurge-root prepared, and Mastich, of each one Dram and an half; of Mace, Cinnamon, and Sal Gem, of each two Scruples: Let all these, clean-powdered, be made into a Mafs, with White-wine, and that dried and powdered again; and lastly, be beat up into a Mafs, of a Consistence fit for Pills, with a sufficient Quantity of Syrup of Buckthorn.

PILULÆ DE RHABBARBARO: The Rhubarb-pills.

Take of Rhubarb, one Ounce; of Resin of Jalap, and Tartar of Vitriol, of each two Drams and an half; of the chymical Oil of Nutmegs, half a Dram; of the thinner Extract of Gentian, a sufficient Quantity to make them into a Mafs of a fit Consistence for Pills.

PILULÆ RUDII.

Take of Colocynth, six Drams; of Agaric, Scammony, black Hellebore-root, and Turbeth-root, of each half an Ounce; of Succotrine Aloes, one Ounce; of Cinnamon, Mace, and Cloves, of each two Scruples: Let the Colocynth be cleared from its Seed, and cut small, the Agaric shaved into Chips, and the Hellebore, Turbeth, and Spices, be grossly bruised; and, pouring upon them four times as much Spirit of Wine, let them macerate four Days together in a moderate Heat; then strain and press out hard the Liquor, in which dissolve the Scammony and Aloes, after

they have been before duly cleansed; last of all, put the Whole into an Alembic of Glass, and draw off so much of the superfluous Moisture, as will leave the Remainder as thick as Honey, for a Mafs to be made into Pills.

It may be given from fifteen Grains to two Scruples, and is effectual for all the Purposes the *Aloephagina* stand recommended for. This, at present, is in great Esteem in the Shops for an Head-purger; and it is, indeed, the principal Pill in Use in most Cases where Cathartics are prescribed in this Form.

PILULÆ RUFFI five COMMUNES: Ruffy's, or the Common Pill.

Take of the best Aloes, two Ounces; of choice Myrrh, one Ounce; of Saffron, half an Ounce: And make them all together into a Mafs, of a Consistence fit for Pills, with a sufficient Quantity of Syrup of Wormwood.

This is accounted a good Stomach-purge, and with good Reason; for it greatly warms and strengthens it; and but very gently purges: It is peculiarly good in cold Constitutions and Indigestions, and will many times, without other Help, cure a Green-Sickness; in which Case it greatly promotes the menstrual Discharges, and opens uterine Obstructions: It may be given from fifteen Grains to one Dram; but this is not so fit for a Catarrh, as an Alterative; and therefore ought rather to be given in moderate Doses, and be long continued:

PILULÆ DE SCAMMONIO: Pill of Scammony.

Take of Jalap-root, one Dram; of Scammony, and Vitriol of Tartar, of each one Scruple; of the chymical Oil of Nutmegs, six Drops; the more liquid Extract of Gentian, a sufficient Quantity to make into a Mafs for Pills. Its Dose is from one to two Drams.

PILULÆ STOMACHICAE CUM GUMMIS: Stomachic Pills with Gums.

Take of the finest Aloes, one Ounce; of Sena-leaves cleansed, five Drams; of Gum Ammoniacum, dissolved in Vinegar of Squills, half an Ounce; of Mastich and Myrrh, of each one Dram and an half; of Saffron, and Salt of Wormwood, of each half a Dram: Make them into a Mafs for Pills, with a sufficient Quantity of Syrup of Buckthorn.

PILULÆ DE STYRACE: Storax-pill.

Take of Storax, Olibanum, Myrrh, the inspissated Juice of Liquorice, and Opium, of each half an Ounce; of Saffron, one Dram: Make them all into a Mafs for Pills, with a sufficient Quantity of Syrup of white Poppies.

Schroder says, that *S. Clossæus* used it, with great Success, to breeding Women, who were in Danger of Miscarriage from the Trouble of frequent Coughing. It is much, that the *Augustan Dispensatory*, as well as the *Pharmacopœia Regia*, hath omitted it; as it is a very good Medicine, and now much used in common Prescription against Catarrhs. There is one Grain of Opium in every six Grains of this Mafs; and therefore it ought, in the extreme Dose, not to exceed twelve or fifteen Grains. It has all the Virtues of the *Pilula de Cynoglossa*, but has somewhat more than double the Quantity of Opium in that. It is much more used, than any other of this Intention; but it ought to be with Caution.

PILULÆ TARTAREAE: The Tartar-pill.

Take of the best Aloes, three Drams; of Gum Ammoniacum, cleansed in Vinegar of Squills, half an Ounce; of Tartar of Vitriol, half a Dram: Make them together into Pills.

PILUM. A Pebble.

PILUS. An Hair. See CAPILLUS.

PIMENTA. Jamaica Pepper. See CARYOPHYLLUS.

PIMPINELLA.

The Characters are;

The Flower is monopetalous, rotated, and generally cut into four Segments, to the very Centre, and adorned with four or more very long Stamina, and herbaceous, minute, and scarce visible Bractææ; for which Reason some pronounce it Apetalous. The Ovary becomes a Fruit, which is generally quadrangular, acuminate at both Ends, and consisting sometimes of one, sometimes of two Capsules, full of oblong Seeds.

Boerhaave mentions eight Species of Pimpinella; which are,
1. Pimpinella; maxima; Canadensis; alba; spicata. *Cor. nut.* 175.

2. *Pimpinella*; *spica brevi, rubra*. *M. U.* 57. *Sanguisorba major, flore spadiceo*. *J. B.* 3. 120. *Sideritis*, II. *Discozoidis, major*. *Col. I.* 124.

3. *Pimpinella*; *sanguisorba*; *minor*; *lævis*. *C. B. P.* 160. *Tourn. Inst.* 157. *Boerb. Ind. alt.* 2. 99. *Pimpinella* & *Sanguisorba*. *Offic.* *Pimpinella bortenensis*. *Ger.* 889. *Emac.* 1045. *Pimpinella vulgaris* *sive minor*. *Park. Theat.* 582. *Raii Hist.* 1. 401. *Sanguisorba minor*. *J. B.* 3. 113. *Raii Synop.* 3. 203. BURNET.

It grows in hilly Pastures, and flowers in June, and the Leaves are in Use. The Plant is alexipharmic, vulnerary, and pulmonic; and is principally used in Catarrhs, Affections of the Lungs, a Phthisis proceeding from Erosion, in malignant Diseases, Loosenesses, and Hemorrhoids: It prevents Abortion, and is a Strengtheners: Outwardly it is of Service in all Kinds of Hemorrhages. *Dale from Schroder.*

There grows to the Root of this Plant, in some Places, a red Grain, which is used in dying a crimson Colour: Whence some take it for the Coccus, and call the Root by that Name; as we are informed by *Lacuna* and *Anguillara*.

What is related of the Virtues of this Plant, may be reduced to two Heads; first, That it is cardiac and alexipharmic: Hence the green Herb is put into Wine, to exhilarate the Heart, and to improve the Wine itself, by communicating to it an aromatic Flavour and Taste, much like that of a Melon: It preserves, also, from the Pestilence, and other contagious Diseases. In the second Place, it is an Astringent: Whence it is of excellent Service in an immoderate Flux of the Menfes, Fluxes of the Belly, all Sorts of Hemorrhages, and in drying, conglutinating, and healing Wounds and Ulcers. *Mr. Boyle* used to exhibit the Powder of the dried Herb or Root, with Sugar of Roses, for an Hemorrhage of the Nose, Spitting of Blood, and a Consumption of the Lungs; the same, without the Sugar, sprinkled on cancerous Ulcers, restrains them from spreading. *Selenander, Lib. 3. Consil. 27.* recommends a Conserve of the Leaves, with a Draught of the simple Water afterwards, for Pissing of Blood; for which Purpose, also, the candied Root, he says, may be used. An Huntsman belonging to *Henry the Second, King of France*, solemnly affirm'd, that *Pimpinella* was of such Efficacy for preventing an Hydrophobia, that whoever should eat it for some Mornings together, either in a Salad, or any other way prepar'd, would never be visited with the least Symptom of that Distemper. *Palmar. de Morfu Canis rabidi*. *Panchorius* relates, that a King of *Chabam*, after a Battle, cured fifteen thousand wounded Men with the Use of *Pimpinella*. *Raii Hist. Plant.*

4. *Pimpinella*; *Sanguisorba*; *elegantior lacinata*. *H. R. Par.*

5. *Pimpinella*; *Sanguisorba*; *minor*; *femine majore*; & *crassiore*. *Bot. Monsp.*

6. *Pimpinella*; *Agrimonioides*; *odorata*. *H. R. Par.*

7. *Pimpinella*; *spinosa*; *feu sempervirens*. *M. U.* 57. *Poterio affinis, foliis Pimpinellæ, spinosæ*. *C. B. P.* 388. *Poterium quibudam, sive Pimpinellæ spinosæ*. *J. B.* 1. 2. 410. *Χαλκοον Anguillæræ, Poterium Dalechampi*. *Clus. H.* 108. *T. Voy.* 1. 158.

8. *Pimpinella*; *major*; *Hispanica, altera*; *conglomerato flore*. *H. R. Par. T.* 157. *Boerb. Ind. alt. Plant. Vol. 2.*

These *Pimpinellas* have the Appellation of *Sanguisorba*, to distinguish them from the *Pimpinellæ Saxifragæ*, which are of a very hot Nature; but the *Pimpinellæ Sanguisorbæ* are astringent. The Plant is aromatic, gently astringent, and of excellent Service in a Relaxation of the Fibres, and a too thin and fluid State of the Blood: It is prescribed in an immoderate Flux of the Menfes, to be eaten with Bread and Butter, or drank like Tea; so used, it renders all manner of Poison of no Effect. The five first Species are commended as Preservatives against the Pestilence. *Pimpinella* is infused, also, in Wine, to be used where a Laxness of the Part requires Astringents; and there is scarce, among Vulneraries, a better Plant for repressing the Flux of Blood in an Hemoptoe: It is of singular Virtue in the Dysentery, both by correcting the Acidity of the dysenteric or peccant Matter, and by gently astringing the relaxed Fibres of the Intestines. There is prepared a Conserve of the Flowers, which is of extraordinary Efficacy in the above-said Disorders. The Leaves infused in Wine, or common Water, are good for the Stone and Gravel in the Kidneys. *Hist. Plant. adscript. Boerhaav.*

PIMPINELLA is, also, a Name for several Sorts of *TRAGOSELINUM*; which see.

PIMPINICHI, *Arbor lactescens*. *J. B.* On all the Coasts of the *Indian Continent*, says *Monardes*, there grows a small Tree, like an Apple-tree; the *Indians* call it *Pimpinichi*, from whose Branches being cut off, there immediately flows a milky Humour, somewhat thick and viscid.

Three or four Drops of this Juice, being taken inwardly, purge very strongly, Bile and Water, by Stool: It is drank in

Wine; or the Powder of it, inspissated, is swallow'd, but in a small Quantity, because of its Violence. Upon taking some Wine or Broth, its Operation is checked, and ceases on a sudden: And the same is reported of the *Indian Ricinus*. *Hernandez. Raii H. P.*

PINASTER. See *PINUS*.

PINDAIBA nonnullis Ibira. *Pison. Arbor baccifera Brasiliensis Fructu Piper respiciente*. A very tall Tree growing in *Brasil*, which, on account of its acrimonious Fruit, and other Qualities, much resembles the *Braslian Pepper*: The Leaves are small, acuminate, and like those of the Olive-tree: The Berries are green in the rainy Months, but turn red in *December* and *January*, when they ripen, and fall off; but, being dried, they turn black, and burn the Tongue, and have an aromatic Taste, being separated from the black oblong Seed contained in them, which smells of Juniper.

The Berries, eaten fasting, corroborate a weak Stomach, and discuss Flatulencies; bruised and applied, they heal the Bites of Serpents: Of the same, dried and pulverized, they prepare a Gargarism against cold Affections of the Throat: They are boiled, in order to be kept in Shops, and serve instead of Pepper, for culinary Purposes. *Raii H. P.*

PINDOVA. The Name of a Species of Palm.

PINEA. A Name for the *Ananas aculeatus*; *fructu pyramidato*; *Carne Aurea*.

PINEALIS GLANDULA. The Pineal Gland. See *CEREBRUM*.

PINEATUM. A Name for various Compositions, the Basis of which are Pine-nut-kernels.

PINEI Nuclei Maluccani sive purgatorii. *J. B. Pinus Indica Nucleo purgante*. *C. B. Pinei Nuclei Maluccani*. *Park.* There grows, says *Acosta*, in some Gardens of *Malabar*, and, also, wild in some Woods, a Tree of the Bigness of a Pear-tree, whose Leaves are of a Watry-green beneath, and of a Deep-green on the upper Face, and are very tender and soft: They are of a very acrid Taste, and vellicate the Tongue for a long while afterwards: The Fruit is triangular, of the Size of a Filbert, and divided into many Capsules, containing each a round Sort of white Seed, equal to a Pine-kernel, when taken out of its Shell.

We are to consider, says *J. Bauhine*, whether these are the cathartic Pine-nuts, of which *Monardes* gives the following Account: There is exported, he says, from *New Spain*, a Sort of Pine-kernels, with which the *Indians* purge themselves; whose Example is imitated by very many in these Countries: They are like our Pine-kernels, growing in large *Strobili*, like the beardless Ears of Mayz, with a softer and blacker Shell than ours, round, white on the Inside, fat, and sweet in Taste.

The *Indians*, as *Acosta* says, take a couple of the Kernels, peel them, and then pound them, and mix them in Clysters, against Difficulty of Urine, and the Pain of the Sciatica; or exhibit them in Cock-broth, for the Evacuation of putrid, slimy, gross, and cold Humours; and particularly for the Cure of an Asthma: They anoint the Impetigo with these Kernels, bruised in Water; and so cure it; but they are very burning. The cathartic Pine-kernels, as *Monardes* says, purge very strongly Bile, Phlegm, and Water; and, though milder than Filberts, excite Vomiting: When roasted, they operate with less Violence, and fewer Gripes: They are exhibited in chronic Diseases, and have a peculiar Virtue of evacuating gross Humours. *Raii H. P.*

PINGUEDO, *πικνὴν, πιάς, πίστις, λίπος*. Fat. See *ADEPS*. Official Fats are, also, called *Axungia*.

Fats in general are heating, moistening, emollient, abstergeing, digestive, generative of Pus, and more or less anodyne: Every Fat in particular partakes of the Nature of the Animal whence it was taken; the weakest is the Fat of Swine, because that Animal is of a cold and humid Nature: The Fat of a Calf is somewhat stronger, next that of the gallinaceous Kind, and the strongest of all is the Fat of a Goose. It is to be observed, that whenever Fat is mention'd simply, or without any Note of Distinction, we are to understand it of the recent unsalted Fat of Swine.

Pinguedo mineralis; what it is, see *Theat. Chym. Vol. 4.*

PINGUICULA. A Plant so called by *Gesner*, because its Leaves are fat to the Touch, as if rubbed over with Oil, or Butter. Of this *Ray* makes four Species; which are,

1. *Pinguicula Gesneri*. *J. B. Pinguicula sive Sanicula Eboracensis*. *Ger. Park. Sanicula montana Flore calcari donato*. *C. B. BUTTERWORT, YORKSHIRE SANICLE*.

The Leaves, which are six or seven in Number, and sometimes more, spread themselves upon the Ground, and are about two Inches long, and one broad, of a yellow Colour, inclining to a pale Green, fat to the Touch, and shining as if they were rubbed over with Butter or Oil. From amidst the Leaves arise Pedicles, a Palm or more in Height, and bearing at the very Top a single purple, violet, or white Flower, like a Violet, but mono-

monopetalous, furnished with a long Spur, and divided into five Segments: It grows in moist and marshy Places, and on plashy Downs, where Springs of Water abound.

2. *Pinguicula Flore albo minore, Calcarei brevissimo.* This was observed by Ray, in moist Places on the Tops of Mount Jura.

3. *Pinguicula Flore amplo purpureo, cum Calcarei longissimo.* This is found in the same Places as the preceding.

4. *Pinguicula Cornubiensis Flore minore carneo.* The Leaves of this Species have their Margin reflexed, and, as it were, convolved; are almost pellucid, and striated with red Veins. Ray observed this Species to grow in marshy Places, about Kilkhampton, and other Places in Cornwall.

The Leaves, bruised, and applied, are said to cure recent Wounds and Bruises: It is usual for the Country-people to cure Chaps in their Hands, and Tumors and Fissures in the Udders of their Cows, with the Fat and buttery Juice of this Herb: Hence it took the Name of *Yorkshire Sanicle*. The common Sort of People in *Wales* prepare from it a Syrup, with which they purge themselves, and those who belong to them; and, also, boil the Herb in Broths, for the same Purpose; for it purges Phlegm briskly enough: They make, also, an Ointment of the same, which is of great Use in Obstructions of the Liver. *Dalechampsius* affirms, that the Root baked, and applied in Form of a Malagma, cures the Sciatica on the third Day, and that the same bruised and applied, cures all Sorts of Pains. *Camerarius* assures us, that it is a vulnerary Herb, and is of excellent Service in Hernias of Children. It dyes Hairs yellow, and serves Women instead of Gum for curling their Hairs. *Raii H. P.*

PINIPINICHI. The same as PIMPINICHI.

PINNA. A Wing. But the lateral and inferior Parts of the Nose are called the *Pinnae* thereof; and the superior broad Part of the external Ear is, also, called the *Pinna* thereof.

PINNA, or PINNA MARINA, is a Sea Shell-fish of a conical Form, and separated into two Parts, which are rough without, and of a darkish Colour, but smooth, green, and resplendent within: Some of them are two Feet in Length, and about half a Foot in Circumference, towards the Middle. This Shell is found upon the Coast of the Sea, either among the Wrack, or the Sand: There are various Species of them, which contain a small Fish, which is an excellent Aliment, and in which there are sometimes found large Pearls.

From the superior Part of the Shell, which terminates in a very obtuse Point, arises a sort of Cord, or small Portion of redish or dark-colour'd Silk, by some Naturalists, though, perhaps, not very properly, called *Byffus*: This Cord helps the Animal sometimes to fix itself to the Rocks: This Silk, when taken from the Fish, and prepared, is made into Stockings, and other Cloaths. The Fish, when eaten, excites Urine; and the Shell, when reduced to a Powder, provokes Urine, and renders the Patient costive. *Lemery des Drogues.*

PINNACULUM FORNICIS GUTTURALIS. The *UVULA*.

PINO. The Name of a sort of Nettle, which grows in *Brasil*.

PINOQUACU. A Name for the two Species of *MA-MOERA*.

PINUS.

The Characters are;

The Leaves are longer than those of the Fir-tree, and always grow by Pairs, out of one common Sheath: The Flower is male, amentaceous, consists of Stamina, and is produced at a Distance from the Fruit of the same Tree. The Fruit is a Cone, consisting of tetragonal Tubercles. Among the Squamæ, which are excavated into two Pits, are two Stones, frequently winged, inclosing an oblong Kernel.

Boerhaave mentions three Sorts of *Pinus*; which are,

1. *Pinus; sativa. C. B. P. 491. Raii Hist. 2. Tourn. Inst. 585. Boerb. Ind. alt. 2. 179. Pinus. Offic. Pinus sativa sive domestica. Ger. 1173. Emac. 1355. Pinus urbana sive domestica. Park. Theat. 1354. Pinus officulis duris, foliis longis. J. B. 1. 248. THE PINE-TREE.*

This is a large spreading Tree, whose Branches are clothed with long, slender, sharp-pointed, green Leaves, two growing together in a common Sheath, which are somewhat hollow on the Inside; on the larger Branches grow large, loose, yellow Catkins, which come early in the Spring; and, after them, large, oblong, round-pointed Cones, heavy and firm, composed of several high, brown, hard Scales, between which lie the Kernels, which are longish and white, of a pleasant Taste, included in an hard Shell, and covered immediately with a thin brown Skin. The Pine-tree grows wild in several Parts of *Italy*; and is usually planted here in Gardens.

The Nuclei, or Kernels, which are principally used, are of a balsamic nourishing Nature, good for Consumptions, Coughs,

and Hoarseness, restorative, and serviceable after long Illness; and, likewise, help the Strangury, Heat, and Sharpness of Urine. *Miller's Bot. Off.*

It has been a Subject much disputed among the Learned, by what Name the *Pinus* of the *Latins* was called among the antient *Greeks*. *J. Baubine* is persuaded, that *πεύον* (*Peuce*) is the antient *Greek* Name for the *Pinus*; and his Brother *Caspar*, with *C. Clusius*, *Bodæus a Stapel*, and other learned Men, are of the same Opinion. For my part, I am inclined to think, with our Countryman *Turner*, that the *πεύον* of *Theophrastus* is indeed the Tree which the *Latins* call *Pinus*; but that *Pliny* took the *πίτυς* (*Pitys*) of the *Greeks*, for the *Pinus*, because that Author renders *πίτυκαμπαι* (*Pityocampæ*) by *Eruca Pinorum*, *The Caterpillars of Pine-trees*, not of the *Picea*, or Pitch-tree. As for the *πίτυς* (*Pitys*) of *Theophrastus*, we are not certain what Tree it was; but *J. Baubine* thinks it likely to be the *Pinaster*, or Mountain-pine. The Occasion of this Uncertainty, and Mutation of Names, seems to be owing to the *Arcadians*, who, as *Theophrastus* writes, called *πίτυς* what the other *Greeks* called *πεύον* and gave the Name of *πεύον* to what the rest called *πίτυς*.

The Bark and Leaves of all the Species of Pine-trees are refrigerating and astringent; whence they are of Service in Dysenteries, and an immoderate Flux of the Menfes. The Decoction or Infusion of Pine-tree-tops in Beer, or any other proper Liquor, is supposed to be very effectual for the Stone in the Kidneys or Bladder, and for the Scurvy, and other Affections of the Thorax. *Hoffman, Meth. Med.* relates how a thousand Persons were cured of scorbutic Affections, by the young and tender Shoots of the Pine-tree.

Pine-kernels are of a most delicious Taste, and even preferable to Almonds; whence, in *Italy*, they are served in at a second Course: They are moderately hot and moist, maturating, lenitive, and fattening; their principal Use is in a Phthisis and Tabes, because they are very nutritive, though not very easy to be digested, as *Dodonæus* thinks: Taken either alone, or in Honey, or in any other Eclegma, they are good for a Cough, and inveterate Disorders of the Breast, because they are lenitive in Exasperations; they are, also, of Service in nephritic Disorders, the Strangury, Acrimony of Urine, and the like, because they mitigate and remove Pains: They increase Milk, and the Semen; on which Account they revive languishing Nature, and excite to Venery, especially when they are preserved in Sugar. The whole Cone, or Strobilus, boiled with fresh Horehound, and afterwards boiled a second time, with a moderate Addition of Honey, to a melleous Consistence, is a proper Medicine, as *Galen* says, to promote Expectoration, is good for an old Cough, and consumptive Disposition, as we are assured, also, by *Dioscorides*. The Water of the Cone is astringent, and, therefore, good to remove Wrinkles in the Face, to repress the Growth of the Breasts, and for the Falling out of the Matrix, and other Disorders of that Kind.

Coccalus, κόκκαλον, according to *Galen, Com. 4. in Lib. de R. V. I. A.* though used by *Hippocrates*, was not the Name for the Pine-nut, among the antient *Greeks*, but *κόνος* (*Conos*); the modern Physicians, he says, almost universally call it *σπείλαιον* (*Strobilos*): The *Coccalus*, together with Myrrh, made into an Eclegma with Honey, is advised by *Hippocrates*, in the Book before-mentioned, for a Pleurisy: And in the same Treatise, he directs an Eclegma to be prepared of the *Coccalus* and Galbanum, with *Attic* Honey, for a Peripneumony; to which last Place *Galen* had, undoubtedly, a respect in his Exegesis, where he writes, *That most take the Coccalus to be the Kernel of the Strobilus*. But *Dioscorides*, by way of Diminution, will have it to be the *Granum Cnidium*. *Κόκκαλον*, in *Hesychius*, is expounded by *ῥόμβος* (*Rhombus*) *σπείλαιον* (*Strobilos*), and *πεύον* (*Peuce*). Pine-kernels are called by *Dioscorides, Lib. 1. Cap. 88. πίτιδες* (*Pityides*); by *Menesthus, in Athenæus, Lib. 2. ἀστράκιδες* (*Astracides*); also, *πίτινοι κόνοι* (*pityini Coni*), and *πίτινα κάρυα* (*pityina Carya*), from *Alexander Myndius*, and *Diocles Carystius. Foesius*.

2. *Pinus; sylvestris. Ger. 1175. Emac. 1356. C. B. P. 491. Raii Hist. 2. 1399. Boerb. Ind. A. 2. 179. Pinus sylvestris, Pinaster. Offic. Pinus sylvestris vulgaris Genevensis & Tada. J. B. 1. 253. THE MOUNTAIN PINE.*

This Tree grows to be as tall, and as large, as the former; but differs from it, in having shorter and slenderer Leaves, smaller and sharper Cones, including smaller Kernels, much of the Nature and Virtue of the former: It grows in great Plenty in divers Parts of *Germany*.

From this Tree is gotten what is called *common Turpentine*, (See *TEREBINTHINA*) which is whitish, thick, and opaque, like Honey, of a strong Smell, and used principally by *Farriers*: From this is distilled the Oil of Turpentine, the finer and more volatile Part thereof, and what comes first, being called

the Spirit: What is left at the Bottom of the Still is the common Rosin, which, if taken out, before it be drawn too high, and then washed in Water by a peculiar Method, is what we call white, or yellow Rosin. The black Rosin is the same, more evaporated, and not washed at all. See COLOPHONIA. The common Frankincense is reputed to be the native Rosin of this Tree, or the *Resina Pini*, which is of a whitish-yellow Colour, whereof some Pieces are fat, soft, and whitish, and others hard, brittle, and more yellow. There is but little of this to be got pure at present, being adulterated by common yellow Rosin, by some way that crafty Knaves have found out. See THUS. The black and yellow Rosin are much of a Nature, being used in Ointments and Plaisters. Mr. Dale, in the second Part of his *Pharmacologia*, affirms, from Dr. Kreig, that the *Pix Burgundica*, or Burgundy Pitch of the Shops, is made of this Turpentine, after it has been boiled some time, and before it has arrived to the Hardness of Rosin: This is done, says he, in Saxony, where the white Rosin is made by boiling the Turpentine in large Vessels, without Distillation. See *Pix BURGUNDICA*. Miller's Bot. Off.

3. *Pinus humilis*; *Iulo purpurascens*. T. 585. *Pinaster Austriacus*, *tenuifolius*. J. B. 1. 255.

The Kernels, dried by the Fire, are good for an Asthma, and deterge Ulcers in the Kidneys. The Decoction of the thin Leaves is commended in the Scurvy, where the Acrimony of the Humours requires Demulcents, and where the Vessels are to be strengthened, as the Case is in a Pthipsis. The expressed Oil of the Kernels has the same Virtues, as Oil of Almonds. Hist. Plant. adscript. Boerhaav.

PINUS AFRICANA. A Name for the *Conocarpodendron*; *foliis argenteis, sericeis, latissimis*.

Besides the foregoing Species of *Pinus*, Dale mentions the following;

Pinus maritima. Offic. *Pinus sylvestris montana*. Ger. 1175. Emac. 1357. *Pinus maritima major*. C. B. P. 492. *Pinus sylvestris maritima, conis firmiter ramis adhaerentibus*. J. B. 1. 243. Tourn. Inst. 586. Raii Hist. 2. 1400. *Pinus maritima major fructifera*. Park. Theat. 1535. SEA PINE.

It grows in *Provence* and *Languedoc* in France; and the Bark, Leaves, and Resin, which are the Parts in Use, agree in Virtues with those of the *Pinus sylvestris*, or Mountain Pine.

Besides these, the following Species are mentioned in Ray;

1. *Pinus cui Officula fragili Putamine sive Cembro*. J. B. *Pinus sylvestris montana tertia*. C. B. *Pinus sylv. altera fructifera, Teda arbor forte*. Pin. syl. 2. Ger. descr.

It grows plentifully in the Country of the *Grisons*, where the Peasants feed on the Fruit, which, though, in the Judgment of *Bellonius*, it has a softer, and more savoury Kernel, than the common Pine, it is yet so cheap, as not to be worth the Exportation; it grows frequently, also, on the Mountains of *Geneve*, and Mount *Genis*, in the Passage from France to the Duchy of *Milan*, where it is known by the Name of *Elvi*. *Gesner* says, that it grows on the high Mountains of the *Grisons*, and of *Wallisserland*; and that no Trees grow in higher Places.

2. *Pinaster latifolius Iulis virecentibus aut pallescentibus*. C. B. *Niger, latiore folio, Iulis pallescentibus*. Park.

3. *Pinaster Austriacus tenuifolius*. J. B. *Pinaster tenuifolius, Iulo purpurascens*. C. B. *Teda, seu Pseudo-Pinus*. Ger. *Pinaster 3. Austriacus*. Clus.

4. *Pinaster conis erectis*. C. B. *Pinaster Austriacus*. Ger. Emac. *Pumilus montanus*. Park. An *Pinus sylvestris*. *Mugho* sive *Krein*. J. B. *Pinus tibulus seu tubulus*. Plin? *Sylv. Mugo*. Matth.

It grows on the Tops of the highest Alps in *Austria* and *Stiria*, among Stones and Rocks, where hardly any other Trees will appear.

5. *Pinaster tertius Hispanicus humilis*. J. B. *Pinus maritima minor*. C. B. Park. *Pinaster marit. minor*. Ger. Emac. *Clusius* observed this Species only in the Kingdom of *Murcia* in Spain, and that very rarely.

6. *Pinus sylv. maritima, conis firmiter ramis adhaerentibus*. J. B. *Sylv. altera maritima*. Lob. Obs. An *Pinaster 2. Hispanicus*. Clus.?

7. *Pinus maritima major*. C. B. *Maritima major fructifera*. Park. *Sylvestris montana*. Ger. *Pinus maritima Theophrasti*. *Lobelii*. J. B. In Trunk, Branches, and Leaves, it appears very like the *Pinaster montanus*; only the Branches are glabrous, and blacker than the Trunk; and the Cone is of a scarlet Colour, and shorter and broader at the Top.

8. *Pinastrum alterum Hispanicum, vel minus Hispanicum*. Clus. *Pinus maritima major fructifera altera*. Park. *Marit. major*. This grows frequently in the Kingdoms of *Murcia* and *Valentia*, in Spain.

9. *Pinus sylv. foliis brevibus glaucis, cum parvis albertibus, Hortulanis negris*. THE SCOTCH FIR, i. e. *Abies Scotica perperam dicta*. It grows spontaneously in the *Stirian Alps*.

This is now frequently cultivated in our Gardens and Groves, on account of its noble and beautiful Appearance.

10. *Pinus sylvestris, five, ut Bellonius, Picea sylvestris Ida Troadis, cujus coni facile decidunt*. J. B. Raii H. P.

PIPA arbor & fructus Linensis. Michael Boym. in *Flora Sinenfi*. Jonston. Dendrolog. The Name of a Plum-tree, which grows in China.

PIPER ALBUM. Offic. Ger. 1353. Emac. 1538. Park. Theat. 1603. J. B. 2. 181. *Piper rotundum album*. C. B. P. 411. Raii Hist. 2. 1342. *Piper album, Leucopiper*. Mont. Exot. 9.

WHITE PEPPER. See **PIPER NIGRUM**. **PIPER NIGRUM.** Offic. Ger. 1353. Emac. 1538. Park. Theat. 1603. J. B. 2. 181. *Piper rotundum nigrum*. C. B. P. 411. Raii Hist. 2. 1341. *Lada, aliis Molanga sive Piper aromaticum*. Pil. Mant. A. 492. *Piper rotundum ex Malabara foliis latis quinque nerviis albicantibus*. Herm. Mus. Zeyl. 52. *Molagocodi*. Hort. Mal. 7. 23. Tab. 12. **BLACK PEPPER.**

The Plant which bears Pepper climbs and twists itself about any thing that is put for its Prop or Support, bearing alternately large, oval, but sharp-pointed Leaves, full of large Nerves, opposite to which grow long Spikes of small monopetalous Flowers, cut into three Parts, succeeded by Bunches of the Grains of Pepper, which are round, of a dark-brown Colour, having a wrinkled Bar on the Outside. There has been a Dispute among the Writers of the *Materia Medica*, whether the white and black Pepper are the Fruit of one and the same Plant, or whether they be two distinct Species. The more antient, as *Garcias ab Horto*, *Parkinson*, *C. Bauhine*, were of Opinion, that they were different; but *Piso*, in his *Mantissa aromatica*, and since his Time, *Herb. de Jager*, in the twenty-sixth Epistle of the *India literata*, in the Appendix to the *Museum Valentini*, plainly demonstrate, that they are but one Species; and that the white is made of the ripest black Pepper, of which they put a Quantity in a deep Trench, where it lies for two or three Days, till the Bark is rotted, when they pour in a Quantity of Water, and, stirring it about, separate the Bark which swims a-top, and dry the Fruit with white Ashes, which they separate from, when dry, with large Fans, as we with new Corn.

Pepper is heating and drying, expelling Wind, and of great Use against Coldness and Windiness of the Stomach, and the Colic; it strengthens the Nerves and Head, and helps the Sight; outwardly it is good for the Tooth-ach, and for cold Affections of the Nerves, and Pains in the Limbs. Pepper ought not to be powdered fine, but only grossly broken, when it is eaten with any Food, or used to season it. Miller's Bot. Off.

Pepper is an aromatic Fruit, of an heating and drying Quality, produc'd in Grains commonly, and us'd in Sauces and Seasonings.

This Fruit, so well known in Europe, is produc'd by a Plant or Shrub, which grows in various Parts of the East Indies.

The Plant which bears it, is weak and creeping; a Circumstance which obliges those who cultivate it to plant it at the Foot of large Trees, such as the *Areca*, and *Coco-nut-tree*. Its Leaves, in Figure, resemble those of *Ivy*, but are less green, more yellow, of a strong Smell, and pungent Taste.

The Pepper comes forth in small Clusters, like our Gooseberries; and the Grains of which these Clusters are compos'd, at first appear green; then they become red, in proportion as they ripen; and at last black, or such as they come to us, after they are left expos'd to the Heat of the Sun for some time.

There are not two Species of Pepper, one white, and the other black; and we have good Reason to embrace this Opinion notwithstanding what Mr. *Pomet*, in his *Histoire des Drogues*, has said to the contrary, since Mr. *Dillon*, a celebrated Physician, and Author of the History of the Inquisition of Goa, assures us, that all the Difference between the white and black Pepper is, that the latter has its Skin, whereas the former wants the Skin; which is taken off by beating it before it is entirely dry, or by suffering it, after it is dry, to soak for some time in Water.

Tho' Pepper is produc'd in various Parts of the Indies, yet it grows most copiously between *Rajapour*, and the Cape of *Camarin*. The Pepper of *Malabar*, or that produc'd between Mount *Eli* and the Southern Extremity of the Coast, is somewhat smaller than the other; but produc'd in such large Quantities, that Europe is principally supplied with it.

The black Pepper, consumed in Europe, is of three Sorts; that of *Malabar*, and that of *Jamby*, and that of *Belipatham*. But this last is least esteem'd in Europe, on account of its Smallness and Driness; two Circumstances which recommend it to the Indians, who think small Pepper less hot than the large Kind.

The white Pepper ought to be chosen large, well-nourish'd, weighty, and without Mixture of black Grains or Rubbish; which when reduc'd to a Powder, is of a beautiful grey or a whitish Colour.

As for black Pepper, which ought to be possess'd of almost all the Qualities of the white already enumerated, we must, also, take care that the Grains be not wrinkled; that there be a large Quantity of white Grains among them; and that the largest Grains have not been separated, in order to be whiten'd, a Practice very common in *Holland, Rouen, and Paris*.

As a great Part of the Pepper, whether white or black, is sold beaten, it is easy for Persons of a fraudulent Disposition to sophisticate it, which Retailers generally do by mixing, with the black Pepper, the grey Spices of *Auvergne; Maniguette*, a Species of *African Pepper*; the Dust of Pepper; and the Crust of Bread. With the white Pepper they mix white Spices, or black Pepper whiten'd; so that it is very difficult to distinguish the sophisticated from the genuine Kind; for which Reason we ought to buy from Persons of Honesty and Skill.

Druggists and Spice-merchants sell various other Kinds of Pepper, describ'd by Travellers in their Relations; such as the Pepper of *Madagascar*, that of *Mascarene*, or the Island of *Bourbon*; the Pepper of *China*; the Long-pepper of the *Indies, Ethiopia, and America*; *Guinea Pepper, Jamaica Pepper*, the Pepper of *Theret*, and that of *Africa*.

The Pepper of *Madagascar* is white, and grows on a Plant, which creeps on the Ground, and whose Stalk and Leaves have the same Smell with the Fruit, which ripens in the Months of *August, September, and October*.

The Pepper of *Mascarene*, which is, also, produc'd in the Island of *Java*, is call'd Cubebs, or Pepper with a Tail. It exactly resembles the black Pepper, except that it is larger, and has a Tail. The Plant which produces it, creeps on the Ground; and its Fruit, which ought to be chosen large, well nourish'd, and without Wrinkles, adheres to it in the Form of Clusters.

The *China Pepper*, describ'd by Father *le Compte* in his Memoirs, has the same Proportion with that of the *Indies*. The Tree which produces it, is as large as a Nut-tree. Its Fruit is as large as a Pea, and of a greyish Colour, mix'd with red Streaks. When it is ripe, it opens spontaneously, and contains a small Nut, as black as Jet; after it is gather'd, it is expos'd to the Sun, in order to be dried. The Nut, which is of a very strong Taste, is thrown away, and the Husk or Bark only kept. The Smell of the Pepper-tree is so strong, that the Fruit must be gather'd at different Times, lest those employ'd in that Work should be injur'd by it.

The Long-pepper, which is a kind of Congeries of many small Grains, strongly united to each other, grows upon a Shrub, whose Leaves are slender, green, and placed upon a short Stalk.

This Pepper is of three kinds, that of the *East Indies*, that of *America*, and that of *Ethiopia*, which is call'd Grains of *Zelim*. But that of the *Indies* is the only true Long-pepper, since the others bear but little Resemblance to it.

Good Long-pepper ought to be recent, well-nourish'd, large, weighty, difficult to be broken, not rotten, without Rubbish or a Mixture of Earth. It is us'd in Medicine, in various *Galenical Compositions*, and is an Ingredient in the *Theriaca*: It is, also, sometimes mixed with Spices.

The *Guinea Pepper* is of a red Colour, resembling that of Coral. It is cultivated in *Languedoc*, and especially in the Villages about *Nimes*. It is commonly found in the Shops of the Druggists and Grocers. The Vinegar-makers use it for making their Vinegar. Some, also, preserve it with Sugar; it ought to be chosen recent, in Pods, which are beautiful, dry, sound, and very red.

There are four Sorts of this Pepper: The first is call'd *Chilchotes*; the second, which is very small, is call'd *Chiltepin*; and these two Kinds are of an acrid and highly pungent Taste. The third is call'd *Tenacibiles*, which is moderately hot, and which the *Indians* eat, like other Fruit, with Bread. The fourth is call'd *Chilpelagua*: This last is neither so pungent as the two first, nor so mild as the third; this is the Species so much esteem'd by the *Spaniards*, and generally us'd by them in preparing their Chocolate.

There is, also, another Species of this Pepper, which only grows about *Peru*, where it is call'd *Agy*. A large Quantity of this Species is cultivated in a small Plain, about six Leagues in Circumference, near the Village of *Arica*, on the Coast of *Peru*, and in the Valleys of *Sama, Tacna, and Cocumba*. Tho' these four Places are of a small Extent, and there is a great Demand for this Kind of Pepper, yet they furnish every Year, as much as draws more than six hundred thousand Piafters; which would appear incredible, if the Excrements of the Bird call'd *Guana*, with which the *Peruvians* dung their Land, did not render it so fertile, that the Grains sown in it, and especially the *Agy*, yield four or five hundred for one.

The *Jamaica Pepper* is the Fruit produc'd by the Tree which furnishes us with the *Indian Wood*.

The Pepper of *Theret*, which the *Dutch* call *Amomi*, on account of its Resemblance to the *Amomi*, or *Jamaica Pepper*, is a small round Fruit, as large as the white Pepper, a little roundish, and with a Species of small Crown at one of its Ends. It is, also, call'd the small round Clove, because its Taste resembles that of the true Clove. *Savary. Dict. de Comm.*

As for the *African Pepper*, which is call'd *Maniguette, Malaguettes, or Cardamoms*, see the Article *CARDAMOMUM*.

PIPER JAMAICENSE. *Jamaica Pepper.* See *CARYOPHYLLUS*.

PIPER INDICUM. *Guinea Pepper.* See *CAPSICUM*.

PIPER LONGUM. *Offic. Ger. 1355. Emac. 1539. Park. Theat. 1604. Ogiib. Chin. 1. 226. J. B. 2. 185. Raii Hist. 2. 1343. Piper longum orientale. C. B. P. 412. Piper longum Pistolobia foliis absque pediculis, Maderaspatana. Pluk. Phytog. Tab. 104. Pimpilim. Pil. Mant. A. 182. Tlatlancuaye five Piperis longi Species II. Hern. 126. Catta-tripali. Hort. Mai. 7. 27. Tab. 14. Arbor Piperifera fructu longo. Jonf. Dendr. 178. Acapatli. Laet. 231. LONG-PEPPER.*

This is a long Fruit, somewhat resembling the *Isulus* or Catkin of the *Hazel*, but hard and firm, consisting of several small roundish Grains, set together in a spiral Order, of a brownish Colour, and an hot biting Taste; they grow upon a Plant, which twists and winds itself about any thing, that is in its Way, having large, oblong, round-pointed Leaves, set alternately on the Stalks; and opposite to them grow monopetalous Flowers, divided into five Segments, which are succeeded by this Fruit. It grows in *Java and Malabar*, and other Parts of the *East Indies*.

As in Taste, so in Virtue, it imitates the black Pepper; warming and comforting the Stomach, expelling the Wind, and promoting Digestion. It is, likewise, accounted alexipharmic, and is an Ingredient in the *Theriaca Andromacki*. *Miller's Bot. Off.*

PIPERELLA. A Name for the *Marum; Hispanicum; nigrum; flore purpureo*.

PIPERITIS. A Name for the *Lepidium*, Ditander.

PISCATORIS EMPLASTRUM. The Name of a Plaister describ'd in *Aetius, Tetrabiblos, 4. Serm. 3. C. 18*.

PISCATORIS MEDICAMENTUM. The Name of a compound Medicine describ'd by *Actuarius, L. 6. C. 9*.

PISO. A Mortar. *Castellus*.

PISONIA. *Fingrigo vulgo*.

The Characters are;

It is male and female in different Plants; the male Flowers consist of a great Number of Stamina, and have no Petals: The female Flowers consist of one Leaf, which is Bell-shaped, and divided at the Top into five Parts; from whose Cup arises the Pointal, which afterwards becomes an oblong, angular, channel'd Fruit, containing oblong Seeds.

Miller mentions two Species.

1. *Pisonia aculeata mas.* *Houft.*

2. *Pisonia aculeata, fructu glutinose, & racemose.* *Plum. Nov. Gen.*

These Plants are feminal Variations, which arise from the Seeds of the same Plant, but as they were not distinguished by any of the Botanists, till the late Dr. *Houftoun* observed their Difference; and therefore the different Sexes are here mentioned as separate Plants.

The Name of this Plant was given by Father *Plamier*, in Honour to Dr. *William Piso*, who published a Natural History of *Brasil*. The Name of *Fingrigo* is what the Inhabitants of *Jamaica* know it by.

These Plants are very common in the *Savannahs*, and other low Places, in the Island of *Jamaica*, as, also, in several other Places of the *West Indies*; where it is very troublesome to whoever passes through the Places of their Growth, by fastening themselves by their strong crooked Thorns, to the Cloaths of the Persons; and their Seeds, being glutinous, also, fasten themselves to whatever touches them: So that the Wings of the Ground-doves, and other Birds, are often loaded with the Seeds, so as to prevent their flying; by which means they become an easy Prey.

It rises about ten or twelve Feet high, with a pretty strong Trunk; but the Branches are long and slender, whereby being unable to support themselves, they generally twist about whatever Plants are near them. *Miller's Dictionary*.

PISSANTHOS. The same as *ORRHOPISSA*.

PISSASPHALTOS. See *BITUMEN*.

PISSE. *πῖσσον*. Pitch.

PISSELEUM, *πισσέλειον*, (from *πῖσσον*, Pitch, and *ἐλαιον*, Oil) Oil of Pitch, is prepared of Pitch by Separation of its watry Part, which swims thereon like Whey upon Milk. It is taken off while the Pitch is in boiling, by spreading over it clean Wool, which, as soon as it is thoroughly moisten'd with the ascending Vapour, is wrung into a Vessel; and this is repeated as long as the Pitch is in boiling.

The *Pisseleum* is effectual for the same Purposes as Tar. A Cataplasm thereof, prepared with Meal of Barley, restores the Hairs in an Alopecia; Tar has the same Effect; and, besides, cures Scabs and Ulcers in Cattle. *Dioscorides, Lib. 1. Cap. 95*.

PISSELEUM INDICUM. *Offic. Bitumen Barbadense.* *Boerh. Chem. Pix liquida Barbadenfis, Pharmacopolis. Lond. Pix Barbados.* *Boerh. Thesaur. Pharm. 108. BARBADOES-TAR.*

This is brought from the Island, whose Name it bears; where it floats on the Surface of the Water: It is of a blackish-red Colour, of a disagreeable Smell, and of the Consistence of liquid

liquid Pitch. It is possess'd of a sudorific Quality, and is good for Disorders of the Lungs and Stomach. By adding a small Quantity of the Oil of Anise, to this Bitumen, the London Apothecaries prepare a Balsam, which they sell for the *Balsam of Chilli*. Dale.

Boerhaave, in his Chymistry, seems to think Barbadoes Tar a vegetable Preparation, since, like the *Oleum Terræ* of the Indies, it consists of the express'd Oil of Coco-nuts mix'd with medicated Earths.

This, says Quincy, seems to be what passes in the Shops by the Name of Barbadoes Tar. It has a strong Scent, not unlike the common Tar; and is not very pleasant to the Sight or Taste; but 'tis certainly a good Balsamic, and where the Stomach will dispense with it, will do great Service in some Disorders of the Breast. It is effectual in obstinate tickling Coughs; and sometimes succeeds where more elegant Medicines have failed. Some commend it in Burns, Scalds, and Inflammations; but the regular Practice does not much justify such Use externally. Among the Country-people, it is in great Request for Scal'd Heads, which is a Disease troublesome to cure, and often puzzles a good Physician. It is with some, also, a Secret to apply to the Soles of the Feet in Agues, and, also, to the Wrists; and I have known Instances where it has succeeded. That Medicine commonly sold by the Name of Oil of Spike, is nothing but Oil of Turpentine tinged with this Simple. See PICTONUM COLICA.

PISSEROS, *πίσσηρος*, from *πίσση*, Pitch, is an Epithet of a Cerate, called by Hippocrates *πίσσηρον κηρόν* (*pissero cerotes*), pitchy Cerate, and order'd by him to be apply'd to Ulcers affected with an Inflammation, and as an Anodyne. It was prepared, as Galen writes, *Comment. 1. in Lib. de Fract.* of Wax melted with Oil, or Oil of Roses, and dry Pitch. Hippocrates sometimes expresses it simply by *πίσσηρον* (*Pissere*), and sometimes with the Addition of *κηρόν* (*Cerotes*), *πίσσηρον κηρόν*.

PISSITES, *πίσσιτης*, Wine of Pitch, is prepared of Tar and Must. The Tar is first to be washed with Sea-water, or Brine, till it becomes white, and the Sea-water runs off pure; after which it is to be washed with sweet Water. Then to eight Congii of Must, put an Ounce or two of this Tar, and suffer it to ferment, and then to settle, after which pour it into Vessels.

This sort of Wine is of an heating Quality, helps Concoction, is absterfivè and pectoral; on which account, it is of Efficacy in Pains of the Thorax, Belly, Liver, Spleen, and Uterus, if unattended with a Fever; also, in inveterate Defluxions, and deep Exulcerations. It is, also, good against a Cough, Slowness of Digestion, Inflations, and an Asthma; and is of Service in Luxations, especially if applied in raw Wool [*εινυγός*]. *Dioscorides, Lib. 5. Cap. 48.*

PISSOCEROS, *πίσσοκερος*. The Wax with which Bees line their Hives, and which is the Foundation of their Combs.

PISSOSIS. Pication. See PICATIO.

PISTACHIA. A Name for the *Terebinthus*; *Indica*; *Theophrasti*.

PISTATIO, according to *Castellus*, is the covering any Materials, included in a proper Vessel, with Paste, in order to their being bak'd, or boil'd.

PISTILLUM. A Pestle.

PISTOLOCHIA. See *Aristolochia*, and *Serpentaria Virginiana*.

PISUM.

The Characters are

It has a long inflated Pod, full of roundish Seeds; the lower Part of the Stalk is fistulous; the Leaves are some of them, as it were, perforated by the Stalk; the other are pinnated, and end in a Tendril.

Boerhaave mentions twenty-six Species of *Pisum*, none of which have any medicinal Virtues ascrib'd to them at present, that I know of, except the sixth; which is,

Pisum; arvense, fructu albo. *Tourn. Inst. 394. Boerb. Ind. A. 2. 40. Pisum*. Offic. *Pisum arvense flore candido, fructu rotundo, albo. C. B. P. 342. Pisum minus. Ger. 1045. Emac. 1219. Pisum vulgare parvum album arvense. J. B. 2. 297. Raii Hist. 1. 891. Pisum sylvestre primum. Park. Theat. 1057. Raii Synop. 3. 318. COMMON WHITE PEAS.*

Peas are more used in the Kitchen, than in the Shop, being known to every body to have whitish-green Leaves, consisting of two or three Pair of large oval Pinnæ, with Claspers at the Ends; the Stalks are weak, angular, and not able to support themselves. The Flowers are white and papilionaceous; and the Peas, when ripe, round and white: They are planted in Fields and Gardens, flowering in May, and the Fruit is eat in June.

Peas, when green, are a pleasant grateful nourishing Food, but somewhat flatulent and windy, as well as when dry. They are good to sweeten the Blood, and correct salt scorbutic Humours, either eaten raw, or boiled. *Miller's Bot. Off.*

Peas are a Puls much used for Food; the smaller and greener they are, the better is their Taste. They are, also, dried for keeping; but then they have not the Taste they had before.

They produce the greatest Part of their good Effects by the Help of their oily balsamic Parts, which, sheathing up sharp Humours of the Breast, stop Coughs; and, by easily condensing in the Vacuities of the solid Parts, repair and nourish them. The first Pottage, or boiling of Peas, is softening and laxative; because 'tis filled with the more dissoluble Salts of this Pulse; these Salts, irritating and pricking the intestinal Glands, cause them to let pass through their Pores a greater Quantity of serous Matter. Peas contain a viscous and thick Juice, which causes Wind, and produces gross Humours; and, therefore, they are not good for those that are troubled with Gravel. *Lenery on Foods.*

Broth of Peas, not only renders the Body soluble, but, also, procures a more free and copious Evacuation of the Lochia. It is, also, beneficial in nephritic Pains, according to *Simon Paulli*, in his *Quadrupartitum Botanicum*. Some, also, with Success, use a Decoction of Peas, in order to cure cutaneous Disorders, and Pimples. *Haffman. Præst. Remed. Domest.*

PITACIUM. A large Cloth, impregnated; or spread over, with some Medicine, in order to be applied to a Part affected.

PITHA. A Name in Boerhaave for the *Cereus*; *scandens*; *minor trigonus*; *articulatus*; *fructu suavissimo*.

PITINE. A Name for the APHACA; which see.

PITOMA. The Name of a large Tree, which grows in *Brasil*, bearing a kind of Apple; of an astringent, bitter Taste; but not eatable, and of no Use in Medicine.

PITTONIA.

The Characters are;

It hath a globular bell-shaped Flower, consisting of one Leaf, which is cut into several Segments at the Brim; from whose Cup arises the Pointal, which afterwards becomes a soft spherical Berry full of Juice, inclosing two Seeds, which are, for the most part, oblong.

Miller mentions seven Species, all of which grow in the warmest Parts of *America*, where the first Sort grows to the Height of twelve or fourteen Feet, and divides into many Branches, so as to form a small Tree. The second, fifth, and seventh Sorts grow to the Height of eight or nine Feet, and produce many Branches near their Roots, so as to form thick Bushes. *Miller's Dict.*

PITTOSIS. The same as PICATIO.

PITUITA. Phlegm. See PHLEGMA.

PITUITARIA GLANDULA. The Pituitary Gland.

PITYIDES, *πυιδες*, a Name for the Fruit, or Kernels, contained in the Cones of the *Pinus*, and *Picea*. These Kernels are of an astringent and somewhat heating Quality, and are good for a Cough, and other Affections incident to the Region of the Thorax, whether taken alone, or with Honey. *Dioscorides, L. 1. C. 87.*

PITUINA, *πυτινα*. The Refin of the Pitch-tree.

PITYLISMA. A Species of Exercise mentioned by *Galen, de Sanitate tuenda, Lib. 2. Cap. 10.* It consisted in walking on Tiptoes, lifting up the Hands above the Head, and moving them swiftly in different Directions.

PITYOCAMPE, *πυτοκαμπη*. A Species of Caterpillar, which is found on the Pitch-tree, and to which *Galen* ascribes the Virtues of Cantharides, *de Simpl. Facult. L. 11.*

PITYRIASIS. A scurfy Disorder of the Head, Chin, and Eye-brows, called, also, *Porrigo*. See LEPRO. From *πυρρην*, Bran.

PITYROIDES. An Epithet for a sort of Sediment in the Urine, resembling Bran.

PITYS, *πυς*. The Pine.

PITYUSA. See TITHYMALUS.

PIX. Pitch. This is a Species of Gum obtained from the Pine-tree, by making Incisions in it. It receives different Names according to its different Preparations, Colours, and Qualities. When it first flows from the Tree, it is called *Barras*, but is afterwards distinguished into two Sorts, which have different Names: That which is most beautiful and clear, is called *Galipot*; and that which is more full of Fæces, and of a worse Colour, is called *Marbled Barras*. The former of these, or the *Galipot*, serves to make all the different Species of Pitch described in this Article.

The pinguious Pitch, which is, also, called *White Burgundy Pitch*, is *Galipot* melted with Oil of Turpentine. Some, however, assert, that the *Burgundy Pitch* flows naturally from resinous Trees, in the Mountains of *Franche-Comté*.

Refin is, according to some Authors, a Gum discharged from the Turpentine-tree, the Larch-tree, the Mastich-tree, or the Cypress: But the Opinion of others is far more probable, who, from Experience, assert, that it is *Galipot*, boiled to a certain Consistence, and reduced to a Mass of any determinate Weight.

The best Refin comes from *Bayonne* and *Bordeaux*. It ought to be chosen dry, white, free from Water and Sand.

Black Pitch, which is properly that known by the Name of *Pitch*, is only *Galipot*, prepared in a particular manner, by putting

ting into it, when it is quite warm, a certain Quantity of Tar, in order to render it black. There are two Kinds of it, one hard, and another soft, which only differ in this Circumstance.

Mr. *Wheler*, in his *Voyages*, has given another Method of preparing black Pitch, used in the *Levant*, and which is not much different from that given by *Furetiere* in his Dictionary.

He orders us to prepare a Heap of Earth, in which we are to make an Hollow two Ells in Diameter at the Top, but which becomes gradually narrower, as it approaches to the Bottom. This Hollow is to be filled with small Portions of such Branches of the Pine-tree, as contain most Gum, laid above each other till the Hollow is full. Then the upper Part is to be covered with Fire, which burns to the Bottom: By which means the Pitch is discharged from a small Hole made at the Bottom for that Purpose.

The best black Pitch comes from *Norway* and *Sweden*, to which that made in *France* is by no means comparable.

The Goodness of hard black Pitch consists in being of a shining black Colour, brittle, dry, and forming, as it were, a Rays, when it is broken.

What is called the *Pix Navalis* in Medicine, ought to be the Pitch scraped off from Ships; but 'tis certain, that most Apothecaries use the common black Pitch in its stead.

From the black Pitch there is obtain'd an Oil, which, on account of its singular Virtues, is called the *Baum of Pitch*. *Diction. de Commerce*.

PIX LIQUIDA. Tar.

Dr. *Berkeley*, Bishop of *Cloyne*, having lately published an Account of the Virtues of Tar-water, which has considerably raised the Attention of the Public, I think myself obliged to give a short Abstract of his Book upon this Subject, especially as the Author is a Person well known in the learned World.

In certain Parts of *America*, Tar-water is made by putting a Quart of cold Water to a Quart of Tar, and stirring them well together in a Vessel, which is left standing till the Tar subsides to the Bottom. A Glass of clear Water, being poured off for a Draught, is replaced by the same Quantity of fresh Water, the Vessel being shaken, and left to stand as before. And this is repeated for every Glass, so long as the Tar continues to impregnate the Water sufficiently, which will appear by the Smell and Taste. But as this Method produceth Tar-water of different Degrees of Strength, I choose to make it in the following manner: Pour a Gallon of cold Water on a Quart of Tar, and stir and mix them thoroughly with a Ladle, or flat Stick, for the Space of three or four Minutes; after which, the Vessel must stand eight-and-forty Hours, that the Tar may have time to subside; when the clear Water is to be poured off, and kept for Use; no more being made from the same Tar, which may still serve for common Purposes.

This cold Infusion of Tar hath been used in some of our Colonies, as a Preservative, or Preparative, against the Small-pox; which foreign Practice induced me to try it in my own Neighbourhood, when the Small-pox raged with great Violence. And the Trial fully answered my Expectation; all those within my Knowledge, who took the Tar-water, having either escaped that Distemper, or had it very favourably. In one Family there was a remarkable Instance of seven Children, who came all very well through the Small-pox, except one young Child, which could not be brought to drink Tar-water, as the rest had done.

Several were preserved from taking the Small-pox by the Use of this Liquor; others had it in the mildest manner; and others, that they might become susceptible of the Infection, were obliged to intermit drinking the Tar-water. I have found it may be drank with great Safety and Success for any Length of Time, and this not only before, but, also, during the Distemper. The general Rule for taking it is, to drink about half a Pint Night and Morning on an empty Stomach; which Quantity may be varied, according to the Case and Age of the Patient, provided it be always taken on an empty Stomach, and about two Hours before or after a Meal.

It seemed probable, that a Medicine of such Efficacy, in a Distemper attended with so many purulent Ulcers, might be, also, useful in other Foulnesses of the Blood: Accordingly, I tried it on several Persons infected with cutaneous Eruptions and Ulcers, who were soon relieved, and soon after cured. Encouraged by these Successes, I ventured to advise it in the foulest Distempers, wherein it proved much more successful than Salivations and Wood-drinks had done.

Having tried it in a great Variety of Cases, I found it succeed beyond my Hopes, in a tedious and painful Ulceration of the Bowels, in a consumptive Cough, and (as appeared by expectorated Pus) an Ulcer in the Lungs, in a Pleurisy and Peripneumony. And, when a Person, who for some Years had been subject to erysipelatous Fevers, perceived the usual fore-running Symptoms to come on, I advised her to drink Tar-water, which prevented the Erysipelas.

I never knew any thing so good for the Stomach as Tar-water: It cures Indigestion, and gives a good Appetite. It is an excellent Medicine in an Asthma. It imparts a kindly Warmth, and quick Circulation, to the Juices without heating; and is therefore useful, not only as a Pectoral and Balsamic, but, also, as a powerful and safe Deobstruent in cachectic and hysteric Cases. As it is both healing and diuretic, it is very good for the Gravel. I believe it to be of great Use in a Dropsy, having known it cure a very bad Anasarca in a Person, whose Thirst, though very extraordinary, was in a short time removed by the drinking of Tar-water.

The Usefulness of this Medicine in inflammatory Cases is evident, from what has been already observed. And yet some, perhaps, may suspect, that as the Tar itself is sulphureous, Tar-water must be of an hot inflaming Nature. But it is to be noted, that all Balsamics contain an acid Spirit, which is, in Truth, a volatile Salt. Water is a Menstruum that dissolves all Sorts of Salts, and draws them from their Subjects. Tar, therefore, being a Balsam, its salutary Acid is extracted by Water, which yet is incapable of dissolving its gross resinous Parts, whose proper Menstruum is Spirit of Wine. Therefore, Tar-water, not being impregnated with Refin, may be safely used in inflammatory Cases; and, in fact, it hath been found an admirable Febrifuge, at once the safest Cooler and Cordial.

The volatile Salts, separated by Infusion from Tar, may be supposed to contain its specific Virtues. Mr. *Boyle*, and other later Chymists, are agreed, that fixed Salts are much the same in all Bodies. But it is well known, that volatile Salts greatly differ; and the easier they are separated from the Subject, the more they possess of its specific Qualities. Now the most easy Separation is, by Infusion of Tar in cold Water, which to Smell and Taste shewing itself well impregnated, may be presumed to extract and retain the most pure, volatile, and active Particles of that vegetable Balsam.

Tar was by the Antients esteemed good against Poisons, Ulcers, and the Bites of venomous Creatures; also, for phtisical, scrophulous, paralytic, and asthmatic Persons. But the Method of rendering it an inoffensive Medicine, and agreeable to the Stomach, by extracting its Virtues in cold Water, was unknown to them. The Leaves, and tender Tops, of Pine and Fir are, in our Times, used for Diet-drinks, and allowed to be antiscorbutic and diuretic. But the most elaborate Juice, Salt, and Spirit of those Ever-greens, are to be found in Tar, whose Virtues extend not to Animals alone, but, also, to Vegetables. Mr. *Evelyn*, in his Treatise on Forest-trees, observes with Wonder, that Stems of Trees, smeared over with Tar, are preserved thereby from being hurt by the venom'd Teeth of Goats, and other Injuries, while every other thing of an unctuous Nature is highly prejudicial to them.

It seems that Tar and Turpentine may be had, more or less, from all Sorts of Pines and Firs whatsoever; and that the native Spirits, and essential Salts, of those Vegetables are the same in Turpentine, and common Tar. In Effect, this vulgar Tar, which Cheapness and Plenty may have render'd contemptible, appears to be an excellent Balsam, containing the Virtues of most other Balsams, which it easily imparts to Water, and by that means readily and inoffensively insinuates them into the Habit of the Body.

The resinous Exudations of Pines and Firs are an important Branch of the Materia Medica, and not only useful in the Prescriptions of Physicians, but have been, also, thought otherwise conducive to Health. *Pliny* tells us, that Wines, in the Time of the old Romans, were medicated with Pitch and Refins; and *Johnstonus*, in his *Dendrographia*, observes, that it is wholesome to walk in Groves of Pine-trees, which impregnate the Air with balsamic Particles. That all Turpentine and Refins are good for the Lungs, against Gravel, also, and Obstructions, is no Secret. And that the medicinal Properties of those Drugs are found in Tar-water, without heating the Blood, or disordering the Stomach, is confirmed by Experience; and, particularly, that phtisical and asthmatic Persons receive speedy and great Relief from the Use of it.

Balsams, as all unctuous and oily Medicines, create a Nauseating in the Stomach. They cannot, therefore, be taken in Substance, so much, or so long, as to produce all those salutary Effects, which, if thoroughly mixed with the Blood and Juices, they would be capable of producing. It must, therefore, be a thing of great Benefit to be able to introduce any requisite Quantity of their volatile Parts into the finest Ducts and Capillary Vessels, so as not to offend the Stomach; but, on the contrary, to comfort and strengthen it in a great Degree.

According to *Pliny*, liquid Pitch, (as he calls it) or Tar, was obtained by setting Fire to Billets, or old fat Pines or Firs. The first Running was Tar, the latter, or thicker Running, was Pitch. *Theophrastus* is more particular: He tells us, the Macedonians made huge Heaps of the cloven Trunks of those Trees, wherein the Billets were placed erect beside each other: That

That such Heaps or Piles of Wood were sometimes a hundred and eighty Cubits round, and sixty, or even an hundred, high; and that, having covered them with Sods of Earth, to prevent the Flame from bursting forth, (in which Case the Tar was lost) they set on Fire those huge Heaps of Pine or Fir, letting the Tar and Pitch run out in a Chanel.

From the manner of procuring Tar, it plainly appears to be a natural Production; lodged in the Vessels of the Tree, whence it is only freed and let loose (not made) by Burning. If we may believe *Pliny*, the first Running, or Tar, was called *Cedrium*, and was of such Efficacy to preserve from Putrefaction, that in *Egypt* they embalmed dead Bodies with it. And to this he ascribes their Mummies continuing uncorrupted for so many Ages.

Some modern Writers inform us, that Tar flows from the Trunks of Pines and Firs, when they are very old; that Pitch is Tar inspissated; and both are the Oil of the Tree grown thick and black with Age, and the Influence of the Sun. The Trees, like old Men, being unable to perspire, and their secretory Ducts obstructed, they are, as it were, choked and stuffed with their own Juice.

The Method used by our Colonies in *America*, for making Pitch and Tar, is, in Effect, the same with that of the antient *Macedonians*, as appears in the Account given in the Philosophical Transactions. And the Relation of *Leo Africanus*, who describes as an Eye-witness, the making of Tar on Mount *Atlas*, agrees, in Substance, with the Methods used by the *Macedonians* of old, and the People of *New England* at this Day.

Tar, and all Sorts of Exsudations from Ever-greens, are, in a general Acceptation, included under the Name *Resin*. Turpentine is a Resin, and on all hands allowed to have great medicinal Virtues. Tar, and its Infusion, contain these Virtues. Tar-water is extremely pectoral and restorative; and, if I may judge from what Experience I have had, it possesseth the most valuable Qualities ascribed to the several Balsams of *Peru*, of *Tolu*, of *Copivi*, and even to the Balm of *Gilead*; such is its Virtue in Asthmas and Pleurifies, in Obstructions, and ulcerous Erosions, of the inward Parts.

The Folly of Man rateth things by their Scarceness, but Providence has made the most useful things most common. Among liquid oily Substances, which are termed *Balsams*, and valued for medicinal Virtues, Tar may hold its Place as a most valuable Balsam. Its Fragrancy shews, that it is possessed of active Qualities; and its Oiliness, that it is fitted to retain them. This excellent Balsam may be purchased for a Penny a Pound, whereas the Balsam of *Judea*, when most plenty, was sold, on the very Spot that produced it, for double its Weight in Silver, if we may credit *Pliny*. Now, comparing the Virtues I have experienced in Tar, with those I find ascribed to the precious Balm of *Judea*, of *Gilead*, or of *Mecha*, (as it is diversly called) I am of Opinion, that the latter is not a Medicine of more Value or Efficacy than the former.

The medicinal Virtues of Amber are to be found in the balsamic Juices of Pines and Firs. Particularly the Virtues of the most valuable Preparation, I mean Salt of Amber, are in a great Degree answered by Tar-water, as a Detergent, Diaphoretic, and Diuretic.

It is remarked both by *Theophrastus* and *Johnstonus*, that Trees growing in low and shady Places, do not yield so good Tar, as those which grow in higher and more exposed Situations. And *Theophrastus* further observes, that the Inhabitants of Mount *Ida* in *Asia*, who distinguish the *Idæan* Pine from the Maritime, affirm, that the Tar flowing from the former is in greater Plenty, as well as more fragrant, than the other. Hence it should seem, the Pines and Firs in the Mountains of *Scotland* might be employed in that way, and rendered valuable; even where the Timber, by its Remoteness from Water-carriage, is of small Value. What we call *Scotch Fir*, is falsely so called, being, in Truth, a wild Forest-pine; and, as Mr. *Ray* informs us, agreeing much with the Description of a Pine growing on Mount *Olympus* in *Phrygia*, probably the only Place where it is found out of these Islands; in which, of late Years, it is so much planted and cultivated with so little Advantage, while the Cedar of *Lebanon* might, perhaps, be raised with little more Trouble, and much more Profit and Ornament.

At present the *Norwegian* Tar is the most liquid, and best for medicinal Uses, of any I have experienced. Those Trees that grow on Mountains exposed to the Sun, or the North Wind, are reckoned by *Theophrastus*, to produce the best and purest Tar: And the *Idæan* Pines were distinguished from those growing on the Plain, as yielding a thinner, sweeter, and better scented Tar; all which Differences, I think, I have observed between the Tar that comes from *Norway*, and that which comes from low and swampy Countries.

The less Violence is used to Nature, the better its Produce. The Juice of Olives and Grapes, issuing by the lightest Pressure, is best. Resins, that drop from the Branches spontane-

ously, or issue from the Trees upon the slightest Incision; are the finest, and most fragrant. And Infusions are observed to act more strongly than Decoctions of Plants; the more subtle and volatile Salts and Spirits, which might be lost or corrupted by the latter, being obtained in their natural State by the former. It is, also, observed, that the finest, purest, and most volatile Part is that which first ascends in Distillation. And, indeed, it should seem the lightest and most active Particles required least Force to disengage them from the Subject.

The Salts, therefore, and more active Spirits, of the Tar are got by Infusion in cold Water; but the resinous Part is not to be dissolved thereby. Hence the Prejudice, which some, perhaps, may entertain against Tar-water, as a Medicine, the Use whereof might inflame the Blood by its Sulphur and Resin, appears not well grounded; it being, indeed, impregnated with a fine acid Spirit, which is balsamic, diuretic, and possessed of many other Virtues. Spirits are supposed to consist of Salts and Phlegm, and probably too somewhat of a fine oily Nature, differing from Oil, because it mixeth with Water; and agreeing with Oil in this, that it runneth in Rivulets by Distillation. Thus much is allowed, that the Water, Earth, and fixed Salt, are the same in all Plants: That, therefore, which differenceth a Plant, or makes it what it is, the native Spark, or Form, in the Language of Chymists and Schools, is none of these things; nor yet the finest Oil, which seemeth only its Receptacle or Vehicle. It is observed by Chymists, that all Sorts of balsamic Wood afford an acid Spirit, which is the volatile oily Salt of the Vegetable. Herein are chiefly contained their medicinal Virtues, and by the Trials I have made it appear, that the acid Spirit in Tar-water possesseth the Virtues, in an eminent Degree, of that of Guaiacum, and other medicinal Woods.

Qualities, in a Degree too strong for human Nature to subdue and assimilate to itself, must hurt the Constitution. All Acids, therefore, may not be useful or innocent. But this seems an Acid so thoroughly concocted, so gentle, mild, temperate, and withal possessed of a Spirit so fine and volatile, as readily to enter the smallest Vessels, and be assimilated with the utmost Ease.

If any one were minded to dissolve some of the Resin, together with the Salt or Spirit, he need only mix some Spirit of Wine with the Water. But such an entire Solution of Resins and Gums as to qualify them for entering and pervading the Animal System, like the fine acid Spirit that first flies off from the Subject, is, perhaps, impossible to be obtained. It is an Apophthegm of the Chymists, derived from *Helmont*, that whoever can make Myrrh soluble by the Action and Powers of the human Body, has the Secret of prolonging Life; and *Boerhaave* owns, that there seems to be Truth in this, from its resisting Putrefaction. Now this Quality is as remarkable in Tar, with which the Antients embalmed and preserved dead Bodies. And tho' *Boerhaave* himself, and other Chymists before him, have given Methods for making Solutions of Myrrh, yet it is by means of Alcohol, which extracts only the inflammable Parts. And it does not seem, that any Solution of Myrrh is impregnated with its Salt, or acid Spirit. It may not, therefore, seem strange, if this Water should be found more beneficial for procuring Health and long Life, than any Solution of Myrrh whatsoever.

Certainly divers Resins and Gums may have Virtues, and yet not be able for their Grossness to pass the Lacteals, and other finer Vessels, nor yet, perhaps, readily impart those Virtues to a Menstruum, that may with Safety and Speed convey them throughout the human Body: Upon all which Accounts, I believe Tar-water will be found to have singular Advantages. It is observed, that acid Spirits prove the stronger, by how much the greater Degree of Heat is required to raise them. And, indeed, there seems to be no Acid more gentle than this, obtained by the simple Affusion of cold Water, which carries off from the Subject the most light and subtle Parts, and, if one may so speak, the very Flower of its specific Qualities. And here it is to be noted, that the volatile Salt and Spirit of Vegetables, by gently stimulating the Solids, attenuate the Fluids contained in them, and promote Secretions, and that they are penetrating and active, contrary to the general Nature of other Acids.

It is a great Maxim for the Preservation of Health, that the Juices of the Body be kept fluid in a due Proportion. Therefore the acid volatile Spirit in Tar-water, at once attenuating and cooling in a moderate Degree, must greatly conduce to Health, as a mild salutary Deobstruent, quickening the Circulation of the Fluids without injuring the Solids, thereby gently removing or preventing those Obstructions, which are the great and general Cause of most chronical Diseases, and in this manner answering to antihysterical Medicines, such as *Asa-foetida*, *Galbanum*, *Myrrh*, *Amber*, and, in general, to all the Resins and Gums of Trees or Shrubs useful in nervous Cases.

Warm Water is itself a Deobstruent: Therefore the Infusion of Tar, drank warm, is easier insinuated into all the nice Capillary Vessels, and acts not only by virtue of the Balsam, but, also,

also, by that of the Vehicle. Its Taste, its diuretic Quality, its being so great a Cordial, shew the Activity of this Medicine. And, at the same time that it quickens the sluggish Blood of the Hysterical, its balsamic oily Nature abates the too rapid Motion of the sharp thin Blood in those who are Hectic. There is a Lensor and Smoothness in the Blood of healthy strong People; on the contrary, there is often an Acrimony and Solution in that of weakly Persons. The fine Particles of Tar are not only warm and active; they are, also, balsamic and emollient, softening and enriching the sharp and vapid Blood, and healing the Erosions occasioned thereby in the Blood-vessels and Glands.

Tar-water possesses the stomachic and cardiac Qualities of Elixir Proprietatis, *Stoughton's Drops*, and many such Tinctures and Extracts; with this Difference, that it worketh its Effect more safely, as it hath nothing of that Spirit of Wine, which, however mixed and disguised, may yet be well accounted a Poison in some Degree.

Such Medicines are supposed to be diaphoretic, which, being of an active and subtle Nature, pass through the whole System, and work their Effect in the finest Capillaries, and perspiratory Ducts, which they gently cleanse and open. Tar-water is extremely well fitted to work by such an insensible Diaphoresis, by the Fineness and Activity of its acid volatile Spirit. And surely those Parts ought to be very fine, which can scour the perspiratory Ducts, under the Scarf-skin, or Cuticle, if it be true, that one Grain of Sand would cover the Mouths of more than an hundred thousand.

Another way wherein Tar-water operates, is by Urine, than which, perhaps, no Method is more safe and effectual for cleansing and carrying off the Salts of the Blood. But it seems to produce its principal Effect as an Alterative, which is sure, easy, and much safer than those vehement purgative, emetic, and salivating Medicines, which do Violence to Nature.

An Obstruction of some Vessels causeth the Blood to move more swiftly in other Vessels which are not obstructed. Hence arise manifold Disorders. A Liquor that dilutes and attenuates, resolves those Concretions which obstruct the Vessels. Tar-water is such a Liquor. It may be said indeed of common Water, that it attenuates; also, of Mercurial Preparations, that they attenuate. But it should be consider'd, that mere Water only distends the Vessels, and thereby weakens their Tone; and that Mercury, by its great Momentum, may justly be suspected of hurting the fine Capillaries; which two Deobstruents, therefore, might easily over-act their Parts, and (by lessening the Force of the elastic Vessels) remotely produce those Concretions they are intended to remove.

Weak and rigid Fibres are looked on by the most able Physicians, as Sources of two different Classes of Distempers; a sluggish Motion of the Liquids occasions weak Fibres, therefore, Tar-water is good to strengthen them, as it gently accelerates the Motion of their Contents. On the other hand, being an unctuous bland Fluid, it moistens and softens the dry and stiff Fibres; and so proves a Remedy for both Extremes.

Common Soaps are Compositions of lixivial Salt and Oil. The corrosive Acrimony of the saline Particles being softened by the Mixture of an unctuous Substance, they insinuate themselves into the small Ducts with less Difficulty and Danger. The Combination of these different Substances makes up a very subtle and active Medicine, fitted for mixing with all Humours, and resolving all Obstructions. Soap, therefore, is justly esteemed a most efficacious Medicine in many Distempers.

Alcaline Salt is allowed to be cleansing, attenuating, opening, resolving, sweetening; it is pectoral, vulnerary, diuretic, and hath other good Qualities, which are, also, to be found in Tar-water. It is granted, that Oil, and acid Salts, combined together, exist in Vegetables; and that, consequently, there are acid Soaps as well as alkaline. And the saponaceous Nature of the acid vegetable Spirits is what renders them so diuretic, sudorific, penetrating, absterfive, and resolving. Such, for Instance, is the acid Spirit of Guaiacum. All these Virtues seem to be in Tar-water in a mild and salutary Degree.

It is the general Opinion, that all Acids coagulate the Blood. *Baerhaave* excepts Vinegar, which he holds to be a Soap, inasmuch as it is found to contain an Oil as well as an acid Spirit. Hence it is both unctuous and penetrating, a powerful Antiphlogistic, and Preservative against Corruption and Infection. Now, it seems evident, that Tar-water is a Soap as well as Vinegar. For though it be the Characteristic of Resin, which is an inspissated gross Oil, not to dissolve in Water, yet the Salts attract some fine Particles of essential Oil; which fine Oil serves as a Vehicle for the acid Salts, and shews itself in the Colour of the Tar-water; for all pure Salts are colourless. And though the Resin will not dissolve in Water, yet the subtle Oil, in which the vegetable Salts are lodged, may as well mix with Water as Vinegar does, which contains both Oil and Salt. And as the Oil in Tar-water discovers itself to the Eye, so the

acid Salts manifest themselves to the Taste. Tar-water, therefore, is a Soap, and as such, has the medicinal Qualities of Soaps.

It operates more gently, as the acid Salts lose their Acrimony, being sheathed in Oil, and thereby approaching the Nature of neutral Salts, and are more benign and friendly to the Animal System; and more effectually, as by the Help of a volatile, smooth, insinuating Oil, those same Salts are more easily introduced into the Capillary Ducts. Therefore, in Fevers, and epidemical Distempers, it is, (and I have found it so) as well as in chronic Diseases, a most safe and efficacious Medicine, being good against too great Fluidity as a Balsamic, and good against Viscidity as a Soap. There is something in the fiery corrosive Nature of lixivial Salts, which makes alkaline Soap a dangerous Remedy in all Cases where an Inflammation is apprehended. And as Inflammations are often occasioned by Obstructions, it should seem, an acid Soap was much the safer Deobstruent.

Even the best Turpentine, however famous for their vulnerary and detergent Qualities, have yet been observed, by their Warmth, to dispose to inflammatory Tumors. But the acid Spirit, being in so great Proportion in Tar-water, renders it a cooler and safer Medicine. And the ethereal Oil of Turpentine, though an admirable Drier, Healer, and Anodyne, when outwardly applied to Wounds and Ulcers, and not less useful in cleansing the urinary Passages, and healing their Ulcerations, yet is known to be of a Nature so very relaxing, as sometimes to do much Mischief. Tar-water is not attended with the same ill Effects, which I believe are owing, in a great measure, to the ethereal Oil's being deprived of the acid Spirit in Distillation, which, vellicating and contracting as a Stimulus, might have proved a Counterpoise to the excessive lubricating and relaxing Qualities of the Oil.

Woods in Decoctions do not seem to yield so ripe and elaborate a Juice, as that which is deposited in the Cells, or Loculi Terebinthiaci, and spontaneously issues from them. And, indeed, though the Balsam of *Peru*, obtained by boiling the proper Wood, and scumming the Decoction, be a very valuable Medicine, and of great account in divers Cases, particularly Asthmas, nephritic Pains, nervous Colics, and Obstructions, yet I verily think, (and I do not say this without Experience) that Tar-water is a more efficacious Remedy in all those Cases, than even that costly Drug.

It has been already observed, that the restorative, pectoral, and antihysterical Virtues of the most precious Balsams and Gums are possessed in an high Degree by Tar-water. And I do not know any Purpose answered by the Wood-drinks, for which Tar-water may not be used, with at least, equal Success. It contains the Virtues even of Guaiacum, which seems the most efficacious of all the Woods, warming and sweetening the Humours, and being diaphoretic, and useful in Gouts, Dropsies, and Rheums, as well as in the Foul Disease. Nor should it seem strange, if the Virtues obtained by boiling an old dry Wood, prove inferior to those extracted from a Balsam.

There is a fine volatile Spirit in the Waters of *Gerontes*, the most esteemed of all the Fountains about *Spa*, but whose Waters do not bear transporting. The stomachic, cardiac, and diuretic Qualities, of this Fountain somewhat resemble those of Tar-water, which, if I am not greatly mistaken, contains the Virtues of the best chalybeate and sulphureous Waters; with this Difference, that those Waters are liable to affect the Head in taking, which Tar-water is not. Besides, there is a Regimen of Diet to be observed, especially with chalybeate Waters, which I never found necessary with this. Tar-water layeth under no Restraint either as to Diet, Hours, or Employment. A Man may study, use Exercise, or repose, keep his own Hours, pass his Time either within or without, and take wholesome Nourishment of any Kind.

The Use of chalybeate Waters, however excellent for the Nerves and Stomach, is often suspended by Colds, and inflammatory Disorders, in which they are acknowledged to be very dangerous; whereas Tar-water is so far from hurting in those Cases, or deserving to be discontinued on that Account, that it greatly contributes to their Cure.

Cordials, vulgarly so called, act immediately on the Stomach, and, by a Consent of the Nerves, on the Head. But Medicines, of an Operation too fine and light to produce a sensible Effect in the *Primæ Viæ*, may, nevertheless, in their Passage through the Capillaries, operate on the Sides of those small Vessels, in such a manner as to quicken their Oscillations, and consequently the Motion of their Contents, producing, in Effect, all the Benefits of a Cordial much more lasting and salutary than those of fermented Spirits, which, by their caustic and coagulating Qualities, do incomparably more Mischief than Good. Such a cardiac Medicine is Tar-water. The transient Fits of Mirth, produced from fermented Liquors, are attended with proportionable Depressions of Spirit in their Intervals. But the

the calm Cheerfulness arising from this Water of Health (as it may justly be called) is permanent. Tar-water is so far from hurting the Nerves, as common Cordials do, that it is highly useful in Cramps, Spasms of the Viscera, and paralytic Numbness.

Emetics, are on certain Occasions, administered with great Success. But the over-straining and weakening of Nature may be very justly apprehended from a Course of Emetics. They are, nevertheless, prescribed and substituted for Exercise. But, in *Plato's Timæus*, Vomits and Purges are said to be the worst Exercise in the World. There is something in the mild Operation of Tar-water, that seems more friendly to the Economy, and forwards the Digestions and Secretions in a way more natural and benign, the Mildness of this Medicine being such, that I have known Children take it for above six Months together, with great Benefit, and without any Inconvenience; and, after long and repeated Experience, I esteem it a most excellent Diet-drink, fitted to all Seasons and Ages.

It is, I think, allowed, that the Origin of the Gout lies in a faulty Digestion. And it is remarked by the ablest Physicians, that the Gout is so difficult to be cur'd, because heating Medicines aggravate its immediate, and cooling its remote Cause. But Tar-water, although it contain active Principles, that strengthen the Digestion beyond any thing I know, and, consequently, must be highly useful, either to prevent or lessen the following Fit, or, by invigorating the Blood, to cast it upon the Extremities, yet it is not of so heating a Nature as to do harm even in the Fit. Nothing is more difficult or disagreeable to Men, than to argue them out of their Prejudices: I shall not, therefore, enter into Controversies on this Subject; but, if them dispute and object, shall leave the Decision to Time and Trial. In the modern Practice, Soap, Opium, and Mercury, bid fairest for universal Medicines. The first of these is highly spoken of. But then those who magnify it most, except against the Use of it in such Cases where the Obstruction is attended with a putrefactive Alkali, or where an inflammatory Disposition appears. It is acknowledged to be very dangerous in a Phthisis, Fever, and some other Cases, in which Tar-water is not only safe, but useful.

Opium, tho' a Medicine of great Extent and Efficacy, yet is frequently known to produce grievous Disorders in hysterical or hypochondriacal Persons, who make a great Part, perhaps the greatest, of those who lead sedentary Lives in these Islands. Besides, upon all Constitutions dangerous Errors may be committed in the Use of Opium.

Mercury has, of late become a Medicine of very general Use; the extreme Minuteness, Mobility, and Momentum of its Parts, rendering it a powerful Cleanser of all Obstructions, even in the most minute Capillaries: But then we should be cautious in the Use of it, if we consider, that the very Thing which gives it Power of doing Good above other Deobstruents, disposes it, also, to do Mischief; I mean its great Momentum: The Weight of it being about ten times that of Blood, and the Momentum being the joint Product of the Weight and Velocity, it must needs operate with great Force. And may it not be justly feared, that so great a Force, entering the minutest Vessels, and breaking the obstructing Matter, might also break or wound the fine tender Coats of those small Vessels, and so bring on the untimely Effects of old Age, producing more, perhaps, and worse Obstructions than those it removed? Similar Consequences may justly be apprehended from other mineral and ponderous Medicines: Therefore, upon the Whole, there will not perhaps be found any Medicine more general in its Use, or more salutary in its Effects, than Tar-water.

To suppose that all Distempers arising from very different, and, it may be, from contrary, Causes, can be cured by one and the same Medicine, must seem chimerical; but it may with Truth be affirmed, that the Virtue of Tar-water extends to a surprising Variety of Cases very distant and unlike. This I have experienced in my Neighbours, my Family, and myself; and as I live in a remote Corner among poor Neighbours, who, for want of a regular Physician, have often recourse to me, I have had frequent Opportunities of Trial, which convince me it is of so just a Temperament as to be an Enemy to all Extremes. I have known it do great good in a cold watry Constitution, as a Cardiac and Stomachic, and at the same time allay Heat, and feverish Thirst, in another. I have known it correct costive Habits in some, and the contrary Habit in others: Nor will this seem incredible, if it be considered, that middle Qualities naturally reduce the extreme; warm Water, for Instance, mixed with hot and cold Waters, will lessen the Heat in that, and the Cold in this.

They who know the great Virtues of common Soap, whose coarse lixivial Salts are the Product of culinary Fire, will not think it incredible, that Virtues of mighty Force and Extent should be found in a fine acid Soap, the Salts and Oil whereof are a most elaborate Product of Nature, and the solar Light.

It is certain Tar-water warms, and therefore some may perhaps still think it cannot cool. The more effectually to remove this Prejudice, let it be farther considered, that, as, on the one hand,

opposite Causes sometimes produce the same Effects, for Instance, Heat by Rarefaction, and Cold by Condensation, both increase the Air's Elasticity; so, on the other hand, the same Cause shall sometimes produce opposite Effects: Heat, for Instance, in one Degree thins, in another coagulates the Blood: It is not therefore strange, that Tar-water should warm one Habit, and cool another; have one good Effect on a cold Constitution, and another good Effect upon an inflamed one; nor, if this be so, that it should cure opposite Disorders; all which justifies to Reason, what I have often found true in Fact. The Salts, the Spirits, and the Heat, of Tar-water are of a Temperature congenial to the Constitution of Man, which receives from it a kindly Warmth, but no inflaming Heat. It was remarkable, that two Children in my Neighbourhood, being in a Course of Tar-water, upon an Intermission of it, never failed to have their Issues inflamed by an Humour much more hot and sharp than at other times. But its great Use in the Small-pox, Pleurifies, and Fevers, is a sufficient Proof, that Tar-water is not of an inflaming Nature.

I have dwelt the longer on this Head, because some Gentlemen of the Faculty have thought fit to declare, that Tar-water must inflame; and that they would never visit any Patient in a Fever, who had been a Drinker of it: But I will venture to affirm, that it is so far from increasing a feverish Inflammation, that it is, on the contrary, a most ready Means to allay and extinguish it. It is of admirable Use in Fevers, being at the same time the surest, safest, and most effectual, Paregoric and Cordial; for the Truth of which I appeal to any Person's Experience, who shall take a large Draught of it Milk-warm in the Paroxysm of a Fever, even when plain Water or Herb Teas shall be found to have little or no Effect. To me it seems, that its singular and surprising Use in Fevers of all Kinds, were there nothing else, would be alone sufficient to recommend it to the Public.

The best Physicians make the Idea of a Fever to consist in a too great Velocity of the Heart's Motion, and too great Resistance at the Capillaries. Tar-water, as it softens and gently stimulates those nice Vessels, helps to propel their Contents, and so contributes to remove the latter Part of the Disorder; and, for the former, the irritating Acrimony, which accelerates the Motion of the Heart, is diluted by watry, corrected by acid, and softened by balsamic Remedies; all which Intentions are answered by this aqueous, acid, balsamic Medicine. Besides, the viscid Juices coagulated by the fetid Heat, are resolved by Tar-water as a Soap, and not too far resolved as it is a gentle acid Soap; to which we may add, that the peccant Humours and Salts are carried off by its diaphoretic and diuretic Qualities.

I found all this confirmed by my own Experience, in the late sickly Season of the Year one thousand seven hundred and forty-one, having had twenty-five Fevers in my own Family cured by this medicinal Water, drank copiously. The same Method was practised on several of my poor Neighbours with equal Success; it suddenly calmed the feverish Anxieties, and seemed by every Glass to refresh, and infuse Life and Spirit into the Patient. At first, some of those Patients have been vomited; but afterwards I found that without Vomiting, Bleeding, Blistering, or any other Evacuation or Medicine whatsoever, very bad Fevers could be cured by the sole drinking of Tar-water Milk-warm, and in proper Quantities, perhaps a large Glass every Hour taken in Bed; and it was remarkable, that such as were cured by this comfortable Cordial, recovered Health and Spirits at once, whilst those who had been cured by Evacuations often languished long, even after the Fever left them, before they could recover of their Medicines, and regain their Strength.

In Peripneumonies and Pleurifies I have observed Tar-water to be excellent, having known some pleuritic Persons cured without Bleeding, by a Blister early applied to the Stitch, and the copious Drinking of Tar-water, four or five Quarts, or even more, in four-and-twenty Hours; and I recommend it to farther Trial, whether, in all Cases of a Pleurisy, one moderate Bleeding, a Blister on the Part affected, and Plenty of tepid Tar-water, may not suffice, without those repeated and immoderate Bleedings, the bad Effects of which are perhaps never got over. I even suspect, that a pleuritic Patient, betaking himself to Bed betimes, and drinking very copiously of Tar-water, may be cured by that alone, without Bleeding, Blistering, or any other Medicine whatever. Certainly I found this succeed by exhibiting a Glass every Half-hour.

I have known a Bloody-flux of long Continuance, after various Medicines had been tried in vain, cured by Tar-water; but that which I take to be the most speedy and effectual Remedy in a Bloody-flux, is a Clyster of an Ounce of common brown Refin, dissolved over a Fire in two Ounces of Oil, and added to a Pint of Broth; which not long ago I had frequent Occasion of trying, when that Distemper was epidemical: Nor can I say, that any to whom I advised it, miscarried. This Experiment I was led to make by the Opinion I had of Tar as a Balsamic; and Refin is only Tar inspissated.

Nothing that I know corroborates the Stomach so much as Tar-water: Whence it follows that it must be of singular Use to Persons afflicted with the Gout. And from what I have observed in five or six Instances, I verily believe it the best and safest Medicine either to prevent the Gout, or so to strengthen Nature against the

Fit, as to drive it from the Vitals. Doctor Sydenham, in his Treatise of the Gout, declares, that whoever finds a Medicine the most efficacious for strengthening Digestion, will do more Service in the Cure of that and other chronical Distempers, than he can even form a Notion of; and I leave it to Trial, whether Tar-water be not that Medicine, as I myself am persuaded it is, by all the Experiments I could make. But in all Trials I would recommend Discretion; for Instance, a Man with the Gout in his Stomach ought not to drink cold Tar-water.

It is evident to Sense, that Blood, Urine, and other animal Juices, being let to stand, soon contract a great Acrimony. Juices, therefore, from a bad Digestion, retained and stagnating in the Body, grow sharp and putrid; hence, a fermenting Hear, the immediate Cause of the Gout: The curing this by cooling Medicines, as they would increase the antecedent Cause, must be a vain Attempt. On the other hand, Spices and spirituous Liquors, while they continue to remove the antecedent Cause, or bad Digestion, would, by inflaming the Blood, increase the proximate or immediate Cause of the Gout, the fermenting Hear: The Scope therefore, must be to find a Medicine that shall corroborate, but not inflame. Bitter Herbs are recommended; but they are weak in Comparison of Tar-water.

The great Force of Tar-water to correct the Acrimony of the Blood, appears in nothing more than in the Cure of a Gangrene, from an internal Cause; which was performed on a Servant of my own, by prescribing the copious and constant Use of Tar-water for a few Weeks. From my representing Tar-water as good for so many Things, some perhaps may conclude it is good for Nothing; but Charity obliges me to say what I know, and what I think howsoever it may be taken; Men may censure and object as they please, but I appeal to Time and Experiment. Effects misimputed, Cases wrong told, Circumstances overlooked, perhaps, too, Prejudices and Partialities against Truth, may for a time prevail, and keep her at the Bottom of her Well; from whence, nevertheless, she emergeth sooner or later, and strikes the Eyes of all who do not keep them shut.

Boerhaave thinks a Specific may be found for that peculiar Venom which infects the Blood in the Small-pox, and that the Prospect of so great a public Benefit should stir up Men to search for it. Its wonderful Success in preventing and mitigating that Distemper, would incline one to suspect, that Tar-water is such a Specific. Some think an Erysipelas and the Plague differ only in Degree: If so, Tar-water should be useful in the Plague; for I have known it cure an Erysipelas.

Tar-water, as cleansing, healing, and balsamic, is good in all Disorders of the Urinary Passages, whether obstructed or ulcerated. Doctor Lister supposes, indeed, that Turpentine act by a caustic Quality, which irritates the Coats of the Urinary Ducts to expel Sand or Gravel. But, it should seem, this expelling diuretic Virtue consisted rather in Salts than the Resin, and consequently resides in the Tar-water gently stimulating by its Salts, without the dangerous Force of a Caustic. The violent Operation of Ipecacuanha lies in its Resin, but the saline Extract is a gentle Purge and Diuretic, by the Stimulus of its Salts.

That which acts as a mild Cordial, neither hurting the Capillary Vessels as a Caustic, nor affecting the Nerves, nor coagulating the Juices, must in all Cases be a Friend to Nature, and assist the *Vitæ* in its Struggle against all Kinds of Contagion; and from what I have observed, Tar-water appears to me an useful Preservative in all epidemical Disorders, and against all other Infection whatsoever, as well as that of the Small-pox. What Effects the Passions of the Mind, have in human Maladies, is well known; and consequently the general Benefit of such a Cardiac cannot be doubted.

As the Body is said to clothe the Soul, so the Nerves may be said to constitute her inner Garment. And as the Soul animates the Whole, what nearly touches the Soul relates to all: Therefore the Asperity of tartarous Salt, and the fiery Acrimony of alkaline Salts, irritating and wounding the Nerves, produce Passions and Anxieties in the Soul, which both aggravate Distempers, and render Mens Lives restless and wretched, even when they are afflicted with no apparent Distemper. This is the latent Spring of much Woe, Spleen, and Uneasiness of Life. Small imperceptible Irritations of the minute Fibres or Filaments, caused by the pungent Salts of Wines and Sauces, so shake and disturb the Microcosms of high Livers, as often to raise Tempests in Courts and Senates; whereas the gentle Vibrations, that are raised in the Nerves, by a fine subtle Acid, sheathed in a smooth volatile Oil, softly stimulating and bracing the nervous Vessels and Fibres, promotes a due Circulation and Secretion of the animal Juices, and creates a calm, satisfied Sense of Health; and accordingly I have often known Tar-water procure Sleep, and compose the Spirits, in cruel Watchings, occasioned either by Sickness, or by too intense Application of Mind.

In Diseases sometimes Accidents happen from without by Mismanagement, sometimes latent Causes operate within, jointly with the specific Taint, or, peculiar Cause of the Malady. The Causes of Distempers are often complicated, and there may be something in the Idiosyncrasy of the Patient that puzzles the Physician: It may, therefore, be presumed, that no Medicine is infallible, nor even

in any one Disorder: But as Tar-water possesses the Virtues of fortifying the Stomach, as well as purifying and invigorating the Blood, beyond any Medicine that I know, it may be presumed of great and general Efficacy in all those numerous Illnesses, which take their Rise from foul or vapid Blood, or from a bad Digestion. The Animal Spirits are elaborated from the Blood: Such, therefore, as the Blood is, such will be the Animal Spirits; more or less, weaker or stronger. This shews the Usefulness of Tar-water in all hysteric and hypochondriac Cases; which, together with the Maladies from Indigestion, comprise almost the whole Tribe of chronical Diseases.

The Scurvy may be reckoned in these Climates an universal Malady, as People in general are subject to it, and as it mixes, more or less in almost all Diseases. A Cachexy, or ill-Habit, is much of the same Kind with the Scurvy, proceeds from the same Causes, and is attended with the like Symptoms, which are so manifold and various, that the Scurvy may well be looked upon as a general Cachexy, infecting the whole Habit, and vitiating all the Digestions.

The Cure of the Scurvy is no more to be attempted by strong active Medicines, than Pitch on Silk is to be removed by Force. The viscid Humour must be gently resolved and diluted, the Tone of the Vessels recovered by a moderate Stimulation, and the tender Fibres, and Capillary Vessels, gradually cleared from the concentered Stuff that adheres to and obstructs them; all which is in the properest manner performed by a watry Diluent containing a fine vegetable Soap. And altho' a complete Cure by Alteratives, operating on the small Capillaries, and by insensible Discharges, must require Length of Time; yet the good Effect of this Medicine on cachectic and scorbutic Persons is soon perceived by the Change it produces in their pale discoloured Looks, giving a florid healthy Countenance in less Time than, perhaps, any other Medicine.

It is well known how extremely difficult it is to cure an inveterate Scurvy; how many scorbutic Patients have grown worse by an injudicious Course of Evacuations; and how difficult, tedious and uncertain the Cure is, in the Hands even of the best, who are obliged to use such Variety and Change of Medicines, in the different Stages of that Malady; which, nevertheless, may be cured (if I may judge by what I have experienced) by the sole, regular, constant, and copious Use of Tar-water.

Tar-water moderately inspissates with its balsamic Virtue, and renders mild the thin and sharp Part of the Blood; the same Water, as a soapy Medicine, dissolves the grumous Concretions of the fibrous Part. As a Balsam, it destroys the ulcerous Acrimony of the Humours; and, as a Deobstruent, it opens and cleans the Vessels, restores their Tone, and strengthens the Digestion, whose Defects are the principal Cause of a Scurvy and Cachexy.

In the Cure of the Scurvy, the principal Aim is to subdue the Acrimony of the Blood and Juices. But as this Acrimony proceeds from different Causes, or even opposite, as acid and alkaline, what is good in one Sort of Scurvy proves dangerous, or even mortal, in another. If I may trust what Trials I have been able to make, this Water is good in the several Kinds of Scurvy, acid, alkaline, and muriatic; and I believe the only Medicine that cures them all without doing Hurt in any. As it contains a volatile Acid with a fine volatile Oil, why may not a Medicine cool in one Part, and warm in another, be a Remedy to either Extreme? I have observed it to produce a kindly genial Warmth without Heat, a Thing to be aimed at in all Sorts of Scurvy. Besides, the Balsam in Tar-water sheaths all scorbutic Salts alike; and its great Virtues, as a Digester and Deobstruent, are of general Use in all scorbutic, and, I may add, in all chronical Cases whatsoever.

I cannot be sure, that I have tried it in a scrophulous Case, tho' I have tried it successfully in one that I suspected to be so. And I apprehend it would be very serviceable in such Disorders. For altho' Doctor Gibbs, in his Treatise of the *King's Evil*, derives that Disease from a coagulating Acid, which is, also, agreeable to the Opinion of some other Physicians, and altho' Tar-water contain an Acid, yet, as it is a Soap, it resolves instead of coagulating the Juices of the Body.

For hysteric and hypochondriac Disorders, so frequent among us, it is commonly supposed, that all Acids are bad. But I will venture to except the acid Soap of Tar-water, having found, by my own Experience, and that of many others, that it raises the Spirits, and is an excellent Antihysteric, nor less innocent than powerful; which cannot be said of those others in common Use, that often leave People worse than they found them.

Many hysteric and scorbutic Ailments, many Taints contracted by themselves, or inherited from their Ancestors, afflict the People of Condition in these Islands; which Ailments might be safely removed, or relieved, by the sole Use of Tar-water.

As the Nerves are the Instruments of Sensation, it follows, that Spasms in the Nerves may produce all Symptoms; and, therefore, a Disorder in the nervous System shall imitate all Distempers, and occasion, in Appearance, an Asthma, for Instance, a Pleurisy, or a Fit of the Stone. Now, whatever is good for the Nerves in general, is good against all such Symptoms. But Tar-water, as it includes, in an eminent Degree, the Virtues of warm Gums and Resins, is of great Use for comforting and strengthening the Nerves, curing Twitches in the nervous Fibres, Cramps, also

also, and Numbness of the Limbs, removing Anxieties, and promoting Sleep; in all which Cases I have known it very successful.

This safe and cheap Medicine suits all Circumstances, and all Constitutions, operating easily, curing without disturbing, raising the Spirits without depressing them; a Circumstance that deserves repeated Attention, especially in these Climates, where strong Liquors so fatally and so frequently produce those very Distresses they are designed to remedy; and, if I am not misinformed, even among the Ladies themselves, who are truly much to be pitied. Their Condition of Life makes them a Prey to imaginary Woes, which never fail to grow up in Minds unexercised, and unemployed. To get rid of these, it is said, there are some who betake themselves to distilled Spirits. Thus are many Lives rendered wretched. But the tender Nerves, and low Spirits of such poor Creatures, would be much relieved by the Use of Tar-water, which might prolong and cheer their Lives.

I verily think, there is not any Medicine whatsoever, so effectual to restore a crazy Constitution, and cheer a dreary Mind, or so likely to subvert the gloomy Empire of the Spleen.

It must be owned, that Tar-water is not so violent and sudden a Medicine, as always to produce its Effect at once, (such, by irritating, often do more Mischief than Good), but a safe and mild Alterative, which penetrates the whole System, opens, heals, and strengthens the remote Vessels, alters and propels their Contents, and enters the minutest Capillaries, and cannot, therefore, otherwise, than by degrees, and in time, work a radical Cure in chronic Distempers. It gives, nevertheless, speedy Relief in most Cases; as I have found by myself, and many others. I have been surprised to see Persons fallen away, and languishing under a bad Digestion, after a few Weeks, recover a good Stomach, and with it Flesh and Strength, so as to seem renewed by the drinking of Tar-water. The Strength and Quantity of this Water to be taken by each individual Person, is best determined from Experience. And, as for the Time of taking, I never knew any Evil ensue from its being continued ever so long; but, on the contrary, many and great Advantages, which sometimes would not, perhaps, begin to shew themselves, till it had been taken two or three Months.

Sir John Floyer remarks, that we want a Method for the Use of Turpentine: And again, he who shall hit, says he, on the pleasantest Method of giving Turpentine, will do great Cures in the Gout, Stone, Catarrhs, Dropsies, and cold Scurvies, Rheumatisms, Ulcers, and Obstructions of the Glands. Lastly, he subjoins, that, for the Use of altering and amending the Juices and Fibres, it must be given frequently, and in such small Quantities at a time, and in so commodious a manner, as will agree best with the Stomach, stay longest in the Body, and not purge itself off; for large Doses, says he, go thro' too quick, and, besides, offend the Head. Now the Infusion of Tar, or Turpentine, in cold Water, seems to supply the very Method that was wanted, as it leaves the more unctuous and gross Parts behind, which might offend the Stomach, Intestines, and Head; and, as it may be easily taken, and as often, and in such Quantity, and in such Degree of Strength, as suits the Case of the Patient. Nor should it seem, that the fine Spirit, and volatile Oil, obtained by Infusion of Tar, is inferior to that of Turpentine, to which it superadds the Virtue of Wood-sour, which is known to be very great, with respect to the Head and Nerves; and this appears evident from the manner of obtaining Tar. And as the fine volatile Parts of Tar, or Turpentine, are drawn off by Infusion in cold Water, and easily convey'd throughout the whole System of the human Body; so, it should seem, the same Method may be used with all Sorts of Balsams, or Resins whatsoever, as the readiest, easiest, and most inoffensive, as well as in many Cases the most effectual Way of obtaining and imparting their Virtues.

After having said so much of the Uses of Tar, I must farther add, that, being rubbed on them, it is an excellent Preservative of the Teeth and Gums; that it sweetens the Breath, and that it clears and strengthens the Voice. And as its Effects are various and useful, so there is nothing to be feared from the Operation of an Alterative so mild and friendly to Nature. It was a wise Maxim of certain ancient Philosophers, that Diseases ought not to be irritated by Medicines. But no Medicine disturbs the animal Oeconomy less than this; which, if I may trust my own Experience, never produces any Disorder in a Patient, when rightly taken.

I knew, indeed, a Person who took a large Glass of Tar-water just before Breakfast, which gave him an invincible Nausea and Disgust, altho' he had before received the greatest Benefit from it. But if Tar-water be taken and made in the manner prescribed at the Beginning of this Essay, it will, if I mistake not, have enough of the Salt to be useful, and little enough of the Oil to be inoffensive. I mean my own Manner of making it, and not the American. Persons more delicate than ordinary, may render it palatable, by mixing a Drop of the chymical Oil of Nutmegs, or a Spoonful of Mountain-wine, in each Glass. It may not be amiss to observe, that I have known some, whose nice Stomachs could not bear it in the Morning, take it at Night, going to Bed, without any Inconvenience; and that, with some, it agrees best warm, with others cold. It may be made for brute

Beasts, as Horses, in whose Disorders I have found it very useful; I believe, more so, than that bituminous Substance, called *Barbados Tar*.

In very dangerous and acute Cases, much may be taken, and often, as far as the Stomach can bear. But in chronical Cases, about half a Pint, Night and Morning, may suffice; or if so large a Dose should prove disagreeable, half the Quantity may be taken at four times, in the Morning, at Night going to Bed, and about two Hours after Dinner and Breakfast. A Medicine of so great Virtue in so many different Disorders, and especially in that grand Enemy, the Fever, must needs be a Benefit to Mankind in general. There are, nevertheless, three Sorts of People, to whom I would peculiarly recommend it; Sea-faring Persons, Ladies, and Men of studious and sedentary Lives.

To Sailors, and all Sea-faring Persons, who are subject to scorbutic Disorders, and putrid Fevers, especially in long Southern Voyages, I am persuaded, this Tar-water would be very beneficial. And this may deserve particular Notice in the present Course of marine Expeditions, when so many of our Countrymen have perished by such Distempers contracted at Sea, and in foreign Climates; which, it is probable, might have been prevented, by the copious Use of Tar-water.

This Water will, also, give charitable Relief to the Ladies, who often want it more than the Parish-Poor; being many of them never able to make a good Meal, and sitting pale, puny, and forbidden, like Ghosts, at their own Table, Victims of Vapours and Indigestion.

Studious Persons, also, pent up in narrow Holes, breathing bad Air, and stooping over their Books, are much to be pitied. As they are debarred the free Use of Air and Exercise, this I will venture to recommend as the best Succedaneum to both. My own sedentary Course of Life had long since thrown me into an ill Habit, attended with many Ailments, particularly a nervous Colic, which rendered my Life a Burden, and the more so, because my Pains were exasperated by Exercise. But, since the Use of Tar-water, I find, tho' not a perfect Recovery from my old and rooted Illness, yet such a gradual Return of Health and Ease, that I esteem my having taken this Medicine, the greatest of all temporal Blessings; and am convinced, that, under Providence, I owe my Life to it.

In the distilling of Turpentine, and other Balsams, by a gentle Heat, it has been observed, that there rises, first, an acid Spirit, that will mix with Water; which Spirit, except the Fire be very gentle, is lost. This grateful acid Spirit that first comes over, is highly refrigeratory, diuretic, sudorific, balsamic, or preservative from Putrefaction, excellent in nephritic Cases, and for quenching Thirst; all which Virtues are contained in the cold Infusion, which draws forth from Tar only its fine Flower or Quintessence, if I may so say, or the native vegetable Spirit, together with a little volatile Oil. *Siris*.

PLACENTA. A Cake. In Anatomy, *Placenta* is a Congeries of Blood-vessels, adhering to the Uterus, during Gestation, which, together with the Membranes, and *Funis Umbilicalis*, is excluded generally after the Fœtus. See *SECUNDINÆ*.

PLACENTULA. A Diminutive of the preceding Word.
PLACIANUM COLLYRIUM. The Name of a Collyrium, described by *Aetius*, *Tetrabib. 2. Sect. 4. Cap. 113.*

PLACITIS, πλακίτις. A Species of *CADMIA*; which see. It is, also, a Name for a crustaceous Sort of Alum.

PLADAROTES, πλαδαρότης. A Disorder of the Eye-lids, consisting in an Eruption of small, soft, discoloured Tubercles, on their internal Surface.

PLADOS, πλάδος. A redundant and superfluous Humidity, rendering any Part lax and weak.

PLAGULÆ. Compresses, or Bolsters.

PLANETES PYRETOS. An erratic Fever; that is, one which is anomalous, and preserves no regular Period, or Type. The Word is, likewise, apply'd to other Distempers, as the Gout, when irregular.

PLANITIES. The Sole of the Foot.

PLANTA. A Plant, or Vegetable. See *BOTANY*. *Planta Noctis* is a minute itching Pustule, which breaks out in the Night.
Castellus. The Sole of the Foot.

PLANTAGINELLA. A Name for the *Plantago*; *aquatica*; *minima*.

PLANTAGO.

The Characters are;

The Calyx is monophyllous, quadrifid, tubulous, and very tender. The Flower in it is monopetalous, shaped somewhat like a Basin, quadripartite, and expanded in form of a Star: The Ovary is guarded by four long Stamina; whence some take the Flower to be apetalous. The Fruit is a Shell, almost of an oval, or conic Form, when ripe, opening transversely into two Parts (one of which rests upon the other); and is divided by an Inter-closure into two Capsules, full of oblong Seeds.

Boerhaave mentions seventeen Species of *Plantago*; which are,
1. *Plantago*; *latifolia*; *rosea*; flore expanso. C. B. P. 189. f. B. 3. 703.
2. *Plantago*; *latifolia*; *rosea*; floribus quasi in Spica dispositis. C. B. P. 189. *Plantago*, *rosea*. J. B. 3. 503.

3. *Plantago*; *latifolia*; *sinuata*. C. B. P. 189. *Tourn. Inst.* 126. *Boerb. Ind. A. 2.* 100. *Plantago vulgaris*, *Septinervia*. Offic. *Plantago latifolia vulgaris*. Park. *Theat.* 493. *Raii Hist.* 1. 876. Synop. 3. 314. *Plantago latifolia*. Ger. 338. *Emac.* 417. *Plantago major*, *folio glabra, non laciniato, ut plurimum*. J. B. 3. 502. GREAT PLANTAIN.

The Root of the Plantain is thick at the Head, having many whitish Fibres growing from it. The Leaves are pretty broad, large and oval, somewhat waved about the Edges, and having seven large Nerves running through the whole Length of the Leaves, and even the broad hollow Foot-stalks, into the Root. The Flowers grow in long Spikes, above half the Length of the thick Foot-stalk, being small and staminate, cut into four Parts, which are succeeded by two small oblong shining brown Seeds, hollowed in on the one Side, growing in little roundish Capsules, which open horizontally, when the Seed is ripe. It grows everywhere by the Way-side, and flowers in May. The whole Plant is used.

Plantain is cold, dry, and binding, and useful in all Kinds of Fluxes and Hæmorrhages, as spitting and vomiting of Blood, bleeding at the Nose, the Excess of the Catamenia, or Lochia, as, also, for the involuntary making of Urine, its Heat and Sharpness, and the Gonorrhœa. It is, likewise, good to stop the Bleeding of Wounds, and to consolidate their Lips.

The only official Preparation is the simple distilled Water. *Miller's Bot. Off.*

Its Leaves are bitter, astringent, and give a faint red Colour to the blue Paper; the Roots give it a deeper, and are only astringent; which shews, that in the Leaves the Sal Ammoniac, and the terrestrial Parts of this Plant, are clogged with a great deal of Sulphur; thus the Plantain is vulnerary, resolving and febrifugous. *Tragus* commends it very much for the Phtisis. In the Country they drink the Juice, from two Ounces to four, at the first Access of the Paroxysm of intermitting Fevers; two Drams of the Extract of this Plant, or a Dram of its Seed, reduced to Powder, cure a Looseness, and all Sorts of Hæmorrhages. The Prisan and Water of Plantain have the same Virtues. They are prescribed in the Dysentery, spitting of Blood, in the immoderate Flux of the Piles, or Terms, for the Whites, and Losses of Blood. In fine, the Plantain is used in all vulnerary and deterfive Porions. In the Inflammation of the Eyes, *Camerarius* made a Collyrium, with the Juice and Leaves of this Plant mixed with Rose-water and Sugar. *Simon Paulli* used the Extract of Plantain, and the Decoction of *Saraparilla*, to cure a young Man that made bloody Urine, after a Gonorrhœa. The Gargarism of Plantain is excellent for the Diseases of the Throat; this Plant is an Ingredient in the Powder which *Julian Paulmier* has prescribed to cure Madness. *Martyn's Tournesort.*

4. *Plantago*; *latifolia*; *incana*. C. B. P. 189. *Tourn. Inst.* 126. *Boerb. Ind. A. 2.* 100. *Plantago incana*. Offic. Ger. 338. *Emac.* 419. *Raii Hist.* 1. 877. *Plantago major incana*. Park. *Theat.* 493. *Raii Synop.* 3. 314. *Plantago major hirsuta, media à nonnullis cognominata*. J. B. 3. 504. HOARY PLANTAIN.

It grows in gravelly Places, and flowers in June. The Leaves are in Use, and agree in Virtues with those of the Great Plantain, and may be substituted in their stead. *Dale.*

5. *Plantago*; *latifolia*; *hirsuta*; *minor*. C. B. P. 189.
6. *Plantago*; *lato*, *sanguineo folio*. H. R. *Monsp.*
7. *Plantago*; *latifolia*, *glabra*; *pedunculi foliis, & Spica, longissimis*.

8. *Plantago*; *latifolia*; *Spica multiplici, sparsa*. C. B. P. 189.

9. *Plantago*; *angustifolia*; *major*. C. B. P. 189. *Tourn. Inst.* 127. *Boerb. Ind. A. 2.* 100. *Plantago angustifolia, Quinquenervia*. Offic. *Plantago Quinquenervia*. Ger. 341. *Emac.* 422. *Raii Hist.* 1. 877. Synop. 3. 314. *Plantago Quinquenervia major*. Park. *Theat.* 495. *Plantago lanceolata*. J. B. 3. 505. RIB-WORT.

This Plantain has longer and much narrower Leaves than the common Plantain, sharp-pointed, and having five remarkable Ribs, or Nerves, running quite thro' them, to the Root, which is less, and more stringy, than the common Plantain. The Flowers grow at the End of long slender Stalks, in oblong Spikes, about an Inch long; they are small and staminate, with white Apices. The Seed grows like that of the common Plantain, but is somewhat larger. It grows in Fields and Meadows, and flowers in May and June; the Leaves are used.

They are restraining and vulnerary, and may be used to the same Purpose with the common Plantain. Some commend the Juice of it, given before the Fit of an Ague, to prevent its coming. *Miller's Bot. Off.*

Mr. Boyle highly recommends a Dram of the Powder of the Leaves given in the Conserve of red Roses, for a Tertian.

10. *Plantago*; *trinervia*; *folio angustissimo*. C. B. P. 189. *Prodr.* 98.

11. *Plantago*; *angustifolia*; *paniculis Lagopi*. C. B. P. 189. *Prodr.* 98.

12. *Plantago*; *angustifolia*; *albida*; *Hispanica*. *Tourn. Inst.* 127. *Boerb. Ind. A. 2.* 101. *Holostium*. Offic. *Holostium Salmanticum*. Ger. 342. *Emac.* 423. Park. *Theat.* 498. *Holostium hirsutum*.

albicans majus. C. B. P. 190. *Holostium Plantagini simile*. J. B. 3. 508. *Raii Hist.* 1. 880. SPANISH PLANTAIN.

This Species grows in sandy Places, and flowers in April and May. It is a vulnerary Plant; and is principally of Use in Hernias.

13. *Plantago*; *angustifolia*; *minima*; *Maffiliensis*, *Lagopi capitulo*. T. 127.

14. *Plantago*; *Orientalis*; *folio Scorzonerae*. T. Cor. 5.

15. *Plantago*; *angustifolia*; *ferrata*; *Hispalensis*. C. B. P. 189.

16. *Plantago*; *Cretica*; *minima*; *tomentosa*; *caule adunco*. T. Cor. 5. *Holostium, seu Leontopodium, Creticum*. C. B. P. 190. *Leontopodium*. Alpin. Exot. 114.

Prosper Alpinus takes this for the *Leontopodium* of *Dioscorides*, and describes it as a small Plant, two Digits in Height; which, from a long slender Root, produces five or seven hairy Leaves, three or four Digits in Length, which, near the Root, are covered with a thick Down. Among the Leaves, near the Root, are little Heads bending downwards from their Stalks, in a wreathed Posture, and bearing black Flowers, which are succeeded by Seeds, involved in so thick a Down, that they can hardly be taken out of it. I have often, says *Prosper Alpinus*, received this Plant dry'd from Candy; and, having produced it from the Seed, found none of its Characters disagreeable with those of the *Leontopodium*. But one thing, he thinks, ought to be observed, which is, what *Dioscorides* has written of the *Catanance*, that when it is dry'd and withered on the Ground, it shrinks and contracts itself into the Figure of the Claws of a dead Kite. Now this Plant *Bellus* plainly proves to be the *Leontopodium*, and not the *Catanance*, since it has neither the Leaves of the *Coronopus*, nor the Seeds of the *Orobis*, which are ascribed to the *Catanance*, but rather of the *Psyllium*. But, I am inclined to believe, he says, that either the *Leontopodium*, and *Catanance*, are the same Plant, or, at least, are not different in Species; and the rather, because *Dioscorides* says of both of them, that they are employ'd as Philtres, or Medicines to procure Love. *Prosper Alpinus de Plantis exoticis.*

17. *Plantago*; *angustifolia*; *major*; *foliis non dentato, rigidiori, ac radice repente*. H. C. *Suppl.* 3. *Boerb. Ind. alt. Plant.* Vol. 2.

Plantain has an astringent Virtue, without any manifest Acrimony. It is of Service in pissing or spitting of Blood, and under an immoderate Flux of the Lochia; in which Cases it never fails the Hopes of the Physician. Externally, it is of Use in Inflammations, being apply'd to the Parts affected. It is a Plant of excellent Use in a Diarrhœa, Hæmorrhages, and Diseases of the Eyes. The bruised Leaves are good to cleanse and consolidate old Wounds and Ulcers. Their Juice is very proper in intermitting Fevers, and in a Phtisis; the distilled Water, mixed with Rose-water, is a good Remedy for Inflammations of the Eyes; the Water injected is of Service in a Gonorrhœa, and the Decoction of the Leaves makes a proper Gargarism in Diseases of the Fauces. *Hist. Plant. adscript. Boerhaav.*

PLANTAGO AQUATICA.

The Characters are;

The Root is very full of Fibres, which unite in a Bulb; the Leaves are like those of the *Plantago*; the Stalk is erect, and bears something like an Umbella. The End of the Pedicle is unfolded into a monophyllous trifid Calyx, which is first expanded like a Star, and, afterwards, retracted backwards. The Flower is tripetalous, rosaceous; the Petals proceeding from the Margin of the reflexed Calyx; the Stamina are six in Number, two from the Origin of each Petal. The Ovary becomes a Fruit, consisting of a Congeries of Seeds, collected, in the large Species, into a triangular Form; in the lesser, into an echinated, or prickly Ball, each Seed furnished with its proper Tube.

Boerhaave mentions three Species of *Plantago Aquatica*; which are,

1. *Plantago*; *aquatica*; *latifolia*. C. B. P. 190. *Boerb. Ind. A. 45.* *Plantago aquatica*. Offic. J. B. 3. 787. *Raii Hist.* 687. Synop. 3. 257. *Plantago aquatica major*. Ger. *Emac.* 417. Park. *Theat.* 1245. *Plantago aquatica major, Limonium verum Dioscoridis & Antiquorum*. Phyt. Brit. 94. *Alisma*. Dill. Cat. Giff. 126. *Alisma, Doronicum Pannonicum*. Mont. Plant. Var. Ind. 36. *Ranunculus palustris Plantaginis folio ampliore*. *Tourn. Inst.* 292. WATER PLANTAIN.

It grows in watry Places, and flowers in June, and the Root is in Use.

Schwenckfeld says, that it cures the falling down of the Anus, and mitigates the Redness and Inflammation of the Gout, and the Pain of the Head, proceeding from a cold Cause; and is a Remedy for pissing and spitting of Blood. The Juice, as *Roslin* says, consumes the Milk in the Breasts. *Dale.*

2. *Plantago*; *aquatica*; *angustifolia*. C. B. P. 190. *Ranunculus, palustris, Plantaginis folio angustiori*. T. 292.

3. *Plantago*; *aquatica*; *minima*. Clus. H. 110. *Plantaginella, palustris*. C. B. P. 190. *Ranunculus aquaticus, Plantaginis folio angustissimo*. T. 292. *Boerb. Ind. alt. Plant.*

It is called *Plantago aquatica*, because its Leaves are like those of the *Plantago terrestris*. Many think it the *Damaconium* of the Antients; but what is said of the *Damaconium*, does not seem, to me, to agree with this Kind. As for M. *Vaillant*, he thought it the *Damaconium*, because *Label* calls one Species of the *Plantago*.

zago by that Name. *Tournefort* refers the whole Kind to the *Ranunculus*, but I know not for what Reason; for their Leaves and Flowers are different.

The Taste shews this to be an acrimonious Plant, tho' the Generality of Botanists, among whom is *Matthioli*, say, it is of a cold Quality. But this Error is corrected by *Gesner*, *Bauhine*, and others, who make it a Plant of a very heating Nature. The Reason why it was thought to be cold was, I conceive, because the *Plantago* is refrigerating; whence they thought the *Plantago aquatica* to be of the same Nature. The Plant then is acrimonious and penetrating, whatever may have been said of its cooling and drying Qualities. The Leaves bruised, and applied to the Breasts, are a sovereign and approved Secret, as *Timach* assures us, for suddenly consuming and drying up the Milk therein. *Hist. Plant. adscript. Boerhaav.*

PLANTARIS MUSCULUS, or TIBIALIS GRACILIS.

This is a small pyriform Muscle, situated obliquely in the Ham, below the external Condyle of the Os Femoris, between the *Popliteus* and *Gastrocnemius Externus*; and its Tendon, which is long, flat, and very small, runs down on the Side of the *Gastrocnemius Internus*, all the way to the Heel.

The fleshy Body, which is only about two Inches in Length, and one in Breadth, is fixed by a short, flat Tendon, above the outer Edge of the exterior Condyle of the Os Femoris, on one Side of the *Gastrocnemius Externus*. From thence the fleshy Body runs obliquely over the Edge of the *Popliteus*, and terminates in a very small, long, flat Tendon.

This Tendon runs between the Body of the *Gastrocnemius Externus* and *Soleus*, all the way to the inner Edge of the upper Part of the *Tendo Achillis*; and from thence continuing its Course downward, it joins this Tendon, and is inserted together with it, in the Outside of the posterior Part of the Os Calcis, without communicating with the *Aponeurosis Plantaris*.

Sometimes this Muscle is wanting, and sometimes it is situated lower down.

From the Description of the *Tibialis Gracilis*, we see evidently, that it can have no Use with relation to the Sole of the Foot. The Use assigned to it by others, of extending the Tarsus, and thereby assisting the *Gastrocnemii* and *Soleus*, seems to me to be very uncertain; both because of the great Disproportion in its Size, and the Obliquity of its Course. If the *Soleus* were not cover'd by the *Gastrocnemii*, the *Tibialis Gracilis* might be imagined to serve as a *Frænum*, in bracing down that Muscle, and hindering it from swelling too much; but the small Number and Direction of its Fibres would still render it unfit for that Function.

Till its true Use is evidently discover'd by some lucky Observation, there is, in the mean time, some Ground to think, that it hinders the Capsular Ligament of the Knee from being compress'd in the Flexion of that Joint; both because of its Adhesion to that Ligament, and because of the Obliquity of its Course; especially since the neighbouring Portion of the same Ligament seems to receive the same Assistance from a tendinous Expansion of the *Semi-membranosus*. *Winslow's Anatomy.*

PLASTICUS, πλαστικός, from πλάσσω, to form. Formative, or endued with a Faculty of forming.

PLATÆ, πλαται. The Scapula.

PLATAMON, πλαταμών. A smooth low Rock, prominent out of the Sea. *Galen*; *Exeg.*

PLATANARIA. A Name for the *Sparganium*; *ramosum*.

PLATANUS.

The Characters are;

The Leaves are large, and lacinated; the Flower is amentaceous, form'd into a globular Figure, and consisting of a Multitude of Stamina. The Fruit, which is produced at a Distance from the Flower, is spherical, and contains vast Numbers of long, apiculated Seeds, intermix'd with much Down.

Boerhaave mentions two Species of *Platanus*; which are,

1. *Platanus*; *Orientalis*; *verus*. *Park. Theat.* 1427. *Raii Hist.* 2. 1706. *Tourn. Inst.* 590. *Boerh. Ind. A.* 2. 209. *Platanus*. *Offic. C. B. P.* 431. *J. B.* 1. 170. *Ger.* 1304. *Emac.* 1489. THE PLANE-TREE.

The *Platanus Orientalis*, so much celebrated by *Herodotus*, and other Writers, is, also, called *Platanus latus*, because it extends its Branches to such a Compass, as to be able to cover more than a thousand Men under its pleasing Shade. Under this Tree, *Hippocrates* found *Democritus*, and saluted him. *Hist. Plant. adscript. Boerhaav.*

The tender Leaves of the *Platanus*, boil'd in Wine, and apply'd as a Cataplasm, stop Defluxions upon the Eyes, and give Relief under Tumors and Inflammations. The Bark, boil'd in Vinegar, makes a Collution for the Tooth-ach. The green Balls or Fruit, drank in Wine, cure the Bites of Serpents; and made into an Ointment with Fat, are a Remedy for Ambushions. The Dust, or Down, of the Fruit, or Leaves, falling into the Eyes, or Ears, injures the Sight and Hearing. *Dioscorides*, *Lib.* 1. *Cap.* 107.

2. *Platanus*; *Occidentalis*; aut *Virginienfis*. *Park. Theat.* 1427. *Boerh. Ind. alt. Plant.*

PLATANUS is, also, a Name for the *Papaya*; *fructu Meol-peponis effugie.*

PLATEA. The Pelican.

PLATIASMOS, πλατίαςμος. A Fault in Pronunciation, when a Person opens his Mouth too wide, which hinders him from speaking distinctly. *Gortæus.*

PLATYCORIA, πλατυκορία. A preternatural Dilatation of the Pupil of the Eye, from a paralytic Cause. *Areteus de Sig. et Caus. diuturn.* L. 1. C. 7.

PLATYOPHTHALMON. A Name for Antimony; so call'd, because it was used by Women, for rendering their Eyebrows and Eye-lashes black and beautiful.

PLATYPHYLLOS. A Name for the *Quercus*; *latifolia*; *mas*; quæ brevi Pediculo est. And for the *Quercus*; *latifolia*; *femina*.

PLATYSMA, πλατύσμα. Any thing which is flat, and broad. Thus a Piece of Cloth, or Plaister, or Plate of Metal, are call'd by this Name.

PLATYSMA MYOIDES is the Name by which *Galen* calls the muscular Expansion, call'd *Quadratus Genæ*. See CAPUT, and LABIA.

PLATYSTERNOS. Broad-chested. An Epithet for a Person possess'd of a broad STERNUM.

PLECHAS, πλεχάς. The Region of the Body, which is terminated on each Side by the Thighs; forward by the *Pudenda*, and backwards by the Anus. *Hippocrates.*

PLECTANE, πλεκτανή, or πλέγμα. A Plexus, or Complication of Vessels. *Plectanæ*, πλεκτάναι, are the *Cornua* of the Uterus.

PECTRUM. A Name for the Styloide Process of the Os *Petrosum*; for the *Uvula*; and, in some Authors, for the Tongue.

PLEGMA. The same as PLECTANE.

PLEGMARIA. See SELAGO.

PLEIAS, πλειάς, or πλειάς, in the Plural Number *Pleiades*, in Latin *Vergiliæ*, is a Constellation of seven Stars in the Sign *Taurus*; but, in *Hippocrates*, it signifies the Fall of these Stars, which is at the End of Autumn, or about the latter End of October. This is what *Galen* intimates, *Com. 1. in 1 Epid.* where he says, "that *Hippocrates* plainly shews, that he knew the Fall of the "Pleiades to be the End of Autumn; which, therefore, by a "compendious way of Expression, he calls πλειάς." Thus *Galen*. And in Confirmation of what he says, we may often observe, that *Hippocrates* uses the Words ὑπὸ πλειάδος, to signify the End of Autumn.

PLEMMYRIS, πλεμμυρίς, is, properly, the same as πλεμμύρα, and signifies the flowing of the Tide, as *Hesychius* expounds it; but is, by a Metaphor, used to express a Redundance, or Overflowing, of Humidities, or, as *Galen* expounds it, πλῆθος ὑγρό-ιστος, "Plenty of Moisture."

PLEMNE, πλέμνη, is expounded, in *Galen's* Exegesis, by τροχὸν χοιρίτις, "the Nave of a Wheel." The Word frequently occurs, *Lib. de Fract. Plemnæ*, πλέμναι, in the plural Number, as expounded by *Hesychius*, are the Perforations round the Nave, or Axis, into which the Spokes of the Wheel are inserted. *Foesius.*

PLENILIUNUM. The Full Moon. At this Time, many Distempers are said to be exasperated; as Madness, the Epilepsy, and Disorders arising from Worms. See ASTRONOMIA.

PLENNA, πλέννα, the same as BLENNA, Mucus.

PLERES ARCHONTICON. The Name of a compound cephalic Powder. *Lemery Pharmacopée Universelle*. *Blancard.*

PLEROSIS, πλήρωσις. Repletion; or a recruiting a Body, worn out, or reduced, by Sickness, or Evacuations.

PLESMONE, πλεσμονή. Plenitude, Satiety, or Repletion.

PLETHORA, πλεθώρα, from πλῆθος, Plenitude. A Plenitude, or Redundance of Blood, and Humours.

The Disorders arising from a Defect of the Circulation of the Humours, are, in Nature, pretty much the same with those spontaneously produced by their Stagnation. In this Case the Air is of great Importance, since, when admitted, it accelerates spontaneous Corruptions, which would otherwise be brought on more slowly; so that the Knowledge and Cure of the former, are the same with those of the latter; and from all these, the Nature, Cause, Effects, Signs, and Remedies of a Plethora may be duly understood, provided the following Circumstances are adverted to.

The Fluids of the human Body, are either crude, and, in some measure, partake of the Nature of the Aliments; or they have acquired those Qualities which are peculiar to the human Fluids; Now, if we consider what happens both to the crude and assimilated Fluids of the human Body, whilst the Circulation is diminished, it will evidently appear, that nearly the same Changes will happen to the Fluids, as if they had been left to themselves, and in a State of Rest; for the human Blood, when suffered to rest for a few Moments, is separated into Serum, and a red coagulated Substance. Now, when the Circulation is considerably diminished, a Misfortune of the like Nature, of course, begins to be formed; and hence it is, that polypose Concretions are so frequently observed after chronical Disorders. But all crud: Ali-
ments

ments are, by the Efficacy of the Circulation of the Blood, assimilated to the human Fluids. Now if the Circulation of the Humours is diminished, the Aliments longer retain their original Quality, and are spontaneously corrupted.

It must be observed, that a free Access of the Air accelerates all spontaneous Degenerations of the Humours; for no Fermentation happens without the Approach of the Air; and whilst the Atmosphere is excluded, a Putrefaction of the Humours is far more slowly formed, than it would otherwise be. Thus, in dropical Patients, stagnant Water often remains for some Months in the Abdomen, with scarce any Degree of Corruption; but it soon becomes putrid upon the Access of the Air.

Whilst, during the last Months of Gestation, the Blood becomes almost stagnant in the distended Vessels of the Uterus, it does not become corrupted; but, after Delivery, upon the Approach of the Air, the Lochia are highly fetid. After violent Contusions, when the Blood remains under the sound Skin, it hardly becomes putrid; but, being gradually attenuated and absorbed, as it were, disappears. But when Blood taken from the Veins is exposed to the free Air, it quickly becomes putrid. Hence, whilst, in the interior Parts of the Body, the Humours either become stagnant, or move slowly, they do not suddenly degenerate into a putrid State, when the Air has not a free Access to them.

But as a Plethora, or increased Quantity of Fluids, retards their Circulation, so its Nature, Causes, Signs, and proper Remedies, are to be deduced from the following Considerations:

A Plethora is a larger Quantity of laudable Blood, than is capable of undergoing those Changes, which must necessarily happen for the Purposes of Life, without inducing Diseases.

A Redundance of laudable Blood is what we call a Plethora: Hence this Circumstance can never, in its own Nature, be a Disorder; since it only supposes a preternatural Quantity of laudable Humours, whilst, in every other respect, the Patient is sound. Hence *Helmont* imagined, that a Plethora was unjustly classed among the Number of Diseases, since, according to him, what is laudable, cannot be peccant in Quantity. Now a Plethoric Patient is such an one, as is not as yet sick, but at the same time is in such a State of Plenitude, that, if the Humours are more increased or rarefied by Heat, or any other Cause, the natural Functions are, by these means, injured. Hence a Plethoric Person may be found, though at the same time in the greatest Danger; for, by an increased Heat of the circumambient Atmosphere, the smallest Error with respect to the Non-naturals, or any violent Passion of the Mind, this sound State may be changed into the most dangerous Disease. But it is impossible to prevent such a Misfortune sometimes happening to the most healthy Person. Hence *Hippocrates*, in *Aphor. 3. Sect. 1.* informs us, "That Persons in a good Habit of Body are in a State of Danger; and that, since they cannot long continue in the same State, nor change for a better, they must, of course, decline into a worse; for which Reason such a State ought, with the greatest Expedition, to be removed."

A Plethora, therefore, does not import every Increase of the Humours, but only an Augmentation of the laudable Juices. Hence *Galen*, in *Meth. Medend. Lib. 13. Cap. 6.* informs us, "That a mutual and equable Increase of the Fluids is called a Plethora; whereas, when the Body abounds with yellow or black Bile, Phlegm, or serous Humours, the Disorder is called a *Cacoehymy*, and not a Plethora."

A Plethora was, by the Antients, distinguished into that affecting the Vessels, and that influencing the Strength. When the Vessels are so preternaturally turgid with the laudable Juices, that they are ready to break, the Misfortune is called simply a *Plenitude*, or *Plethora of the Vessels*. But when the Vessels are not too full of laudable Humours, but yet contain more than the weak vital Force is able to put into a due Circulation, the Disorder is called a *Plenitude*, or *Plethora, with respect to the Strength*. Thus *Galen*, in his *Treatise de Plenitudine*, *Cap. 3.* informs us, "That there are two Species of Plethoras, one affecting the Strength and vital Powers; and the other the Vessels." And in his *Treatise de Curandi Ratione per Venæsectionem*, *Cap. 6.* he tells us, "That the more heavy a Person perceives himself, the more a Plethora, with respect to the Strength, is increased; whereas a Plethora, with respect to the Vessels, is discovered by a Sense of Tension."

But a Plethora, in the common Acceptation of the Word, is confined to the Vessels, and in this Sense we now consider it.

This Species of Plethora, then, is generated by every Cause which produces a large Quantity of laudable Chyle and Blood; and at the same time hinders their Attenuation, Consumption, and Perspiration.

By the Functions of Life, the Solids are necessarily worn,

and the Fluids diffipated. Hence what is lost, ought to be recruited by Aliments. If every Day as much is restored to the Body as is lost, there remains a perfect Equilibrium, the most perfect Sign of confirmed Health; for *Sanctorius* has shewn, by his Experiments, that the Body is in the most perfect State of Health, when daily, after the Digestion of the Aliments, it returns to its usual Weight. Now the Restitution of what is lost, is produced by laudable Chyle, and the Blood formed of it. If, therefore, by whatever Cause, there is a larger Quantity of laudable Chyle and Blood, than is sufficient for restoring what is lost, generated, there will be an Accumulation of superfluous Juices gradually produced, and such an Accumulation will be greatly increased, if the Efficacy of those Functions is diminished, by which the Fluids ought to be attenuated, consumed, and diffipated; by the usual Ways of Excretion.

Among the other Causes of a Plethora, we may justly reckon the great contractile Force of the chylopoetic Organs, Heart, and Arteries; a lax Texture of the Veins, and other small Vessels; mild Aliments, easily convertible into Chyle; much Sleep; an easy Mind; a Want of due muscular Motion, and habitual Evacuations of Blood, whether natural or artificial.

As for the contractile Force of the chylopoetic Organs; whilst the Viscera, subservient to the Change of the Aliments into laudable Chyle, are sound and strong, there is a large Quantity of Chyle prepared from the Food and Drink; and whilst the like Strength remains in the Heart and Arteries, a laudable Blood is generated from this large Quantity of Chyle; whilst at the same time the Veins, being naturally lax, easily yield to the distending Fluid, and receive its superfluous Quantity, unless a Depletion of them is produced by proportionably greater Motion and Exercise; for the more languid the Circulation is, the more Humours are accumulated in the Veins: Whereas, on the contrary, the brisker the Motion of the Blood is, the Arteries become the fuller, and the Veins the more empty: Whilst Drunkards often destroy large Quantities of Liquor, they would be suffocated, unless the Veins were capable of receiving the superfluous Liquor; for which Reason their Veins are, at such times, greatly inflated. When, therefore, the chylopoetic Organs prepare a large Quantity of Chyle; when the Viscera, subservient to Sanguification, convert this Chyle into Blood, and there is, at the same time, a Laxity of the Veins, there must necessarily be a Redundance of laudable Blood accumulated.

As for mild Aliments; all acrid Substances, by their stimulating Quality, increase the Circulation of the Blood; and an increased Motion of the Blood diminishes the Quantity of the Juices: Mild Aliments, therefore, of the ripe, farinaceous kind, Broths prepared of Flesh, the tender Fleashes of young Animals, and soft Pot-herbs, from all which a large Quantity of laudable Chyle is generated, have a Tendency to produce a Plethora.

As for much Sleep; it is shewn, under the Article *FIBRA*, how plentiful Sleep conduces to the Relaxations of too rigid Fibres. Now the relaxed Vessels easily yield to the distending Fluids, for which Reason they are the more filled. Besides, during Sleep, what was lost by the Functions of Sensation, and voluntary Motion, is restored. On the contrary, whilst we are awake, what was accumulated during Sleep, is consumed. Hence those, who are fatigued by the Labours of the Day, rise brisk and vigorous, after a salutary Sleep. When, therefore, any Person indulges himself in a great deal of Sleep, the more the Humours are daily accumulated, and the less of them is diffipated. Hence arises a Plethora. Hence, also, it is, that Habits exhausted by violent Disorders are so happily restored by long Sleep; and Bears sustain Life all the Winter by sleeping, without any manner of Food.

As for an easy Mind; that Serenity of Mind contributes greatly to the Preservation of Life, is sufficiently obvious. Now the Effect of the best Health is a Plethora: Besides, violent Passions, and racking Cares, palpably prey on the Body. And *Galen*, in his *Method. Medend. Lib. 14. Cap. 15.* mentions the Cares of the Mind, among the other Methods of curing Obesity or Fatness.

As for a Want of due muscular Motion; after Man, for the Punishment of his Sin, was sentenced to earn his Bread by the Sweat of his Brow, bodily Exercise became necessary for the Preservation of Health: Accordingly Persons, who led delicate and idle Lives, are afflicted with the most terrible Disorders. *Hippocrates*, in his *Treatise de Viâs Ratione Sanorum*, *Lib. 1.* informs us, "That a Person, who eats heartily, cannot be sound, without Exercise; for though Aliments and Exercise have different Effects, yet they mutually concur to the Preservation of Health; since Labour consumes what is superfluous, whilst Aliments and Drink recruit what is lost." And in the same *Treatise*, *Lib. 3.* he orders us to consider, "Whe-

“ whether the Aliments surpass the Exercise, or the Exercise the Aliments, since, when either happens, Diseases are produced; whereas, when they are equal, and duly proportioned to each other, Health is preserved.

Such an Equilibrium, therefore, is requisite between the Aliments and Exercise, that as much may be daily dissipated, as is taken in by way of Aliment. Whilst the same Quantity of Food is used, and the Exercise lessened, a Plethora begins to be formed. When Horses are well-fed in Stables, they soon become fat, but when exercised in hard Running for some Days, the additional Fat is soon dissipated.

As for usual Evacuations of Blood, whether natural or artificial; it is certain from Experience, that the oftener a Man is bled, provided he is not quite weakened by it, his Vessels are afterwards rendered more turgid with Blood. Women have every Month a natural Evacuation of superfluous Blood; and Men, accustomed to repeated Venesections, are, about the usual times of Venesection, afflicted with the same Disorders Women labour under, in consequence of a Retention of the Menstrues: Thus at last the Strength of such Men degenerates into the lax and feeble State of Woman. Mr. Dodart, in *Hist. de l'Academie des Sciences*, An. 1707. observes, that in a Man, not weakened by Venesection, sixteen Ounces of Blood taken from the Veins were restored in five Days time. Hence it is obvious, that repeated Venesection disposes to a Plethora, whilst the Blood is, by that means, so soon regenerated, though the Body is rendered less firm, more lax, and consequently its Vessels more easily filled. I saw a Woman, who, on account of violent and often-returning Passions of Mind, was bled above sixty times in a Year, and became so fat, that in a few Months she weighed one hundred and fifty Pounds more, than in her natural State; but the Blood, being daily regenerated, laid a Foundation for repeated Venesections, till, her whole Strength being destroyed, she fell into a Dropsy. It doth not, therefore, seem to be a laudable Custom for healthy Persons to bleed frequently every Year, by way of Caution and Prevention; since, by that means, the Body is weakened, and disposed for the more easy Repletion. Galen, who, in *Meth. Medend. Lib. 9. Cap. 5.* in certain Disorders, recommends frequent and bold Venesections, till the Patient faints away, condemns this Custom in the following manner: “ I hardly think it expedient to open a Vein often every Year; because, in conjunction with it, the vital Spirits are evacuated; and, if these are greatly diminished, the whole Habit is refrigerated, and all the natural Operations worse performed.”

All the Effects of a Plethora depend upon that Rarefaction of the Blood, which is to be ascribed to its increased Velocity, and the Heat arising therefrom, or to other Causes, only to be known from Observation. Hence arises a Dilatation of the Arteries, both sanguiferous and lymphatic, a Change of the Secretion, a Compression of the sanguiferous and lymphatic Veins, a Suffocation of the Circulation, an Inflammation, a Rupture of the Vessels, a Suppuration, a Gangrene, and Death.

All the Effects of a Plethora depend on the Rarefaction of the Fluids. When the Vessels are furnished with too large a Quantity of laudable Blood, there may still be a State of Health preserved: But when, by whatsoever Cause, the Blood contained in the Vessels is rarefied, then the Functions begin to be injured and impaired; and when, on such an Occasion, certain Changes appear in the Body, these are called the Effects of a Plethora; though they do not depend upon this Cause alone, since the Plethora is only the predisposing, and the Rarefaction the exciting or occasional Cause of them. From these two Causes, therefore, united, is formed the proximate Cause of these Phenomena; and as the exciting Cause, that is, the Rarefaction, puts the Plethora in Action, which alone, except in an high Degree, would not soon prove hurtful, hence, in that Sense, the Effects of a Plethora are said to depend upon the Rarefaction of the Fluids.

The Rarefaction of the Blood is to be ascribed to its increased Velocity, and the Heat arising from that Circumstance. When, in the same Time, a larger Quantity of Blood flows thro' the Vessels, its Velocity is said to be increased; but this cannot happen, without an increased Attrition of the Fluids on the Vessels. Hence arises Heat, and the Heat produces Rarefaction: But all the Causes, which, from Experience, seem to rarefy the Blood, seem to produce this Effect, by increasing the Velocity of its Motion, and the Heat arising from that Circumstance. Now a Rarefaction of the Blood is alone sufficient to produce all those Effects; which arise from a Plethora; for if the Blood was doubly rarer than it is, it would be the same thing, with regard to the Vessels, as if its Quantity was doubly increased. If, therefore, to a Plethora a Rarefaction of the Blood is added, all the Symptoms, capable of arising from a Plethora, will be

augmented. Hence it is obvious, why all those Medicines and Diseases, which, in consequence of an increased Velocity of the Blood, induce Heat, and consequently Rarefaction, produce the Symptoms of a distending Plethora. When a pale and chilly Girl is affected with the Small-pox, there forthwith arise a Heat, Redness, and inflammatory Tension of the Vessels, together with an intolerable Head-ach; not from an increased Quantity of the Blood, but from its Rarefaction, produced by an Acceleration of its Motion, and a consequent greater Heat.

Hence arises a Dilatation both of the sanguiferous and lymphatic Arteries. The Blood, when either increased in Quantity, or by Rarefaction, possessing more Space than it did before, will necessarily dilate the Vessels in which it is contained, more than before; and hence both the Arteries and Veins will be distended, and the Blood cannot be so easily propelled from the Arteries into the too much distended Veins: Hence a greater Resistance is made about the Extremities of the Arteries: For this Reason the Arteries will be more distended, by the Blood forced into them from the Heart. Now since, among the Causes enumerated by Physicians, why, from the same Blood, so various Liquors are secreted in various Parts, we may justly reckon the various Proportions which the secreting Ramifications bear to their Trunks, hence it is obvious, that, when this Proportion is disturbed by a Dilatation of the Arteries, all the Secretions may, also, be disturbed by that means.

As for a Compression of the sanguiferous and lymphatic Veins; in most Parts of the Body, Veins run along with the Arteries; and, when the Arteries are too tumid, they compress the adjacent Veins, which are furnished with weaker Coats: The compressed Veins convey their contained Blood to the Heart; the Heart forces it into the Arteries, and the Veins being compressed, are capable of receiving a smaller Quantity of it: Hence a still greater Dilatation of the Arteries succeeds; and, at last, almost the whole Blood is accumulated in them, whilst the Veins are more compressed and emptied.

As for a Suffocation of the Circulation of the Humours; this must necessarily happen, since, by these means, the Resistance made to the Blood, to be convey'd out of the Left Ventricle of the Heart, is every Moment increased. Hence the Pulmonary Veins cannot so easily convey the Blood into the Left Ventricle of the Heart: For this Reason the Blood will begin to be accumulated in the Vessels of the Lungs; the Resistance made to the Right Ventricle of the Heart will be increased, and, at last, the Circulation of the Blood suffocated. Hence we observe, highly plethoric Persons very red, with their small Arteries dilated, and receiving the red Blood. At last such Persons, being, as it were, suffocated, begin to assume a livid Colour, and often die suddenly; unless, either by Nature or Art, the Vessels are relieved, by lessening the Quantity of Blood, and, consequently, diminishing its Heat and Rarefaction.

As for an Inflammation; this must necessarily happen, on account of the gross Humours which have entered the too much dilated Offices of the minute Vessels; and which cannot pass through the narrowest Parts of them.

As for a Rupture of the Vessels; this happens principally in those Parts where the Vessels are most tender: Hence it is, that, in plethoric Patients, Arteries breaking in the Brain so often produce mortal Apoplexies: Hence, also, it is, that Spittings of Blood are so frequently observed to arise from a Rupture of the Pulmonary Vessels, by the distending Blood in plethoric Patients.

As for a Suppuration and a Gangrene; these are the common Terminations of an Inflammation, which cannot be resolved.

As for Death; this seems to happen, because the too much distended Vessels make so great a Resistance to the Heart, that it cannot discharge its Contents. Hence the Circulation is suffocated: Or, because the large Vessels, being too turgid with Blood, compress the minute Vessels in the Brain, Cerebellum, and Nerves; or, when, in consequence of a Rupture of the Vessels, the Humours necessary to Life are evacuated; or, lastly, when, in consequence of a Rupture of the Vessels, the extravasated Fluids destroy the Actions of the Viscera, more immediately subservient to Life.

A Plethora then, when present, is easily known; and its future Effects readily foreseen.

A present Plethora is known, if the Causes which generate too large a Quantity of laudable Blood, and which are already enumerated, have preceded; if there is a great Redness in the whole Body, especially in those Parts in which the Vessels appear naked, and uncovered with Skin, as in the Corners of the Eyes, the Tunica Adnata, the internal Parts of the Eye-lids; the internal Parts of the Nostrils, the Mouth, Fauces, and Lips; if a great Heat is perceived, even at the Extremities of the

the Body; if the Veins are inflated, and the Pulse strong and full; if, after violent Exercise, an increased Heat of the Atmosphere, Wine, or any other heating Substances, the Patients perceive, in all their Muscles, a soft, full, distending Tumor, together with a certain Immobility, so that they can hardly clinch their Fingers; then they begin to be sluggish, lethargic, and have a Discharge of Tears from their Eyes.

In forming the Prognostic of a Plethora, we foresee, that all the Symptoms already enumerated will happen; and particularly, that the Functions of the whole Brain will be disturbed, because, in the Head, all the Parts are naturally full. Hence, when the large Vessels full of red Blood are distended, the other smaller Vessels will be compressed; because the Bones of the Cranium cannot yield. Hence all the Disorders of the Brain, from the slightest Vertigo to the most fatal Apoplexy, may arise from a Plethora.

A Plethora is cured by Venesection, Exercise, Watchings; a sharp and acrid Diet, after due Evacuations; and by a gradual Omission of these Evacuations.

By Venesection. A Redundance of laudable Blood is the Cause of all the Misfortunes already enumerated. Every thing, therefore, which diminishes this Redundance, is beneficial. But this is best done by Venesection, immediately after which all the Symptoms are relieved. A Physician never practises more rationally, than when he imitates the Ways and Methods, which Nature herself takes, in relieving Disorders. Now we see, that both in Health, and under Diseases, a Plethora, arising either from a Redundance or Rarefaction of the Blood, is happily removed by a salutary Hæmorrhage, especially from the Nostrils. Hence, in young Persons, in a perfect State of Health, at that Period of their Lives, when their Vessels, now becoming stronger, begin more forcibly to resist the Fluids, such Evacuations of Blood are so frequently salutary, especially in the Spring, when the Heat increases. For the same Reason, also, Hæmorrhages from the Nose have often proved salutary in the most violent and acute Disorders: Now Physicians, imitating these Efforts of Nature, order the Quantity of Blood to be lessened by Venesection; and if Symptoms indicate, that the Arteries are only highly distended, and the Veins collapsed, because the Blood cannot pass from the Arteries to the Veins, which frequently happens in acute, inflammatory Disorders, then some of them venture to order Arteriotomy; and, as in large Arteries this cannot be done without Danger, the same Effect may more safely be produced by opening many small Arteries by Scarifications. Hence *Prosper Alpinus*, in his *Treatise de Medicina Egyptiorum*, informs us, that the *Egyptians*, among whom these acute Disorders are frequent, greatly esteem such Scarifications.

Some, especially of the Followers of *Helmont*, condemned Venesection, as a Practice both cruel and useless: They believed, that, by Abstinence from Aliments and Drink, the Redundance of the Humours was more effectually lessened, since, by insensible Perspiration, and the other Excretions, several Pounds of Humours are daily evacuated; which, however, are restored by Aliments and Drink. Hence they maintained, that since the natural Excretions continued to diminish the Fluids, whilst what was lost was not restored by Aliments and Drink, there was a greater Diminution of the Fluids, by Abstinence for twenty-four Hours, than by the boldest Venesection: But by this Method the most subtle Humours are only dissipated from the Body, whilst the red, thick Blood, distending the larger Vessels, is hardly diminished; which is the Circumstance most required; and all the Humours become more acrid, whilst no new Chyle is mixed with the Blood.

But tho' Venesection lessens the Redundance of the Blood, yet it not only leaves the Body equally subject to Repletion, but even disposes more to the Generation of a fresh Plethora, as we have already observed. Hence it is necessary the Body should be rendered so firm, as that it may not easily, for the future, accumulate a Redundance of Blood.

As for Exercise; this not only dissipates what was retained during a State of Rest, but, also, to corroborate the Solids, that they do not easily yield to the Fluids they contain. Thus we rarely find Persons daily accustomed to hard Labour, plethoric, even though they should be highly voracious: But Exercise is not proper, till by Venesection the Vessels are emptied; otherwise, being distended, a Rupture of them would very readily happen.

As for Watchings; much Sleep is reckon'd among the Causes of Plenitude; so that Watching must produce the opposite Effect.

As for a sharp and acrid Diet after due Evacuations; soft Aliments easily changed by the Chylopoetic Organs, afford a large Quantity of Chyle. Hence the Quantity of Blood is daily increased, unless, by violent Exercise, the superfluous Hu-

mours are dissipated. Hence Nature has supplied new-born Infants with an highly soft Milk, already changed in the Mother's Body, because, in that Age, a very quick, and daily Increase of the Humours is requisite. But when the contrary is required, as in the Cure of a Plethora, for Instance, then harder Aliments of a more difficult Digestion, and acrid, aromatic, and stimulating Substances, prove beneficial; because, by this means, less Chyle, and, consequently, all other Circumstances being alike, less Blood will be generated; and the Motion of the Humours being increased by acrid stimulating Substances, an Accumulation of them will not so easily happen. But before the Quantity of the distending Fluids is lessened by Evacuants, acrid Substances are highly pernicious, lest a Rupture of the too full Vessels should happen upon an Increase of the Motion of the Blood by means of stimulating Substances.

As for the gradual Omission of usual Evacuations; we have already observed how much frequent Venesections dispose to a frequent Plethora. Hence these Evacuations are to be omitted; but this is not to be done all at once, because all sudden Changes from usual to unaccustom'd things are bad, especially in this Case; for by frequent Venesections the Body is habituated to accumulate a large Quantity of Blood, which unless removed, will produce all the Effects of a Plethora: For this Reason, such usual Evacuations are to be gradually lessened as to their Quantity, and a greater Interval of Time put betwixt them, that they may be gradually diminished without any Danger. In taking such Measures, we imitate the salutary Method of Nature, about the Time when the Menstrues begin to prove defective in Women; for then this Evacuation is naturally and gradually diminished in Quantity, and its Returns appear at longer Intervals, till it at last totally ceases. But, when the Menstrual Discharge ceases suddenly, it is generally productive of terrible Consequences.

Van Swieten.

PLETHORICUS. An Epithet for a Person abounding with Blood, or labouring under a *Plethora*.

PLETHRON. The sixth Part of a *Stadium*.

PLEURA. The Pleura is a Membrane which adheres very closely to the inner Surface of the Ribs, Sternum, and Musculi Intercostrales, Sub-costales, and Sterno-costales, and to the convex Side of the Diaphragm. It is of a very firm Texture, and plentifully stored with Blood-vessels and Nerves, in all which it resembles the Peritonæum, and, likewise, in that it is made up of an inner true membranous Lamina, and a cellular Substance on the Outside, which is a Production or Continuation of the Lamina.

The cellular Portion goes quite round the inner Surface of the Thorax, but the membranous Portion is disposed in a different manner. Each Side of the Thorax has its particular Pleura, entirely distinct from the other, and making, as it were, two great Bladders, situated laterally with respect to each other, in the great Cavity of the Breast, in such a manner, as to form a double Septum, or Partition, running between the Vertebrae and the Sternum, their other Sides adhering to the Ribs and Diaphragm.

This particular Duplication of the two Pleurae is termed *Mediastinum*. The two Laminæ, of which it is made up, are closely united together near the Sternum and Vertebrae; but in the Middle, and toward the lower Part of the fore Side, they are separated by the Pericardium and Heart. A little more backward they are parted in a tubular Form, by the Oesophagus, to which they serve as a Covering; and in the most posterior Part, a triangular Space is left between the Vertebrae and the two Pleurae from above downward, which is filled principally by the Aorta.

Before the Heart, from the Pericardium to the Sternum, the two Laminæ adhere very closely, and there the Mediastinum is transparent, except for a small Space near the upper Part, where the Thymus is situated; so that in this Place there is naturally no Interstice, or particular Cavity. The apparent Separation is owing entirely to the common Method of raising the Sternum, as was plainly demonstrated by *Bartholinus*, in his *Treatise of the Diaphragm*, published at *Paris* in 1676.

The Mediastinum does not commonly terminate along the Middle of the Inside of the Sternum, as the common Opinion has been. I demonstrated, says *Winslow*, in 1715. to the Royal Academy of Sciences, that, from above downward, it inclines toward the Left Side; and that if, before the Thorax is opened, a sharp Instrument be run through the Middle of the Sternum, there will be almost the Breadth of a Finger between the Instrument and the Mediastinum, provided that the Sternum remain in its natural Situation, and the Cartilages of the Ribs be cut at the Distance of an Inch from it, on each Side.

From all this we see, not only that the Thorax is divided into two Cavities, entirely separated from each other, by a middle Septum without any Communication; but, also, that, by the Obliquity of this Partition, the Right Cavity is greater than the Left; and hence we may judge of the Uncertainty of Trepanning

panning the Sternum, which the Antients have recommended in some Cases.

The cellular Portion of the Pleura connects the membranous Portion to the Sternum, Ribs, and Muscles; to the Diaphragm, Pericardium, Thymus, and Vessels; and, in a Word, to whatever lies near the convex Side of the membranous Portions of the Pleura. It, likewise, insinuates itself between the Laminæ of the Duplicature, of which the Mediastinum is formed, and unites them together. It even penetrates the Muscles, and communicates with the cellular Substance in their Interstices, all the Way to the Membrana Adiposa on the external convex Side of the Thorax. In this the Pleura resembles the Peritonæum.

The Surface of the Pleura, turned to the Cavities of the Breast, is continually moisten'd by a lymphatic Serosity, which issues through the Pores of the membranous Portion. This Fluid is said to be secreted by imperceptible Glands; but the Existence of these Glands has not been hitherto demonstrated.

The Arteries and Veins of the Pleura are principally Ramifications of the Intercostrals; and these Ramifications are exceedingly numerous, and, for the most part, very small. The Mammariæ Internæ and Diaphragmaticæ, likewise, send Branches hither, which communicate very frequently with those that come from the Intercostrals.

The Mediastinum has particular Vessels called the *Arteriæ* and *Venæ Mediastinæ*, which are commonly Branches of the Subclaviæ. The Mammariæ Internæ send, likewise, Ramifications to the fore Part of it, the Diaphragmaticæ to the lower Part, and the Intercostrales and Œsophagææ to the back Part.

The Nerves are Ramifications of the true Intercostrals, call'd otherwise *Costales*, and *Dorsales*. Near the Vertebrae, they communicate with the great Sympathetic Nerves, improperly call'd *Intercostrales*, and but very little with the middle Sympathetici, or those of the Eighth Pair.

The Pleura serves in general for an inner Integument to the Cavity of the Thorax. The Mediastinum cuts off all Communication between the two Cavities, and hinders one Lung from pressing on the other, when we lie on one Side. It, likewise, forms Receptacles for the Heart, Pericardium, and Œsophagus; and is continued over the Lungs.

Before we leave the Pleura, it must be observed, that these Portions of it which adhere immediately to the Ribs, may be looked upon as the Periosteum of their inner Sides. This Adhesion keeps the Pleura stretched, and hinders it from slipping or giving way. It, also, renders this Membrane extremely sensible of the least Separation caused by a coagulated Lymph, or accumulated Blood; the nervous Filaments being, likewise, in this Case, very much compressed in Inspiration, by the Swelling of the Intercostrals Muscles. *Winflow's Anatomy.*

PLEURITIS, πλευεΐτις, from πλευρα, the PLEURA. A Pleurisy, or Inflammation of the PLEURA. See PERIPNEUMONIA.

PLEURON, πλευρον. The same as PLEURA.

PLEUROPNEUMONIA. The Name of a Distemper, consisting of a Complication of a Pleurisy, and Peripneumony.

PLEURORTHOPNŒA, according to *Blancard*, is a Pleurisy, in which the Patient cannot breathe without keeping his Neck erect.

PLEXUS, in Anatomy, is a kind of Net-work, or Complication of Vessels. Thus a Congeries of Vessels within the Brain is call'd *Plexus Choroides*, *Reticularis*, or *Retiformis*. A Plexus of Nerves is an Union of two or more Nerves, forming a sort of Ganglion, or Knot.

PLICA POLONICA. In *Poland* and *Lithuania*, this Disorder is endemial, and well known. It consists in a preternatural Bulk of the Hairs, which, being firmly conglutinated and wrapped up in inextricable Knots, afford a very monstrous and unseemly Spectacle. When these are cut, the Blood is discharged from them, the Head racked with Pain, the Sight impaired, and the Patient's Life frequently endangered. This Misfortune is principally incident to the *Jews* who live in those Countries. Though it seems difficult to account for this Disorder, and assign its true Causes, we shall, nevertheless, make an Attempt of this Kind. What, therefore, contributes not a little to its Production, is the sordid and nasty manner of Life to which these People are addicted; for they rarely comb their Hairs, sleep in low, moist Rooms, and drink large Quantities of Brandy. The Waters, also, concur and assist in the Generation of this Disorder. Hence *Gebema*, in *Epist. ad Bontekoe de Plica Polonica*, is justly of Opinion, that the Causes of this Disease is lodged in some particular Waters of *Poland*, which, if either drank, or used for washing the Body, produce the Plica; which he confirms by the Fate of two Soldiers, who, when intending to wash their Bodies, had scarce immersed their Heads in the Water of a certain Pond, before their Hairs were contracted into many Folds. Besides these Causes, we suppose an hereditary Fault convey'd from the Parents, and which consists in too great a Bulk of the Pores and bulbous Hairs under

the Skin of the Head. Hence the thick and glutinous nutritious Juice, produced by their coarse Aliments, and impure Waters, is, by the Heat excited by their drinking Brandy, forced into the Cavities of the Hairs, and, sweating through their Pores, produces this terrible Disorder. *Hoffman. de Morb. cert. Reg. propr.*

This Disorder, unless the peccant Matter is convey'd to the Hairs, is very dangerous; and violent Symptoms are produced in almost all the Parts of the Body, where it is deposited and lodged.

But if Nature, in a salutary and critical manner, throws the peccant Matter to the Hairs, an unseemly Twisting of them is produced, whilst the Patient remains free from every other Symptom; since Nature generally throws the Remains of the peccant Matter to the Hairs, the Disorder of which is, by many, supported to the Ends of their Lives, without any inconsiderable Inconvenience.

If the folded or twisted Hairs are rashly cut off, Blindness, and other terrible Symptoms, are excited, not because, as some think, the Head is by this means exposed to Cold, which might be prevented by wearing a Cap; but because the Substance, in which Nature used to lodge the peccant Matter, is removed, and a free Evacuation of the sordid Humours by that means prevented. And in this Disorder the same happens as in old Ulcers, which, unless the Body is first well cleansed, cannot be healed up without the greatest Danger. Nor is it safe to close Fontanels, which have been kept open for a considerable time.

When the peccant Matter is no longer lodged in the Body, the Plicæ, or Twistings of the Hair, are spontaneously removed; and if we are absolutely certain, that such a Matter is no longer in the Body, which, however, is hard to be known, the Plicæ, or Twistings, may be cut off.

A perfect Method of curing this Disorder is, in my Opinion, unknown; undoubtedly, because in those Parts of *Poland* in which this Disease is endemial, there have been few Physicians, who, from what is commonly known of the Nature and Cure of the *Plica Polonica*, have been able to lay down a rational and judicious Plan for treating it.

'Tis certain, that Purging and Venesection are so far from being beneficial in this Disorder, that they often prove hurtful. Thus the Rector of the Academy of *Zamosca* informs the Physicians of *Padua*, that, if they attempt the Cure of this Disorder by common Purgatives, the Patient will be render'd worse, because these, instead of correcting and subduing the peccant Humours, throw them into violent Commotions, and more effectually distribute them through the whole Body; in consequence of which, intense Pains are produced in all its Members. *Hercules Saxonia* is of the same Opinion, and confirms this Doctrine by various Instances of Persons rendered blind, lame, and subjected to other Misfortunes, by using Purgatives in the Beginning of the *Plica Polonica*, as, also, in the Scurvy.

'Tis, therefore, most safe and expedient, as soon as possible, to solicit the peccant Matter to the Hairs, to which it naturally tends. And this Intention, as we learn from Experience, is, of all others, the most effectually answered by Lotions prepared of Bears-breech. *Sennertus.*

PLICHAS, πλιχάς. The same as PLECHAS.

PLINIA.

The Characters are;

It hath a Bell-shaped Flower, consisting of one Leaf, which is divided into five Segments at the Margin; from whose Cup rises the Pointal, which afterward becomes a globular, soft, chaneled Fruit, in which is included one Seed of the same Form.

Miller mentions but one Sort of *Plinia*; which is,

Plinia fructu croceo odorato. *Plum. Nov. Gen.*

This Plant was discovered by Father *Plumier*, in the *West Indies*, who gave it this Name, in Honour to *Pliny* the famous Natural Historian. *Miller's Dict.*

PLINTHIUM, πλινθιον. A Name of several Machines for making Extension. One of these is described by *Oribasius*, *de Laqueis*, Cap. 13. He, also, describes two more, in his *Treatise de Machinamentis*, Cap. 8. one of which he calls *Nilei Plinthium*.

PLINTHITIS, πλινθίτις. A Species of Alum, called, also, **PLACITIS**.

PLOTES. A Name for the *Mugil*, in *Oribasius*, *Collect. Medicinal. Lib. 2. Cap. 58.*

PLUMACEOLUS. A Pledget, Bolster, or Compress.

PLUMACEUS. An Epithet for certain Magisteries in *Zwelfer*, importing their being extremely fine, and soft as Feathers, or Down.

PLUMBAGO.

The Characters are;

The Root is fibrous, thick, fleshy, hot, and perennial; the Leaves

Leaves are alternate and entire. The End of the short Pedicle unfolds itself into a monophyllous, quinquefid, and very hairy Calyx, shaped like a Tube, in whose Centre is seated the Ovary furnished with its proper Tube. On the Apex of the Ovary, grows a monopetalous Flower, consisting of a long Tube, which has its upper Part expanded into a Circle, so as to resemble the Flower of Jessamin; these Flowers are disposed in Spikes. The Seed is oblong and acuminate.

Boerhaave mentions two Species of *Plumbago*; which are,
1. *Plumbago quorundam*. Tour. Inst. 140. Boerb. Ind. A. 77. *Dentellaria*. Offic. *Plumbago Plinii*. Ger. 1069. Emac. 1254. Raii Hist. 1. 394. *Dentellaria Rondeletii*. J. B. 2. 941. *Lepidium Dentellaria dictum*. C. B. P. 97. *Lepidium Monspeliacum Dentellaria dictum*. Park. Theat. 885.

LEADWORT.

The Stalks of this Leadwort are but weak and slender, clothed with long, narrow, whitish, green Leaves, which encompass them. The Flowers grow in short thick Spikes, small and purple, of a single Leaf cut into five Segments, which are succeeded by rough, hairy, naked, solitary Seeds. The Root is large and thick, and the whole Plant is hot and biting, like *Lepidium*.

This is a Plant seldom or never used. It is of an hot, and even a caustic Nature, like *Pellitory of Spain*; and has been made use of, like that, for the Tooth-ach; it is said, that, even held in the Hand, it will cure the Pain of the Teeth. *Miller's Bot. Off.*

2. *Plumbago Ceylanensis*, folio splendente Ocymastri, flore lacteo.

PLUMBAGO. *Plumbago*. The same as *MOLYBDÆNA*.
PLUMBUM. Lead.

The Greek Authors frequently use the same Name to express both Lead and Tin; and, accordingly, their Latin Translators interpret *nausitese*, both by *Plumbum* and *Stannum*. *Geo. Agricola* mentions three Kinds of *Plumbum*, one white, which we call *Tin*; another of an Ash-colour, which we call *Bismuth*; and the third livid, which is our Lead.

THE FORMS OF ITS ORE.

Lead is seldom found pure in the Mines, and has different-coloured Ores, viz. black, yellow, and ash-coloured; it is, also, found in red, or white rocky Stone, and sometimes in the Form of Dice, with shining Lead-coloured Surfaces; and, sometimes mixed with white, yellow, or green Fluors. There are many Lead Mines in *Spain*, *Italy*, and *Germany*; but the richest are those of *England*.

The Ore is of a poisonous Quality, especially with regard to Brutes. "They who live near where it is washed, says Mr. *Beaumont*, can neither keep Dog nor Cat, nor any Sort of Fowl, but they all die in a short time." He adds, that, "not only Calves, but even Children, have been known to be kill'd, by only being in Houses where Lead-ore had been kept some time; and that if any Sort of Cattle fed often on the Grass, on which the Steam which rises from the Smelting of Lead, falls, they all die soon after." *Phil. Collect.*

DIFFERENCES OF ITS ORE.

There is a very considerable Difference between the Ores of different Mines. Some is so like Steel, that the Workmen call it Steel-ore; which being of more difficult Fusion than ordinary, they mix other Ore with it. There is another, which, from its Readiness to vitrify, and its Use in glazing the Potters Vessels, is called *Potter's Ore*.

Our English Lead-ores are reducible to three Classes; the first, those which, in the ordinary ways of Melting, afford from thirty to forty Pounds of Metal, for every hundred Weight of Ore. The second, from forty-five to sixty. The third, from sixty to eighty.

LEAD CONTAINS SILVER.

The Lead found in some Parts of *England*, contains from five to ten Pounds of Silver in a Tun Weight; which they get out by testing, and recover the Lead without any great Waste.

The Lead of many Mines, being skillfully treated, affords Silver; but the Quantity of Silver in the Ore, does not hold in Proportion to the Quantity of Lead. Mr. *Boyle* caused some Lead-ore to be tried, which, being the most promising he had ever known, gave him Hopes of some considerable Quantity of Silver: But though it proved so rich in Lead, as to afford after the Rate of seventy Pounds to the Hundred; yet one of the most expert Artists in *Europe* could not extract one Grain of Silver from it. Yet a Piece of Lead-ore was brought from *Ireland*, which seemed so light in the Lump, that he thought it scarce deserved to be wrought for Lead; which, however, was found upon Trial, so well stored with Particles of Silver, that he encouraged the Owner of the Mine to work it.

HOW SMELTED.

Some Lead-ore requires no previous Preparation to its being smelted, unless by grinding. They barely throw it upon a Wood-fire, or a Forge-hearth, where the Metal running into a Bason in the Hearth, they ladle it out, and cast it into an iron Mould, which gives it the Form of what we call *Pigs*.

In the Lead-works at *Mendip*, in *Somerſetſhire*, the Method of procuring the Metal is thus delivered by Mr. *Glanvil*, in *Phil. Transact.* No. 39. "When they have got the Ore they beat it small, then wash it clean in a running Stream, and then sift it in iron Rudders. They next make an Hearth, or Furnace, of Clay, or Fire-stone; and therein build their Fire, which they light with Charcoal, and keep up with young oaken Gads, blown with Bellows. After the Fire is lighted, and the Fire-place hot, they throw the Lead-ore on the Wood, which melts down into the Furnace; and, then with an iron Ladle they take it out, and cast it in Sand into any Form they please."

Lead is the heaviest Body, after Mercury. Hence melted Lead constitutes a Fluid of the third Order of Gravity; where-in all Bodies, whether metalline or not, excepting Gold and Mercury, might float, if there were no other Cause to the contrary.

If all the Impurities of Lead could be perfectly purged away, its Weight might nearly approach to that of Mercury. Accordingly, in analysing this Metal, it is said to yield a considerable Quantity of Mercury; though what the other Ingredient is, united with the Mercury, seems hard to say. Lead, though a cheap and common Metal, has yet a great Affinity with Gold, at least in point of Weight, which seems to be the most distinguishing and immutable Character of Gold; and what makes the Resemblance still closer is, that Lead does not mix with any Metals, except those allowed to be Mercurial ones.

Lead proves extremely simple in all Kinds of Trials.

It is not fixed, but fumes in the Fire; and, after continuing long in Fusion, penetrates most of the Vessels hitherto used.

It is the softest of all Metals, easily ductile, and the least elastic or sonorous. There is no Metal whose Figure is so easily changed; and hence it proves very ductile, and easily flexible, though not capable of being drawn out into such simple, fine, coherent Parts, as Gold.

It diminishes the Sound of other Metals, when mixed with them. This Property follows from its Softness; for, if two equal leaden Balls be struck with equal Velocities against each other, they will both remain fixed in the Point of Contact, without any Vibration or Resilition; so that of course no Sound can be produced. 'Tis on account of this Unelasticity of Lead, that it has been used by Dr. *Wallis*, Mr. *Huygens*, and others, for determining the Laws of Percussion. By this Property, also, Lead should appear to be nearly allied to Gold, which is the next least sonorous or springy of all Metals. Accordingly several Experiments have been produced, to prove that Lead, melted, always either contains, or generates, some Portion of Gold. Mr. *Hornberg* assures us, that taking a Quantity of Silver, and separating it from all heterogeneous Matter by testing with Lead, then putting a Piece of it in Aqua-fortis, a little Gold fell to the Bottom. And, upon adding Copper to the Aqua-fortis, the Silver was precipitated.

Lead melts the soonest of all Metals, except Tin, even long before it ignites; and thus grows scurfy, readily vitrifies, and, being now fused, it passes through any Vessel. A Quantity of Lead, being set over the Fire in an iron Ladle, no sooner begins to run, than its Surface appears exceedingly bright, and shines like Mercury; but its Face soon alters, and you discern a Cloud in it, which gradually increases, till the whole Surface appears darkened with a dusty Scoria. This Dust being blown away with Bellows, there strait arises a new Supply; and so on till the whole Lead is thus converted into Scoriae, which are only the Matter of the Lead gently calcined. A more violent Fire vitrifies them; that is, converts them into an heavy, brittle, pellucid, elastic, sonorous Matter, called *Glass*; into which other Metals are indeed convertible, but Lead the easiest; and which is of such a penetrating Nature, that it runs through all the common Crucibles, almost as Water through a Sieve.

The Calx of Lead has nothing of the Appearance of Lead; and yet by only exposing it to a strong Fire, and adding a little Iron-filings, or any unctuous inflammable Matter, the Lead is easily recovered.

And if, while the Lead is in Fusion, it be kept continually stirring with a Spatula, it turns into a red Powder, called *Minium*, or *Red-lead*; in which Operation this is farther observable, that the Lead augments in Weight.

Lead throws up light Bodies that are cast into it; vitrifies with the baser Metals; and, having so done, carries them along with

with it from the Cavity of the Test; thus leaving only Gold and Silver behind, separated from the rest. After Fusion, it quickly returns, in the Cold, to a solid Mass, though more slowly than Tin. Lead dissipates all Metals tested with it, on the Cupel, except Gold and Silver; which is a Property, that had we been unacquainted with, all our Treasures of Gold and Silver had lain in little Compass; this being of principal Use in obtaining those Metals.

The Foundation of the Process is this: Any Mass, of what Kind soever, whether Metal or Stone, Salt or Sulphur, Gold and Silver only excepted, being mixed with Lead, and exposed to the Fire, separates, and flies off.

Upon the Whole, there are three ways whereby all the Matters mixed with Gold and Silver are destroy'd and lost, when cupel'd with Lead. 1. By volatilizing and evaporating. 2. By turning to Scorizæ, and retiring to the Sides of the Test. 3. By penetrating the Pores of the Cupel; which only happens to such Bodies as can neither fly off in Fumes, nor work to the Sides in the way of Scorizæ.

Lead dissolves in Aqua-fortis, not in Aqua-regia, and thus yields a sweet Salt. It dissolves in most of the weak Acids; but very difficultly in the stronger, unless they be diluted with Water. Thus in Aqua-fortis it dissolves slowly; but very readily in Vinegar, small Aqua-fortis, *Rhenish* Wine, Spirit of Vinegar, and the like; and even in Oil of Vitriol well diluted with Water. Add, that, in whatever Acid it is dissolved, the Solution becomes considerably sweet like Sugar. The Fumes of Wine or Vinegar dissolve it into a white Powder, or Calx, called *Cerufs*, or white Lead.

It is found plentifully in various Mines of *Europe*; being cheap, and the Consumption of it large: But 'tis in its Nature very surprising, and for certain Purposes exceedingly useful. In the fabulous way, it is called, the *Origin and Father*; as well as the *Devourer of other Metals*.

Its Ore is usually ponderous and shining, of a Lead-colour, which yield half the Quantity of Metal. Sometimes it is white, red, or yellow, which are poorer Kinds: It often contains a little Silver, by which the Assayers, if not on their Guard, are liable to be deceived.

ITS MEDICINAL VIRTUES.

Both in its crude State, and in all its Preparations, Lead seems to be cooling, thickening, repelling, absorbing, and contracting, so as to retard the Circulation of the Blood, hinder all the Secretions, and hurt the Nerves, by causing Spasms, Convulsions, Tremblings, Difficulty of Breathing, and Suffocation. Whence it appears unfit for internal Use in any large Dose; and, accordingly, its medicinal Uses are principally external.

ITS OTHER USES.

Its Uses in the Hands of the Plumber, Glazier, Shot-maker, white and Red-lead-maker, Potter, Assayer, Jeweller, Painter, and others, need not be mentioned, as being commonly known. A Mixture of it with Tin is the Foundation of enamelling; and counterfeit Gems are made by its means.

HINTS FOR ITS ALCHEMICAL HISTORY.

Let the Saturnus Cornuus be examined for Mercurification.

What Vessel will hold the Glass of Lead in Fusion?

Let the talky Nature of Litharge be examined.

As Lead fulminates with Nitre, and flashes in the Flame of a Candle, and burns blue, it may seem to contain a Sulphur.

Is not the sulphureous Principle in Lead small in Quantity, and but loosely joined; since a small Degree of Fire is able to separate them?

Exposed upon a Tile to the Focus of a Burning-glass, it fumes and turns to a yellow or red Calx; then melts into a yellow Fluid, which soon evaporates in Smoke; but, if removed before this happens, it hardens to a yellow Mass like Orpiment, consisting of Laminæ like Talc. This being again exposed to the Focus, on a Piece of Charcoal, recovers the Form of Lead. But if the Lead be laid upon Charcoal, it thus totally dissipates in Fume, and leaves no Glass behind. Hence what Relation has it to Mercury, Gold, &c.?

Is it not composed of a soft, talky, vitrifiable Earth, and a small Proportion of a Sulphur, or inflammable Substance, lightly joined therewith?

THE CALX OF LEAD BY THE VAPOUR OF VINEGAR.

Take a large glass Body, cut so as to have a wide Mouth, with an Alembic-head answering to it; in this Head put thin Plates of Lead, so as to stand somewhat erect, without falling, all around the hollow Part of the Ledge; put Vinegar into the Body; set it in a Sand-heat, put on the Head with its Lead-plates, apply a Receiver, and distil with a gentle Fire for twelve Hours; then leave off, and let all cool for twelve Hours; the Plates, being now gently dried, grow white, or appear covered with a white Powder, which, being brushed off with a Hare's-foot, is called *Ce-*

rufs, or White-Lead. If the Operation be several times repeated, the whole Body of the Lead will be turned into the like perfectly, insipid, scentless, white Powder; the Vapour of the Vinegar raised in the Operation condenses into a whitish, turbid, sweet, nauseous, styptic Liquor, called the Vinegar, or the Solution of Lead.

REMARKS.

Hence we may see how easily Lead is dissolved by a very mild Acid, and soon changed from its malleable State into a loose Powder, or brittle scaly Plates; but the distilled Liquor, impregnated with dissolved Lead, is a true Solution of Lead, which, being inspissated, affords the true Salt of Lead. This Operation is continually made in Lead exposed to the Air, that abounds with Acids; whence Coverings of Lead, that are exposed to the Air, resolve into a white Calx, and this the sooner, the more the Air abounds with Acids. If the same Operation be performed upon Iron or Copper, these Metals, also, are dissolved on their Surfaces; the Iron into a red Calx of Iron called Rust, and the Copper into a green Substance called Verdigrise; the Iron into a gold-coloured Liquor, and the Copper into one that is perfectly green. The Cerufs thus prepared is likewise compounded of the Acid of Vinegar, and the dissolved Body of the Lead, but the Acid is here latent. This Cerufs is of Use in watry, ulcerous, running Sores, or Diseases of the Skin, being sprinkled thereon. If this fine Powder be drawn along with the Breath into the Lungs, it causes a violent and almost incurable or mortal Asthma: If received into the Mouth, and swallowed along with the Spittle, it occasions inveterate Distempers in the Viscera, intolerable Faintings, Weakness, Pains, Obstructions, and at length Death itself. These terrible Effects are daily seen among those who do any Work in Lead, but principally among the Makers of White-lead. Let Men, therefore, beware of this Poison, which being both without Smell and Taste, proves the more pernicious as it is the less discovered; and does not shew itself 'till it has destroyed the Body. Hence we learn also how easily Lead may be dematerialized, and turned to a Calx; and this appears upon all Experiments. If Lead be melted over a gentle Fire, in a clean unglazed earthen Vessel, it runs pure like clean Quicksilver, but soon grows dark upon its Surface, and gathers a Skin, which being carefully taken off with an iron Ladle, proves a kind of Calx: Now, again, the Surface appears white, and again generates a Skin, that may be taken off, 'till at length, the whole Body of the Lead is changed into this Calx, which also is poisonous. This Calx, and the former Cerufs, being long calcined, and stirred over the Fire, at length increase in Weight, and turn of a bright-red Colour; and the like is found in Lead-ore long calcined. In the Smelting of Copper, there rises a Scum, which principally consists of Lead; and, if of a Colour betwixt Red and Yellow, it is called Litharge of Gold; if paler, the Litharge of Silver; tho' both of them are nearly the same thing, and of the same Virtue. Lead-ore does not much differ from the former. Hence the same Lead may exist under various Colours, Gravities, Masses, and Forms, and may be dissolved in the same Liquors, and thus afford the same Productions; nor is it of much Significance, whether Cerufs, Litharge, Red-lead, or Lead-ore be thus corroded by Vinegar; for in each Case the same Salt of Lead is produced; they have all of them the same medicinal drying Virtue, and poisonous Quality. Red-lead gains considerably in Weight from the Fire; this may, perhaps, proceed from the Acid of the Fuel, imbibed by the Lead from the Fire.

THE VINEGAR OF LEAD.

1. Boil Cerufs in a tall Bolt-head, with twenty times its Weight of strong distilled Vinegar, in a little wooden Furnace, often shaking the Vessel for four Hours; then let all cool, strain off the pure Liquor, add more distilled Vinegar to the Remainder, repeat the Operation as before, and continue thus, till the Cerufs is almost dissolved: Mix the several Solutions together, they will be found to have lost the Sharpness of the Vinegar, and to have become sweet, nauseous, and styptic. This is called the Vinegar of Lead, as also Virgins Milk, because it cures red Spots, Pimples, and little Ulcers in the Face. If this Vinegar be filtered, and distilled with a gentle Fire to a Fourth, there comes over a nauseous Water, that is not acid, but of a disagreeable and particular Odour. All the Acid of the Vinegar is retained below, in the resolved Cerufs. Let it be preserved under the Title of Vinegar of Lead, and it is to be esteemed of the same Virtue with Vinegar of Litharge.

2. If instead of Cerufs we take the Litharge of Gold, or Silver, Red-lead, or Lead-ore, reduce them to Powder, and boil them with Vinegar as above, they will afford the same undistinguishable Vinegar of Lead. This only is particular of it, that, when cold, it filters with Difficulty, as then blocking up the Paper; but, when hot it runs through easier.

3. When fresh-distilled Vinegar is pour'd to this inspissated Solution, and boiled, and again reduced almost to the Consistence of Honey, the Vinegar distilled off loses much of its acid Virtue, leaving the acid Part in the metallic Liquor; the Part that floats

floats above, being somewhat oily, unctuous, and saccharine, is called Oil of Lead, and consists of the Metal and the Vinegar. The oftener this Addition of Vinegar is repeated, the more unctuous the Liquor becomes, and the harder to dry.

REMARKS.

Hence we have a new Method of calcining and dissolving a very ponderous Metal, and bringing it into a Liquor. Here we see a new Taste and Odour produced, by Acid and Metal; and an Attraction and Separation of the Acid by the Metal, till it is fully saturated and impregnated. This Vinegar of Lead long preserves uncorrupted the Bodies of Animals that are plunged therein, or penetrated and dried therewith; it coagulates the animal Juices, and preserves them from Putrefaction; if diluted and rubbed upon the Skin, it cures Breakings out, Redness, Inflammations, and the Erysipelas; it gives a Whiteness and Beauty to the Skin, but proves pernicious to the Body; at length occasioning a Consumption, as appears by many melancholy Examples. If the inspissated Oil of Lead be mixed with an equal Quantity of Oil of Roses, it makes a white Balsam highly commended by the Surgeons.

THE SALT OF LEAD WITH VINEGAR.

1. Inspissate a Quantity of the Vinegar of Lead in a low glass Body, with a very wide Mouth, till it becomes almost as thick as Oil; set it in a quiet cold Place, and a whitish-grey Mass will shoot to the Bottom, in small erect Spiculæ; pour off all the Liquor, and with a gentle Fire slowly dry the Remainder; which will now be white like Sugar, and is called the Sugar of Lead.

2. Dissolve this Sugar of Lead in fresh and sharp distilled Vinegar; let it stand to depurate; inspissate the Liquor to the Thickness of Oil; set it in a cold quiet Place, and there will shoot at the Bottom thick solid Crystals, perfectly resembling the Form of vegetable Candy-sugar, and having nearly the same Taste.

3. If these Crystals be again dissolved in fresh-distilled Vinegar, and the Solution be depurated by standing, then inspissated by a soft Fire to the Thickness of Oil, a Liquor will be obtained which can hardly be dried, and rendered hard by a small Fire; but it remains somewhat fixed, and may be liquified like Wax, with a gentle Heat. The oftener this Impregnation is repeated with fresh Vinegar, and the Matter dried, the more fixed it becomes in a small Fire, so as not to smoke, but easily run. If now it be committed to a moderate Heat, and afterwards suffered to cool, but, while it remains fluid, it be poured into another cold Vessel in the cold Air, it strongly coagulates in the pouring, and concretes into fine Threads, like Cobwebs, perfectly resembling silver Thread, and affording a very agreeable Sight. This was published as a Secret by a Jesuit, though somewhat disguised in the Delivery.

4. As soon as this Body, coagulated into Threads, is exposed to a greater Heat, it presently runs again, so that it may be again poured out. And if this Resolution and Inspissation be carefully and patiently repeated, each time separating the Fæces, and then, if the Matter be long, digested with a gentle Heat, till it grows thick, and concretes, a Mass is at length formed, which to the unwary Eye resembles Silver. *Isaac Hollandus* deserves to be read on this Subject, where he speaks concerning the Stone from Lead. The Process, also, may be continued at Pleasure, by those who desire to see unusual Appearances of Bodies.

REMARKS.

The Production is called the Sugar, Salt, Magistery, or Vitriol of Lead. It shews how a fermented vegetable Acid may be combined with Lead, into a Substance soluble in Water. It is astringent, styptic, and presently coagulates the Blood. Being dissolved in Water, it affords the Vinegar of Litharge, good against Inflammations, when externally used. Internally, it is recommended for a safe Remedy against Spitting of Blood, Bleeding at the Nose, making bloody Urine, the Gonorrhœa, the Fluor Albus, and the like, as, also, for a mollifying Remedy against the Acrimony of the Blood; but I never durst make Trial of it, because I never saw it successfully used by others; and because there is scarce a more deceitful and destructive Poison than this Lead, which presently returns to Ceruss, as soon as the Acid is absorbed from it, by any thing it may meet with; whence it afterwards proves an exceeding dangerous and almost incurable Poison to the Body. If the Salt of Lead be gradually distilled in a Retort, and at length urged with a violent Fire, there comes over a flat inflammable Spirit, perfectly changed from the Nature of the Vinegar employ'd; and there remains at the Bottom a Substance like Glass, which, when urged by a strong Fire, penetrates almost all the Vessels that are known, vitrifying all Bodies, and carrying them through with it, except Gold and Silver.

THE SALT OF LEAD WITH SPIRIT OF NITRE.

1. Put an Ounce of granulated Lead, Ceruss, Litharge of Red-lead, into a tall Bell-head; pour thereon fifteen Ounces of

Spirit of Nitre, or Aqua-fortis, diluted with ten times their Weight of Water; there arises a great Ebullition with a white Froth; which being over, set the Glass in a little wooden Furnace, to boil for five or six Hours. Let the Liquor rest and cool, then filtre it, and distil to a Pellicule; a nauseous, but not acid, Water will come over. Put the remaining Liquor in a cold Place, and there will shoot white, solid, and very ponderous Crystals, that do not run in the Air, but continue solid; they are of a sweetish Taste, and more austere than those of the preceding Process; the Liquor, also, after the Solution, or both before and after the Crystallization, has a saccharine Sweetness like the Salt. 2. If fresh Aqua-fortis be poured to this Salt, so as to dissolve it, and the Liquor be again inspissated, an Oil of Lead may thus, also, be prepared, which coagulates with Difficulty, but gradually fixes, so as to run like Wax, with a gentle Heat. 3. This Salt, being dried, and thrown upon live Coals, does not take Flame, but crackles violently in the Fire, and flies all around, with great Danger to the By-standers; but, if red, used to fine Powder, it may be melted in a strong Fire.

REMARKS.

Hence we have a new Method of producing a metallic Salt, and its Oil; a sweet Taste from an acid and an insipid Body; a Glass from a Metal; and of shewing, that Spirit of Nitre will not make an inflammable Salt with every Metal, as it does with Silver. The Salt here has the same Virtues as that of the preceding Process, but it is more sharp and astringent.

THE SALT OF LEAD TREATED WITH ALCALIES.

To two Ounces of the crystalline Salt of Lead, made according to either of the two last Processes, thoroughly dried and reduced to fine Powder, add four Ounces of Oil of Tartar per Deliquium; set them in Digestion, where the longer they stand, the better; then add an Ounce of Sal Ammoniac; mix them well, and digest again in a close Vessel; pour back the saline Liquor that comes over in the Digestion, and digest again; which being twice or thrice repeated, dry the Matter thoroughly by a gentle Fire, and expose it to a moist Air, that it may dissolve; dry it again, and distil it in a coated glass Retort, with Degrees of Fire to the highest that Sand will give, into a large Receiver containing a little fair Water. Three Kinds of Matter will thus come over, which seems surprising, while another of a particular Nature, and strangely changed, remains at the Bottom of the Retort.

REMARKS.

Many very particular Things are learned from this Experiment, and such as are pleasant to behold; for the Metal thus successively opened, and dissolved by opposite Salts, then coagulated, and dissolved in the Air, is highly changed, opened, subtilized, divided, and separated from all that is not purely Mercurial, or metallic; and may thus exhibit its pure, metallic, Mercurial Part, separated from the rest, if the Industry of the Operator can reach so far.

THE CALX OF THE VITRIOL OF LEAD.

Take the Vitriol of Lead, made according to the two last Processes but one; dry it thoroughly with a gentle Fire, grind it to fine Powder; put in'o a glazed earthen Dish; set it over the Fire, and keep it continually stirring with a Tobacco-pipe, till it yields no more Fumes with a great Heat; a fine and almost insipid Powder will thus be obtained, which is another Calx of Lead, made in the moist Way.

REMARKS.

All the Acid which was united with the Lead, in the Form of the Vitriol of Lead, is here again separated from it by the Fire, except that Part, which, intimately adhering thereto, does not appear externally, and was therefore much more closely united with it in this Operation.

THE BALSAM OF LEAD WITH EXPRESSED VEGETABLE OILS.

1. Put granulated Lead, any Calx thereof, Ceruss, Litharge or Red-lead, into a glazed earthen Vessel; add to it twice its Weight of any expressed Oil; then gradually raise the Fire, and the Lead will begin to melt at the Bottom, before the Oil boils; but if the Fire be gradually increased, so as to make the Lead boil, the Body of the Lead, or Calx, will begin to disappear, and mix so intimately with the Oil, as to make a true Balsam, which, by longer boiling, may be brought to a Substance that is solid in the Cold, semi-metallic, will melt in the Fire, and is ductile. 2. If instead of Lead or its Calx, we use that Calx prepared in the last Process, or the Salt of Lead, first dried, and treat it with expressed Oil, in the Manner above delivered, the like Balsam will be obtained as from the true Metal, and the Oil.

REMARKS.

PLU

REMARKS.

Hence we see, that true and very ponderous Metals may, by the means of Fire, be dissolved in vegetable Sulphur, and so mixed, as to lie perfectly concealed therein: Whence we are often ignorant, whether Metals are concealed in certain Bodies or not; how wonderfully they may be disguised; and how often they may proceed from Matters not thought to contain them, when they have been often falsely supposed to be obtained from them by Transmutation. All these Particulars admonish us to be cautious of the Impositions of the fraudulent Alchemists. These emplastic Preparations of Lead are of Use to strengthen and warm the Parts, whereto they are applied; they, also, discuss, mollify, and absorb acrimonious Humours; in particular, they are excellent for lining Vessels designed to contain Water; for if Red-lead be boiled in Oil to a proper Thickness, and be exactly spread over a Stone Wall made almost red-hot, so as intimately to penetrate and stick therein, it will cause the Wall to resist Water, as well as if it was built with Cement. This Mixture we use to prevent Worm-tubs from leaking.

THE BALSAM OF LEAD WITH DISTILLED VEGETABLE OIL.

Gently dry the Sugar of Lead, prepared according to the third of these Processes; put it into a tall Bolt-head, and add to it four times its Weight of the ethereal Oil of Turpentine; boil it for some time; which is easily done, if the Glass with this Mixture be put into a Vessel, in which Linseed-oil grows just hot enough for the Purpose, which happens long before Linseed-oil of it self will boil: Thus the Oil of Turpentine will almost wholly dissolve the Sugar of Lead, whereby the Balsam is obtained.

REMARK.

This Process has the same Use with the former.

THE GLASS OF LEAD.

1. Mix two Parts of Red-lead, with one of clean Sand, reduced to fine Powder, by grinding them long together; then put them into a clean Crucible; set it in the Fire, so that the Matter may melt, and continue in Fusion for some time, till, when examined by dipping a Tobacco-pipe therein, what sticks thereto appears transparent; then pour it out upon a Marble: A brittle, yellow, transparent, inodorous, insipid Mass will be thus obtained, that proves hard in the Cold, and melts in the Fire; whence it is called Glass of Lead. This Matter, when fused in the Fire, passes through all the known Vessels, as Water through a Sponge; and converts almost all Bodies into Glass, with itself in Fusion, carrying them through the Pores of the Vessels, except Gold and Silver. In order to make the Mixture of the Red-lead and Sand run sooner into Glass, some add Nitre, and others Sea-salt, and keep the Crucible in the Fire till the Salt is melted. 2. If the Sugar of Lead be put into a Crucible, and urged with a gentle Fire, successively increased, the Vinegar flies off, and the Matter is so changed, as to run into a yellow Glass, at the same time that wonderful pleasing Colours appear in the middle, like those of the Rainbow, or the Peacock's Tail. 3. If Lead itself be long kept melted in the Fire, it becomes drossy at Top, which increases till the Lead is almost wholly converted into the same kind of Matter; and this, being again urged with a strong Fire, turns of itself into Glass; but this is a laborious Operation, and requires much Caution. The easiest Method appears to be the following. 4. Take four Parts of Red-lead; one Part of Sand, and two Parts of dry decrepitated Sea-salt; grind them together, the longer the better; put them into a close-covered Crucible; melt them together, and suffer the Whole to Rest; the Salt will be found melted in a Glebe at Top, and the Glass below, when the Crucible is broke, and should be separated from the rest, for the Purposes of Metallurgy, where it is extremely useful. 5. These Glasses, being mixed with a little powdered Charcoal, and melted in the Fire, easily turn to Lead again.

REMARKS:

We have a wonderful Change of this Metal (by means of Fire) and the Discharge of a metallic highly poisonous Vapour) from a perfectly malleable State, to an extremely brittle, and true glassy Matter. Whence we see how wonderfully, and under what various Forms, Metals may lie concealed, and how easily they may again appear. And hence, perhaps, Metals vitrify in the Fire, after being separated from a certain sulphureous Part. This seems to appear from the making of the Glass of Antimony, and other Experiments. And, upon restoring this Sulphur, the metallic Form begins to return, as may be seen in many Instances, especially in Lead. This Glass of Lead is the true Test of Metals, and destroys every thing in the Fire, except Gold and Silver, which it leaves untouched, without any Diminution

PLU

of their Weight. And upon this Foundation depends the whole Art of Assaying and Refining, which is of so great Use in Civil Affairs. Whoever would know more of the Subject, may consult Boyle, Bohn, Homberg, and Geoffroy. But let it be carefully remember'd, that the Fume, the Powder, and all the Parts of Lead are carefully to be avoided, as highly poisonous. Boerhaave's Chymistry.

The burning Spirit and Oil of Lead are obtained from the Sugar or Salt by Distillation; but the Virtues of these inflammable Substances are the same with those of Spirit of Wine, whatever Chymists may pretend to the contrary; for the Spirit is only the Spirit of Wine, concentrated in the Vinegar disengaged by this Preparation, and the red Oil is likewise extracted from the Vinegar.

The mineral Mummy of Lead of Poterius is the Calx of Lead and Quicksilver amalgamated together, made in this manner:

Take of Mercury revived from Cinnabar, two Parts; and one Part of Lead. Amalgamate them together, and continue to shake them strongly in an earthen Vessel over a Charcoal-fire, till the Whole be reduced to a black Powder. Bake this Powder in a Sand-bath, in a glass Matrafs, till it turns yellow; and keep it for Use.

This Mummy cures, in a very small time, the Itch, Tetter, and other Diseases of the Skin, cleanses callous Ulcers, and dissolves the Callus, and dissipates Swellings in the Glands of the Breasts, being mixed in any Ointment or Plaister. It is, likewise, of Service in Cancers, which are not arrived at their last Stage. It must, however, be cautiously and sparingly used, lest the Suppuration prove too great. But, if a Carcinoma, for Instance, be not ulcerated, a Dram of this Mummy, accurately mixed with an Ounce of Emplastrum Magneticum of Angelus Sala, and applied to the Tumor, will gradually dissolve it. But, if there be an Ulceration, then a small Pencil of Lint dipped either in the Mummy alone, or mixed with Powder of Myrrh, is to be thrust into the Ulcer, the Emplastrum Magneticum being applied upon it. By this means the hard Tumor gradually resolves by a gentle Suppuration; and, by proper internal Remedies used at the same time, the Carcinoma is healed. Geoffroy.

PLUMIERIA.

The Characters are;

It has the Appearance of the *Apocynum*, and abounds with a lacteous Juice. The End of the Pedicle passes into a little short monophyllous Calyx, out of which grows the Flower, as in the *Nerium*, but wants the petaloid Crown. The Ovary, which grows in the Bottom of the Calyx, becomes a long, filiquous, double Fruit, when opening lengthwise, and pregnant with a Multitude of Seeds, placed as in the *Apocynum*, but foliated.

Boerhaave mentions but one Sort of *Plumieria*; which is, *Plumieria*; flore roseo, odoratissimo. T. 659. Boerb. Ind. alt. Plant.

Besides the foregoing Sort of *Plumieria*, Miller mentions the five following;

1. *Plumieria flore majore odorato & incarnato.*
2. *Plumieria flore niveo, foliis longis angustis & acuminatis.* Inst. R. H.
3. *Plumieria flore niveo, foliis brevioribus & obtusis.* Inst. R. H.
4. *Plumieria foliis longissimis, minus succulentibus, flore pallido.* Houtt.
5. *Plumieria folio latiore obtuso, flore luteo minore.*

This Name was given to this beautiful Species of Plants, by Dr. Tournefort, in Honour to Father Plumier, who was Botanist to the late King of France, and a long time in America, searching after new Plants; and who has published a Catalogue of the Plants, with the new Genuses he constituted; and two Volumes in Folio, with Figures and Descriptions of many of the Plants.

These Plants grow wild in the Spanish West Indies, from whence some of the most beautiful Kinds were brought into the English Settlements in America, and are cultivated in their Gardens for Ornament. The first Sort here mentioned is the most common Kind, which is preserved in the Gardens of the Inhabitants of Jamaica and Barbadoes. The Flowers of this kind nearly resemble those of the red Oleander, but are larger, and have an agreeable Odour. These are produced in small Bunches, at the Extremity of the Shoots, and generally appear in July and August in this Climate; but in the West Indies they flower a great Part of the Year.

The milky Juice of these Plants is very caustic, and reckoned very poisonous. In cutting off any of the Branches of the Plants, if the Knife be not immediately cleaned, the Juice will corrode it, and turn the Blade almost black in a very little time, so as not to be cleaned off again; and, if dropped on Linen, will cause it to wash in Holes, equal to Aqua Fortis. Miller's Dictionary, Vol. 2.

PLUMOSUM. An Epithet for a Species of Alum.

PLUTEA, in Avicenna, is a Reduplication of the Dura Mater, as in the Formation of the Longitudinal Sinus.

PLUVIALIS.

PLUVIALIS. The Plover; of which there are two Sorts. The first is the *Glottis*. Offic. Genf. de Avib. 450. *Limosa Venetorum*. Ejusd. *Puvialis major*. Aldrov. Ornith. 3. 535. Will. Ornith. 220. Raii Ornith. 298. Charlt. Exer. 114. Jonf. de Avib. 114. *Chloropus Germanis Gult seu Gluttis*. Aldrov. 3. 452. **THE GREAT PLOVER.**

The Gall of this Bird is recommended as a Remedy for Disorders of the Eyes. A Jelly of the Flesh is recommended as a good Analeptic, or Restorative.

The other Species is the *Vanellus*. Offic. Charlt. Exer. 113. Mer. Pin. 182. Gefn. de Avib. 692. Jonf. de Avib. 113. *Capella five Vanellus*. Aldrov. Ornith. 3. 523. Raii Ornith. 307. Ejusd. Synop. A. 110. Will. Ornith. 228. *Vaneau*. Bellon. des Oyse. 209. **THE LAPWING, or BASTARD PLOVER.**

This Animal delights in marshy Places; and its Ashes, Heart, and Skin, are us'd for medicinal Purposes. The Ashes drank in Wine, are beneficial in Colics; and, when applied by way of Cataplasm, cure the Bite of a Mad-dog. The Heart alleviates Pains of the Loins, and the Skin is esteem'd good in Cephalalgias. Dale.

They create an Appetite, yield pretty good Nourishment, digest easily, and are look'd upon to be good to provoke Urine, to strengthen the Brain, purify the Blood, and for the Falling Sickness.

They are not very solid Food, but soon waste; and therefore Persons accustomed to great Exercises, or hard Labour, are not to use them. *Lemery on Foods.*

PLUMA, πλῦμα. The Water wherein any thing is wash'd.

PNEUMA, πνεῦμα, in *Hippocrates*, sometimes imports Spirit, Air, or Vapour; and frequently it signifies the Breath, that is, the Air drawn in by Inspiration, and expel'd during Expiration. But *Pneuma*, by the above quoted Author, is often us'd to express a difficult, short, and laborious Respiration.

Pneuma halizomenon, πνεῦμα ἀλιζόμενον, from ἀλίζομαι, to be coarctated, crouded, means a raised, dense, and full Respiration. *Coac.* 339.

Pneuma hōsper anacaluteno, πνεῦμα ὥσπερ ἀνακαλυμένον, from ἀνακαλέω, to recal, 1 *Epid.* 1. imports a broken Respiration, as when a Person, after a short Expiration, seems to call back his Breath, and to expire with a renewed Force, in order to supply the Defects of the former Expiration. The same is called πνεῦμα πρόσκοπτον (*proscopton*), and προσπάλειον (*prospaleion*), an impinging Breath, which strikes in its Passage, and is interrupted by the Elision. It is otherwise described, 2 *Epid.* and *Coac.* 260. by διπλή ἐσω ἀνάλησις διω ἐπεισπνέειν, a double Revocation inwards, as in those who fetch their Breath "double;" and by πνεῦμα ἐνεδιπλασιάζετο, "the Breath was "double," that is, as *Foefius* endeavours to explain it, was doubled, or sounded double, by suffering an Elision in its Passage.

Pneuma anapherein, πνεῦμα ἀναφέρειν, from ἀναφέρω, to exalt, is to have a great and full Respiration, or to expire vast Quantities of Breath; which is esteemed a Symptom of an internal Inflammation, 2 *Prorrhet.* *Coac.* 486. But πνεῦμα ἀνω φερόμενον, in *Lib. de R. V. I. A.* is no more than the Breath discharged by Expiration.

Pneuma anelomenon, πνεῦμα ἀνελόμενον, from ἀνέλω, to draw upwards, to raise, or elevate, in 1 *Prorrhet.* 87. imports a Respiration performed with a great Elevation of the Thorax, in such a manner, that even the Scapulæ seem to be moved thereby, as *Galen* explains the Word; who, also, takes it to be used by *Hippocrates* in the same Sense as μέλαρον and πρόχειρον, which see below.

Pneuma anespasmenon autica, πνεῦμα ἀνεσπασμένον αὐτίκα (from ἀνασπάω, to retract) the Breath immediately or at every Turn retracted, imports an interrupted or intercepted kind of Respiration, which fails on a sudden. It seems to be much the same with the πνεῦμα διον συσπνέειν τινος, *Coac.* 266. and *Prorrhet.* 87. a short and convulsive kind of Respiration, as is usual with those who fetch their Breath under Convulsions.

Pneuma aræon, mega, πνεῦμα ἀραιόν, μέγα, is a rare and great Respiration, or a full Respiration perform'd at long Intervals (see *ARÆON*); such as is proper to those who labour under a Delirium, as *Galen* observes, *Lib. 2. de Dyspn.* and *Com.* 1. in *Prorrhet.* and as it is confirmed by many Instances in the first and third Books of the *Epidemics*.

Pneumata asema, πνεύματα ἀσημα, signifies an obscure Respiration, or such as is small, interrupted, and hardly perceptible; which is usual in Hysterics, a Syncope, and in dying Persons. See *ASEMOS*.

Pneuma bechodes, πνεῦμα βηχῶδες, from βῆξ, a Cough, is a Respiration attended with Coughing, from something derived into the Aspera Arteria. *Coac.* 62. 632.

Pneuma dia pollou Chronou, πνεῦμα διὰ πολλῶ χρόνου, as explain'd by *Galen*, *Lib. 2. de Dyspn.* is the same as the *Pneuma aræon* before. The πνεῦμα διὰ χρόνου, 3 *Epid.* imports the same.

Pneuma manoteron, πνεῦμα μανότερον, from μανός, rare, loose, *Coac.* 211. imports an Alteration from a short, difficult, and turbulent, to a more remiss, rare, and easy Respiration.

Pneuma mega, πνεῦμα μέγα, a great Respiration, *Coac.* 126. and 290. is when, in breathing, the Thorax is very much enlarged in its Dimensions.

Pneuma meteoron, πνεῦμα μετέωρον, a sublime and elevated Respiration, imports such a Respiration as is performed with an Elevation of the whole Thorax, and an Erection of the Neck, under a great Straitness and Oppression, as is often the Case in a Quinsy, Peripneumony, Pleurisy, and Asthma. Thus *Galen*, *Com.* 1. in *Prorrhet.* explains the Epithet; and tells us, that πρόχειρον and φαινόμενον πνεῦμα are used by *Hippocrates* in much the same Sense. And, *Com.* 2. in 3 *Epid.* he further observes, that τὸ μέλαρον πνεῦμα may import, that the Patients under the fore-mentioned Disorders desire and endeavour μέλαρξιν ἐν εἰσπνέειν, to raise themselves up: Whence he says, μέλαρον πνεῦμα, in 3 *Epid.* is the same as ὀρθόπνοια (*Orthopnoia*) in *Prognost.* There is another Signification of μέλαρον πνεῦμα quoted by *Galen* from *Salinus*, who describes it by τὴν ἀπὸ τῆς ῥινὸς γινόμενὴν ἀναπνοήν, "Respiration performed at the Top of the Nose;" that is, when the Passages for Respiration being almost stopped, the Patient, in drawing his Breath, moves the Pinnæ of the Nostrils, as is the Case with those who are suffocated by a Quinsy, Peripneumony or *Empyema*; or when the Strength is quite exhausted, as in dying Persons. This Sense of the Phrase, tho' criticised by *Galen*, seems, to be in some measure, imply'd in that of *Hippocrates*, in 7 *Epid.* where, speaking of the Wife of *Olympiades*, as almost expiring, he says πνεῦμα μετέωρον κατὰ ῥίνα σπόμενον, "Respiration was such as is called sublime, and perform'd "through the Nose." *Galen*, at the End of *Lib. 3. de Dyspn.* proves this μέλαρον πνεῦμα, or sublime Respiration, to be, also, small and quick, or short.

Pneuma minuthodes, πνεῦμα μινυθῶδες, from μινύω, to diminish, is a small and weak Respiration. *Lib. 2. περὶ γυναικ.*

Pneuma mychthodes, πνεῦμα μυχθῶδες, *Coac.* 519. and 540, is a broken, and most painful Respiration, which is interrupted in the midst of Expiration, as is observable in the sobbing Respiration of Children.

Pneuma proscopton, πνεῦμα πρόσκοπτον, from προσκρίψω, to impinge, 4 *Apb.* 67. is expressed in *Celsus*, *Lib. 2. Cap. 7.* by *Spiritus in Fauibus elisus*, Breath suppressed or intercepted by Elision in the Fauces. This impinging kind of Respiration is explain'd by *Galen*, *Lib. 4. de Loc. affect.* in the following manner: "There is another Species of Dyspnoea, he says, "which is, when the Action of the Thorax is interrupted by a "short Rest, sometimes in Inspiration, and sometimes in Expiration, whether this Symptom proceeds from a spasmodic "Disposition of the Muscles of the Thorax, or from an Abundance of Hear, which constrains the Patient to continue his "Inspiration or Expiration".

Pneuma prosptæon, πνεῦμα προσπάλειον, from πάλω, to impinge, or strike against, *Lib. de R. V. I. A.* is the Breath impinging or interrupted in Expiration, as *Galen*, in his Comment in the Place, explains it.

Pneuma prochiron, πνεῦμα προχείρον, quasi pedes χεῖρα, ready at hand, or obvious, is a conspicuous Respiration, such as is the sublime and elevated Respiration accompany'd by an Elevation of the upper Parts of the Thorax and the Scapulæ, as may be observ'd in Asthmatic Patients, and those who die of a Suffocation. Hence it appears to be the same as μέλαρον. See 1 *Prorrhet.* 25. It is also called φαινόμενον (*phenomenon*) visible, apparent; because the Patients, as *Galen* observes, are plainly perceived, through their Clothes, to move the whole Scapulæ, when they draw their Breath.

Pneuma rycnon, πνεῦμα ρυκνόν, is a quick and frequent Respiration; and a kind of Dyspnoea, which in *Hippocrates* is often accompany'd with a Greatness or Smallness of Respiration, as is observed by *Galen*, *Lib. 3. de Dyspn.* See *RESPIRATIO*.

PNEUMATIE, πνευματίας. See **PNEUMATODES**.

PNEUMATICI. An Appellation of certain Physicians, who constituted the Pneumatic Sect. See the **PREFACE**.

PNEUMATOCELE, from πνεῦμα, wind, and κύλην. A Tumor. A flatulent Hernia, or Wind-rupture.

PNEUMATODES, πνευματώδες, in *Hippocrates*, is one who fetches his Breath short and quick, otherwise called *Pneumatis*, πνευματίας, as in *Lib. de R. V. I. A.* This is the Explanation which *Galen*, *Lib. 3. de Dyspn.* gives of the Word; where he also observes, that it sometimes signifies one who has his Belly or Illia distended with Flatulences; and proves it from the fourth of the *Epidemics*. *Pneumatis* and *Pneumatomenos*, πνευματίζμενος, are used in the same double Sense. *Foefius*.

PNEUMATOMPHALOS. An umbilical flatulent Rupture.

PNEUMATOSIS, πνεύματος. An Inflation of the Stomach; or a Collection of Flatulences in the Stomach.

PNEUMENOS, πνεύμενος. Asthmatic, or breathing with Difficulty.

PNEUMON, πνεύμων. The Lungs.

PNEUMONANTHE. A Name for the *Gentiana, angustifolia, Autumnalis, major*.

PNEUMONICUS. An Epithet for Medicines destin'd to the Lungs.

PNEUMOPLEURITIS. The same as **PLEUROPNEUMONIA** **PNIGALION, πνιγάλιον.** The *Incurbus*, or *Ephialtes*.

PNIGITES. Offic. Charit. Foss. 3. Worm. 5. *Terra Pnigites*, Aldrov. Musf Metall. 259. Matth. 1592. **BLACK EARTH.**

It is a fat, dense, soft, black, astringent, and very acrimonious Substance, of the Taste of Vitriol. To these Marks *Dioscorides* adds, that in Colour it somewhat resembles the *Eretria Terra*, is cold to the Touch, and so glutinous as to adhere to the Tongue. The same Author says, that it has the same Virtues as the *Cimolia*, only is weaker: Some, he says, sell it for *Eretria Terra*. *Dioscorides*, Lib. 5. Cap. 177.

PNIGMOS, *πνιγμός*. The same as PNIX.

PNIGOS, *πνιγός*. A sultry suffocating Heat.

PNIX, *πνιξ*. Any Suffocation; particularly that which happens in hysterical Fits. With an Addition of the Epithet *Hysterical*, it implies an hysterical Fit.

POA. A Name for the *Gramen*; *pratense*; *majus*; *latius folio*. See MILIUM.

POCAN. A Name for the *Phytolacca*; *Americana*; *majori fructu*.

POCATSJETTI. H. M. The Name of a small Shrub which grows in *Malabar*. The Leaves powdered, and sprinkled upon Ulcers, repress luxuriant and fungous Flesh; and, taken internally, they excite a Sweat, and diminish the Paroxysm of an intermitting Fever.

Of the Bark, and Root, powdered, and mixed with Oil, an Unguent is made; said to be good for the Itch, and other cutaneous Disorders. *Raii Hist. Plant.*

POCO SEMPIE. The Down or Moss growing upon the *Agnus Scythicus*. This is esteemed good for stopping of Blood, if given in the Quantity of six Grains. See AGNUS SCYTHICUS.

PODAGRA, *ποδάγρα*, from *πῶς*, a Foot; and *ἄγρα*, a Prey. The Gout in the Feet. See ARTHRITIS.

PODAGRARIA. See ANGELICA. It is, also, a Name for the *Myrrhis*; *folio Angelicæ rugoso*; *hirsuto*.

PODEON, *ποδεών*, is the prominent part of a Vessel, or Bottle, made of a Skin, by which the Liquor is poured in and out, and which used to be tied with a String, in order to keep in the contained Fluid: Thus (*Lib. περὶ καθάρων ποδῶν ποδεῶνα ἀορίσ, &c.*) To the Extremity, or prominent part of the Vessel, or Bottle, a Pipe is tied, for introducing the Air, and distending the Intestines, in order for their being washed with a Clyster, in the Cure of the Ileus. *Foefius*.

POERINSII. A Name for the ARBOR SAPONARIA.

POINCIANA. Flower-fence.

The Characters are;

The Calyx is pentaphyllous; the Flower polypetalous, and furnished with numerous Stamina; the Pod is flat, hard, gaping into two Parts, and divided into Capsules, or Cells, containing roundish Seeds.

Boerhaave mentions but one Sort of Poinciana; which is, Poinciana; flore pulcherrimo. *T. 619. Frutex, Pavonis, flos Crista Pavonis*. *Breyn. Cent. 1. 61. Acacia Orbis Americani, altera, flore pulcherrimo*. *H. R. Par. Crista Pavonis*. *H. L. Erythroxylon, Indicum, minus spinosum, Colutæ foliis, filiquis angustioribus, flore ex luteo & rubro eleganter variegatis*. *Par. Bat. Prodr. 333. Boerb. Ind. alt. Plant. Vol. 2.*

Besides this Sort, *Miller* mentions three more;

1. Poinciana flore luteo. *Houft.*
2. Poinciana flore rubente. *Houft.*
3. Poinciana spinosa, vulgo Tara. *Feuil.*

The Seed-pods of the last Sort are used by the Dyers in the *Spanish West-Indies*, for dying of Black; and they are, also, used for making of Ink. The Infusion of these Pods with Galls affords the most beautiful black Ink in the World.

POLEMONIUM.

The Characters are;

The Leaves are alternate, and pinnated; the Flower is monopetalous, rotated or wheel-shaped, and pentapetaloid; the Fruit is round, tricapsular, gaping, and full of oblong Seeds.

Boerhaave mentions four Species of Polemonium; which are,

1. Polemonium; vulgare; cœruleum. *Tourn. Inf. 146. Boerb. Ind. A. 252. Raii Synop. 3. 288. Polemonium. Offic. Valeriana Græca*. *Ger. 918. Emac. 1076. Park. Theat. 122. Raii Hist. 2. 1102. Valeriana Græca quorundam flore cœruleo*. *J. B. 3. 212. Valeriana cœrulea*. *C. B. P. 164. Vulneraria alata Blattariæ flore cœruleo*. *Hist. Oxon. 3. 605. GREEK VALERIAN, or JACOB'S LADDER.*

This Plant is produced in Woods; and flowers in Summer: The Herb itself, and its Root, are used. The Root, drank in Wine, is good against the Bites of venomous Animals, and Dysenteries. When drank in Water, it is beneficial in Dysurries, and ischiadic Pains. A Dram of it exhibited in Vinegar, proves serviceable to Patients labouring under Disorders of the Spleen: When chew'd, it mitigates Tooth-achs. *Dioscor.*

The Herb is vulnerary. *Sim. Pauli.*

This Plant is so imperfectly described by the Antients, that we are as yet ignorant what it really is; since some of them make it a Species of the Valerian; and others of the Lychnis.

But I have chosen to follow *Tournefort*, who ascribes this Name to this Plant, which is described by *Dioscorides* in the following manner: "The Polemonium is a Plant, with small Branches, pinnated on both Sides: Its Leaves are a little larger and longer than those of Rue; greatly resemble those of Calamint, or Bloodwort; and have Clusters, in which are contained black Seeds, hanging from their Tops." *Dale.*

2. Polemonium; vulgare; album. *T. 146. Valeriana Græca quorundam, flore albo*. *J. B. 3. 212. Valeriana alba*. *C. B. P. 164.*

3. Polemonium; vulgare; flore variegato. *T. 146. Valeriana Græca, flore ex albo & cœruleo variegato*. *H. L.*

4. Polemonium; vulgare; foliis eleganter variegatis. *Boerb. Ind. alt. Plant. Vol. 1.*

POLEMONIUM is, also, a Name for the *Lychnis*; *sylvestris*; *quæ Been album vulgo*. See BEHEN.

POLEMONIUM, *Monspeliensium*. A Name for the *Jasminum*; *luteum, vulgo dictum bacciferum*.

POLENTA. See ALPHITA.

POLETIS SAL. A compound Salt, described by *Aetius*, *Tetrabib. 3. Sermon. 1. Cap. 24.*

POLIATER. A Physician in ordinary to a Town.

POLIUM.

The Characters are;

The Leaves are, for the most part, hoary; the Stamina supply the Place of the Galea; the Beard is quinquefid, like that of the *Chamædrys*; the Flowers grow in Heads, on the Tops of the Stalks and Branches.

Boerhaave mentions ten Species of Polium; which are,

1. Polium; Lavendulæ folio. *C. B. P. 220. Tourn. Inf. 206. Boerb. Ind. alt. 183. Polium alterum. Offic. Polium montanum. Offic. Polium montanum Lavendulæ folio*. *Park. Theat. 25. Raii Hist. 1. 525. Polium Lavendulæ folio flore albo*. *Ger. Emac. 635. Ajuga folio integro*. *Rivin. Irr. M. POLEY-MOUNTAIN WITH LAVENDER-LEAVES.*

This Plant is found in the Gardens of Botanists, and flowers in June. The Herb is only used, and is said to agree in Virtues with the other Species, though in a lower Degree. *Dale.*

2. Polium; montanum; luteum. *C. B. P. 220. Raii Hist. 1. 525. Ger. 528. Emac. 653. Tourn. Inf. 206. Boerb. Ind. A. 183. Polium montanum. Offic. Chom. Pl. Usu. 352. Polium montanum vulgare*. *Park. Theat. 24. YELLOW POLEY-MOUNTAIN.*

This Plant is produced in *Provence* in *France*, and in *Spain*: It flowers in June. The Herb is used; and is said to agree in Virtues with the white Poley-mountain. *Dale.*

3. Polium; Lavandulæ folio angustiori. *C. B. P. 220.*
4. Polium; montanum; repens. *C. B. P. 221.*
5. Polium; Pyrenaicum, supinum; Hederæ terrestris folio. *T. 206. An Chamædrys montis Sumani*. *J. B. 3. 289.*
6. Polium; montanum; luteum; dasphyllum; ferratum; tomentosum. *M. H. 3. 355.*
7. Polium; montanum; luteum; ferratis, angustioribus, incanis, foliis. *Barrel. Ic. 34.*
8. Polium; montanum; album; supinum; folio ad suprema crenato; capitulis multis, globosis.
9. Polium; maritimum; supinum; Venetum. *C. B. P. 221. Polium Venetum*. *J. B. 3. 300.*
10. Polium; Hispanicum; fruticosum; maritimum; Rorismarini folio; flore rubro. *T. 207. Boerb. Ind. alt. Plant. Vol. 1.*

This Plant resists Putrefaction, and with it the Sea-slink is, for that Reason, preserved; because Vinegar and Salt are not thought good enough for the Preservation of so delicious and costly an Animal: This Plant is bitter, and approaches much to the Nature of *Germander*: It provokes Urine, removes Obstructions of the Menstrues, and cures the Jaundice. An Infusion of the Leaves and Flowers is beneficial in lethargic Disorders, and, consequently, in Epilepsies: What the Polium of the Antients was, we know not. This Plant is an Ingredient in various Confections, Opiates, and in the Theriaca. It is said to be beneficial against the Bites of poisonous Animals. *Hist. Plant. adscript. Boerb.*

POLIUM CRETICUM. A Name for the *Teucrium*; *calice campanulato; stachados facie*.

POLIUM GNAPHALODES. A Name for the *Gnaphalium*; *maritimum*.

Besides the foregoing Species of Polium, *Dale* mentions the two following,

1. Polium montanum. *Offic. Polium montanum album*. *C. B. P. 221. Ger. 528. Emac. 653. Raii Hist. 1. 524. Tourn. Inf. 206. Polium montanum Monspeliacum*. *Park. Theat. 24. WHITE POLEY-MOUNTAIN.*

This Plant is produced in *Italy* and *France*, and flowers in the Summer: The only Part of it used is the Herb itself, which ought to be chosen recent and odorous: It provokes Urine and the

the Menfes, afflicts dropfical and iſteric Patients, and is beneficial in the Bites of venomous Animals. *R. H.* It is, alfo; of an inciding and aperient Quality.

Dioſcorides makes two Kinds of Polium; one of which is the Poley-mountain, which he deſcribes in the following manner: "It is, ſays he, a ſmall white Shrub, nine Inches long, and full of Seeds; which, on their Tops, bears a ſmall Head, reſembling a certain Species of Cluſters, or the grey Hairs of a bald Perſon: This Head has a diſagreeable Smell, but is ſomewhat ſweet to the Taſte: The other Species of Polium is more of the Nature of a Shrub, and is not ſo ſtrong, with reſpect to its Smell, and other Qualities." The above-quoted Deſcription of Poley-mountain is ſo ſhort, that Botaniffs, in different Countries, have taken it, ſome for one Plant, and ſome for another. *Tournefort* and *Chomel* have given the Poley-mountain, both white and yellow, of *C. B. P.* a Place in the *Materia Medica*. *Herman* and *Rockerus* think, that the white is the *Polium Officinale*; and *Commelin* and *Philip Miller* take the yellow Polium to be the *Polium Officinale*. But *Rupp* takes the *Polium Lavendulae Folio*. Pin. for the *Polium Montanum*. And *Joſeph Miller*, and *Rand*, take the *Polium Maritimum erectum Monſpeliacum* of *C. B.* for the Poley-mountain: Concerning which *Magnol* informs us, that the *Polium montanum album* of *C. B.* is much ſmaller, and not of ſo grateful a Smell. For this Reaſon, tho' the *Polium montanum album* ought to be preferred in the Shops, yet I have not omitted the other Species.

Befides the Species already mentioned, there is another, tho' not ſo frequently found in the Shops: It grows in *Crete*; and, becauſe it is of a more grateful Smell, and more efficacious, than the others, is, therefore, preferable to them. *Dale*.

2. *Polium montanum*. Offic. Mill. Bot. Offic. 352. *Rand*. Ind. Plant. Offic. 69. *Polium maritimum erectum Monſpeliacum*. *C. B. P.* 221. *Raii Hiſt.* 1. 524. *Tourn. Inſt.* 206. *Polium Monſpeſſulanum*. *J. B.* 3. 299. *Polium montanum minus*. *Park. Theat.* 23. **ERECT, or MOUNTAIN POLEY.**

This Polium grows to be about a Foot high, much branched with ſquariſh woolly Stalks, having two ſmall, white, woolly Leaves at a Joint, not above half an Inch long, and ſcarce half ſo broad, blunt-pointed, indented about the Edges towards their Ends: The Flowers grow at the Ends of the Branches, in roundiſh, woolly, thick Spikes, ſmall, and of a white Colour, labiated, but having no Galea, being ſet in white, hoary, five-pointed Calyces. Both Leaves and Flowers have a pleaſant aromatic Scent. It grows in *Italy*, and the Southern Parts of *France*, and flowers in *July*. The Tops and Heads are uſed.

Mountain-poley is opening and attenuating, good for Obſtructions of the Liver and Spleen, helps the Dropſy and Jaundice, provokes Urine and the Menſes, and is good againſt the Bites of venomous Creatures; and is an Ingredient in the Theriaca Andromachi. *Miller's Bot. Off.*

POLLEX. The Thumb. *Pollex Pedis* is the great Toe.

It often happens, that the Nail of the great Toe, on one Side, turns in; and enters the Fleſh, thereby occaſioning violent Pains and Inflammation, ſo that the Patient cannot walk without the greateſt Difficulty. The moſt general Cauſe of this Diſorder is wearing ſtrait Shoes: Whence it is plain, that the propereſt Method of preventing it is to wear Shoes ſufficiently wide and eaſy. If the Nail is already fixed in the Fleſh, let the Patient keep his Foot in warm Water for half an Hour, till the Nail begins to ſoften; and, to make it yield the more eaſily, ſcrape it with a Knife, or Piece of Glaſs; then, gently raiſing the Nail with the Finger, or a proper Probe, interpoſe, between the Nail and the Fleſh, a little ſcraped Lint, and dreſs with warm Spirit of Wine. This muſt be repeated, till the Pain is removed.

If this Method proves ineffectual, we muſt have recourſe to the Knife. For this Purpoſe, let the Foot be ſome time bathed in warm Water, for the Reaſon already given; then place it upon a Seat, where it muſt be firmly held by an Aſſiſtant: Then let the Operator carefully inſinuate a Pair of ſtrong Nail-ſciſſars (ſee *Tab. LVII. Fig. 12. 13.*) under the injurious Part of the Nail, to cut it off; and, if it does not fall off of itſelf, it muſt be extracted by the Forceps. Though the Patient will feel the Operation extremely painful, yet he will ſoon be ſenſible of the Eaſe it has procured him. Let the Part be then dreſſed with ſcraped Lint, or Compreſſes moiſten'd in Oxycrate, or warm Spirit of Wine, or Lime-water; and it may be fomented twice or thrice a Day, till the Inflammation and Pain ceaſe. In the mean time, the Patient ſhould reſt for ſome Days, till all Danger of the Pain and Inflammation be removed. Sometimes proud Fleſh ſprouts up, which may be ſafely conſumed with burnt Alum. In order to prevent the Nail from growing again into the Toe, and producing the ſame Trouble, *Dionis* recommends, that the Shoes ſhould be made eaſy; and the Nail ſhould be every Month ſcraped ſo thin, with a Piece of Glaſs, or ſharp Knife, that it may not have Strength

to run into the Fleſh, by the Preſſure of the Shoe. *Heiſter's Surgery.*

POLLINCTURA. The embalming of dead Bodies.

POLLUTIO. An Incontinence of the ſeminal Juices; a Species of GONORRHOEA; which ſee.

POLPHOS, *πολφός*. A Bulb, or bulbous Root.

POLYÆMIA, *πολυαιμία*, from *πολύς*, much; and *αἷμα*; Blood. A Redundance of Blood, or PLETHORA.

POLYANTHOS. A Name for the PRIMULA VERIS.

POLYANTHUS. A Name for the Acarna. See CAR-
DUUS.

POLYARCHION. The Name of a Malagma; thus called from *Polyarchus*, its Author. It is deſcribed by *Galen*, *Lib. 8. de Comp. M. S. L. Cap. 5.* and *Lib. 7. de Comp. M. S. Gen. Cap. 7.* From whence *Actius* and *Paulus Ægineta* have tranſcribed it.

POLYCHRESTOS, *πολύχρηστος*. An Epithet for many Medicines, importing their being good, or uſeful for many Diſorders; from *πολύς*, much, and *χρησός*, uſeful.

The BALSAMUM POLYCHRESTON is deſcribed under the Article BALSAMUM.

In *Lemery's Pharmacopée Univerſelle*, we find the following Pills deſcribed:

Pilula Polychreſtæ. Meſue.

— *Polychreſtæ*. Quercetani.

— *Polychreſtæ*. Quercetani Reformatæ.

— *Polychreſtæ Majores*. Meſue.

— *Polychreſtæ Majores Reformatæ*.

— *Polychreſtæ Minores*. Meſue.

— *Polychreſtæ Minores Reformatæ*.

POLYCLONOS. Ramoſe, or abounding with Branches. An Epithet for the *Artemiſia*, Mugwort.

POLYCNEMON. See CALAMINTHA PALUSTRIS.

POLYETES ANTIDOTUS. The Name of ſeveral Antidotes deſcribed by *Nicolaus Myreſus*.

POLYGALA.

The Characters are;

The Leaves are alternate; the Calyx conſiſts of five Leaves, the two larger of them expanded like Wings, and the three leſſer acute; the Flower is monopetalous, anomalous, perfonated, with its hinder Part perforated, and its fore Part bilabiated, the upper Lip bifid, and the lower beautifully fimbriated, or fringed: It is furniſhed with eight Stamina, and diſpoſed in looſe Spikes. The Fruit, which is embraced by the quinquephyllous Calyx, as with Wings, is compreſſed, gaping into two Parts, and divided into two Capſulæ, or Cells.

Boerhaave mentions fix Species of Polygala; which are,

1. Polygala; vulgaris. *C. B. P.* 215. *Tourn. Inſt.* 174. *Boerb. Ind. A.* 236. Polygala. Offic. Ger. 448. Emac. 563. *Raii Hiſt.* 2. 1335. Synop. 3. 287. Polygala minor. *Park. Theat.* 1332. Polygalon multis. *J. B.* 3. 386. *Flos Ambarvalis vulgo*. *Herm. Cat.* 500. MILKWORT.

Gefner, who, in his Letters, calls this Plant *Amarella*, affirms, that an Handful of it, infuſed in a Glaſs of Wine, purges very well, and without any ill Conſequence. *Martyn's Tournfort*.

This Plant is moſt frequently found in dry Meadows, and flowers in *July*. The Herb itſelf is only uſed. Its bitter Taſte proves it to be of an hot and drying Quality: Its Leaves, boiled in Wine, purge Bile, by Stool. *Gefn.*

This is the Polygala of the Shops of *England*, and of the modern Botaniffs: But that it is the Plant to which *Dioſcorides* gives the ſame Name, neither its Deſcription nor Virtues will ſuffer us to believe; ſince it has neither the Leaves of the Lentil, nor a Power of increaſing Milk, both which are aſcribed to the Polygala. *Dale*.

2. Polygala; flore rubro; purpureſcente. *H. Eyſt. Vern.* o. 6. *F. 11. Fig. 2.*

3. Polygala; alba. *Tabern. Ic.* 831.

4. Polygala; carnea.

5. Polygala; violacea.

6. Polygala; fruteſcens; folio Buxi; flore maximo. *Oldenl. T.* 175. *Chamaebuxus*, flore Caluteæ ex purpura ruſcente. *C. B. P.* 471. *Anonymos*, flore Caluteæ. *Cluſ. H.* 105. *Pſeudo-Chamaebuxus*. *H. Eyſt. Vern.* o. 6. *F. 12. F. 3.* *Boerb. Ind. alt. Plant. Vol. 1.*

POLYGALA is, alſo, a Name for ſeveral Sorts of CORONILLA; which ſee.

Befides the foregoing Species of Polygala, *Dale* mentions the following;

POLYGALA VERA. Offic. Polygala major Maſſiliotica. *C. B. P.* 349. Polygala Valentina maritima. *Park. Theat.* 228. Calutea caule Geniſtæ fungoſo. *J. B.* 1. 383. *Raii Hiſt.* 1. 925. Coronilla caule Geniſtæ fungoſo. *Tourn. Inſt.* 650. *Aſtragalus Matthioli*. Ger. 1059. Emac. 1239. MILK-VETCH.

This Plant is cultivated in Gardens, and flowers in Summer. The only Part of it uſed is the Herb itſelf, which, according to

to *Dioscorides*, increases the Quantity of Milk, if drank in some proper Liquor.

The *Polygala* was so common and well-known a Plant among the *Greeks*, that *Dioscorides* has only given a very short Description of it, which has laid a Foundation for various Disputes among the *Botanists*. The *Polygala* here spoken of, seems to be the genuine *Polygala* of *Dioscorides*; because, as *Matthioli* justly observes, it exactly agrees with the Description of that Plant. *Calceolarius* affirms, that he has often found from Experience, that it augmented the Milk of Nurses. Dale.

POLYGALON. A Name for the *Coronilla*; *minima*; and, also, for the *Polygala vulgaris*.

POLYGANON. A Name for the *Polygala*; *vulgaris*; and, also, for the *Onobrychis major*; *filiculis echinatis*, *cristatis*, in *Spica digestis*.

POLYGLOTTA. The Name of a beautiful *Indian Bird*, remarkable for its Song, but of no Use in Medicine.

POLYGONATUM.

The Characters are;

The Flowers are monopetalous, Bell-shaped, tubulated, naked, divided into six Segments, and furnished with six Stamina, which grow out of the Insides of the Divisions. The Ovary, which grows in the Centre of the Flower, produces a long Tube, furnished with a fimbriated Apex; and becomes a soft, globular Fruit, full of roundish Seeds.

Boerhaave mentions seven Species of *Polygonatum*; which are,
1. *Polygonatum*; latifolium; vulgare. C. B. P. 303. *Tourn.* Inst. 78. *Boerb. Ind. A.* 2. 63. *Polygonatum*, *Sigillum Solomonis*: Offic. *Polygonatum*. Ger. 756. Emac. 903. Raii Hist. 1. 664. Synop. 3. 263. *Polygonatum vulgare*: Park. Theat. 696. *Polygonatum*, vulgo *Sigillum Solomonis*. J. B. 3. 529. **SOLOMON'S SEAL.**

The Root of *Solomon's Seal* is about a Finger thick, white and woody; full of flat, seal-like Impressions, creeping upon the Surface of the Earth, with many pretty large Fibres. The Stalks grow to be about a Foot high; single, and not branch'd; round and slender; clothed with pretty large, oval, nervous Leaves, of a bluish-green shining Colour, set alternately on the Stalks, and inclining all to one Side, and having the Top bowing that way. The Flowers come from the Bosoms of the Leaves; on pretty long Foot-stalks, generally two together; being hollow and cylindrical; of one Leaf; parted, at the Ends, into five Segments; these, also, hang all one Way, and are of little or no Scent. They are succeeded by round Berries, green at first, and black when ripe; divided into three Parts; containing small oblong Seeds. It grows in Woods and Copfes, in divers Parts of *England*, and flowers in *May*. The Leaves and Root are used.

Solomon's Seal is vulnerary and restraining; good to stop all Kinds of Fluxes and Hæmorrhages; helps to consolidate Wounds, Fractures, and Ruptures; especially the Root, which, preserved in Sugar, is commended by *Matthioli*, as of great Service against the Fluor Albus. A Cataplasm of the Root is good to take away black and blue Marks, arising from Contusions. *Miller's Bot. Off.*

The Fruit of the *Polygonatum* is black, and cover'd with a Meal like fresh Plums; which, perhaps, deceived *Casalpinus*, who affirms it to be whitish.

Euchsius, to accommodate himself to *Dioscorides's* Description of the *Polygonatum*, fancied he found something like the Taste of Pomegranates in this Species. It might be so, perhaps, in *Greece*; but *Galen* found nothing in it, save an unpleasant Bitterness.

The Leaves of our *Solomon's Seal* are insipid. They have something glutinous in them, which gives slight Nauseas. The Roots are sweet, a little acrid, and glutinous; they give a faint red Colour to the blue Paper; and the Leaves more faint. This Plant seems to contain a viscous Phlegm, mix'd with a great deal of Oil. For, by the chymical Analysis, it yields little besides some acid Liquor and Oil; a little Earth, and fix'd, but no volatile Salt.

Schroder affirms, that fourteen or fifteen Berries of *Solomon's Seal* provoke Vomiting; and they say, that one Dram of its Root has the same Effect. Some macerate half an Ounce of it all Night in a Glass of White-wine, and give the Infusion of it to drink, for several Months together, to those that have Ruptures. The Patients never vomit, and find great Relief; especially if the Roots are applied to the Part at the same time. They are very good, also, for all sorts of Contusions. The distill'd Water clears the Face, and beautifies the Complexion. The Decoction of the whole Plant cures the Itch, and the like cutaneous Diseases. *Martyn's Tournefort.*

2. *Polygonatum*; latifolium; vulgare; cauliculis rubentibus.
 3. *Polygonatum*; latifolium; maximum. C. B. P. 303.
 4. *Polygonatum*; latifolium; flore duplici; odoro. H. R. Par.
 5. *Polygonatum*; latifolium; Hellebori albi foliis. C. B. P. 303.
 6. *Polygonatum*; latifolium; minus; flore majore. C. B. P. 303.
 7. *Polygonatum*; angustifolium; non ramosum. C. B. P. 303.
- Polygonatum*, angustifolium. J. B. 3. 531. *Polygonatum*, alterum. Dod. p. 345. *Boerb. Ind. alt. Plant.*

POLYGONUM.

The Characters are;

The Root is creeping, and very fibrous; the Stalks and Branches are very full of Joints. The Calyx is deeply cut into five Segments, which, in their lower Part, are herbaceous; but, above, of a fuscous Colour; when ripe, the Calyx becomes a Capful of Seed. The Flowers are produced at the Wings of the Leaves, and are conceal'd, in their first Rise, under a very thin Membrane; the Seed is exactly triangular.

Boerhaave mentions two Species of *Polygonum*; which are,
1. *Polygonum*; latifolium. C. B. P. 281. *Tourn. Inst.* 510. *Boerb. Ind. A.* 2. 88. *Centinodium*, *Polygonum*. Offic. *Polygonum mas vulgare*. Ger. 451. Emac. 565. Raii Hist. 1. 184. *Polygonum mas vulgare majus*. Park. 443. *Polygonum sive Centinodia*. J. B. 3. 374. **COMMON KNOT-GRASS.**

The Stalks of this Plant recline pretty much to the Earth, being smooth, and finely chaneled; slender, and branched, full of Knots or Joints, at which grow long oval sharp-pointed Leaves, set alternately on short Foot-stalks. In some Plants these will be broader, and more oval, in others longer and sharper; whence Authors have made two Sorts. At the Joints, with the Leaves, grow several small, staminate, blinking Flowers; sometimes of a white, and sometimes of a redish Colour; in each of which grows a small black triangular Seed. The Root is long and large, and strikes deep in the Earth. It grows every-where by Waysides, and in waste Places; flowering in Summer; the Herb is used.

Knot-grass is cooling, drying and binding, a good Vulnerary, and helpful against all Kinds of Bleedings, either external or internal, as against Fluxes; and outwardly applied, is good for Blood-shot, inflamed Eyes. *Miller's Bot. Off.*

This Plant has an herby, glutinous Taste, and a little Acid; it gives a deep Tincture of Red to the blue Paper; it is likely, that the Salt of Knot-grass resembles Alum, but is mixed in this Plant with a little Sal Ammoniac, and a great deal of Sulphur. For,

By the chymical Analysis, it yields a great deal of Acid, Earth, and Oil, a little volatile, concreted, and very lixivial fixed Salt.

Knot-grass is very vulnerary and astringent; the Juice; Pissan, or Infusion of it in Wine, is given to drink for the Dysentery, Piles, Spitting of Blood, and all Sorts of Hæmorrhages; the Extract has the same Virtues; the Leaves, bruised, cure Wounds. *Martyn's Tournefort.*

2. *Polygonum*; oblongo; angusto; folio. C. B. P. 281. *M. H.* 2. 591. *Boerb. Ind. alt. Plant.*

Polygonum is, also, a Name for several Sorts of *Herniaria*.

Polygonum bacciferum. A Name for the *Ephedra*; *maritima*; *minor*.

Polygonum Cocciferum. See *Coccus* and *KNAWEI*.

Polygonum Germanis. See *KNAWEI*.

Polygonum maritimum. A Name for the *Ephedra*; *maritima*; *major*.

Polygonum minimum. A Name for the *Knawel*; *folio Al-fines*, *glabro*; *flosculis plurimis*.

Polygonum montanum. A Name for the *Paronychia*; *Hispanica*; and for the *Paronychia*; *Hispanica*; *nivea polyanthos*.

Polygonum perenne. A Name for the *Telephium*; *Dioscoridis*.

POLYIDÆ SPHRAGIS. The Name of a Pastil, described by *Celsus*, Lib. 5. Cap. 20. It consists of scissile Alum, four Drains; Virriol, two Drains; Myrrh and Aloes, five Drains; of the Heads of Pomegranates, and Bulls Gall, each six Drains: All which, when triturated, are to be mixed with austere Wine.

POLYMORPHOS. Multiform; an Epithet for the *Os Sphenoides*. See *CAPUT*.

POLYNEURON. A Name for Plantain.

POLYOSTEON. A Name for that Part of the Foot which consists of a great Number of Bones.

POLYPHARMACOS. The same as **POLYCHRESTOS**.

POLYPHOROS. An Epithet of Wine, importing strong and generous.

POLYPODES. The same as **MILLEPEDES**.

POLYPODITES. An Epithet for Wine impregnated with *Polypody*.

POLYPODIUM.

The Characters are;

The Plant is not ramous; the Leaf is cut to the very Rib, into narrow oblong Parts, not adhering to a Pedicle, but with a wide Base embracing the Rib. Oftentimes the Lobes, or Segments, are not divided as far as the Rib, but are continuous, or joined by a leafy Structure. The Fruit grows on each Lobe, in a double Row, parallel to the Rib of that Lobe, and are membranaceous, covered with a thin Pellicle, and surrounded with an elastic crenated Circle, which explicating itself into a strait Line, discharges, with some Violence, angulous Seeds, growing within two very tender Membranes.

Boerhaave mentions six Species of *Polypodium*; which are,
1. *Polypodium*; vulgare. C. B. P. 357. Park. 1039. *Tourn. Inst.* 540. *Boerb. Ind. A.* 24. *Polypodium*, *Quercinum*. Offic. *Polypodium*. J. B. 3. 746. Ger. 972. Emac. 1132. Raii Hist. 1. 137. Synop. 45. *Felix Polypodium dicta*. Herman. Cat. 258. **POLYPODY OF THE OAK.**

This is a capillary Plant, consisting only of pretty large, long, unbranched, pinnated Leaves, whose blunt Pinnæ are very finely indented, and grow not directly opposite to one another on the Stalk, but alternately, a little above one another; the Leaves terminate in a sharp Point, having no Pinnæ on the lower Part of the Stalk: On the back Part of each Pinna, come forth the Flowers and Seed, in double Rows of round Tubercles, of a redish-brown Colour. The Root is slender, and full of small Knots, which appear like the Feet of an Insect, whence it takes the Name of *Polypodium*; it is of a brownish Colour on the Outside, and greenish within, of a sweetish styptic Taste. It grows upon old Walls, and at the Roots of Trees, and in the decayed Bodies of them; that which grows on the Oak, is most esteemed. The Roots only are used.

They are accounted opening, and gently purging; but are rarely given by themselves, but put among those purging Simples, which are stronger; they are supposed to purge bilious, melancholic Humours, and to open Obstructions of the Liver, and to help the Jaundice and Dropsy, and provoke Urine; they are good for the Scurvy, and are frequently an Ingredient in antiscorbutic Diet-drinks. *Miller's Bot. Off.*

The Root, being analysed, yields several acid Liquors, a little urinous Spirit, no concentered volatile Salt, a good deal of Oil, and a moderate Quantity of Earth. The Antients believed this Root was purgative. *Monardes* was the first among the Moderns, who knew that it loosened the Body but very gently. And *Dodonæus* confesses it does not purge at all, unless it is boiled in Cock-broth, with Mallows and Leeks. It sweetens the Blood, and removes Obstructions of the Bowels. It must be used in a dry Cough, when the expectorated Matter is salish, in the Asthma, Scurvy, and hypochondriac Affections. It is an Ingredient in several Compositions. *Martyn's Tournefort.*

2. *Polypodium*; minus. *An. C. B. P.* 358. *Dod. p.* 464.

3. *Polypodium*, sensibile; aut *Polypodium Virginianum*. *Munt. H.* 289. *Herba viva, foliis Polypodii*. *C. B. P.* 359. *Filix Indica, Polypodii facie*. *Mentzel.*

4. *Polypodium*; Cambro-Britannicum; pinnulis ad margines laciniatis. *Raii H.* 137. *Filix, amplissima; lobis foliorum laciniatis, Cambrica*. *Plukn. Phytogr. T.* 30.

5. *Polypodium*; tenerum minus. *Boerb. Ind. A.* 25. *Dryopteris*. *Offic. Dryopteris Adversariorum*. *Ger. Emac.* 1135. *Dryopteris sive Filix Querna repens*. *Park.* 1041. *Filix Querna*. *C. B.* 358. *Filix minor non ramosa*. *J. B.* 3. 740. *Tourn. Inst.* 537. *Raii Hist.* 1. 46. *Synop.* 48. OAK-FERN.

This Plant, the Whole of which is used, grows in marshy and putrid Places: When irritated with its Roots, it takes Hairs off the Body. It is to be apply'd by way of Ointment, and, when the Body is in a Sweat, the Sweat is to be wip'd off, and the Ointment apply'd again. *Discor.* It is possess'd of a septic Quality.

Rondeletius affirms, that he has found bad Effects produced by this Plant, when mixed with Medicines instead of *Polypodium*, by some ignorant Apothecaries of *Dauphiné*. I have sometimes found it in the Shops of some Apothecaries under the Title of *Adiantum album*. *Dale.*

6. *Polypodium*; angustifolium; folio vario. *Tourn. Inst.* 540. *Boerb. Ind. A.* 25. *Lonchitis*. *Offic. Aspera*. *Ger.* 978. *Emac.* 1140. *Raii Hist.* 1. 138. *Synop.* 45. *Aspera minor*. *Park.* 1042. *Minor*. *C. B.* 359. *Lonchitis altera foliis Polypodii*. *J. B.* 3. 744. *Lonchitis altera foliis Polypodii, Asplenium sylvestre nonnullis*. *Chab.* 556. *Filix sive Lonchitis altera foliis Polypodii*. *Pluk. Almag.* 152. ROUGH SPLEENWORT.

This Plant grows in moist, woody, rough, and uncultivated Places. The Herb is proper for agglutinating Wounds, without suffering an Inflammation to come on. When drank in Vinegar, it consumes the Spleen. *Discor.* The Root is aperient and diuretic. *Boerhaave.*

POLYPOSIA, πολυποσία. A copious drinking of Wine.

POLYPUS, πολύπους. A Name for any Animal possess'd of many Feet. But it is generally apply'd to a large Sea-fish, resembling a Cuttle-fish. It has eight Claws or Legs, which serve it to swim, walk, and convey its Aliments to its Mouth. These Claws, tho' distant from each other, are, nevertheless, joined by a large Membrane, which runs between them. The four middle Claws are the largest, in Bulk surpass a Man's Arm, and are all along adorned with a double Range of Tubercles, like small Horns. The four other Claws are call'd Brachia, Crura, Cirri, and Barba. The Eyes of this Fish are lodged at the Root of two of these Claws, and its Mouth, which is furnished with Teeth, is situated in the Middle. It has upon its Back a long Body, which, like a Rudder, it turns sometimes one way, and sometimes another, according as it intends to steer its Course. Its Flesh is not covered with any apparent Skin, but is spongy or porous, hard, and of difficult Digestion. This Fish is found in the *Adriatic* Sea, and feeds upon Shell-fish, human Flesh, when it can find it, Fruits and Herbs: It, also, loves Oil; it has, like the Cuttle-fish, near its Stomach, a Bladder full of a black or redish-brown Liquor, which it discharges, when it intends to conceal itself. Its Eggs are like those of the Cuttle-fish, but of a whitish Colour. It contains a large Quantity of Oil, Phlegm, and Salts, both of a volatile and fixed Kind. Its Flesh, when roasted and eaten, is good against a windy Colic. *Lemery Traité des Drogues.*

POLYPUS.

That Men in the Flower of their Age, and blessed with a naturally sound and robust Constitution, often die suddenly and unexpectedly, is sufficiently confirmed by Experience. Nor are the Vulgar ignorant, though Physicians cannot often account for the Thing, that there are some chronical and violent Disorders, whose Diagnostics and Prognostics are highly difficult, and which are in themselves so obstinate, as to prove mortal. But, the more frequent these Diseases are, and the more fond People are of knowing their Natures, the more surprising it is, that the genuine Causes of such Effects have so long remained latent, till luckily the modern Physicians began to make Anatomical Dissections of the Persons who have died of such Disorders, with a View to discover the genuine Condition of their Viscera; for Medicine has made more Advances in this present Age, by means of Anatomy alone, than were made in all preceding Ages, in which it was neglected; for as, by dissecting Bodies, many Causes of sudden Deaths, and dangerous Diseases, have been detected, so the most considerable of these are the Coagulations and Concretions of the Blood, firmly impacted in the large Vessels of the Heart and Lungs, and known by the Name of *Polypuses*; which, by intercepting and obstructing the free Circulation of the Blood, are capable, not only of destroying all the Functions, but, also, Life; for which Reason they are with Difficulty cured, and ought to have their fatal Causes in due time prevented, or removed by proper Medicines.

But that we may prove, that such Polypose Concretions have frequently been found, in dissected Carcasses, to be the Causes of Death, and incurable Diseases, we shall enumerate a few Instances of this Kind, from the Writings of modern Authors. Thus *Bartholine*, in *Lib. de Lacteis Thoracis*, *Cap.* 14. informs us, that in those who died suddenly, he, upon laying them open, found the larger Vessels of the Heart filled with a concentered Blood. This is, also, evinced by *Bonetus*, in *Anatom. Pract. Lib. 2. Sect. 2. Obs.* 5. where he treats at large of sudden Deaths produced by extraneous Bodies found in the Sinuses of the Heart. And *Fridericus Loffius*, in *Lib. 1. Obs.* 15. mentions a Boy of three Years of Age, who, though seemingly robust, and in good Health, yet died unexpectedly in his Mother's Arms: Upon dissecting the Body, the Viscera appeared perfectly sound, so that, besides an highly coagulated Blood in the Ventricles of the Heart, no other Cause of Death could be discovered. *Carolus Fracastorius*, who had many Opportunities of dissecting those who died suddenly, found nothing as the Cause, but Blood concentered and impacted in the Ventricles of the Heart, and in the pulmonary Vessels. And, that many died suddenly from an Infarction of the Vessels, is sufficiently evinced by *Panarolius*, who informs us, that, in the Year 1656, when sudden Deaths raged so much, many were suffocated by too large a Quantity of Blood retained within the Heart; so that, upon laying open the Bodies of these Persons, he hardly found any other Cause for their Misfortune, than a remarkable Infarction of the Vessels. *Johannes Daniel Horstius*, in *Manuduct. ad Med.* informs us, that in a Person who died suddenly, he found a whitish Phlegm in the Left Ventricle of the Heart. And *Riverius*, in *Cent. 1. Obs.* 82. tells us, that, in the Left Auricle of the Heart of a Man who died suddenly, he found a thick, compact, and entirely white Matter, resembling boiled Bacon.

From what has been said, it is sufficiently obvious, that in all Ages such Concretions of Blood have been formed in the Heart, and larger Vessels, as have produced sudden Deaths, and other incurable Disorders. But since, in the Writings of the Antients, the Word *Polypus* does not occur, we may reasonably conclude, that the Moderns have bestowed this Name upon such Concretions, because they generally send off many Ramifications, dispersed here-and-there among the adjacent Vessels; but, notwithstanding this Interpretation, it is to be observed, that the true Polypuses are only such Concretions, as consist of a whitish, fibrous, and pretty compact Substance, and are widely different from grumous or coagulated Blood; which, though it may create various violent Disorders in several Parts, especially when lodged in the Heart and Uterus, yet it hardly deserves the Name of a Polypus, but is, for the most part, by Authors called a *Pseudo-polypus*.

We now come to consider, why polypose Concretions are so fatal to Mankind. Now these Concretions are principally the Causes of violent Disorders, and of Death, when their Bulk is so increased, or, which more frequently happens, when they are, either by a slight internal, or external Cause, so removed from their Seat, as to intercept and disturb the free Circulation of the Blood from one Ventricle of the Heart, through the Lungs, to the other; or when, by blocking up the Orifices of the Vessels, they entirely destroy the Circulation of the Blood; for so long as small polypose Concretions only adhere to the Sides of the Vessels of the Heart, and of the other Vessels, they

they do not much retard the Circulation of the Blood; and for that Reason do not manifestly injure the Functions. This is confirmed by Experience, which teaches us, that such Concretions may be formed in the Auricles and Sinuses of the Heart, on account of the various Windings, and fleshy Fibrils, about the Divarications of the Vessels, and, also, in other Parts of the Body, whilst, at the same time, the Blood is, notwithstanding, suffered to circulate freely. Thus *Vesalius*, in *Lib. 1. Cap. 5. de Corporis humani Fabrica*, informs us, that, in the Left Ventricle of the Heart of a certain Man, he found almost two Pounds of glandular, but blackish Flesh, the Heart being extended like the Uterus; and he adds, that though the Patient's Pulse was surprisingly unequal and various, yet he walked about like a sound Person for several Months before his Death, till at length, during the last Weeks of his Life, his Pulse became so greatly intermittent, that, during the Time usually requisite for nine natural Strokes of the Pulse, only two or three could be perceived in him.

We next come to consider what Diseases are produced, obstinately sustained, or disposed to an unhappy Termination, by means of polypose Concretions: Among these, the most considerable are various Disorders of the Breast, such as Pleurisies and Peripneumonies, among the acute kind; and, among the chronic kind, all sorts of Asthmas, the suffocative Catarrh, the Chin-cough, the Phthisis, and a Spitting of Blood: As for this last, it is certain from Experience, that, in consequence of a Stagnation of viscid and congested Blood, it easily disposes to polypose Concretions, which, in their Turn, produce a Spitting of Blood; for if, by means of these polypose Concretions, the free Passage and Repassage of the Blood through the Pulmonary Vessels is disturbed, the Blood must necessarily be accumulated in the capillary Vessels of the Pulmonary Artery; and at last, upon the breaking of some Ramification, expectorated by way of Spit, especially in Persons disposed to an Hæmoptysis. For this Reason it is no unusual thing for Polypose Concretions to be found in dissecting Persons, who have died of Spitting of Blood: Thus, in *Hoffman's Consult. Med. Tom. 1. Sect. 2. Obs. 73.* we have an Instance of a young Man of seventeen Years of Age, who died of a Spitting of Blood, accompanied with a slow Fever; and, upon laying open his Body, there was a callous Concretion found in his Pulmonary Artery. *Bonetus*, also, in *Anatom. Pract. Tom. 1. Lib. 2. Sect. 5. de Sputo Sanguinis*, gives us an Account of the Dissection of a Person who died of a Spitting of Blood, made by *Sylvius* in the Hospital of *Leyden*, in the Year 1664. In both Ventricles of this Person's Heart there was found a thick, fibrous, and, as it were, fleshy Matter, extended into all the Vessels running off from the Heart. But, particularly, such a Concretion, above three Spans long, was extracted from the Left Jugular Vein; but this Matter, to which much grumous Blood adhered, was, in the Ventricles of the Heart, of a considerable Thickness, and, in a singular manner, interwoven with the fleshy Fibres of the Heart, which its Fibrils, as it were, embraced. Besides, in the Middle there appeared a grumous Blood, and it seemed to have minute Vessels. I have, also, seen polypose Concretions in those who have died of a Phthisis. And *Baehne*, as we are informed by *Georgius Horstius*, in *Op. Tom. 1.* tells us in express Words, that he almost always found polypose Concretions in those who died of a Phthisis and Dropsy. The Curious may, with respect to this, consult *Needham de Formatione Fœtus, Cap. 2. Malpighius, de Polypo Cordis*; and *Harderus*, in *Obs. 45, 46, and 47.*

An Asthma, especially that which is of the incurable kind, and on which depends a Dropsy of the Breast, is almost always generated and sustained by polypose Concretions. I have often had Opportunities of dissecting the Bodies of such as have died of this kind of Asthma; and found either Polypuses in the Heart, and Pulmonary Vessels, or a fetid Serum extravasated in the Cavity of the Thorax. Nor are there wanting a sufficient Number of Observations to confirm this. Thus the celebrated *Grævius*, a Physician to the Army, in his *Dissertatio de Astmate Convulsivo*, informs us, that, upon laying open the Bodies of fifty Soldiers, who died of Dropsies of the Breast, and Asthmas, he found Polypose Concretions in the Ventricles of all their Hearts. *Lancisi*, also, in his *Treatise de Motu Cordis*, gives us the following memorable Case: A Man of twenty-four Years of Age, of a slender Habit, and accustomed to a gross Air, and coarse Aliments, was seized with frequent Anxieties about the Heart, and Faintings, accompanied with a violent Difficulty of Breathing, and a Refrigeration of the Extremities. His Pulse was small and unequal, and his Jugular Veins and Abdomen were surprisingly tumid, till at last he died of a slow Fever. Upon laying open his Body, his Heart was found wonderfully flaccid and small, with polypose Concretions filling both its Ventricles, and the Pericardium firmly adhering to it. More Observations, with respect to that Asthma which is generally accompanied with a Dropsy of the Breast, may be seen in *Diemerbroeck. Anatom. Lib. 2. Cap. 9. Bartholin. Epist. 2. Cent. 4.*

and *Epist. 56. Cent. 2. Harderus, Obs. 56. Leiver de Cordis, Cap. 2. Pezoldus, Obs. 58. and 61. Russch, Obs. 19. and in the M. N. C. Dec. 2. An. 9. Obs. 174. and Dec. 3. An. 2. Obs. 185.*

A Dropsy of the Pericardium and Thorax not only frequently accompanies an Asthma brought on by polypose Concretions; but, also, dropfical Tumors of other Parts of the Body derive their Origin from the same Cause. Hence nothing occurs more frequently in Practice, than to observe a spasmodic and convulsive Asthma, arising from polypose Concretions, succeeded by a cachectic Habit of Body, œdematous Swellings of the Feet, and sometimes an Ascites; for when the Circulation of the Blood, from the Right Ventricle of the Heart, through the Lungs, to the Left Ventricle, is hindered by such a polypose Concretion, the whole Circulation of the Blood, thro' the Vena Cava, must necessarily be rendered slower; and violent Stagnations by this means must be produced here-and-there in the inferior Parts, and particularly in the Liver, which when obstructed or indurated, the Blood begins to stagnate in the Mesentery, and all the Ramifications of the Vena Porta: Whence the Serum, being secreted, regurgitates to the lymphatic Vessels, which, when too much distended, are formed into Hydatids, the Breaking of which produces a fatal Extravasation of Serum. Memorable Observations of this kind occur in *Rhodus, Cent. 3. Obs. 4. and Peyer, in Hist. Anatom. Cap. 6. Wepfer, in his Exercitat. de Apoplexia*, informs us, that he observed fibrous and pituitous Concretions in the Bodies of those, who, during their Lives, had been for a long time cachectic, or often afflicted with Diseases. *Smetius, in Miscel. Medic. Lib. 10.* gives us a singular Instance of an œdematous Tumor in both Legs, arising from a tense and somewhat hard Polypus, and which, reaching as far as the Thighs, formed a full and hard Tumor in the lower Belly between the Pubes and the Navel, and which at last filled all the Region of the Abdomen. *Bonetus*, from *Boyle, Obs. 9.* makes mention of Polypuses in the Hearts of two Women, one of whom died of a Dropsy, and the other of a Cachexy. And *Albinus*, in *Dissert. de Polypis, Thes. 5.* mentions a memorable Species of Dropsy in a Man for some time afflicted with a Difficulty of Breathing, Palpitations and Anxieties of the Heart, who had Tumors in his Arms, and his Veins tumid, and protuberating into Knots, in consequence of a pretty large Polypus ascending from the Right Auricles of the Heart into the Trunk of the Vena Cava, and sending off Ramifications; but, in such a Situation, the Dropsy infallibly proves mortal.

But, waving the farther Consideration of an Asthma, and of a Dropsy, which often accompanies it, we now come to investigate the other Disorders of the Breast, which arise from polypose Concretions. The most considerable of these may be justly accounted the suffocative Catarrh; for, upon laying open the Bodies of such as have died of this Disorder, polypose Concretions have, for the most part, been found to be the principal Causes of Death, as is obvious from *Bartholin. Cent. 2. Obs. 86. Greiseli, in M. N. C. An. 1640. Obs. 74. and Malpighi de Polypo Cordis*; for the last-mentioned of these Authors informs us, that in all those he had laid open, who died either of an Apoplexy, or of a suffocative Catarrh, he found callous, viscid, and glutinous Bodies in the Heart and Brain, and frequently in both. Nor must we overlook a Palpitation of the Heart, which is, for the most part, and, when of the chronic kind, almost always, produced by polypose Concretions. But, referring the Curious to the Article PALPITATIO, we come to consider those inflammatory and highly acute Disorders of the Breast, a true Pleurisy, and Peripneumony, which often arise from Stagnations of the Blood, produced by polypose Concretions. Thus *Malpighi*, in his *Treatise de Polypo Cordis*, affirms, that the Bodies of pleuritic Persons, when laid open, are found to contain a large Quantity of white Portions of concremented Matter, not only in the Præcordia, but, also, in the Liver and Veins. *Willis*, in his *Treatise de Febribus, Cap. 11.* informs us, that, upon laying open the Bodies of those who died of Pleurisies, the Blood has been found concremented into long Portions in the Sinuses of the Heart, and every-where about the Cavities of the Vessels. *Peyer*, also, in his *Exercitat. Anat.* mentions a Man of Sixty, who died of a Pleurisy changed into a Peripneumony; and, upon opening his Body, there appeared in his Heart large and tenacious polypose Concretions, resembling Portions of Fat.

Polypose Concretions prove the Causes of incurable Diseases, not only in the Heart, and annexed Pulmonary Vessels, but, also, in other Parts, especially the Veins, as is obvious from Dissections. Thus various Observations in *Wepfer, Peyer, Willis, Blasius*, and in *M. N. C.* sufficiently evince, that violent Cephalalgias, Apoplexies, and Deliriums, have been excited by Polypuses found within the Jugular Veins, and in the Sinuses of the Brain; but no Part of the Body is more disposed to the Generation of Polypose Concretions, than the Uterus, in whose Veins, on account

of their winding Complication, and the consequent slow Circulation of the Blood through them, such Polypose Concretions are easily formed, which afterwards lay a Foundation for frequent Abortions, immoderate Hæmorrhages of the Uterus, copious Effusions of Serum and Lymph from it, a Dropsy thereof, and Barrenness.

Having thus considered those incurable Disorders, and such as cannot be cured without the greatest Difficulty, which arise from Polypose Concretions, we shall now subjoin some Phenomena, by means of which it may be known, whether these Polypose Concretions are lodged in the Præcordia, where they have their principal Seat. But, among all the Signs which evince this, the most considerable are, a long-continued Palpitation of the Heart, often excited by a slight Cause, such as the Commotions of the Mind, flatulent Aliments, and such as render the Patient costive; for such is the Nature of these things, that, by disturbing the equable Circulation of the Blood, they produce a greater Impetus thereof to the Heart, where, being preternaturally congested and accumulated, on account of the obstructing Polypus, it cannot find a sufficient Space for expanding itself, but violently distends the Heart, and its Vessels; by which means it produces a violent Anxiety, and convulsive Motion of the Heart, which is called a Palpitation. Immediately after this, arises another Sign, which is, the Inequality and Intermision of the Pulse, often accompanied with Faintings; for as the Pulse is generally the best Circumstance, by which we can judge of the Motion of the Heart, and of the Circulation of the Blood through all the Parts of the Body; so, if it is irregular, or plainly intermittent, it, if other Circumstances concur, lays a Foundation for suspecting, that some Polypose Concretion, by its Bulk, disturbs, or, for some time, intercepts, the due Constriction of the Heart, and other Vessels, on which the Circulation of the Blood depends. Nor must we exclude, from the Signs which manifest a Polypus, a frequent Obstruction of Breathing, without a manifest Cause; a Compression of the Præcordia, in consequence of spasmodic Strictures of the Breast, and, what most generally accompanies this, a fixed Pain about the Heart; for each of these, if they are almost perpetual, are palpable Signs, that the Circulation of the Blood is obstructed by some foreign Body.

We now come to consider Polypose Concretions in a more particular Manner, and account for their Generation and Production. First, then, 'tis to be observed, that all Polypuses are not of the same Texture, Colour, and Bulk; for some are found so solid, hard, and so compacted of Fibres, that they seem to resemble small Tendons; whilst others are soft, composed of mucilaginous and thin Pellicules, and externally covered with a Membrane. Some are so large as to weigh a few Ounces; some, on the contrary, are smaller, and have sometimes many pinguious Parts intermixed with them. That the Colours of Polypose Concretions are widely different, is sufficiently obvious, from the various Denominations given them by Authors, especially those of a pretty antient Date; for sometimes they are represented under the Idea of Fat, which, according to some, is white, and resembles Candle-tallow; and, according to others, of a whitish yellow Colour, resembling that of the heated Marrow of Bones; at other times they are said to resemble Flesh, and at other times other Substances. Polypuses also differ in this, that some of them being rooted in the Right, and others in the Left Ventricle of the Heart, send off more or fewer Ramifications to the adhering Arteries and Veins; as also, in this, that some are by their own Bulk sufficient to prove mortal, by blocking up the Mouths of the Vessels; whilst others only produce that Effect, by being moved out of their Places.

But from sufficiently important Considerations, I am induc'd to think, that the Matter of Polypose Concretions is supply'd by the more weighty, viscid, and fixed Particles of the Chyle and Lymph, which by their Motion are easily united, and so form'd into one Mass, as to form a fibrous and membranous Body. This is sufficiently confirmed by various Experiments, made with respect to the Generation of these Substances. Thus *Ruyfch*, that incomparable Anatomist, in his *Thesaur. Anatom.* 6. informs us, that of his own Blood, only by shaking, he formed a kind of spurious Membrane, which was furnish'd with many Stamina or Fibres, and so much resembled a genuine Membrane, that it was universally believed to be the Work of Nature: And in his *Thesaur. Anatom.* 1. n. 3. he tells us, that by strong Conquassation alone, continued for the Space of one Hour, he produced a Polypose Substance from the Blood of a newly killed Sow: Hence, we are enabled to form a distinct Idea of a Polypus; which may justly be defined, a certain solid, fibrous, Concretion, formed of the more viscid Parts of the Lymph, by means of a strong Motion, or Impulse.

Tho' Polypuses are formed in both Sinuses of the Heart, and in the Arteries as well as the Veins, yet 'tis certain from accurate Observation, that they are more easily and frequently formed in the Right Auricle and Ventricle of the Heart, than in the Left; as, also, more commonly in the Veins than in the

Arteries: Nor is this hard to be accounted for, since the Chyle, which, by means of the Subclavian Vein, is convey'd to the Vena Cava, and the Right Ventricle of the Heart, being full of gross Particles, and moving slowly, easily deposits its heavy Parts, by which the Columna of the Heart being embraced, one Substance, or Body, as it were, is produced. Then the Blood convey'd to the Veins, by means of their too weak contractile Force, circulates more slowly, is of a thicker Consistence, and more weighty, than the arterial Blood: Hence it easily deposits its thick Parts; but especially, when these, not being intimately mixed, cohere slightly, they, by the Force of their Gravity, tend most to the Bottoms and Sides of the Vessels. But it is otherwise with the arterial Blood; for, as this is not only considerably promoted in its Course, by the elastic Motion of the Arteries, but, also, in the Lungs, impregnated with an highly subtil aereo-ethereal Matter, and intimately mixed, by being forced through very minute Vessels, so 'tis by these means rendered more light and red: Hence the Reason is obvious, why the arterial Blood is less fit for the Generation of Polypuses, than that of the Veins.

Nor only those advanced in Years, but also Children and Infants are found subject to Polypose Concretions. That such Misfortunes are incident to Adults, is universally allowed; for which Reason we shall here give a few Instances, in which such Polypose Concretions have been found in Infants: Thus *Albinus*, in his *Dissert. de Polypo Cordis*, gives us an Instance of a Polypus blocking up the Auricle of the Heart, in a very young Boy. *Bonetus*, in *Sepulchret. Anatomicum*, Lib. 2. Sect. 11. Obs. 6. mentions pretty large Polypuses found in the Sinuses of his young Son's Heart. *Snell*, in his *Dissertatio de Cordis Polypo*, tells us that in a Boy of six Years of Age, who died of an Atrophy, he found a Polypus in each Sinus of the Heart. *Dorstenius*, in *E.A.C. Dec. 2. An. 3. Obs. 153.* mentions four extraneous Bodies, found in the Left Ventricle of the Heart of a very young Boy; and in *E.A.C. Dec. 3. An. 2. Obs. 18.* an enormous Polypus, found in a Youth, is described. This might be proved by a great Variety of Instances. 'Tis not, however, to be denied, that Adults, and those pretty far advanced in Years, are more disposed to the Generation of Polypuses than those who are younger; for the Blood peccant both in Quantity and Temperature is more easily accumulated, when the Work of Nutrition is over, than when it is carrying on; especially, when, in consequence of numerous and large Vessels, and a diminished Elasticity of the Solids, any one is disposed to a Plethora, addicted to an idle Life, without Exercise, or has the Misfortune of an improper Diet.

We almost always find Men more subject to Polypuses, and the Diseases produced by them, than Women; the Reason of which is, in my Opinion, this, that in the Female Sex, whilst the menstrual Evacuations are duly carried on, the Quantity of Blood is not so easily increased; and, in consequence of the Laxity of the Fibres, and greater Fluidity of the Humours, or a Blood more abounding in Serum, it more difficultly happens, that the gross Particles unite, and form themselves into Concretions. 'Tis, also, to be observ'd, that in marshy Places, and Northern Countries, far more die of Polypose Concretions, than in the hotter Climates: Which, in my Opinion, besides the cold Air, and the more obstructed Perspiration, is principally, to be ascribed to the gross Aliments, such as Sea Fish, coarse Bread, smoked and salted Flesh, from which a tenacious Chyle, full of terrestrial Particles, and consequently a thick Blood, is generated.

We now come to consider the procaccatic Causes of Polypose Concretions; the most considerable of which is a Redundance of Blood; for, in consequence of an increased Diastole of the Vessels, under a plethoric State, the Fibres lose their Elasticity; by which means, the Systole of the Vessels is diminished, the Circulation of the Blood surprisingly retarded, and a palpable Foundation for the Cohesion of the terrestrial Particles laid. Besides, in consequence of this, an Obstruction of the Vessels happens; the great Tendency of which to the Generation of Polypuses is sufficiently obvious from an Experiment made by *Lancisi*, in *Lib. de Aneurismatibus*, Propos. 38. where that Author informs us, that with a waxed Thread he tied a certain Ramification of the Iliac Artery of a live Dog; and that, upon cutting the Ramification, without the Ligature, about fifteen or twenty Days after, he found a Polypose Concretion: Nor is it difficult to account for this, since, by making such a Compression, the more tenacious and least moveable Parts of the Blood, being mutually united, begin gradually to adhere to the Sides of the Vessels, till at last their Bulk being increased, they constitute a thick and fibrous Substance, called a Polypus. But not only a Redundance, but, also, a Penury or Scarcity, of Blood lays a Foundation for Obstructions, and consequently for Polypose Concretions. Hence I have frequently observed copious and frequent Hæmorrhages succeeded by the same Disorders, which are produced by Polypuses; for since, in consequence of the Distention, the Fibres are rendered more lax, and the Pores larger, they transmit all kinds of thick and viscid Humours, which are fit for generating Polypose Concretions.

As Length or Tenuity of Body disposes to various Diseases, so it, in a particular manner, contributes to the Generation of Polypuses, and all the Disorders arising from them; for, in tall Persons, the perpendicular Ascent of the Fluids is difficult: Hence, the Circulations in all the Parts of the Body become slower, and Stagnations and Obstructions of the Viscera are easily formed, but especially of the Lungs, where the Blood circulating with Difficulty, stagnates in the minute Vessels, and the secreted heavy Parts are, in Process of Time, condensed into a thick Mass. If this Account of the Matter is not sufficient, it may be still farther confirmed by Experience, which reaches us, that excessively tall Persons are not only inferior in Gaiety of Temper, and Strength of Body, to such as are of a lower Stature, but, also, far more subject to the Diseases arising from a slow Circulation, and Stagnation of the Blood, such as Polypose Concretions, a Phthisis, an Asthma, and a Difficulty of Breathing.

But nothing is more injurious to the human Body, or has a greater Tendency to occasion sudden Death, than large Draughts, of cold Liquors, hastily drank after any violent Commotions or Over-heating of the Body. Thus *Galen*, in his Book *de Sanitate tuenda*, justly thinks that such a Practice induces a Cough, and Difficulty of Breathing; weakens the Brain, and excites Defluxions from it; impairs the Strength of the Stomach, and injures the Nerves; for such is the pernicious Nature of Cold, that, by stopping the intestine Motion of the Fluids, it not only coagulates the Blood, but, also, precipitates the terrestrial and gelatinous Parts; Hence 'tis not to be wondered at, if Obstructions, Inflammations, and Polypose Concretions, should be produced; which last may be observed, when Blood flowing warm from the Veins is suffered to fall into cold Water; or, when warm Water, in which such Blood has fallen, becomes cold; for, in this Case, the fibrous and more heavy Part will be separated and precipitated from the other, in a most beautiful manner. Many Instances might be alleged, in which the drinking cold Liquors has suddenly prov'd mortal.

Both Experience and Reason concur to evince how effectually Acids, and spirituous Liquors, contribute to induce violent and dangerous Coagulations of the Humours; for, according to a known Experiment, Blood which is sufficiently fluid, when taken from the Veins, is by an Affusion of any acid Liquor, or rectified Spirit of Wine, forthwith coagulated into an hard Mass. Now none who accurately advert to this Circumstance, can doubt but the same may happen in the human Body, tho' not in the same Time and Manner. But if they should doubt of this, let them remember into what violent and chronic Disorders, arising from Obstructions in the Viscera, such as a Phthisis, a Cachexy, a Dropsy, a convulsive Asthma, and excessive Hæmorrhages, great Drinkers of Brandy, and spirituous Liquors, bring upon themselves.

Nor are we to overlook the Affections of the Mind, especially Anger, Frights, and Sorrow, which lay a sufficient Foundation for Polypuses, and the Disorders arising from them. Without making a curious Inquiry into the latent Causes of so singular an Effect, we shall only give some memorable Instances of the Facts. Accordingly, the celebrated *Malpighi* gives us an Account of a Patient, otherwise sufficiently robust, who, by means of a Fright, was seized with a great Inequality and Obscurity of the Pulse, especially in the Left Wrist, without any Fever, and a recurring Difficulty of Breathing. But soon after he expectorated by Spit, sometimes a Portion of red Blood, and at other times a large Quantity of small white Portions of Matter, not unlike Polypuses. But afterwards his superior Parts became turgid, and he was suffocated by the Redundance of confined Blood. *Riverius*, also, in *Cent. 4. Obs. 2.* gives us an Instance of a certain Man of Distinction, who, having the Misfortune of a sudden and unexpected Fright, complained of a violent Tremor of his Heart, a Difficulty of Breathing, together with an unequal and intermittent Pulse, till he soon after died; when, upon laying open the Cavity of his Breast, the Heart, and larger Vessels, were full; and in the Left Ventricle of the Heart were found round Caruncles, resembling the Substance of the Lungs, the largest of which, approaching to the Size of an Hazel-nut, blocked up the Mouth of the Arteria Aorta.

Nor must it be forgotten, that the preposterous Methods of curing violent Hæmorrhages, and intermittent Fevers, by Astringents, Opiates, Chalybeates, and even the Peruvian Bark, greatly contribute to bring on violent chronic, and even incurable Disorders, which are produced and supported by Polypose Concretions. And I can, after a Practice of more than fifty Years, affirm, that I have known more Mischiefs done by no Medicines, than by the unseasonable and incautious Use of these; since I have seen, not only acute and mortal Disorders, such as Apoplexies, Epilepsies, and suffocative Catarrhs, but, also, long and chronic Disorders, such as a Phthisis, a convulsive Asthma, hypochondriac and hysterical Disorders, violent Hæmorrhages, slow and hectic Fevers, pro-

duced by this means. If we inquire whence so many Misfortunes arise, it is to be observed, that the Cause of these terrible Disorders is principally to be sought for, in the slow and retarded Circulation of the Blood and Humours through the minute and capillary Vessels of the Body; for, by this means, the natural Secretions and Excretions, which are, also, made through minute Emunctories, composed of subtile Vessels, are surprisingly retarded: Hence arise various Stagnations in different Parts, Infarctions and Indurations of the Viscera, together with a large Train of other Symptoms. Now if a Physician, in such a State where there is already a Thickness of the Blood and Humours, and a slow Circulation, or where violent Spasms strongly compress the Vessels, should exhibit astringent and in-craffating Medicines, or even those of the sedative Kind, he must necessarily do his Patient a considerable Injury, by rendering the Disorder more terrible. This happens the more infallibly, if the preposterous Use of these Medicines is too long persisted in: Nor can it be doubted, that such Polypuses as may prove the Causes of incurable Diseases, may be produced by these means; and I have had Opportunities, in many Diseases arising from this preposterous and empirical Method of Cure, sometimes of prognosticating Polypose Concretions, from pretty certain Signs; and sometimes of seeing them, in dissecting such Patients after Death.

Thus we have consider'd the principal Causes which concur to the Generation of Polypuses: And, with respect to the other Causes, as they rarely occur, so they may be easily reduced to some one or other of those already mentioned.

The CURE.

So obstinate are most Persons, that they rarely think of attacking the Beginning of Diseases, but call for the Physician, and the Assistance of his Art, when, their Disorders being increased by Delay, they have a near Prospect of Death: But, by this means, they only hasten the fatal Day, which, by a speedy Use of proper Medicines, might have been totally averted. Persons afflicted with polypose Concretions are the more culpable in this respect, since it is certain from Experience, that their Cure is, at best, difficult and dubious, and, when the Disorder is of long Standing, absolutely impossible; for, if any Assistance is to be expected in those Diseases arising from an intercepted Circulation by means of Polypose Concretions, great Expedition is absolutely necessary: And the principal Intentions of the Physician ought to be to hinder the Generation of such Concretions, and to prevent their Increase, and injurious Effects, where they are already present.

First, then, in order to prevent the Generation of Polypose Concretions, our principal Care ought to be, to dilute and resolve the inspissated Blood, and duly to diminish its Quantity in plethoric Habits. In order to obtain this End, nothing is of more Importance than a right Regimen, and Method of Living; for which Purpose let their Diet be spare, slender, and moistening; and let the Patient abstain from all hard, acid, saline Aliments, and such as afford much Nourishment: Let his Drink be of a proper Quality, and very thin. For this Purpose he may very commodiously use small and pure Beer, or Spring-water, either alone, or mixed with a due Quantity of Wine, or a Decoction prepared of mild and aperient Ingredients; among which the most considerable are the Roots of Vipers-grass and Sarsaparilla, together with China Root, and the Bark of Sassafras-wood; for, by these means, the Purposes of Dilution and Resolution will be excellently obtained. To these Measures let the Patient, also, add frequent Exercise, by which the Fluidity and equal Circulation of the Blood through all the Parts are greatly promoted. But all Persons, especially those of fat and plethoric Habits, ought carefully to guard against violent Exercise suddenly begun, since, by this means, too much Blood is projected to the Lungs, where circulating slowly, it is easily coagulated. In order to prevent this, it is expedient forthwith to drink some warm Liquor; which is still the more necessary, if, after the Body has been over-heated by violent Exercise, it is suddenly cooled; or, which is worst of all, if large Quantities of any cold Liquor have been drank. Besides, the Air the Patient breathes ought to be pure, serene, and temperate, neither too hot, nor too cold, nor too moist. But, if the Patient cannot have the Benefit of such an Air, such Infusions as promote Perspiration, have an excellent Tendency to attenuate the Fluids, and disjoin the united Molecules.

The Patient ought, also, to guard against violent Affections of the Mind, especially Grief, Anger, and Frights: But if at any time a Change is induced on the Body by these, such things are with all Expedition to be used, as allay violent Commotions, and render the disturbed Circulation of the Blood again regular and equable. Thus, if the bad Effects of a sudden Fright are to be removed, such Medicines are most efficacious as are gently resolvent, and promote a mild Perspiration; because, perhaps, by this means, that Part of the Mass of Blood which

which was beginning to be coagulated, is most commodiously resolved: For this Purpose I always, with great Success, exhibited the *Pulvis Marchionis*, either alone, or with a few Drops of the anodyne Liquor, taken in Cinnamon-water, or Baum-water prepared with Citron-juice and Wine; after which I order some Cups of a warm Infusion to be drank: And this Method I, also, found highly beneficial in those wasted by long Grief. Besides these Measures, in violent Frights, moderate Exercise is greatly to be commended; since by it the Heart is enabled more easily to free itself from the Quantity of Blood congested to it, in consequence of which the Disorder becomes less terrible. Those, therefore, but ill consult their own Advantage, who, immediately after a Fright, betake themselves to a State of Rest, or endeavour to fall into a profound Sleep.

Care must, also, be taken, that the Body be duly soluble; and, if the Patient is costive, Clysters, or balsamic Pills, are, with all Expedition, to be used, in order to remove this Misfortune. Nor is less Care and Prudence requisite, that the other Passages subservient to the Secretion and Excretion of the Humours, be kept free and open, lest, as it generally happens, these being obstructed, the Mass of Blood should be contaminated, and rendered impure: But it ought, in a particular manner, to be the Physician's Care, that no natural Evacuation of Blood, such as the Hæmorrhoids in Men, and the Menfes in Women, be either totally suppressed, or too long retained; for, in this Case, there easily happen dangerous Congestions of Blood to other Parts, which, by the skilful Physician, may be commodiously prevented, by proper Venesection, Pills, and other Medicines of a gently balsamic and temperate Quality. Nor are artificial Evacuations of Blood to be neglected; but these are still more strictly to be regarded, if the Patient is plethoric, and has, by long Custom, render'd them natural to him.

Having laid down these Rules, with respect to Regimen, we must, among the Class of Medicines calculated for inciding and resolving the inspissated Fluids, recommend Salts of a neutral and alkaline Nature, such as the Arcanum Duplicatum, vitriolated Tartar, Nitre, the digestive Salt of *Sylvius*, the aperitive Salt, Oil of Tartar per Deliquium, the Terra foliata Tartari, and the Liquor of fixed Nitre. Among spirituous Preparations, this Intention is answer'd by the Essence of white Burnet, the *Tinctura Antimonii Acris*, and others of a like Nature. But, among all the Medicines, I know none is so powerful in dissolving those Parts of the Blood which are fibrous, and disposed to Concretion, as mineral Waters, especially those which are impregnated with an alkaline Salt, and of a mild and temperate Quality; such as the *Embsen* and *Selteran* Waters, those of *Aix la Chapelle*, but especially the *Caroline* Springs, which, by their Salt, open all the Emunctories of the Body, wash away and evacuate the impure Sordes, and resolve and dilute the thick and viscid Blood.

Having already shewn the Method of preventing Polypuses, we now come to inquire what Measures are to be taken, when there are any Signs of a Polypus already formed in the Heart, or larger Vessels, and by what means its farther Growth may be prevented: It is, therefore, to be observed, that whilst a Polypus is only beginning, and, as yet, pituitous, we are not to lose all Hopes of resolving it, which may be done by alkaline and neutral Salts, which excellently resolve the viscid Humours; by a slender Diet; by a sufficient Quantity of Drink of such a Nature as to dilute the Humours; but, especially, by the *Caroline* Waters; by the prudent Use of which I have known many cured, who had strong Symptoms of a Polypus formed within. But if the Polypus has already degenerated into a fibrous and hard Substance, all possible Care is to be taken, lest, becoming bigger, or, being moved out of its Place, it should totally block up the Vessels, and suddenly destroy the Patient. For answering this Intention, it is of the greatest Importance to prevent a Redundance of Blood, and to preserve its Fluidity, by the Medicines already recommended for that Purpose. But, when a Difficulty of Breathing arises from a Polypus, we must by no means use Venesection in the Arm, since, by that Practice, a greater, and even a suffocative Congestion is produced. Besides, let the Patient avoid all spirituous Liquors, too much Exercise, and Perturbations of Mind, all which, partly by coagulating the Blood, and partly by throwing it into too violent Commotions, render the Disorder worse.

We shall now subjoin some Cautions with respect to the Treatment of Hæmorrhages, and Intermittent Fevers. We have already shewn how faulty Physicians are in this respect; for which Reason I sincerely advise, that, in stopping Hæmorrhages, the Physician would not attempt the Cure by Astringents alone, but rather by a proper Evacuation of Blood, and gently anodyne Medicines; as, also, by Frictions of the inferior Parts, to restore the equable Circulation of the Blood. With respect to the Cure of Intermittent Fevers, the greatest Care is to be taken, that they be not too soon suppressed; for which Reason it is ex-

pedient prudently to use gently aperient and evacuating Medicines; to which we may commodiously subjoin, and even interpose, resolvent, temperating, and corroborating Medicines. *Hoffman.*

POLYSARCIA, *πολυσαρκία*, from *πολύς*, much, and *σὰρξ*, Flesh. Corpulence.

This is a superfluous Increase of Flesh, by the Greeks so called, on account of its Excess. It is a Disorder directly opposite to that, in which Nutrition ceases, and in which the Body becomes tabid and consumptive. Too large a Quantity of Nourishment conveyed to the Parts, is the Reason, why an excessive Quantity of Flesh is generated, and the Patient, by that means, oppressed. We may justly reckon this to be a Species of Cachexy; for the Patients are afflicted with several terrible Symptoms, such as a superfluous Quantity of Flesh, an Excess of prominent Fat, Slowness of Motion, Oppression, Weakness, Difficulty of breathing, and Sweating upon the least Exercise; so that the Patient becomes apprehensive of Suffocation, and can hardly wear the slightest Garments. Many Physicians have, therefore, given Rules for diminishing the Quantity of Flesh, or preventing an Increase of the Body. But their Doctrine is refuted by *Soranus*; for, if the Habit of Body is good, a moderate Quantity of Flesh, accompanied with Strength, is rather to be preserved, than destroyed. But the *Polysarcia* we call a Disorder, which may be justly accounted a Cachexy, and is accompanied with many dangerous Symptoms; for all the Misfortunes, which attend voracious Animals, or those fattened for Use, such as Inflation, Extension, and Prominence of the Body, also, attend those afflicted with a *Polysarcia*. The like happens in ulcerated Bodies, in which the luxuriant Flesh is either consolidated, or springs up afresh on the Lips of the Ulcers, after it has been removed.

There are two Methods of curing a *Polysarcia*, the one by preventing too copious Nourishment, and which consists in quick Gestation, and the Use of such mild Aliments, as do not nourish much, or have a Tendency to increase the Body; the other consists in the Observation of certain Rules, and laborious Exercise, in order to induce a Change on the Body: But, for the sake of Distinctness, we shall give more particular Directions with respect to the Cure. It is, therefore, expedient to exercise the Patient much and long, either on Horseback, or in Coach; to order him to sail, to read, and use his Voice; to wrestle, and walk quickly, that his Legs may be the more exercised: He must, also, run, and have the Parts of his Body rubbed with the Hands dry, or with a rough Linen Cloth, and some Sand sprinkled on the Parts; then he is to use various *Pæstrian* Exercises, such as that which the Greeks call *μελαδία* and *Choricomachia* (perhaps *χευμαχία*); which Exercises are directed by their respective Masters: Then he is to use what the Greeks called *ἀπλομαχία*, that is, a Mock-fighting with Arms: Then he is to use the Exercise of Wrestling, which the Greeks called *ἀτεροκοπία*, or *τεχνηλισμός*. He is, also, to use the long tractary Machine, called by the Greeks *Macro-sparton*, and the Italians *Sphere*, and Wrestling; as, also, quick, hard, long-continued, and dry Frictions; for if the Parts are rubbed with Oil, the Hands slip, and the Patient cannot perform his Exercise with due Vigour. The Patient's Body must, also, be exposed to the Sun, a Practice which the Greeks call *ήλιωσις*. Then a Sweat is to be excited by means of a Flame, live Coals, and dry Steams. Sometimes Hot-baths, which diminish the Body, and, at other times, Cold-baths, which condense it, are to be used; for the Bodies of such as have used the Cold-bath are perceived to be thick, and, as it were, testaceous. It is, also, expedient to apply hot Sand to the Body, and to swim in the Sea, or in Medicinal Waters. After Sweating in the Bath, the Body must be sprinkled with Salt, by which the Fleshes of Animals are preserved dry, dense, and free from Withering. Then the Patient is to use what the Greeks call *zegma*, (perhaps *smegma*) a Friction of Nitre reduced to Powder; and, after Bathing, Meat and Drink are to be long abstained from; for then the Appetite begins to languish, and its Edge is obtunded by the Delay; the Keenness, also, of the Digestion languishes, when the Fomes, which sustained it, is withdrawn. Drinking before Eating is to be forbidden, and very little is to be drank at all, though the Patient may drink most at Meals; for, by drinking much, the Aliments are rendered fluid, the Flesh softened, and by Digestion, the Food is rendered capable of adhering to the Solids, and, consequently, of increasing the Solids: But if the Patient is afflicted with an insatiable Thirst, he may drink a small Quantity of moderately sharp Wine. But Puls, Alica, Flour, Milk, Nuts, the Brains of Animals, Eggs, tender Fishes, and all pinguious Substances, are to be abstained from; but the Patient may eat Bread that is cold, fermented, and prepared with the Bran; for such Bread nourishes but little, especially if it is old. Dry Aliments are, in a particular manner, beneficial; Pot-herbs, and Fishes of hard Digestion, are to be used; as, also, the drier Sorts of Birds, and wild Aliments, such as Hares, and

and wild Goats; as, also, Pork long dried in the Salt. The Patient ought, also, to use but one kind of Aliment at a Meal, and keep from sleeping a great while after it; for, by Watching and Restlessness, the Bulk of the Body is much impaired by Exhalation; whereas it is fattened, and its Bulk increased, by Sleep. Besides, the Body is, by Sleep, rendered more moist. Cold Liquors are to be drank, and, during the Continuance of the Polyfarcia, the Metasyntetic Cyclis is to be begun; for sometimes the Patient is to use total Abstinence, and sometimes to take but a small Quantity of Aliments and Water, which is to be regularly augmented, as the Situation requires. We are to begin the Cure by Vomiting, the Patient fasting, or by an Exhibition of proper Roots. Then the Patient is to use acrimonious Substances, Things of a neutral Quality, Birds, and wild Animals. These Measures are the more expeditiously to be taken in a few Days, the more severe and violent the Beginnings of every Cyclis are. Diuretics are, also, to be exhibited among other Pot-herbs; such as Asparagus, Carrots, Parsneps, Smallage, Fennel, Leeks, and other Things of a like Nature; for by this means a Change may be induced on the Body by the Use of common and ordinary Aliments. We must, also, have a due Regard to the various Symptoms in the Cure of this Disorder. Some Physicians recommend Phlebotomy, purgative Medicines, Clysters, the Use of Venerly after Bathing, and before Meals, and on the same Day a small Quantity of Nourishment, and Water for Drink: They, also, recommend Vomiting after Supper. Some, also, as contrary to the Polyfarcia, recommend Exercising the Body by Pandiculation, after rising out of Bed, which they call *articularis*; as, also, the Drinking Night-dew, before the Rising of the Sun. But the Madness and Absurdity of late Physicians is sufficiently obvious; for, by Phlebotomy, the Strength is impaired, and the Patient's Body rendered flaccid, which the Greeks call *paræsis*. Purgative Medicines, such as Clysters, and those above-mentioned, corrupt the Fluids, and induce a bad Habit of Body, by the Greeks called *Cachexia*. Venerly, also, renders the Patient effeminate, and destroys his Strength. Some, also, order Bathing twice a Day, and Sleep before Meals; but this is very improper, since Sleep rather renders the Patient fat, than lean. Vomiting, also, after Supper, destroys the Strength; and though it diminishes the Flesh, yet it fills the Head with Fumes, disturbs the Organs of Sensation, renders the Gums putrid, corrupts the Breath, corrodes the Stomach, and renders the Patient disagreeable to himself, which the Greeks call *Δυσάρεστος*, and which is accompanied with a State of Inequality, resembling that of Fevers. Besides, Vomiting is improper, and justly to be condemned, because, by corrupting the Juices, it does more Harm to the Body. But if the Patient has eaten too large a Quantity of Aliments, then a Vomit is to be exhibited; for the Uneasiness arising from the Excess is greater than that produced by the Vomit. Close and violent Application of Mind, also, contributes greatly to the Cure of the Polyfarcia; for which Reason we observe the Bodies of close Students more thin and slender, than those of Persons who lead lazy and indolent Life, whose Bodies are more full and solid. *Cælius Aurelianus. Chron. L. 5. C. 11.*

POLYSOMATICA. The same as POLYSARCIA.

POLYSPASTON, from *πᾶς*, much, and *σπάω*, to draw. The Name of a Machine for making Extension, in case of Fractures, or Luxations. See the Article FRACTURA, and the Explication of Table XXIX.

POLYTRICHUM; see TRICHOMANES.

POLYTRICHUM AUREUM; see ADIANTHUM AUREUM.

POLYTROPHIA. Abundant Nourishment.

POMACEUM. Cyder.

Cyder is the Juice of Apples, made spirituous by Fermentation; the Apples are gathered in Autumn, when they are ripe; then they are ground in a Mill, the Juice is pressed out, and left to ferment in Hogheads.

There may be as many Sorts of Cyder made, as there are different Sorts of Apples. Apples that are commonly eaten, and are of a sweet pleasing Taste, produce Cyder that will not keep; and therefore others are preferred for this Purpose. These Apples are of a curious Colour, but they have an harsh, bitter, and styptic Taste; which makes the Cyder pungent, strong, and to keep long. Cyder ought to be fine, of a curious gold Colour, having a pleasant Smell, and a pungent sweet Taste.

Cyder is pectoral; fortifies the Heart and Stomach; moistens, and quenches Thirst; and is looked upon to be good for scorbutic and melancholy Persons. When drank to Excess, it occasions Drunkenness of longer Continuance, more dangerous, and of more pernicious Consequences, than is produced by Wine.

By an exact Analysis of Cyder, a sulphureous Spirit is first drawn from it, and then Phlegm; afterwards, by the Help of a great Fire, a little thick Oil is extracted, and a Spirit, which is nothing but essential Salt, dissolved in the Phlegm. What

remains will yield a little fixed Salt by Calcination, Lotion, Filtration, and Evaporation.

When the Juice of Apples has not been well purified, it soon corrupts; because the Dregs, which remain mixed with the Liquor, are small Pieces of the Apples, which are as subject to rot, as the Apples themselves, and give the Cyder an unpleasant rotten Taste. In order to purify it, some use Water-glue dissolved in Wine; and, to prevent the Cyder from growing sour, they put Mustard into it. Others draw off what is clear, into earthen or glass Bottles, which are afterwards well corked.

Apples of an harsh and bitter Taste are best for Cyder, because they contain much essential Salt, proper for separating the oily Parts from the Dregs. Besides, these Apples supply the Cyder with a sufficient Quantity of tartarous Parts, to hinder the Spirits from evaporating; and hence this Cyder is stronger, more pungent, and will keep the longer. On the contrary, sweet Apples being deficient in these Particulars, the Cyder made from them quickly dies.

Cyder is good and wholesome, provided it be used with Moderation; and may be said, in general, to be better for the Health than Wine, because its Spirits are not so impetuous, nor so much agitated, as those of Wine; and are, besides, detained and moderated by a great Quantity of viscous Phlegm, which still contributes to make this Liquor moistening and cooling. We know by Experience, that most of those who drink nothing but this Liquor, are stronger, more healthy, and look better, than those who drink Wine; of which Lord Bacon gives us a remarkable Instance: Of eight old People, says he, some were near, and others above an hundred, who, during their whole Lives, drank nothing but Cyder, and were so vigorous, that they danced and jumped about like young Men.

Cyder, drank to Excess, does not intoxicate so soon as Wine; but the Drunkenness caused by it continues longer, because its Spirit conveys along with it, into the Brain, a great many heavy and viscous Particles, which hinder its sudden Dissipation. These Viscosities, dispersing themselves afterwards, into all the Substance of the Brain, stop the Channels of the Nerves, and oppress the animal Spirits, in such a manner, that they require some time to recover themselves, and to expel that which detain'd them in a kind of Repose and Unactivity. Hence proceeds that Sleepiness after Drunkenness.

By letting the gross Substance of the Apples ferment in Water, a moistening and cooling Liquor, called small Cyder, is made. This Liquor will not produce Drunkenness, and many Women in *Normandy* make it their common Drink.

Of the Juice of Pears extracted and fermented, is made a kind of Cyder, or vinous Liquor, called Perry, which, in Colour and Taste, resembles White-wine. Bitterish and harsh Pears are best for this Purpose. As the Fermentation of both Liquors is the same, and as the Virtues of Perry are nearly allied to those of Cyder, what has been said may be sufficient.

Many other spirituous Liquors may be made of the fermented Juices of several Fruits; but the greatest Part of these Liquors never become spirituous, as Wine, or Cyder, and will not keep so long.

The Juice of Quinces, after it has been fermented, becomes viscous. It fortifies the Stomach, works by Urine, is good for the Colic, Spitting of Blood, Dysenteries; and qualifies the Motion of sharp and bilious Humours, which cause Evacuations upwards and downwards. As this Liquor soon grows sour, and decays, they mix Honey, Sugar, or the like, with it, to preserve it.

Ananas is a juicy and delicious Fruit, that grows in the *West Indies*, whose Juice the *Indians* extract, and make excellent Wine of it, which will intoxicate. Women with Child dare not drink it, because they say it will make them miscarry. The *Ethiopians*, also prepare a sort of Wine, called *Sebanfcon*, from a certain Fruit that grows among them.

Pliny says, that they made a Liquor in *Egypt*, which was somewhat spirituous, of the Juice of *Sebetes*, which produced good Effects in Persons of a bilious Constitution. The Juice of Jujubes, prepared in the same manner, has, also, the same Virtues.

From some Trees they draw Liquors, which are almost as spirituous and pleasant, as those we make from Fruits. A kind of a large and fruit Palm-tree grows in the *Indies*, called *Coquo*, in whose Branches they make Incisions, and extract a vinous Juice, which the *Indians* call *Sura*, or *Taddi*, and from which they distil a good Spirit. They, also, make a sort of Vinegar with this Juice, by exposing it to the Sun: Others boil it upon the Fire, to make a sweet Wine of it called *Orraca*.

The first Juice being drawn out of the Branches of the Tree, there comes out a second, that is not so spirituous as the other, which they suffer to evaporate, in order to make a kind of Sugar of it, which they call *Jagra*.

The Fruit of this Tree supplies them, also, with a sweet and well-tasted Liquor, which is very cooling and moistening.

The Birch-tree yields a Sap, which, being drank, is of an opening Nature. *Van Helmont* values it much for its Virtues in curing the Stone. Several Physicians, also, use it, for the same

same Distemper, for the Strangury, and scorbutic Humours.

The Body, Branches, and Root of the Maple yield a sweet and pleasant Sap: This Liquor, Mr. Ray says, is more abounding in cold and rainy Weather, than in any other; whilst the Birch, on the contrary, yields more in hot and dry Weather.

The Root of the Nut-tree, also, yields a Juice, which Boyle and Schröder value much, they having observed it to have produced good Effects in the Gout, and several other Distempers.

Several other Trees supply different Nations with pleasant Drinks. *Lemery on Foods.*

The Countries in England, most celebrated for the Production of Cyder, are, *Herefordshire, Worcestershire, and Devonshire.* *Musgrave* informs us, that the *Devonshire* People are very subject to the Gout, which he attributes to the copious Use of strong Cyder. I have sometimes known an habitual Colic removed by an entire Change of Malt Liquor, or Wine, for Cyder, by way of common Drink.

POMAMBRA. Apples of Amber; these are made of odorous Powders, to which Oils may be added; and these Powders, being receiv'd in Wax, liquid Storax, or Mucilage of Tragacanth, with a little Turpentine, to render them tenacious, if it is necessary, and intimately incorporated, by an Addition of a proper Quantity of Rose-water, or some other such Liquor, are to be reduc'd to Balls of any Size, which shall be judg'd most expedient.

They derive their Name from Amber, not because that Substance is always and necessarily an Ingredient in them, but because they have a grateful Smell, and in that respect resemble Amber: Thus, for a Preparation of this Kind, we may take the *Odoriferum Crollianum*, which is prepar'd in the following manner:

Take of Mace, Cloves, Cinnamon, or the Cassia Lignea, each two Drams; of Musk, Civet, and Gum Arabic, each one Dram; and of Tragacanth dried in a Furnace, two Drams.

Let these two Gums be triturated with the Musk; and, when all the other Ingredients are carefully triturated, mix the Civet with them, and add a sufficient Quantity of Water prepar'd from the Flowers of the Orange-tree; or the Water of Damask Roses, prepar'd with odorous Specifics, and Rose-water, in which has been digested for eight Days a small Quantity of the Carbo Paracelsi, or the Zibetta Occidentalis; all these are to be incorporated together.

The Carbo or Zibetta Occidentalis, so far as we may conjecture from the *Archidoxa* of Paracelsus, is nothing else but human Dung, or Sulphur plac'd in Digestion for some time, till, instead of its ferid Smell, it assumes one highly grateful and agreeable. See *Hartman in Croll.*

This Medicine may, also, be prepared by pulverizing the Mucilage of Tragacanth, dissolv'd in odoriferous Water, and mixing the other Ingredients with it.

This Medicine, when applied to the Nostrils, by its grateful Smell, conveys a brisk Motion to the Blood; and surprisingly comforts the Heart in Apoplexies, Epilepsies, Colics, Suffocations of the Uterus, and Plagues.

A small Quantity of it may be mix'd with express'd Oil of Nutmegs, in order to make a Liniment, to be us'd in the above mention'd Diseases. *Croll.*

Schröder, in his *Pharmacop.* gives three other Formulæ of the *Pomambra*; but, as they are of little Importance in Medicine, we refer the Reader to that Work without inserting them.

POMATUM UNGUENTUM. Take of fresh Hog's-lard, three Pounds; of fresh Sheep's-suet, nine Ounces; of the Apples commonly called Pome-waters, pared and sliced, one Pound nine Ounces; of the most fragrant Rose-water, six Ounces; of Florentine Orrice-root, grossly powdered, six Drams; let these boil together in *Balneo Mariæ*, till the Apples are dissolved; then strain without Expression, and keep for Use: Heat it then over again, and wash the Whole with Rose-water.

Almost all the official Dispensatories abound with Prescriptions for this Ointment. The *Pharmacopœia Regia* has one, containing these Ingredients, but crouded with many more; as has the *Augustan* Collection, one yet more loaded; but that, also, gives another from *Amatus Lusitanus*, much more contracted; and from thence, likewise, our College seem'd first to take it, but yet with a farther Abridgment of Superfluities. *Zwelfer* takes great Pains, in his Animadversions, to teach the most convenient Manner of Composition, and Mixture of so many things of different Texture. But, as short a Compass as it is reduced to here, seemingly to avoid these Difficulties, the common Practice of the Shops has of late found out a much nearer way; which is by buying it of Persons, who make it their sole Business to beat up fresh Hogs-lard with Rose-water, into a kind of Curd; and scent it with any of the aromatic Oils, most suitable to the Liking of their Customers. *Quincy.*

POMPHOLYGODES. Frothy.

POMPHOLYGERON, *πομφολυγερών*. The Name of a Plaster describ'd by *Paulus Ægineta*, L. 7. C. 17.

POMPHOLYX, *πομφόλυξ*, is a Bubble excited in a liquid Substance, by some flatulent Spirit, or Air, contained therein. Thus *πομφόλυγες* are expounded in *Hesychius*, *δι' ἐν τῷ ὕδατι γινόμεναι ἀερίαι, ἢ φυσήματα ὕδατος*, "Tumors arising on the Water, or Swellings of the Water." Bubbles, *πομφόλυγες*, appearing on the Top of the Urine, indicate a Disorder of the Kidneys, and that the same will be of long Continuance. *Hippocrates*, 7 *Aph.* 34.

POMPHOS, *πομφός*, in *Galen's* Exegetis, are expounded, *ἐπανάσεις τῶ δερμάτος ὑψώσεις τε ἀμα καὶ πλασάει καὶ ἐνεργεῖς*, "scaly Eminences or Tumors on the Skin, which are at the same time red, and full of Moisture." In the Words *Galen* seems to have an Eye to that Passage of *Hippocrates*, (*Lib. 2. περὶ γυναικ.*) *καὶ ἐν τῇσι κνήμῃσι πομφόλοι ἀνίσταται*, "and *Pomphi* arise in the Legs." The Word occurs, also, *Lib. 2. de Morbis*, where we read *καὶ κατὰ πᾶσιν πομφόλοι ὥς ἐπὶ κνίδος*, "and she was full of *Pomphi* [red, watry Tumors], as tho' she had been rubbed over with Nettles."

POMUM. See **MALUS**.

POMUM AMORIS. See **AMORIS POMI**.

POMUM ADAMI. A Name for the *Limon*, *fructu Aurantii*. *Pomum Adami* is, also, a Name for a Protuberance in the anterior Part of the Neck, form'd by the Thyroide Cartilage.

POMUM ARENOSUM. A Name for the *GUAJAVA*.

POMUM CITREUM. See **CITREUM**.

POMUM HIERUCHUNTANUM. A Name for the *Solanum spinosum*; *fructu rotundo*.

POMUM SPINOSUM OPUNTIIATUM. A Name for the *Melocactus*; *India Occidentalis*.

POMUM SYLVESTRE. See **AGRIOMELA**.

PONDO, or **PONDUS**. A Weight. See **DRACHMA** and **LIBRA**.

As it is necessary to be acquainted with the Weights us'd by different Nations, at different times, in order to understand their Practice, I have given Tables of the principal antient and modern Weights; and, after these, Table of their Measures.

PONGA. H. M. *Jaca minor sylvestris Malabarica*. D. *Comelin.* *Tataisba Brasiliensum* Pison. *similis*. It is a tall evergreen Tree, growing in *Malabar*, and bearing no Flowers; at least none which are conspicuous; but the Fruit adheres to the Branches in the same manner as that of the *Jaca*; whence the Portuguese call the Tree the wild *Jaca*. The Calyxes are echinate, first green, and afterwards redish, and containing Multitudes of roundish-oblong, acuminate, and redish Seeds.

A Cataplasm prepared of the green Fruits of the Tree bruised, being apply'd to Tumors, potently promotes their Suppuration. Of the Bark and Root boiled in Water, is prepared a Fomentation for oedematous Tumors of the Legs, an endemic Disease among the Indians, and called by the Portuguese *Pêdo S. Thomæ*, which preserves them from an Inflammation. *Raii H. P.*

PONGAM. See **MINARI**.

PONGELION *five Perimaram*. H. M. *Arbor Indica siliquosa, Floribus racemosis, pentapetalis, Siliquis foliaceis, ad singulos Flores ternis*. It is a tall large Tree, growing in several Parts of *Malabar*. The Oil, prepared of the Bark first bruised, and then boiled, being rubbed on the Body, extracts vicious Humours. The Juice which distils from the Tree, being drank with Butter-milk, dissolves Flatulencies. The Fruit, triturated with *Manga*, and mix'd with a Decoction of Rice, being insilled into the Eyes, cures the Cephalalgia and Ophthalmy.

PONNA. H. M. *Prunifera seu Nucifera Malabarica Foliis Nymphææ, Fructu rotundo, Cortice pulvinato*. It is a vast Tree, thirty Yards in Height, and four in Thickness, bears ripe Fruit in *March* and *September*, and continues fruitful for the Space of three hundred Years; it grows in sandy Places almost everywhere in *Malabar*.

From the dry'd Kernels of the Fruit they express an Oil, which is used in Lamps, and cures Pains in the Limbs, being anointed therewith. Of the Bark of the Root macerated in Vinegar, they prepare an Extract, which, rubbed on the Head, cures the *Cephalæa*. The Tear which distils from the Tree, and its Fruit, being collected and exhibited, excites Vomiting, provokes to Stool, and violently purges corrupt Humours both upwards and downwards. *Raii H. P.*

Tsiferou Ponna, H. M. is the *Malabarjan* Cornel-tree, with Leaves like those of the *Nymphæa*. This is accounted a smaller Species of *Ponna*, and bears Fruit like that of our Cornel-tree, in Shape, Size, and Substance: This Fruit is eaten by the Natives, and from its Kernels they express an Oil, which is used in their Lamps, but is of no Service in Medicine. *Raii H. P.*

PONNAGAM, H. M. is a tall bacciferous Indian Tree with a smooth tricapsular Fruit, containing in each Capsula a single Seed. It is always cover'd with Leaves, Flowers, and Fruit.

Of the Leaves and Fruit bruised, with Honey, is prepared a Cataplasm, which, being apply'd, is a sovereign Remedy for the Bites and Stings of Serpents, and other venomous Animals. The Root, bruised, and apply'd in the Form of a Cataplasm to Contusions, dissolves the coagulated Blood, and cures the Part affected. *Raii H. P.*

Pee Tjerou-Ponnagam, H. M. is a larger Species of *Ponnagam*, which grows to a greater Height than the former; but, in all other respects, is very little different from it. *Raii H. P.*

PONNAM. A Name for the *Senna*; *orientalis*; *fruticosa*, *Sophora diffusa*.

PONS VAROLII. The Name of a sort of Arch in the *Cerebellum*, form'd by two medullary Processes, call'd thus from *Varolius*, the first Observer of it.

PONTAGIA. A Term in *Paracelsus de Tartaro*, importing, as is said, a Mixture of saline Substances with those which are bitter, or styptic.

PONTICUS, an Epithet in *Paracelsus*, expressive of a certain saline Taste, resembling that of Sea-water.

Pontica Vina are acid, feculent, and tartarous Wines.

Ponticum Mel is a sort of poisonous Honey. See **ÆGOLITHRON**.

POPONAX. The same as **OPOPANAX**.

POPLES. The Ham, or Joint of the Knee.

POPLITEUS MUSCULUS.

This is a small Muscle obliquely pyramidal, situated under the Ham; from whence it has its Name.

It is fixed above by a strong narrow Tendon to the outer Edge of the inner Condyle of the Os Femoris, and to the neighbouring posterior Ligament of the Joint. Thence it runs obliquely downward, under the inner Condyle of the Os Femoris; its flat, and pretty thick, fleshy Body, increasing gradually in Breadth, till it is fixed in the back Side of the Head of the Tibia, all the Way to the oblique Line, or Impression observable on that Side.

The Popliteus performs the Rotation of the Leg, when bent, in a Direction contrary to that of the Biceps. The Biceps turns the Leg from before outward; the Popliteus from before inward. This Rotation, therefore, answers to the Pronation of the Radius, by the Pronator Teres; as that made by the Biceps Tibiæ does to the Supination made by the Biceps of the Arm.

This Muscle is commonly reckoned among the Flexors of the Leg; but it seems very ill contrived for such a Function, because of the Obliquity of its Situation, and because its Insertion is so near the Centre of Motion of the Joint. By its Connection with the Capsular Ligament, it may serve to prevent its being catch'd between the two Bones in the Flexions of the Leg. *Winslow*.

POPULAGO. Marsh-marigold.

The Characters are;

The Root is perennial, the Leaves are entire and roundish. The Flower is roseaceous, like that of the Ranunculus, and naked. The Fruit consists of a Multitude of little Sheaths inclined downwards, stellated, and full of many oblong Seeds.

Boerhaave mentions two Species of *Populago*; which are,

1. *Populago*; flore majore. See **CALENDULA Palustris**.

2. *Populago*; flore pleno. T. 173. *Caltha palustris, flore pleno*. C. B. P. 276. *Pseudo-belleborus ranunculoides, pratensis, rotundifolius, multiplex*. M. H. 3. 461. *Boerb. Ind. Plant. Vol. 1.*

This Plant is said to be of a refrigerating Quality, like the *Nymphaea*; but it is really of a very caustic Nature, so that Cattle avoid it, tho' in the greatest want of Grass; but, if they happen to eat it, they are first seized with an Inflammation of the Fauces, Oesophagus, and Stomach, and at last die. Hence it appears to be a very acrimonious Herb, and of the Nature of Hellebore. *Hist. Plant. adscript. Boerhaav.*

POPULARIS. Endemial, or Epidemical.

POPULUS.

The Characters are;

The Leaves are roundish. The Flower in the male Tree is amentaceous, and consists of apiculated Leaves; from the squamous Calyx shoots forth a long Axis, to which grow on every Side masculine Floscules so disposed, as by their Union to resemble a Car's Tail; each of these Floscules consists of a thin, caducous Membrane, furnished with an hairy Margin, and, under this of another less caducous Membrane, from which, on the supine Part, arise eight Stamina, furnished with red, oblong Testiculi: This Membrane, when mature, has its Margin indented, and adorned with a lanuginous Fimbria, or Fringe.

Boerhaave mentions five Species of *Populus*; which are,

1. *Populus*; alba; majoribus foliis. *Tourn. Inst. 592. Boerb. Ind. A. 2. 211. Populus alba*. *Offic. Ger. 1301. Emac. 1486. Park. Theat. 1410. Raii Hist. 2. 1418. Synop. 3. 446. Populus alba leuon*. J. B. 1. 155. *Populus alba (quæ leuon ab albedine dicitur) majoribus foliis*. C. B. P. 429. **THE ABELE, or WHITE POPLAR**.

It delights in watry Places, and the Bark is of Use both inwardly and outwardly in the Sciatica, Strangury, and Ambustions.

2. *Populus*; alba; minoribus foliis. C. B. P. 429.

3. *Populus*; nigra. *Offic. Ger. 1301. Emac. 1486. C. B. P. 429. Park. Theat. 1410. Raii Hist. 2. 1419. Synop. 3. 446. Tourn. Inst. 592. Boerb. Ind. A. 2. 211. Populus nigra sive Alysse*. J. B. 1. 155. **THE BLACK POPLAR**.

The black Poplar grows frequently to be a large Tree, having a whitish Bark, and smooth shining green Leaves, growing on long Foot-stalks; they are broad and round toward the Bottom, ending gradually in a narrow sharp Point. The Stalks and Leaves have frequently large Swellings, or Tumors on them, made by small Insects. The Catkins are long and loose, coming out early in the Spring. It grows by watry Places and Rivers; the Leaves and Buds are used.

The only Use that they are put to, is to make the Unguentum Populeum; but, as the black Poplar is hot, the Ointment cannot receive its cooling Virtue from those Leaves or Buds, but from the other Ingredients which are put in it. *Schroder* says, the Women in *Germany* use the Buds to make their Hair grow thick and ornamental. *Miller's Bot. Off.*

The Buds of this Tree are used in the Ointment of Poplar; to which *Tragus* adds the Root of Bryony; and the Tops of the Bramble: It is very lenifying, and is used with Success in the Inflammation of the Piles; but a good Quantity of Opium must be added to it. The Tincture of the Buds with Spirit of Wine, is excellent for old Loosnesses, and internal Ulcers; the Dose half a Dram, or a Dram, taken Morning and Evening in a Spoonful of warm Broth. *Martyn's Tournefort*.

The Eyes, or young Buds, gather'd in April, are used in Medicine. It is disputed whether they are of a cold or hot Quality; but the most probable Opinion is, that they are moderately hot. *Dale*.

POPULEON, or POPULNEUM UNGUENTUM.

Take of the fresh black Poplar-buds, a Pound and an half; the Leaves of Violets, and Navelwort of the Wall, each three Ounces; fresh unsalted Hogs-lard, cleared from its Membranes, and washed, four Pounds. Bruise, mix; and macerate these together; and then add the tender Tops of the Bramble, Leaves of black Poppies, Mandrake, Henbane, Nightshade, Lettuce, the greater Houfleeck, and the greater Burdock, each three Ounces. Bruise again, and mix all together very well; and then after ten Days standing, pour on them one Pound of Rose-water; after which boil over a gentle Fire, continually stirring with a Spatula, until all the superfluous Humidity is evaporated; then strain and squeeze out with a Press, so as to obtain an Ointment, according to Art.

This is originally ascribed to *Nicolaus*. The Pharmacopœia Regia gives a Prescription of it, as, also, does the *Augustan Dispensatory*; but the latter comes much the nearer to what is here retained. The new College Dispensatory has corrected a Mistake, which the former Editions were liable to, in expressing the Houfleeck to be the greater Sort, because the lesser, commonly called Stone-crop, which was liable to be put in its stead, is of a very opposite Quality to the Intention of the Medicine. *Quincy*.

4. *Populus*; tremula. *Offic. C. B. P. 429. Tourn. Inst. 592. Boerb. Ind. A. 2. 411. Populus Libyca*. *Ger. 1302. Emac. 1487. Park. Theat. 1411. Raii Hist. 2. 1419. Synop. 3. 446. Populus Libyca Plinii, nœgis Theophrasti*. J. B. 1. 163. **THE ASP or ASPEN-TREE**.

It grows in Woods; and in moist watry Places; and the Leaves are supposed to agree in Virtues with those of the black Poplar-tree.

5. *Populo similis arbor*; resinosa altera. C. B. P. 430. *Tacamabaca*. *Ibid. Boer. Ind. alt. Plant. Vol. 2.*

The Bark of the Poplar is a very good Detergent, and the tender Buds are used by the Women in adorning and promoting the Growth of their Hair; they have, also, an anodyne Virtue, being externally apply'd; for which purpose they are an Ingredient in the *Unguentum Populeum*; so named from them: This Ointment is of excellent Service in the Hemorrhoids, especially if it be prepared with a good Quantity of Opium. The Tincture of the Buds is very good for an inveterate Diarrhoea, and internal Ulcers. The bruised Leaves are by some apply'd with good Success in the Gout; and the Liquor, which is collected in the Cavities of the Poplar, is believed to cure Warts and the Impetigo. *Hist. Plant. adscript. Boerhaav.*

PORCELLIONES. The same as **MILLEPEDES**.

PORCELLUS INDICUS. The Guinea Pig. The Flesh of this Animal has not much Taste, and is hard of Digestion. Some are of Opinion, that Broth prepared of it is good against Dysenteries, and proper for exciting a Discharge of the Urine. *Lemery des Drogues*.

PORCUS MARINUS. The Sea-hog. This is a Species of Dolphin, or large oblong Fish, whose Nose resembles that of the Land Hog, and it digs up the Earth in the same Manner. This Fish is frequently carried up with the Tide into Rivers, and is very commonly seen at *Roan*, in the River *Seine*. It is of a yellowish Colour and very fat; its Flesh is eaten, but is not very delicious, and is, besides, somewhat hard of Digestion. When the Grease of it is melted, and perfumed with some

Some odorous Plant, it is called the Oil of the Porpoise, or Sea-hog. It is of an emollient, resolvent, and anodyne Quality, and good in Disorders arising from a Coldness of the Humours. *Lemery des Drogues.*

PORCUS. Offic. *Porcus domesticus* five *Sus*. Raii Synop. A. 92. *Sus*. Aldrov. de Quad. Bisul. 937. Gefn. de Quad. 872. Jonst. de Quad. 70. Charlt. Exer. 13. Schw. de Quad. 123. *Mes Aper*, the BOAR. *Femina Sus*, the SOW. *Fetus Porcellus*; a PIG. THE TAME SWINE, or HOG.

The Parts of this Animal, used for medicinal Purposes, are the Lard, the Gall, the Excrement, the Lungs, the Astragalus, and the Bladder. As the Lard is not of a very hot Quality, it is, therefore, made an Ingredient in refrigerating Ointments, and used for alleviating inveterate Pains of the Loins and Joints. *Dioscorides* informs us, that the Gall of this Animal is used with great Success against Ulcers of the Ears, and of all other Parts. It is, also, said to prevent the Growth of the Hairs. The Excrements are of an emollient and discutient Quality, and for that Reason beneficial in Itchings, Exanthematous Eruptions; Corns of the Feet, and other hard Tubercles; the Excrements of this Animal, also, cure the Bites of venomous Animals, and stop Hæmorrhages of the Nose; the Lungs are highly beneficial, if applied to Abrasions of the Skin contracted by the Shoes. The Astragalus is recommended for Fractures of the Bones, as also for Pains of the Neck and Head. The Bladder is beneficial to those who discharge their Urine involuntarily. *Schrod.* It produces the same Effects, when applied to the Pubes, and is said to provoke Urine. *Pliny. Dale.*

There are two Sorts of Hogs, the wild and the tame. Of the tame Hogs, those are the properest for Food, which are neither too old, nor too young, which are large, fat, tender, and have been well fed, as with Acorns, Mast, Beans, Turneps, and the like.

Pork is nourishing Food, and renders the Body soluble; but it is difficult to digest; produces dull, viscous, and gross Humours; and is improper for gouty Persons.

It contains much Oil, volatile Salt, and Phlegm.

It agrees principally, in cold Weather, with young, hot and bilious Constitutions; with those who have good Stomachs, and are used to labour, and exercise; but it has bad Effects upon old, weak, and tender Habits.

When an Hog is about a Year old, he is gelded, and in *Latin* called *Maialis*. He then grows fatter, and the Flesh is more juicy, and better tasted, than before. A Sow is in *Latin* called *Porca*, or *Scropha*, and not so much fed for Food as the Hog, because its Flesh does not taste so well.

A Pig, in *Latin* called *Porcellus*, is esteemed an excellent Dish, and that which is neither too young, nor too old, is most wholesome; when too young, it abounds too much with Humidity; and, when too old, it becomes hard of Digestion.

An Hog is subject to the Measles, Leprosy, and many other Distempers, because it is full of gross Humours, and such as are liable to produce the like Diseases in those who feed upon them.

Pork affords a Food that does not easily waste, because it contains oily, balsamic, and viscous Principles, which easily stick to the Fibres of the Parts, in such a manner, that they are not without Difficulty separated from them. Pork is, also, laxative, because the oily and phlegmatic Principles, with which it abounds, loosen the Fibres of the Stomach and Entrails, and dilute the gross Humours contained in those Parts.

Galen says, that Pork is not only better tasted, than the Flesh of other Animals, but, also, that it is more wholesome. He adds, that it nearly resembles human Flesh, which he proves, in his third Book, and second Chapter, of the Nature of Foods, by an Account of certain Persons, to whom he ordered human Flesh to be presented instead of Pork, which they eat without being able either by Taste, or Smell, to discover the Fraud. Lastly, he assures us, that Pork, when well digested in the Stomach, affords more Nourishment than any other Food; and says, that the Athletes, or Wrestlers, and such as were inured to hard Labour, were never so strong and vigorous, as when they fed upon Pork; and that when those People, who were used to this Food, lived but only one Day upon the Flesh of another Animal, and still continued the same Exercises, they found themselves weaker the next; and when they continued several Days to disuse Pork, their Strength sensibly decayed, and they became lean.

We readily agree with *Galen*, that Pork may be very nourishing and wholesome, for those who are used to Fatigue and hard Labour; because it is durable Food, and not soon wasted. But Pork in general is not wholesome, and ought to be used moderately; for this Animal's Way of Living is lazy and unactive, and the Filth it continually feeds upon, plainly shews, that its Flesh is full of viscous and gross Juices, fit to produce Humours of the same Nature, in those who eat it, to cause Indigestions, and several other Inconveniences.

Some Nations never eat Pork, as the *Jews*, *Arabs*, *Mahometans*, *Moors*, *Tartars*, and others.

If we reflect upon the Distempers Swine are subject to, indisputably from their habitual Way of living, and their noxious

Juices thence contracted, we may, perhaps, find Reason to admire the Legislator of the Jews, who forbade the Use of it; and to commend the Wisdom of the Eastern Nations, who esteem it their Duty to observe this Prohibition. It is not at all improbable, that the Scurvy, a Distemper to which the Northern Nations are extremely subject, may be excited by the habitual eating of Swines Flesh, especially when hardened with Salt and Smoke.

Aper. Offic. *Schrod.* 5. 268. Schw. de Quad. 54. Aldrov. de Quad. Bisul. 1013. Gefn. de Quad. 918. Jons. de Quad. 74. Charlt. Exer. 13. Raii. Synop. A. 96. THE WILD SWINE, or BOAR.

The Parts of this Animal used for medicinal Purposes, are the Lard, the Teeth, the Penis, the Gall, the Excrements, and the Urine. The Lard is possess'd of the same Qualities, tho' in a stronger Degree, with that of the tame Swine. The Teeth are exhibited as a Specific in the Pleurisy, and are said to cure the Quinley. The Penis and Testicles are said to remove Impotence and Barrenness. The Gall discusses strumous Swellings. The Excrements, when dried, are thought beneficial in stopping Vomiting of Blood, and Hæmorrhages, when applied externally. The Urine is a Specific for resolving and expelling the Stone of the Bladder. *Schrod. Dale.*

A wild Boar that is young, fat, well-fed, and tender-fleshed, is best for Food; he ought, also, to be hunted, and well run. This Food is very nourishing, and does not soon waste, but is easier of Digestion than common Pork. It produces gross Humours, and is not good for sedentary and tender Persons.

All the Parts of a wild Boar contain much volatile Salt and Oil. Its Flesh is good principally in Winter, for young People of an hot bilious Constitution, for those that have a good Stomach, and are used to Fatigue.

The wild Boar is so called, because it is of the same Shape and Size with the tame Hog, only that it lives in Woods. It is fiercer, more nimble, and rougher bristled, than the other; and is usually of a black, or dark red Colour: *Pausanias* says he had seen white ones. *Pliny* and other Authors, assure us, that there were no wild Boars in *Candia*, *Africa*, and the *Indies*; and *Ælian* observes, they had none in *Macedonia*. The *Spaniards* have found some in *America*, which were much smaller, had a shorter Tail, and their Feet made otherwise than those of our wild Boars; and their Flesh was also more delicate, and easier of Digestion, than ours; and they found others in some Places with a Pair of Horns on their Heads.

The wild Boar in *Latin* is called *Verres Sylvaticus*, and the Sow *Sus fera* or *Scropha Sylvestris*. *Pliny* says, that, *Servilius Rufus* was the first who introduced Hunting the wild Boar among the *Romans*.

The Flesh of all wild Boars is not equally good. Those that are pent up in Parks are inferior Food to those that range at large, and feed upon Roots, Swine-bread, Corn, and Fruits.

The wild Boar is not of so moist a Nature as the common Hog, by reason of the Exercise, and different Food it lives upon; its Flesh is, therefore, less viscous, more agreeable to the Taste, and easier of Digestion. This Flesh is very nourishing, because it contains oily and balsamic Juices; but it is proper only for those who are of robust Constitutions, and inured to Fatigue; because, being very compact in its Parts, it requires a strong Stomach to digest it; and as Persons who are used to much Exercise, lose much of their Substance, they must have gross Foods, which adhere to the Parts, and are not so easily spent. *Lemery on Foods.*

Porcus sometimes imports the female *Pudenda*.

PORFILIGON. The Scales which fall from Iron upon being hammered. *Rulandus.*

PORFIRETICUM. A Brass Mortar, or a Rasp. *Rulandus.*

POROCELE, *πρωκέλη*. A callous Hernia; from *πῶρος*, a Callus, and *κέλη*, a Rupture or Tumor.

POROMPHALON, *πρωμφαλον*, from *πῶρος*, a Callus, and *ὄμφαλος*, the Navel. In the Definitions ascribed to *Galen*, it is the Concretion of a Toph, or Callus, in the Navel.

POROPOEIA, *πρωποεία*, from *πῶρος*, a Pore, or Passage, and *ποιέω*, to make. An Opening, or Reseration, of the Pores, or Passages.

POROS, *πῶρος*. A Pore, or Passage. See **CUTIS**, and **PERSPIRATIO**.

POROS, *πῶρος*. A Toph, or Callus. See **PORUS**.

POROSIS, The Generation of a *Callus*.

POROTICA, Medicines which generate a *Callus*.

PORPHYRA, See **PURPURA**.

PORPHYRIO. A Bird so called on account of its Colour, which resembles that of Purple. It is a Water-fowl, as large as a Cock, of a bluish or diversified Colour, with a large, sharp, and purple-coloured Beak. It has a Comb on its Head; its Legs are long, and its Feet divided into five Claws; its Tail is pretty short, and the Fowl itself feeds upon any Kind of Fish it can catch. Its Fat is of an emollient, resolvent, and anodyne Quality. *Lemery des Drogues.*

PORPHYRITES. Offic. *Worm.* 44. *Charlt. Foss.* 20. *Boet.* 505. **PORPHYRY**, or RED MARBLE.

POR

This is a Species of Marble highly hard, and of a red Colour; it is brought to us from the Confines of Egypt, the Red-sea, and Esbiopia. It is thought to be possess'd of a Lithontriptic Quality, and to agree in Virrues with the OPHITES. The principal Use of Porphry, in Medicine, is to levigate hard Substances, so as to reduce them to an impalpable Powder. Dale.

PORRACEUS. Of the Colour of Leeks.

PORRIFIGL. In Surgery, is the same as FICUS.

PORRIGO. A Disorder of the Skin; the same as FURFUR. See LEPRO.

PORRUM.

The Characters are;

The Bulbs, or Roots, are oblong, narrow, almost cylindrical, and coated: The Leaves grow out of the Coats of the Roots, are plain, and sometimes carinated: The Flower is hexapetalous, as it were Bell-shaped, and adorned with broad and flat Stamina, ending in three Capillaments, the middle of which is adorned with an Apex; the Flowers are disposed in almost globular Bunches: The Ovary becomes a roundish, tricapular Fruit, full of roundish Seeds.

Boerhaave mentions four Species of Porrum; which are,

1. Porrum; commune; capitatum. C. B. P. 72. Tourn. Inf. 382. Boerb. Ind. A. 2. 143. Porrum. Offic. Park. Parad. 512. Ger. 138. Raii Hist. 2. 1136. J. B. 2. 551. LEEKS.

Leeks are well known to have long, white, round Roots, with several white Fibres shooting from the Bottom; the Leaves are long and broad, encompassing the Stalk, which grows two or three Feet high, smooth and round, having at the Top a large, round Head, composed of a great Number of small, greenish, purple, six-leaved Flowers. it is sown in Gardens, and flowers in June and July; they have a strong Onion-like Scent.

Leeks are more used in the Kitchen among Soops, and Broths, than in Medicine; they are warming and attenuating, and good to cleanse the Lungs from rough Phlegm, and to help Shortness of Breath, and Stoppage of the Stomach; they are, likewise, reckoned good against the Bites of venomous Creatures. The Juice of them is used to dissolve the Gums in the *Pilula fetida*. Miller's Bot. Off.

2. Porrum, commune, capitatum. C. B. P. 72. M. H. 2. 390. Capite, sphaerico, minori, flosculis, & pedunculis florum, carneis.

3. Porrum, commune, capitatum. C. B. P. 72. M. H. 2. 390. Capite sphaerico, maximo, flosculis candidis, pedunculis florum penitus viridibus.

4. Porrum, commune, capitatum. C. B. P. 72. Capite, sphaerico, minori, flosculis albis, in pedunculis penitus viridibus. Boerb. Ind. alt. Plant. Vol. 2.

This Plant contains a fetid, oily, volatile Salt: Whence its Bulb being bruised, causes a Distillation of Tears from the Eyes and Nostrils. For this Reason it is proper in Cases where Heat is required, or where an Excess of Heat is not feared; but is injurious to those who abound too much with Blood, or whose Blood is of too loose a Contexture; as when it is voided by the urinary Passage, by an Hæmoptoe, or by the hæmorrhoidal Veins. It provokes the Menies, and Urine; and is very good for the Bites of Serpents, and Combustions. Hist. Plant. adscript. Boerhaav.

Besides the foregoing Species of Porrum, Dale mentions the following.

- Porrum vitignium*. Offic. Ger. Emac. 176. *Porrum tonsile*. Ger. 139. *Allium sylvestre Amphicarpon, foliis Porraceis, floribus, & nucleis purpureis*. R. Synop. Edit. 2. p. 230. VINE-LEES.

They have been observed by Mr. Lawson, to grow on the Mountains of Westmorland, and to flower in June. The Leaves are used.

Dale takes this Plant for the *Ampeloprasum* of Dioscorides; the Virtues of which see under the Article ALLIUM, from Dioscorides, Lib. 1. Cap. 180.

PORRUM, or PORRUS, in Fallopius, is a Species of rough Wart, which resembles the Root of a Leek, on account of a great Number of Filaments on the Surface.

PORTA. See HEPAR. The Female Pudendum is sometimes thus called.

PORTAIGUILLE. The Name of a Chirurgical Instrument. See the Explication of Fig. 2. and 3. of Tab. XXVII.

PORTATILE. In the *Collectanea Chymica Leydensia*, there is a Preparation of Tartar, intitled, *Acetum in Sacco Portatile*.

Take of white Tartar, half a Pound; after it is carefully wash'd and dried, reduce it to a Powder; infuse this Powder in strong Wine-vinegar. Then dry the Powder again, and infuse it a second time in Vinegar. Let these Measures be repeated ten times, and an highly acid Powder will be obtained, which, when dissolved in any Water, renders it acid; and this is called *Acetum Portatile*, or, *Portable Vinegar*. Collect. Chym. Leyden.

PORTORARIUM. The Duodenum, or the Pylorus.

PORTULACA.

The Characters are;

POR

The Leaves are somewhat thick and succulent; the Calyx is monophyllous, bifid, and closely adheres to the Ovary; the Flower is roseaceous and pentapetalous. The Ovary in the Bottom of the Calyx becomes an oval Vessel, consisting of two Shells, one within the other. Half the outer Shell, when ripe, bursts horizontally, or leaving an horizontal Opening, over the inner Shell, which afterwards flies open in the same horizontal Manner, discovering a Multitude of small Seeds.

Boerhaave mentions six Species of Portulaca; which are,

1. Portulaca; latifolia; sativa. C. B. P. 288. Raii Hist. 2. 1039. Boerb. Ind. A. 220. Portulaca. Offic. Park. Parad. 499. Portulaca domestica. Ger. 418. Emac. 521. PURSLANE.

This Plant is well known, and has round, smooth, reddish, and succulent brittle Stalks, with fat, thick Leaves, round, and broader at the End, than next the Stalk. The Flowers grow on the Tops of the Stalks among the Leaves, being small, five-leaved, and yellow, succeeded by roundish Seed-vessels, including small, black, rugged Seed. The Root is small and fibrous. It is sown in Gardens; the Leaves and Seed are used. The Seed is one of the Four lesser cold Seeds.

The Leaves are much used as a Salad, being cooling, and good for the Scurvy, attempering the Heat of the Bile; and help the Strangury, Heat of Urine, and Gonorrhœa. The Seed is cooling and restraining, and good to kill Worms. Miller's Bot. Off.

2. Portulaca; sativa; latifolia; foliis flavis. M. H. 2. 570.

3. Portulaca; angustifolia; five sylvestris. C. B. P. 288. Tourn. Ind. 236. Boerb. Ind. A. 220. Portulaca sylvestris. Offic. Ger. 418. Emac. 521. Park. Theat. 722. Raii Hist. 2. 1039. Portulaca sylvestris minor sive spontanea. J. B. 3. 678. WILD PURSLANE.

It grows frequently in fallow Grounds, and by the Sides of Paths. The Herb is used, and agrees in Virtue with the common or Garden Purslane.

4. Portulaca; Curassavica; lanuginosa; procumbens. Par. Bat. 215.

5. Portulaca; Africana; sempervirens; flore rubicundo. H. A. 2. 177.

6. Portulaca; Curassavica, folio capparidis. Par. Bat. 213. Boerb. Ind. alt. Plant.

This Plant affords an excellent Aliment and Medicine; its Parts are very succulent, and the Juice astringent, remarkably aperient, expulsive, and cooling in inflammatory Diseases, and very good to wash the Gums, when affected with a Gangrene. A Decoction of the Leaves makes an excellent Gargarism for the Quinsy, and is no less serviceable in the Phrensy, Pleurisy, Peripneumony, Scurvy, and Inflammations of the Viscera and Intestines; it tempers Bile, and is corroborative, especially if the Plant be boiled with Whey. The Juice is somewhat acid, nitrous, and very viscid: Whence it has the same Virtues as the *Sempervivum*, or *Nummularia*, which renders it qualify'd to correct an excessive Motion, or Volatility of the Spirits, a Putrefaction, and a Rigidity of the Fibres; whence it is of Service in all acute Diseases. Being eaten in Salads in the Summer-season, it mitigates Bile, and prevents Disorders which may be justly apprehended from an Excess of that Humour; it destroys Worms, and is of Service in malignant putrid Fevers, Heat of Urine, and the Nephritis. The Leaves, applied to the Head, ease the Pains thereof; the distilled Water is very good for an excessive Flux of the Menfes, and for Hæmorrhages; the Juice is of great Efficacy in a Consumption. The whole Plant is extremely full of Juice; so that if you compress and rub the Leaves between your Fingers, they will almost spend themselves wholly in Juice; so that if you bruise a Pound of the Leaves, and squeeze out all the Juice, there will scarce remain a Dram of solid Substance. Hist. Plant. adscript. Boerb.

- Portulaca maritima*. Offic. *Portulaca marina nostras*. Park. 724. *Halimus sive Portulaca marina*. C. B. 120. Raii Hist. 1. 195. *Halimus vulgaris sive Portulaca marina*. Ger. Emac. 523. *Atriplex maritima angustissimo folio*. Tourn. Inf. 505. COMMON SEA PURSLANE.

It is commonly found in the salt Marshes, and flowers in July and August. The Leaves, and tender Branches, pickled after the manner of Samphire, are used by the English as well as the Dutch, in Sawces, for exciting an Appetite. Raii Cat. Angl. It is an hot Plant. Magnol. Bot. Monps. Mr. Stubbs commends it for a Cosmetic. Dale.

PORUS. See POROS.

PORI BILIARII. The Biliary Ducts. See HEPAR.

PORUS. Pliny, in the seventeenth Chapter of his thirty-sixth Book, after he has spoken of sarcophagous Stones, which soon consume dead Bodies, which are laid in them, speaks of others which have a contrary Property of preserving them: Such, he says, was the *Chernites*, very much much resembling Ivory, in which it is reported Darius was laid; and such another is the *Porus*, which, for Whiteness and Hardness, he describes

scribes to be like the *Parian Stones*, but less ponderous. *Pliny* is so brief in his Description, that we are not certain whether he speaks of the Stones which we now call *Pori*. These have their Name from the Multitude of their Pores, or Perforations; in Substances they resemble Coral, and only differ from it in their Porosities. Some of them are near akin to Coral; others are widely different from it. Those of the whitest and closest Substance much resemble Coral, and spread themselves in Branches after the same manner; but it must be observed, that they are all white in general. Those which are wrinkled have striated Lines, which run along the Trunk, and even to the Extremities of the Branches lengthwise; and they are, also, furnished with their internal porous Substances with Meatues, which proceed according to the Longitude of the Branches, being separated by the Interposition of a sort of Thread. Those which have Punctations in their Superficies, have their Meatus interrupted by Rays proceeding from a Centre in the interposed Thread to the Circumference. Ray from *J. Baubine*:

POSCA. Oxycrate, that is, Vinegar and Water.

POSSETUM. A Posset. The foreign Writers mention this as a sort of Food, or rather Medicine, peculiar to the *Englisch*. The Serum of a Posset, or Posset-drink, appears to be an excellent Liquor, either considered as a Medicine, or Aliment, from what is said of Whey, under the Article LAC.

POSTBRACHIALE. The METACARPUS.

POSTHE, *πρόθη*. The Prepuce.

POSTHIA, *πρόθια*. A Disease of the Eye-lids; the same as CRITHE, or HORDEOLUM.

POSTPOSITIO. When the Paroxysm of an intermittent Fever comes on later than it is expected, this is called the *Post-position of the Paroxysm*; as when it seizes sooner, it is called the *Anticipation*. The first is esteemed a good Sign; the latter, the reverse.

POTABILE AURUM. See AURUM.

POTABILIS MARS. In the *Collectanea Chymica Leidensia*, we find three Preparations of Iron under this Title, from *de Maets*. The first of them is thus prepared:

Take of the Filings of Iron finely triturated, and of the whitest crude Tartar obtained from *Rhenish Wine*, each as much as you please; and of filtrated Rain-water, a sufficient Quantity to form into small Balls: Dry these Balls in the Sun, and bake them along with Loaves in an Oven. Then reduce them to a Powder again; and with a sufficient Quantity of Rain-water, as before, form them into Balls, and again bake them in an Oven. These Measures are to be repeated, till the Iron is found to be soluble in any Liquor. This Medicine is to be exhibited in a Spoonful of Rain-water. The Dose is from six to sixteen Grains, and one Scruple.

Or,

Take of the finest Filings of Iron, one Part; and of the Flowers of Sulphur, two Parts. Triturate them together, and add a sufficient Quantity of Rain-water to reduce them to the Form of a Poullice. Let them stand in a moderately warm Digestion for twelve Hours. Then pour as much Rain-water upon them as rises three or four Inches above them, and boil all together, till a yellow Tincture is extracted. When this Tincture is poured off, and filtrated, inspissate it till only a fourth Part of it remains; for by this means it will in a few Days assume an highly red Colour.

But the most simple Method of exhibiting Iron, for removing any Obstructions, and especially for promoting the Menfes, and destroying peccant, acid, and austere Ferments, is the following:

Take of well-washed Filings of Iron, triturated in Alcohol, and passed through a fine Sieve, one Part; of the finest Sugar, half the Quantity; and of Mace, a fourth Part: Mix them intimately together. The Dose of this Powder is as much as may be contained on the Point of a Knife.

POTAMOGEITON.

The Characters are;

The Root is fibrous and perennial; the Leaves are disposed alternately on the Stalks, and arise at the Origin of the Pedicle of the spiked Flowers. The Calyx is tetraphyllous, the Flower tetrapetalous, and disposed in Spikes. The Seeds are angulose, naked, four in Number, each succeeding its Floscule. The Plant is produced in the Waters, and grows under them.

Boerhaave mentions eleven Species of this Plant; which are,

1. Potamogeton; rotundifolium. C. B. P. 193. *Raii Hist.* 1. 188. *Synop.* 60. *Tourn. Inst.* 233. *Boerb. Ind.* A. 196.

Potamogeton. Offic. *Potamogeton rotundifolius* folio. J. B. 3. 776. *Potamogeton latifolium*. Ger. 675. Emac. 821. *Fontalis major latifolia vulgaris*. Park. 1254. POND-WEED.

This Plant is frequently found in stagnant Waters and Fish-ponds. It flowers in the Months of June and July. The only Part of it used is the Herb, which is of a refrigerating and inspissating Quality. It is, also, beneficial against Itchings, inveterate Ulcers, and Nomæ. *Diosco. Dale*.

This Plant receives the Name of *Potamogeton*, from the Greek Words *ποταμός*, a River, and *γειτάν*, adjacent, because it grows about Fountains; *Millefolium*, from the Smallness of its Leaves; and *Viola Aquatica*, from the Colour of its Flowers.

Hist. Plant. adscript. Boerhaav.

2. Potamogeton; foliis latis; splendentibus. C. B. P. 193.

3. Potamogeton; longo; serrato; folio. C. B. P. 193.

Lapathum, fluitans, longo, serrato, folio. J. B. 2. 988.

4. Potamogeton; foliis crispis, conjugatis. *Tribulus aquaticus, minor, alter*. Clus. H. 252.

5. Potamogeton; seu Fontalis crispa; foliis alternis; cauliculis compressis. *Tribulus, aquaticus, minor*. Clus. H. 252.

6. Potamogeton; aquis immersum; folio pellucido, lato, oblongo, acuto. *Raii Synop.* C. 1.

7. Potamogeton; caule compresso; foliis graminis canini. *Raii Synop.* 61.

8. Potamogeton; pusillum; gramineo folio; caule rotundo. *Raii Hist.* 190.

9. Potamogeton; flosculis ad foliorum nodos. T. 233. *Millefolium, aquaticum flosculis ad foliorum nodos*. C. B. P. 141.

Myriophyllum, aquaticum, minus. Clus. H. 252.

10. Potamogeton; foliis pennatis. T. 233. *Millefolium, aquaticum, pennatum, spicatum*. C. B. Prodr. 73.

11. Potamogeton; ramosum; angustifolium. C. B. P. 193. J. B. 3. 778. *Boerb. Ind. alt. Plant.*

POTAMOGEITON, SALICIS FOLIO. A Name for the *Periscaria, salicis folio, perennis*.

POTASH. See ALCALI.

POTENTILLA. A Name for the *Pentaphylloides; argenteum; alatum; seu Potentilla*.

POTERIUM. See TRAGACANTHA.

POTERIUM, *ποτήριον*, is, also, a Name for a *Malagma*, recommended by *Galen* for a Dropsy, L. 9. de Comp. M. S. L. Cap. 3.

POTIO. A Potion; a liquid Form of a Medicine, consisting of as much as can be drank at one Draught. The Writers on Pharmacy distinguish Potions into Cathartic, Cardiac, and Alterative.

POUST. The *Indian* Name for a base Kind of Opium, procured by boiling the Leaves and Stalks of the Poppy.

POUTAETSJA. The Name of a low Berry-bearing Shrub, which is very common in *Malabar*.

Of the Leaves of this Tree boiled in Milk, they prepare a Drink, which prevents Sleep, and is of Service in a Lethargy, and other soporose Affections. The Leaves, Flowers, Bark, Root, and other Parts boiled in Water, make a Bath, which is of Efficacy in the Epilepsy, and other spasmodic Disorders. *Raii Hist. Plant.*

PRÆBIUM. A Dose; the Quantity of a Medicine exhibited at one time.

PRÆCIPITANTIA. Precipitating Medicines; (that is, Medicines which moderate the Motion and Heat of the Blood) as was supposed, by absorbing and correcting the Acid contained therein. *Præcipitans Magnum* is a Name for the *Os Sepia*.

PRÆCIPITATIO. Precipitation is that Process, by which Particles, after having floated, and been suspended some time in a Menstruum, at length sink to the Bottom. These Particles sometimes precipitate of their own Accord, but oftener by the Assistance of some other Liquor added to the Menstruum. The Reason of the Descent in both Cases is the same.

It may be easily conceived, that Fluids may be made to sustain Bodies specifically heavier than themselves; by making the Resistance, arising from the Cohesion of the Parts of the Fluids, equal to the Excess which there is of specific Gravity in those Bodies above the Menstruum. And it has been shewn, that this Resistance is proportional to the Surface of the Corpuscles. Therefore a contrary Condition to this, is all that is requisite to their being sustain'd no longer; or, which is the same thing, to their Precipitation: That the Tenacity of the Menstruum be not proportional to the Gravity of the Corpuscles: And this may be produced two Ways.

In the first place, Precipitation generally follows upon dropping in a Liquor specifically lighter: For, by this Mixture, the Gravity of the Menstruum, which always is proportional to the compound Gravities of both Liquors, become lighter. The Menstruum being thus diluted, the Force of Cohesion is, also, weaken'd, so that it is not able to resist, or bear up, the Bodies dissolved in

in it: Hereupon, the Equilibrium being taken off, they are precipitated by the Force of their own Gravity, just in the same manner as Hydrometers, which are easily sustain'd in Water, upon pouring in a good deal of any inflammable Spirits, sink to the Bottom of the Glass. And this does not only agree very exactly with the Laws of Mechanics, but, also, with Experiments themselves. Thus Spirit of Sal Ammoniac does very plentifully precipitate the Filings of Metals, which are dissolved in acid Menstruums, though it be abundantly lighter than any of them. The same thing is done quicker by Spirit of Wine, whose Gravity is known to be almost the least of any. By this Spirit, also, all Salts which are suspended in Water, are precipitated, and afterwards unite into Crystals: So, if you drop in distill'd Vinegar the Dross of Antimony, diffused in Water, it falls to the Bottom, and affords the Golden Sulphur. After the same manner, Water, Vinegar, &c. make a Precipitation from Acids, tho' more sparingly. Acids themselves, being poured upon others which are heavier, will precipitate whatever is swimming in them. Thus Spirit of Salt precipitates either Lead, Copper, or Tin, dissolved in Oil of Vitriol. So little need is there for Alcalies in this Business, though all the Chymists have unanimously contended for them as absolutely necessary.

In the second place, Precipitation will succeed as well, if there be added a heavier Liquor to the Menstruum: For the Particles of this Liquor, what with their Weight, and what with the Impetus they acquire in their Descent, carry down and sink all the solid Corpuscles they meet with in their Way: So that the Corpuscles, being thus forced down, and kept there by this adventitious Liquor, cannot mount up into their former Situation. And, if any one has a mind to try the Truth of this Reasoning by Experiments, there are enough to confirm it: For not only acid Spirits, but Water alone, will precipitate Tinctures of Vegetables extracted by Spirit of Wine. And the very same Tinctures, extracted with Water or Wine, are precipitated very copiously by acid Spirits, which are heavier. After this manner, Metals which are dissolved in Spirit of Sal Ammoniac, are precipitated with Oil of Vitriol, or Spirit of Nitre. The same Bodies, though suspended in Aqua-fortis, are easily precipitated with Oil of Vitriol, or Bezoartic Spirit of Nitre. And this very Oil, if poured upon Sal Volatile Oleosum, or any other Solution of Salt, ever so much saturated, does not only sink the smaller Particles, but converts almost the whole Liquor into Salt. For when these Liquors are poured upon one another, the Salts with which they abound, being put into Motion by their attractive Force, run mutually towards one another; and, because they don't recoil far back after the Shock, they are at length so united, as to become like a Solid, there being very little Phlegm remaining. The same may, also, be observed in *Tartarum Vitriolatum*. In making all these Experiments, there happens such a Conflict and Effervescence, as evaporates almost all the Moisture, with which the Salts are diluted. And upon this depends the Rationale of chymical Coagulation, a thing of very great Consequence in the Business of Precipitation. Nor can we account for Oil of Tartar's precipitating Bodies dissolved in Acids, any otherwise than from its making a kind of Coagulation with these Corpuscles, which thereby becomes too heavy for, and exceeds the Tenacity of the Menstruum.

Nor does Coagulation succeed only upon the mixing of heavier Fluids, but it, also, very often promotes Precipitation, when the Gravity of the infus'd Liquor is entirely equal to that of the Menstruum, or but very little different from it. And this Agglutination of Parts is to be seen in many Liquors, but most of all in saline ones. Thus Spirit of Sal Ammoniac, Spirit of Hartshorn, that of human Blood, and Sal Volatile Oleosum, whose Gravities are nearly the same as that of common Water, precipitate the Solution of Sublimate very plentifully, as you may observe in making white Precipitate of Mercury: In which Experiment, the Increase of the Weight gives sufficient Indication of an Union of those Salts, which are pretty copious in the Sublimate, and Liquors which are poured upon it: For that which subsides at the Bottom, exceeds in Weight the Sublimate which was at first put in. Also, the Magisteries of Vegetables, extracted by Precipitation, confirm this Account of Coagulation; for these have a greater specific Gravity than the Powders of the Plants they are made from. This additional Weight, therefore, is to be imputed to the Particles of the Liquor, with which Precipitation is performed. Quincy.

PRÆCORDIA. The Diaphragm. The Word, also, very commonly imports the same as *Hypochondria*, which, according to *Galen*, in *Prorrhetic*. are those Parts above the Navel, which on both Sides are subjacent to the spurious Ribs; for the *Epigastrium*, or *Abdomen*, says the same Author, *Cam.* in 2 *Aph.* 35. is divided into the Hypochondrium, the Parts about the Navel, and the lower Belly, (which the *Greeks* call *πτερυγ*, (*Ectru*) which lies between the Navel and the Pudenda [See

a very accurate Division of those Parts under the Article *ABDOMEN*]. The *Præcordia*, or *Hypochondria*, then, may be more fully described, as that external Part of the Abdomen, which extends itself above the Navel on both Sides, from the *Ili*a, under the cartilaginous Parts called the *spurious Ribs*, (situated above the empty Places called the *Ceneones*) and comprehending, in the Right Side, the Liver; and, in the Left, the Spleen. But the Word, in a larger Sense, is used to signify all the inferior Parts comprehended within this Region, as the Stomach, Liver, Spleen, and Diaphragm; which is the Signification of the Word *ὑποχονδρια* in that Sentence, 1 *Prorrh.* 56. where it is said, that "Fevers proceeding from Pains of "the *Præcordia*, or *Hypochondria*, are of a malignant Nature." And let this suffice for adjusting our Notion of the *Præcordia*, by which we mean that Part of the Abdomen which is situated above the Navel, and extends itself to the Right and Left under the spurious Ribs.

The *Præcordia* (which we shall henceforth in this Discourse call *Hypochondria*) may be regarded, first, as in a State which is usual to Persons in Health, and is best for the Patient; or they may be considered as in a bad Condition, and unlike that of healthy Persons; as when, for Instance, they are affected with Tensions, Pains, Tumors, and Suppurations. On this Subject we may observe *Hippocrates* speaking in his *Prognostics*, where he says, "The *Hypochondria* are in the best State when "they are free from Pain, and are soft and equal both on the "Right and Left Side." And he might justly say so; for, when the *Hypochondria* are in such a State, we are satisfied, that no Part contained within their Region, as, for Instance, the Stomach, or Diaphragm, have received any Injury. And the good State of those Parts under acute Fevers is of no small Moment towards prognosticating an happy Event; and it is impossible for any of those Parts to be injur'd, and the *Hypochondria*, at the same time, to be soft, and free from Pain. In acute Diseases, therefore, it is of extraordinary Moment towards predicting a Recovery, for the *Hypochondria* to appear in a very good Condition, as, when they are soft, equal, and free from Pain, both on the Right and Left Sides.

With respect to the Thickness or Carnosity, and the Thinness or emaciated State, of the *Hypochondria*, *Hippocrates*, 2 *Aph.* 35. commends the former, in pronouncing, that, "Under "all Diseases, it is better for the Parts about the Navel, and "the lower Belly, to appear thick and fleshy; but when they "are remarkably lean and extenuated, it is a bad Sign." Whence it follows, that the *Hypochondria* when thick and carnosous, have a promising Aspect. But the best way will be for us, first, to procure a thorough Knowledge of the Patient's *Hypochondria*, and of the State, whatever it be, in which they usually appear; for, oftentimes, they are perceived to be unequal, and not alike soft, in Persons enjoying a good State of Health; for which Reason, not only those *Hypochondria* which are in the best State, but sometimes those which are unequal and tense, provided they were so when the Patient enjoy'd Health, afford a good Prognostic. It is not, however, as good a Sign to have the *Hypochondria* tense and unequal, though it be no more than what was usual in Health, as to have them soft, equal, and free from Pain. But those tense and unequal *Hypochondria*, which are elevated into a Tumor attended with Pain, are always bad, unless they appear as Signs of a Crisis, at the Approach of which there is frequently a Tension, Tumor, or Pain, of the *Hypochondria*.

Of critical Tensions of the *Hypochondria*, the Author of 1 *Prorrhetic*. 144. thus speaks: "Palpitations about the Belly, "with an oblong Tumor and Tenseness of the *Hypochondria*, "indicate an Hæmorrhage." And a little after, *Text*. 147. "A Tension of the *Hypochondria*, with an Heaviness of the "Head, Deafness, and Confusedness of Sight, prognosticate "an Hæmorrhage." *Galen*, also, in his third Book of *Crisis*, says, that a Tension of the *Hypochondria* without Pain is a proper Sign of an approaching Hæmorrhage from the Nose; but when the Tension is accompanied with Pain, it is no Prognostic of an Hæmorrhage, but indicates an Inflammation. Hence we infer, that a Tension of the *Hypochondria* without Pain, and sometimes, from the great Degree of Tension thro' the Redundance of the Blood, with Pain, a Dulness of the Sight, or Scintillations striking on the Eyes, an Heaviness of the Head, with a Redness, or high Colour, of the Face, are all critical; and, in particular, are Signs of an approaching Hæmorrhage from the Nose: For which we have the Authority of *Galen*, *Lib. 3. de Crisibus*, & *Lib. de Prasag. ad Posthumum*, and the Author of the *Prorrhetica*, *Lib. 1. & 2.* But a Tension of the *Hypochondria*, accompanied with a Coma, Anxiety, and Pain of the Head, are Signs of the Parotides, according to the Author of the *Coac.* 289. And *Hippocrates*, *Lib. Prognost.* teaching us to prognosticate future critical Abscesses from Tensions of the *Hypochondria*, says, "That an Inflammation about "the *Hypochondria* is succeeded by an Abscess in the inferior "Parts;

“ Parts; but if the *Hypochondria* be soft, and free from Pain, “ you may expect an Abscess in the superior Parts of the Body.” Hence it plainly appears, that even a Tension of the *Hypochondria* is sometimes very good and salutary, as it is an Indication of an approaching critical Evacuation.

We may reason in the same manner with respect to Tumors of the *Hypochondria*, though rarely any good Event may seem to be prognosticated from Tumors in those Parts. *Hippocrates*, however, in his *Prognostics*, speaking of those Tumors, says, “ That soft Tumors, which are free from Pain, and yielding “ to the Touch, remove the Crisis to a greater Distance of “ Time, and are less to be dreaded.” And more plainly to the same Purpose, a little after, he says, “ Soft Tumors, in- “ dolent, and yielding to a Pressure with the Finger, are slower “ in coming to a Crisis, and less dangerous.” Again, in the same Book, he tells us, that “ Tumors of the Belly are less dis- “ posed to form Abscesses than Tumors of the *Hypochondria*, “ and Tumors below the Navel least of all; but an Hæmor- “ rhage may be expected from the superior Parts.” And, *Coac.* 290. “ A Tumor of the *Hypochondria*, succeeded by a great “ or full Respiration, and an high Fever, in bilious Patients, “ occasion the Parotides;” because in such Constitutions the bilious Humours take their Course upwards.

There are, also, Pains of the *Hypochondria*, which are critical; as, when they are occasioned by a Redundance of Blood distending the Vessels: The Signs concomitant, and indicating a Crisis, are, as we said before, an high Fever, an Heaviness of the Head, or Deafness, or Dimness of Sight, or a Redness of the Face. To this we may add, that Pains of the *Hypochondria* are not bad, when succeeded by a Fever. Of these Pains we find *Hippocrates*, 6 *Aph.* 40. thus pronouncing: “ They “ who are afflicted with Pains about the *Hypochondria*, with- “ out an Inflammation, are relieved from them by the coming “ on of a Fever.” And, *Coac.* 281. we read, “ That Pains “ and Tumors of the *Hypochondria*, if recent, and not attend- “ ed with an Inflammation, meet with a Solution from Rum- “ blings arising in those Parts, and especially from their Erup- “ tion together with Discharge by Stool and Urine.”

Of Abscesses affecting the *Hypochondria*, the Author of the *Coac.* 281. pronounces, that, “ As to those which break out- “ wardly, it is best, that they should be contracted into a very “ small Space, and to a very sharp Head.” And, continuing to speak of the same Abscesses, he says, “ For those which tend “ inwardly, they are to be accounted the safest, which shew no “ outward Mark of themselves, neither by Tumor, nor Pain, “ nor Colour; but the contrary to these are of the worst “ Kind.”

The *Hypochondria*, in acute Diseases, tense, hard, pained, and unequal, are bad, as we are taught by *Hippocrates* in the *Prognostics*; and the same Author, 2 *Aph.* 35. passes a like Judgment on a remarkable Emaciation or Extenuation of those Parts. But, in order to a clearer and more distinct Notion of these Disorders, which affect the *Hypochondria*, and are all of them bad Prognostics, if attended with other bad Signs, we shall choose to treat of them all singly, and of their Causes, before we inquire what Prognostics may be formed from them; for without a just Idea of those Disorders, and some Knowledge of the Causes from whence they proceed, we shall never be able, with any tolerable Certainty, to form Predictions from them.

We shall begin, then, with a Tension of the *Hypochondria*; which Disorder is sometimes accompanied with a Tumor, and an Hardness which resists the Touch. Sometimes there is a Tenseness of the Parts without a Tumor, in such a manner, that though they appear distended, yet they are empty; and such Tensions as these, are what *Galen* calls *empty, softish, and tumorless Tensions*. *Hippocrates* has sometimes Occasion to speak of these Tensions, as in 3 *Epid.* *Ægr.* 2. where he says of *Hermocrates*, that “ He had a soft Tension of the *Hypochon- “ dria*.” Sometimes he calls those Kinds of Tensions *υπολαμπεις*, “ softish;” and the *Hypochondria* thus affected, *μετιστα*, “ elevated;” as he does in the Case of *Erasmus*, 1 *Epid.* *Ægr.* 8. In such Cases there is indeed a Tension of the *Hypochondria*, but such a Tension as is empty, and free from any hard Tumor. As to their Figure, these Tensions are sometimes oblong, according to that of the *Musculi Recti Abdominis*; sometimes broad, and sometimes round like a Crescent, in which Shape Tumors of the Liver are represented.

A Tension of the *Hypochondria* is attended with an Hardness, or an hard Tumor, from an Inflammation affecting either the Muscles, or the convex or gibbous Part of the Liver, or the Spleen, or even the Stomach. There is, also, a Tension without Hardness, as from a Repletion of the Muscles with a flatulent Spirit; and a Tension with an Hardness, but no Tumor, as from a Redundance of Blood in the Vessels. A Tension without Hardness is, also, without Pain, as is frequently observed, where a copious Hæmorrhage from the Nose succeeds;

a Tension from a Flatus is without Hardness, and without Sense of Weight; a Tension from a Redundance of Blood is attended with both; and, lastly, a Tension from an Inflammation is attended with a Tumor, if an Inflammation affects the external Part of the Muscles, or the convex Part of the Liver, or the Spleen, or the Stomach. And this is the Doctrine of Tensions in general. But we think ourselves obliged to be more explicit, because it has been said, that a Tension of the *Hypochondria*, attended with an Hardness, proceeds from an Inflammation of the Viscera before-mentioned; whence we may be inclined to conclude, that this kind of Tension is always from the same Cause. This, indeed, is true; for all Tensions, attended with a Tumor, or Hardness, and Pain, indicate an Inflammation of the Viscera: Yet it is as true, according to the Doctrine of *Galen*, that there are several Sorts of Tensions, which are not hard, but soft, or, as the same Author explains it, void, empty, and sublime; and these Tensions may not be accompanied with an Inflammation of the Viscera; for which Reason they deserve our more accurate Examination. Those Tensions, then, which are soft, or empty, or tumorless, which Words all signify the same thing, are caused either by an Inflammation of the internal Parts of the Viscera, or by a Driness in the Origin of the Nerves, which supply the Diaphragm. Hence the *Hypochondria* are attracted upwards, and, on that account, are sometimes, by *Hippocrates*, call'd properly *μετιστα*, “ sublime.” In this Case the *Hypochondria* are, indeed, distended; but the Inflammation being seated in the internal Parts of the Viscera, remote from our Notice, there is no concomitant Tumor, nor Hardness. *Galen*, in 3. *Epid. Com.* 2. *Text.* 1. tells us, that “ a “ soft Renitency of the *Hypochondria* indicates an Inflammation “ of some Part of the Viscera, as the Liver, Diaphragm, or “ Spleen.” And the same Author, on 1 *Epid.* treating of the Tension which affected the *Hypochondria* of *Silenus*, says, that “ through an Inflammation of the Diaphragm, the *Hypo- “ chondrium*, by virtue of its Continuity, was attracted up- “ wards, and distended, without a Tumor.” Again, on 3 *Epid.* speaking of this kind of Tension, he has these Words: “ As if he “ (*Hippocrates*) had said, the Right *Hypochondrium* was dis- “ tended, but without a Tumor, either because the Inflam- “ mation of the Liver was not great, or affected only the lowest “ Parts, by which it is united to the Belly; the gibbous Part “ thereof, in Conjunction with the inferior Parts, being not as “ yet elevated into a Tumor.” And this was the Case of *Hermocrates*. The *Hypochondria*, then, may be affected with a Tension of a soft kind, that is, without a Tumor, from an Inflammation of the Diaphragm, Spleen, or Liver, provided this last-mentioned be not wholly nor violently affected, but in a small Degree, or only in its lower Parts; whence the gibbous or convex Part of the Liver being free from an Inflammation, the Tension will feel soft to the Touch, and appear without a Tumor; but this Sort of Tension will never happen, when the Liver is either wholly or violently inflamed.

It was said before, that such a soft kind of Tension may proceed, not only from an Inflammation of the Viscera, but from a great Driness. *Galen*, *Com. in Prognost.* 27. comprehends both these Causes under the following Expression: “ Sometimes, says he, there is a Tension of the *Hypochon- “ dria* without an Inflammation, properly so called, either from “ an immoderate Driness, not only in the Parts themselves, “ but in the Diaphragm or Pleura; or from an Inflammation “ with a Tumor affecting the Muscles of the *Hypochondria*, “ without an Inflammation, properly speaking, which is a Tu- “ mor attended with a Pain.” And those Causes of a soft Tension are expressed yet more plainly by the same Author, *Com.* 2. in 3 *Epid. Cap.* 4. where he says, “ There is a Tension “ of the *Hypochondrium*, when the adjacent Parts are attracted “ by the Diaphragm; and there is a Tension of the Dia- “ phragm itself in a Pleurisy, sometimes from a violent Inflam- “ mation of the Pleura, sometimes from a Retraction of the “ Nerves belonging to the Diaphragm towards the Origin of “ the Nerves, and sometimes from an Inflammation of the Part “ itself.”

Having said thus much of the Causes of a Tension of the *Hypochondria*, we proceed to inquire, what may be predicted from it. And here we are told by *Hippocrates*, in *Prognost.* “ That an hard and painful Tumor in both the *Hypochondria*, “ or only in the Right *Hypochondrium*, is a very bad Pro- “ gnostic; for such Tumors, appearing in the Beginning, sig- “ nify, that Death is not far off.” *Galen*, commenting on this Place, by Tumor understands an Inflammation of the Liver, Stomach, or Spleen, which often proves mortal in a short time, especially when violent; tho' our Prognosticating from this Symptom must be confirmed by other pernicious Signs. But when the Tumor proceeds from an Inflammation of the Muscles, it is seldom accounted mortal. And *Hippocrates* himself, a little afterwards, seems to limit the Judgment he had passed on hard and painful Tumors of the *Hypochondria*, in saying, that their Appearance

Appearance in the Beginning prognosticates Death in a short time, in such a manner, as if none but great Tumors, and those not always, portended so fatal an Event, by saying, "When- ever, therefore, a Tumor (thus circumstanced) is painful, hard, and large, it signifies, that the Patient is in Danger of dying in a short time;" as if he had said, Those Kinds of Tumors, that is, Inflammations of the Viscera, if they prove mortal at all, destroy the Patient in a short time; for if they continue long, they indicate a Suppuration, rather than Death; agreeably to that of *Hippocrates*, delivered a little before, where he says, "If the Fever continues above twenty Days, and the Tumor subsides not, the Disease changes to a Suppuration." Tumors, therefore, of the Hypochondria, attended with Pain, and not proceeding from an Inflammation of the Muscles, but of the Liver, or Stomach, are dangerous, especially if the Inflammation be violent.

But our Prognostications in these Cases will be confirmed by the Pathognomonic Signs of these Inflammations, which indicate their Nature, and, if pernicious, portend a fatal Event. Such were the Signs observed by *Hippocrates* in *Apollonius*, 3 *Epid. Sect. 3. Ægr. 13.* of whom he says "that he was afflicted with Want of Sleep, and a bad kind of Inflation; had a great Thirst; laboured under a Coma, with a Tumor of the Right Hypochondrium, attended with a Pain; that his extreme Parts, on all Sides, were somewhat refrigerated; talked a little irrationally; forgot all he had said; and was delirious."

No less dangerous are softish Tensions of the Hypochondria without a Tumor, since, as we have shewn, they indicate either an Inflammation of some one of the principal Viscera, or a very great Driness of the Origin of the Nerves which descend to the Diaphragm, or of the Pleura. But these Tensions, it is to be observed, though always bad, never of themselves portend Death, but only in Conjunction with other bad Signs appearing at the same time; for not all who labour under an Inflammation of the Liver, Stomach, or Diaphragm, die. It will be necessary, therefore, to consult the rest of the Signs; and if these, too, are bad, and of the Number of those which are fatal, we may safely venture to predict the Death of the Patient. Thus fatally circumstanced were the Tensions observed in *Silvius*, *Hermocrates*, *Philistes*, the young Man of *Melibæa*, and the young Man who lay in the *Forum Mendacium* [*ἐν τῷ ψευδοῦ λόγῳ*] who all, as you may read in the first and third Books of the *Epidemics*, had this softish Tension of the Hypochondria, attended with other bad and deadly Signs.

On the same account Pains of the Hypochondria, attended with the aforesaid Tension, and other bad Signs, are usually mortal. Thus it was in the Case of the Wife of *Dromeades*, 1 *Epid. Ægr. 11.* who, on the third Day, was seized with a Pain of the Hypochondria; and made thick, turbid Urine, which had no Settlement; and had cold Sweats; which were all mortal Signs. And, *Ægr. 12.* it is related, "that a certain young Man, being feverish, went to Supper, and drank pretty freely; at Night he vomited up all, and was seized with an high Fever, attended with a Pain of the Hypochondrium, and a softish Phlegmon tending inwardly; and he had a troublesome Night; his Urine, at first, was red and thick, and deposited no Sediment; his Tongue was very dry, but he was not very thirsty." All these were very pernicious Signs, and very fatal to the Patient, who died on the eleventh Day. The Author of the 1 *Prorrhetic. 56.* says, "that Fevers, proceeding from Pains in the Hypochondria, are malignant." But *Galen* says, that all Fevers from the Hypochondria are not malignant, since there are several Parts seated therein; but only such as are excited by an Inflammation of the Diaphragm, Stomach, and Liver; nor are even these all malignant, nay, perhaps, not so much as acute, so far are they from Malignancy: Thus *Galen*. But the Malignancy of acute Fevers is to be demonstrated from other bad Signs. It may be added, that those Kinds of Tensions and Pains are bad and mortal, if they continue long attended with some pretty copious Evacuation. Of these it is said, *Coac. 284.* "that Pains arising in the Hypochondria are bad in every Circumstance, but especially if accompanied with a Looseness." This appears from the Cases of the Sick, to which we just now referred; particularly that of *Silenus*, 1 *Epid. Ægr. 2.* who laboured under a Tension of the Hypochondria, accompanied with thin blackish Stools: And in the Case of *Erasmus*, *Ægr. 8.* who had a painful Tension of the Hypochondria, attended with Sweats.

We have spoken enough on the Subject of Predictions from bad Tensions of the Hypochondria; and proceed to speak of Suppurations affecting the same Parts, which are bad, if attended with a great Looseness, Nausea, Syncope, Vomiting; and worst of all, when the Fever is not at all remitted, nor the Patient relieved thereby. We said before, that Tumors, which continue long with a Fever, pass into an Abscess, or Suppuration,

on the Authority of *Hippocrates*, who, in his Prognostics, says, "That, if the Fever holds the Patient above twenty Days, and the Tumor does not subside, there is a Conversion into a Suppuration;" and a little after, "If the Fever goes beyond the Bounds of sixty Days, and the Tumor, in that time, does not subside, it indicates a Suppuration, both in this Case, and, also, when the Tumor affects any other Part of the Abdomen." Of the Prognostics, which may be drawn from these Kinds of Suppurations, the Author of *Coac. 281.* treats, where he says, "Among mortal Abscesses are to be esteemed those which break inwardly; but, of those which break outwardly, the most laudable take up the least Space, and gather to the sharpest Head. Of those Abscesses, which tend inwardly, the best are those which shew no outward Marks of any Tumor, Pain, or Heat; but the contrary to those are very bad." Hence we learn to know bad Suppurations; and that, to be sensible of a Tumor, Pain, or Heat, in the Hypochondria, is an Indication of a latent and not elevated Inflammation. If, therefore, this Tension of the Hypochondria continues after the Suppuration, without in the least relaxing, it is a pernicious Sign; but if there be, also, a Pain and Heat, it is a worse and more fatal Prognostic; but there is the greatest Reason for predicting the Death of the Patient, when a copious Evacuation of Pus gives him no Relief; and when he finds himself the worse after such Excretions, his Case is esteemed desperate. For such an Evacuation is one of these critical Symptoms, which determine nothing, and, consequently, are fatal; and the more so, if attended with a Decay of Strength, or some other bad Sign.

These are the Predictions we have Reason to make from a Suppuration in the Hypochondria; but, before we conclude this Discourse, it will be fit to observe, that *Hippocrates*, in his Prognostics, tells us "That if there be a Pulsation in the Hypochondria, it indicates a Disorder of the Reason, or a Delirium." But, in this Case, we are to observe the Eyes of the Patient; for, if he frequently moves his Eyes, and casts his Looks from Place to Place, Madness is to be expected; agreeably to that in *Coac. 282.* "A Pulsation in the Hypochondria, with a Perturbation or Disorder of the Senses, portends a Delirium; and the more, if it be attended with frequent Motions of the Eyes." And such an Event seems probable, either from an Inflammation of the Diaphragm, or an Effervescence of the Humour, by which a Multitude of Flatulencies are generated; which, ascending in great Quantities to the Head, by heating and stimulating the Membranes of the Brain, excite a Delirium. This Pulsation of the Hypochondria is generally bad; though sometimes good, when it precedes a Crisis; in which Case it is distinguished from a bad Pulsation by critical Signs. But when a Pulsation in the Hypochondria is attended with other bad Signs, it ought to be esteemed a mortal Prognostic; agreeably to *Coac. 283.* where we read, that "A Cardialgia, [*καρδίας πόνος*] attended with a Pulsation of the Hypochondria, and a Fever, in which the external Parts are refrigerated, is bad, both on other accounts, and the more; if it be attended with an EPHIDROSIS" [See that Word]. And let this suffice to be spoken concerning Predictions from good or bad Hypochondria. *Prosper Alpinus de Prasag. Vit. et Morb. Ægrot.*

PRÆCURSORES, in *Paracelsus*, are the Signs of an approaching Distemper.

PRÆDICTIO. A Prediction; that is, a Prognostic.

PRÆFOCATIO. A Suffocation. It is applied to hysterical Fits.

PRÆFURNIUM. The anterior Part of a Chymical Furnace, by which Coals are conveyed to the Grate, or Fireplace.

PRÆGNATIO. Impregnation.

PRÆLINGUA. The anterior Part, or Tip, of the Tongue.

PRÆLUM. A Press, in Pharmacy, for the Expression of Oils and Juices.

PRÆNOTIO. A Prognostic, or Foreknowledge.

PRÆOPINATIO. An Uncertainty in the Mind of a Physician, in prognosticating the Event of a Distemper.

PRÆPARANTIA MEDICAMENTA. Preparing Medicines; that is, such as prepare the morbid Humours, and dispose them to separate from the healthy, and pass off by the Help of Evacuants.

PRÆPARANTIA VASA are the Spermatic Vessels.

PRÆPUTIUM. The Prepuce, or Foreskin. See GENE-RATIO.

PRÆSAGIA. Presages.

Three Things principally contribute to render a Physician perfect: The first is, that, from accurate Observations, he be able to trace and investigate the Origins and Causes of Disorders, in order to oppose them in their Beginnings by proper Remedies; or that, knowing these Causes, he

may give salutary Precepts for preventing their Effects: The second is, that he accurately know the various Natures of Diseases, and their Differences, with respect to different Constitutions, that he may be the better capable of discovering Medicines proper and adequate for removing them. The third is, that he may be able to form a right Judgment concerning the Event of Disorders; as, also, concerning the Operation and Effects of Medicines. But though this last does not contribute directly to obtain the End of the Healing Art; yet it is certain, that it greatly promotes the Certainty of Medicine, and the Reputation of the Physician. For this Reason *Hippocrates*, in the very Beginning of his *Prænotiones*, speaks in the following manner: "It is, in my Opinion, most expedient for the Physician to form a Prognostic; since, when he declares, not only what is past, present, and to come, but, also, what escapes the Patient himself, he must, by these very means, procure the greater Confidence and Trust." And in *Prorrhetic. Lib. 2. Sect. 3.* he tells us, "That the Physician ought to be mindful of this; that, if his Prediction succeeds, he will be admired by the Patient; whereas, if he fails in his Prognostic, he will be hated, if not looked upon as a Madman." But this exalted Art of Prognosticating is so difficult, uncertain, and precarious, that we find, from Experience, the most sagacious Physicians have failed in it; since we often see the Patient die, of whose Recovery they were certain. *Hippocrates* confesses this, and pronounces all Prognostics in acute Diseases fallacious. In consequence of this Difficulty in forming Prognostics, the most sagacious Physicians have placed Medicine among the conjectural Sciences; and the Vulgar have not only deemed the salutary Art uncertain, but, also, despised its Professors.

But, though no Part of Medicine is incumbered with more Difficulties, than the Prognosticating Art, yet I do not despair to reduce it to the Form of a Science, and to establish it on certain general Axioms, and even Definitions; provided we assume what is necessary for this Purpose: But we shall first inquire into the Causes which may have so long hindered this Part of Medicine from being established into a Science. The most considerable, therefore, of these Causes is a Defect of Observations; for, as accurate Observations, and Histories of Diseases, are the first Foundation of Medicine, from which we learn whatever happens in Nature, what Effects are produced in this or the other Disorder, and what Changes are induced on human Bodies by particular Substances; so such Observations supply us with the Circumstances, the Matter and Opportunity of forming right Prognostics. The Physician, who duly compares these Things, and has a sufficient Knowledge of Natural Philosophy and Anatomy, is able accurately to investigate the true and adequate Causes of what is past, present, and to come; from which he can afterwards form a right Judgment of the Danger of a Disease, and tell, whether it will terminate in Death, or Recovery. But, as the Antients drew their Prognostics, not from entire Histories of Diseases, but from particular Circumstances, Numbers of which are collected by *Hippocrates*, and others, who have trod in his Steps, so it is not surprising, that they should rarely answer, but frequently prove fallacious. Besides, as the Antients wanted a rational Medicine, neither understood the true and genuine Natures and Causes of Life, Diseases, and Death, and were grossly ignorant of the Structure of the human Body, and the various Motions depending upon it; so they could not, even from the fullest and most circumstantial Observations, deduce the true Causes and Signs of the future Event of a Disease, with respect to Death, or Recovery: Much less could they comprehend and account for the different Operations of Medicines. Hence it is obvious, that the Antients treated, not only this, but all other Parts of Medicine, in an empirical manner. Thus, for Instance, if any one laboured under an acute Fever, and died under a particular Train of Circumstances, and if this happened for several times, they forthwith laid it down for a Rule, that these Symptoms were Signs of Death. But, because these Symptoms vary very surprisingly, according to the Diversity of Patients, Diseases, Countries, and Seasons, hence numberless Precepts are laid down, especially by the Antients, which rarely hold good; so that *Hippocrates* confessed, that the Prognostics, with respect to Life and Death, were very uncertain in acute Diseases.

That this Art of Prognosticating may receive more Advances, and, in time, find a Place among the Sciences, all Circumstances are to be carefully consider'd, and adverted to, in the Progress or History of the Disease: Nor is it sufficient to know the Disease, and its Causes, since, in order to form a right Prognostic, it is absolutely necessary the Physician should have a perfect Knowledge of the Constitution of the Patient; for it is of great Importance, to know the Age and Strength of the Patient, the State of his Viscera, the Condition of his Blood and Humours, his previous Method of Life, the Season of the Year, whether his Body is strong or weak, and whether his nervous System is disposed to anomalous and spasmodic Mo-

tions. It is, also, necessary the Physician should know the several Stages of the Disease, in which certain particular Symptoms happen: He must, also, inquire in what Method the Cure has been carried on, that thus he may know, whether any Error has been committed by the Patient, or by any other Physician. From these Things, duly consider'd, he is to form a Judgment, what Signs or Symptoms, under these or other Circumstances, in this or the other Patient, prognosticate a salutary, or a fatal Event: For it often happens, that a particular Symptom of the same Disease proves fatal to one Patient, and not so to another. Thus we frequently observe, that when infirm and old Persons, those wasted with Hunger, or previous Diseases, or long Grief, are seized with a Fit of the Stone or Colic, they generally die under the slightest Train of Symptoms, which seem to portend no Danger, and which are easily supported by the Robust and Vigorous. In acute Disorders, the same is, also, observable: Thus, in acute Fevers, those who are of a slender Habit, and whose Parts are exquisitely delicate and sensible, are racked with violent Pains, Anxieties, Watchings, a Delirium, and insatiable Thirst, and yet escape; whereas, when those who are of a spongy Habit of Body, or whose Strength is impaired, are seized with the same Kind of Fever, they do not complain of any great Uneasiness, Pain, or violent Heat; yet die delirious, in the Height of the Disorder, upon the least external Refrigeration. The Stages of the Disorder are, also, of great Importance in forming a Judgment of its Symptoms: Thus it is certain, that an Epilepsy, especially in Children, often happens without any Injury, in the Beginning of the Small-pox; whereas an Epilepsy, in the Height of this Disease, infallibly proves mortal. In the Beginning, also, of the Small-pox, a Phrenitis is in young Persons often observed to be without Danger; but, if it seizes the Patient about the ninth or tenth Day, it is a certain Sign, that Death is not far off: For this Reason, in forming Prognostics, all Circumstances are duly to be separated, distinguished, and considered: Hence *Hippocrates*, in his *Prorrh.* justly advises Physicians to Caution, as in all the Parts of Medicine, so more particularly, in forming Prognostics; for a Physician in no manner opens the Mouths of People against him, and exposes himself to Contempt, more effectually and shamefully, than by false and ill-founded Predictions; especially when a Patient is left for irrecoverable, and afterwards recovers; or, when the Patient dies, though the Physician was absolutely certain of his Recovery: For I have known some Physicians affirm, that their Patient would not die, when a few succeeding Hours have put an End to their Lives.

Thus, though the Prognosticating Art is very difficult, yet the Physician ought to do all he can, to have some certain Signs and Marks of future Recovery, or Death, which, in my Opinion, may be obtained; for it is certain, that all Events, whether with respect to Life or Death, proceed from certain adequate Causes, without which they cannot happen. If, therefore, the Physician thoroughly knows the Causes why a Patient must necessarily die by a Disease; and if he observes these Causes in the Patient, by their usual and infallible Signs; he may certainly, from their Presence, predict and foretell the Event they will produce. In the same manner, if a Physician knows in what Manner, at what Time, by what Ways or Excretions, a Disease is terminated, and the Patient recover'd; from the Presence of these Circumstances, he may confidently and reasonably predict future Health. We must, also, condemn the Practice of those Physicians, who, in the Beginning or Progress of a Disease, before they either have, or can have, certain Signs, either of Health or Death, rashly form a Prognostic, with respect to its Event: For we are by no means, from the Beginning of a Disease, to form a Judgment of its End; for a Disorder which begins gently, and proceeds mildly, often rages with Violence, when arrived at its Height.

I am not of Opinion, that a Physician can, in the Beginning or Progress of a Disease, form a Prognostic, either with respect to the Life or Death of the Patient, as the Vulgar believe, and, therefore, demand a satisfactory Answer from the Physician. I assert, however, that both in acute and chronical Disorders, there are certain Signs and Marks by which we may both foresee and predict a fatal, or a salutary Event; but, before we can do this, we must wait for the Times in which these Signs discover themselves. Besides, it is one thing to pronounce a Disease dangerous, and another to prognosticate future Death; for the former may be conjectured at, even in the Beginning of the Disease, from the Nature and Strength of the Patient, and the Genius of the Disease; whereas the latter cannot be prognosticated, except when the true Signs of Death are present. But, before we consider the Signs by which we may be sure of a future Death, in any violent and dubious Disorder, we shall give a Theory of Death, and investigate its true Causes, that what we are afterwards to advance, may be the better understood.

As the Antients were entire Strangers to solid Reasoning in medicinal Affairs, so it would be to no Purpose to endeavour from their Works, to discover wherein the Nature and Essence of Death consists; for they assert nothing more, than that Life consists in a due Temperament of the innate Heat, and the radical Moisture; and Death in the Exinction of these: But as these Words convey no clear Idea to the Mind, so nothing solid or satisfactory can be deduced from them: But after, in our Times, by the Study and Contemplation of Nature, and by a careful Discovery of the Structure of the human Body by Anatomy, Light and Truth began to diffuse their genial Rays on Medicine, and the Circulation of the Blood was discovered, the Reasons and Causes of Life and Death can no longer remain in the Dark; for as by the constant and free Circulation of the Blood and Humours, the Body, in itself subject to Putrefaction, is preserved from every Degree of Corruption, all the Actions, whether natural or animal, remain entire, and Vigour is imparted, both to the Mind and Body; so, when this Circulation is totally destroy'd, we observe, that the Force of the Mind and Body is cancel'd, all their Functions cease, and the Body itself is forthwith converted into Putrefaction: Hence we understand, that Death is present, when the Circulation of the Blood is so effectually stopped, that it can by no Means or Art be restored. Now, as this Circulation of the Fluids depends on the Motion, Impulse, and Tone of the Heart, Arteries, and all the Vessels furnished with nervous moving Fibres, so the Cause of Death is only to be sought for in a total Destruction of the Pulsation of the Heart and Arteries, and an effectual Abolition of the Motion of the Thorax, so subservient to Respiration. We now come to explain, how in Diseases these Motions of the Heart and Thorax are totally intercepted.

The Seats, therefore, of Diseases, and, consequently, the Causes of Death, can in no manner be more accurately investigated, than by Anatomy, or the Inspection of Carcasses: Now, upon laying open Carcasses taken off by any Disorder, the evident Causes of the Patient's Death are forthwith subjected to our Senses; for whether the Patient has died of an acute, or a chronical Disorder, a putrid Corruptio of some Part or other, accompanied with an highly fetid Smell, is always observed; for always, in some of the nobler internal Parts, either in the Stomach and Intestines, or within the Brain, and its Membranes, or in the Liver, Uterus, Kidneys, Spleen, or Lungs, there is a certain putrid and sphacelous Corruption, hardly tolerable on account of its fetid Smell; and this is found to proceed either from a Stagnation or Inflammation of the Blood, which, in acute Disorders, produces Death; or from a Stagnation and Extravasation of the Blood and Humours into the principal Cavities of the Body, such as the Head, Thorax, or Abdomen. This last principally happens in chronical Diseases, where the Viscera, especially in the Thorax and Abdomen, are found corrupted by extravasated Pus, or Serum. Upon dissecting the Bodies of those who have died of any violent Disorder of the Head, an Apoplexy, for Instance, or a Lethargy, there is always an inflammatory and sphacelous Stagnation of Blood, in the Meninges, observed: The like happens in those who die of violent Disorders of the Breast; for in Patients taken off by a profound Pleurisy, or Peripneumony, the whole vascular Compages of the Lungs is found infarcted and obstructed, by-corrupted Blood. In Patients who die by a Phthisis, the Lungs are found full of purulent Tubercles, or a great Part of them are corrupted, and corroded with Pus. In convulsive Asthmas, a large Collection of Water in the Thorax generally destroys the Patient; and in a suffocative Catarrh, which soon proves mortal, there is a Collection of Blood or Serum in the Bronchia of the Lungs, which hinders the free Ingress and Egress of the Air. In investigating the Causes of Death, in those Disorders which have their Seat in the Abdomen, we find in a Cachexy and Dropsy, that the Liver and Omentum are indurated, or corrupted by a large Extravasation of Serum. In the Morbus Niger of Hippocrates the Spleen is generally large, infarcted, and corrupted, whilst, at the same time, there is an Extravasation of Blood in the Cavity of the Stomach and Ileum. In those who die of violent Iliaz Passions, Colics, Choleras, Dysenteries, and Cardialgias, the Parts of the Stomach and Intestines, are found inflamed, sphacelated, and corroded, so as to diffuse an highly fetid Smell. The Patient who dies of a violent Pain arising from a Stone firmly impacted in one of his Ureters, has his Stomach principally inflamed, the Kidneys, and urinary Ducts and Passages, being at the same time affected, and corrupted. In such Disorders of the Uterus as prove mortal, the Womb is either inflamed, exulcerated, sphacelated, or corrupted by extravasated Serum.

As for acute Disorders, the most considerable of which are Fevers, which destroy so many in the Flower of their Age, and are so unfriendly to the human Constitution, they prove

fatal in no other manner than by an Inflammation, which terminates in a Sphacelus of the internal Parts, especially of the Stomach, Intestines, and Meninges; for these Phenomena are universally observed in those destroyed by Fevers. Poisons of every kind prove mortal by a sphacelous Inflammation, especially of the Primæ Viæ, which, upon opening the Patient immediately after his Death, is subjected to the Senses; so that such an Inflammation is, among all others, the most certain Sign of having taken Poison. In Patients destroyed by Worms, the Intestines are visibly corroded and inflamed. From all which I think it sufficiently obvious, that Death cannot readily happen, without the Putrefaction and Corruption of some internal Part; so that Putrefaction may be justly said to be highly unfriendly to Life, and fatal to Mankind; for, as the Putrefaction of the human Body quickly succeeds a total Destruction of the Circulation of the Blood, so it is generally the adequate, true, and almost perpetual Cause of Death, and which attacks either the external Parts, though rarely, or, which happens most frequently, those of the internal Kind; so that we may truly affirm, that hardly a Patient among a thousand dies without a Sphacelus: Only we must except such as die violent Deaths, and those who are suddenly taken off by a Polypus blocking up the Mouths of the Vessels. But, in all other Subjects, when opened after Death, a fetid Putrefaction, highly ungrateful to the Smell, is perceived.

But though the Causes of Death are most evidently discovered, by dissecting Persons after Death; yet we must here give a Caution, not to confound the Causes of Death with the Causes of Diseases, which we see frequently done: For I have observed, that several Physicians, when a Patient dies of a dangerous Disorder, immediately order his Body to be laid open; and, when the internal Parts are found sphacelated and corrupted, they shew them to the By-standers, and inform them, that the Patient could not possibly be saved, in consequence of so violent a Disorder, thus manifestly confounding the Causes of his Death, with the Causes of his Disease; whereas it ought principally to be consider'd, whether those Causes which produced Death, might not, by proper Measures, taken in due Time, have been prevented. By these means they endeavour, artfully, to palliate and cover their Errors, if they have, possibly, committed any. Since, therefore, the Nature and Essence of Death consists in a putrid Corruption; hence we may justly infer, that the Physician, who intends to preserve his Patient, ought carefully, by proper means, to prevent and remove this sphacelous Corruption, which always proceeds from a Stagnation of the Humours, and strictly forbid him the Use of every thing which can, in the least, promote such a Putrefaction.

But, that we may more accurately consider this Subject, and be able, from certain Signs and Marks, to foresee and predict such a future Corruption, we are to investigate the Causes by which it is generated in the human Body: For as no Effect in Nature is produced without certain and adequate Causes, so, we may affirm, that there are certain Causes of this Corruption, from which, when present, a right Prognostic is to be deduced. But, before we attempt an Explication of these Causes, we shall briefly shew, why Putrefaction is so unfriendly to the human Constitution, that a slight and gentle Sphacelus, in a small Part of the Stomach and Intestines, is sufficient to destroy the Patient suddenly. This, therefore, in my Opinion, happens in the following manner: The Circulation of the Blood, on which depends the Soundness of all the Functions of the Body, is supported by the Impulse, Strength, and moving Force of the Solids. But this depends not, as some imagine, on any immaterial Being, but, rather, on the highly subtile Fluid of the Blood and Nerves, and its Influx into these Parts, as is sufficiently obvious from this Experiment, that when the Nerve, or Artery, which runs to any Part is tied, or cut, all Sensation, Motion, and Nutrition, are destroyed in that Part. Besides, that the Strength of the Parts depends on some material Principle, is certain from this, that, by Hunger, Strength is impaired; but immediately restored by the Exhibition of proper Aliments. Now there is nothing in Nature so prejudicial, and which so soon destroys Strength, as Putrefaction; as we observe in a Sphacelus, or in an exulcerated Cancer, which soon destroys, not only Strength, but Life. It is, therefore, certain, that Putrefaction conceived in the Body, especially when it increases and diffuses itself, intimately mixes its malignant Vapour, principally with the nervous Parts, and moving Fibres; and being highly unfriendly to the Fluid, which is the Origin of the Motion of the Solids, it corrupts it, as it were, extinguishes the Systole and Diastole of the Heart, and totally destroys the Tone and Motion of the Fibres.

In Diseases there are, therefore, two Methods by which Death is brought about; one of these is sudden and precipitate, and this is produced by violent Constrictions of the nervous Parts, which either arise from Inflammations, and sometimes,

in the Vigour of the Disease, generate fresh inflammatory Stagnations, which tend to a Sphacelus, and the Death of the Patient, which principally happens in Fevers, and acute Disorders: The other Method is more slow, and happens gradually, from a Corruption of the Viscera, and a Stagnation and Extravasation of the Humours; and this principally happens in chronical and long-protracted Disorders. As for Death, in acute Disorders, or Fevers, it generally proceeds from violent Spasms, which bring on an Inflammation of the Stomach, Intestines, or Membranes of the Brain, together with a mortal Corruption; for Spasms are universally hurtful, and unfriendly to the Constitution, because they direct the Motion of the Blood and Humours from the Circumference of the Body to the internal Parts, and obstruct the salutary Secretions, so necessary to Life and Health. Besides, such is the Force and Power of Spasms, that they hinder the free Circulation of the Blood, in which the very Essence of Health consists; and, by rendering its Motion unequal, produce Congestions of Blood in the nobler Parts, especially in the Head, Stomach, and Intestines, which, if not surmounted by Nature, by means of an happy Discussion and Resolution, infallibly bring on Corruption and Death: For in every Commotion of Nature, or Fever, there are two Kinds of Motions, which ought to be duly adverted to, and carefully distinguished from each other. The one is highly pernicious, and performed from the Circumference to the Centre: This is that spasmodic, and always morbid Motion, which tends to the Destruction of Nature, and the vital Motions, and discovers itself by Coldness, Rigor, Horror, Anxiety, and a small and weak Pulse. The other is of the salutary Kind, succeeds the Spasms, is contrary to them, directed from the Centre to the Circumference, and discovers itself by Heat, and a brisk and strong Pulse: And this is, as it were, the Medicine of Nature, which frees the Body from Destruction, and by means of which these spasmodic Strictures are resolved, the inflammatory Stagnations dissolved, and the excretory Ducts, before closed up and constricted, happily open'd. This is that Motion which the Antients called *the healing Power of Nature*, by the Efforts of which Diseases are subdued, the Patient recovered, and the Danger of Death averted: This is, also, that Motion under which no ones dies, which rather happens under a spasmodic Motion directly contrary to it. The Physician, therefore, who duly knows the Genius, Power, mutual Actions, Effects, and Relations, of these two opposite Motions, is able to act with Prudence in the Management of Diseases, to foretel their Dangers judiciously, and with Reputation to prognosticate their happy Terminations: Such a Physician is, also, qualified for understanding the seemingly uncouth Phrases of the Antients, when they tell us, that a Fever is the Struggle of Nature with a Disease; and that the Patient recovers, when Nature gets the better of the Disorder: For if Spasms, Inflammations, Congestions, and Stagnations of Blood, in themselves mortal, are not in a certain Period of Time, by the hot, solvent, and febrile Motion, digested and dissolved, but remain in their full Force and Vigour, then Nature sinks; and the Patient must necessarily die. But since there are certain Signs, by which the Victory both of Nature over the Disease, and of the Disease over Nature, may be estimated, it is sufficiently obvious, that the Prognosticating Art depends upon certain Principles and Foundations.

We shall, therefore, here briefly consider those Effects and Signs of fatal Spasms, as rarely prove fallacious in acute Disorders; and such as, if they appear about the critical Days, after the Patient is weaken'd by the Disease, and either are not removed, or increase, may render the Physician pretty certain, with respect to the fatal Termination of the Disorder. Nor are these fatal Spasms observable in one, but in many Parts of the Body. If, therefore, a Rigor, accompanied with Coldness, is observed about the Height of the Disease, or recurs often; if the Body is not equally soft, but hard, dry, and rough; if exanthematous Eruptions are, by the Spasms of the Skin, repel'd or diminished; if the external Parts are seized with an Horror and Coldness; if Fontanels, or Ulcers, discharge no more Matter; these are bad Signs, and prognosticate the greatest Danger of Death; because, in consequence of the Spasms of the Skin, the Motion of the Blood and Humours to the internal Parts excites dangerous inflammatory Congestions, and hinders the peccant Matter from being expelled by Perspiration. In acute Disorders these Spasms generally affect the Parts subservient to other Excretions; such as those by Urine and Stool, by constricting which, the Urine is render'd thin and aqueous, the Patient costive, and afflicted with an Hardness and Tension of the Abdomen. Some Patients, in consequence of the Violence of these Spasms, are afflicted with a frequent Desire of discharging their Urine and Excrements.

But the Danger is still greater, when these spasmodic Contractions affect the internal and more noble Parts, subservient to the vital Motions; for the small, the contracted, the quick

and hard, as, also, the unequal and intermittent Pulse, proceed from no other Cause than the spasmodic and convulsive Stricture of the Nerves, which terminate in the Fibres and Coats of the Heart, and always, in the Height of the Disease, prognosticate great Danger. Equal Danger is indicated, by a frequent, uneasy, and difficult Respiration, happening about the critical Times; for, as *Hippocrates*, in his Prognostics, justly observes, that as in all Diseases an easy Respiration is of great Importance to Recovery, so in acute Disorders, a frequent and difficult Respiration is always an unlucky and inauspicious Omen. If the Nerves of the Præcordia are affected with violent Spasms; insupportable Uneasiness, Inquietude, Tossing, and Change of Situation in the Bed, happen; if the nerveo-muscular Membranes of the Oesophagus and Stomach are seized with Spasms, Efforts to vomit, Regurgitations of the Liquors drank, frequent Discharges of a limpid Serum from the Fauces, Difficulty of Deglutition, a Dryness of the Tongue and Mouth, afflict the Patient; and if the Duodenum is drawn into Consent; the whole Body, and especially the Face, is tinged with a yellow Colour: But when more excessive and universal Spasms shake and rack the whole nervous System, the certain Death of the Patient may be prognosticated from the Pinching of his Nostrils, his collapsed Temples, his cold and flaccid Ears, his hollow Eyes, the Coldness and Tension of his Skin about the Forehead, and his black or highly pale Colour; all which make up the *Facies Hippocratica*, an infallible Prognostic of Death. Convulsions of the Nerves, which, according to *Hippocrates*, in *Sept. 4. Aph. 6.* are always bad Signs in acute Disorders, are indicated by the following Signs: If the Patient lies on his Back, with his Knees contracted; if he falls downward to the Feet of the Bed; if he makes bare his Arms and Legs, and tosses them irregularly about him; if his Nails and Fingers are pale; if he gathers the Knaps, or Fingers the Edges, of the Bed-cloaths; if he picks off the Eminences from any adjacent Wall, and is afflicted with a Twitching of the Tendons: When all these appear, they prognosticate a speedy Death.

Tho' most acute Disorders have, for their Cause, an Inflammation of some internal Part, and, for that Reason, are not free from Danger; yet, in the Height and Violence of the Distemper, fresh Inflammations are frequently formed, especially in the Stomach and Membranes of the Brain, and such Inflammations are always terrible and sure Prognostics of Death: These Inflammations, whether separately or jointly, infallibly destroy the Patient, if they appear on the seventh, ninth, or eleventh Day, not only of malignant, petechial, contagious, and Camp-fevers, but, also, in other acute Fevers, such as the Synochus, Burning Fevers, the Purple Fever, the Small-pox, and Measles: An Inflammation of the Stomach is known, if there is a violent Heat, and, as it were, a Sense of Burning, accompanied with an acute Pain about the Præcordia; if these Parts are hard to the Touch; if the Extremities are cold; if the Patient is uneasy and restless; and if every thing he takes, whether Medicines or Drink, is immediately either thrown up by Vomit, or, if retained, creates great Uneasiness, and increases the Anxiety: Sometimes, also, the Inflammation is so great, as to pass through the Oesophagus to the Fauces, which, in this Case, are full of burning painful Puustules, and continually covered with a viscid and putrid Mucus: All which are Prognostics of a quickly approaching Death. Another more dangerous Inflammation, which is generally joined to this, and happens a little before the Death of the Patient, is, that of the Membranes of the Brain, by the *Greeks* called *Phrenitis*, which generally succeeds an obstinate and continual Watching, and an intense Pain of the Head: Its Approach may be predicted from a previous Rigor, thin and copious Urine, a Ringing of the Ears, a strong Pulsation in the Head, and a Discharge of a few Drops of Blood from the Nose: Its Presence is known from the following Signs: The Eyes are red, fiery, and stern; there is an Alienation of Mind; the Words are senseless and incoherent; the Patient makes improper Answers to the Questions put to him, often discharges Tears involuntarily, gnashes his Teeth, and has no longer any Appetite for Drink. If the Phrenitis is succeeded by a Convulsion, it is a pretty infallible Sign of a soon approaching Death. These are the principal Causes which, in acute Disorders, take off the Patients. Persons of sanguine Temperaments, those of choleric or sanguineo-choleric Habits, young Persons and Adults, those of delicate Constitutions, those prone to Anger, those of lean and constricted Habits, or who have indulged themselves in high, rich, and spirituous Living, are principally subject to these acute Disorders, which are produced by violent Inflammations and Spasms.

But, in acute and continual Fevers, there is another Cause of Death, in those who are of a plethoric and spongy Habit of Body, who are phlegmatic, or whose Strength is exhausted, either by Diseases, Hunger, long Grief, or Hæmorrhages; for these

these are not so much destroy'd by vehement Spasms, and a terrible Train of Symptoms, as by an Imbecility and Defect of the Motions, a Want of due Tone in the Parts, and a Loss of Strength. In Cases of this Nature, the Stagnations of the Blood and Humours, in the very Beginning of the Disorder, dispose to a putrid Corruption. And as these Disorders are attended with mild Symptoms, they often deceive the Physician, and elude his Prognostics. Hence, because their Nature is not so evident, but occult, their Events are, with Difficulty, prognosticated, and they are generally classed among the Fevers of the malignant Kind. Such Fevers are known by the following Signs: They appear with a slight Coldness and Horror; but, in the very Beginning of the Disease, there is an uncommon Loss of Strength, and a languid, frequent, and contracted Pulse. In an erect Posture the Patient easily faints away; the Urine is thin, and without a Sediment; the Patient cannot sleep, though he has a perpetual Propensity to it. This Condition is succeed by a still greater Loss of Strength, and an Alienation of Mind; he complains of no Pain, Thirst, or any great Uneasiness; he is, however, pretty restless, and tosses in Bed; and if his Extremities become cold, and his Pulse begins to be defective, and can no longer be felt in his Wrists, we may justly prognosticate, that the Death of the Patient is not far off. But tho' such Patients are not taken off without an Inflammation of the Stomach, and Membranes of the Brain, yet this Inflammation is not accompanied with violent Spasms, or terrible Symptoms. But a Corruption is easily brought on, which accounts for their Death.

But since all Inflammations generally terminate in a Morrification, or sphacelous Corruption, we shall subjoin some Marks or Signs, by which the Transition from the Inflammation to the Sphacelus may be known. In this Case, therefore, a certain internal Sense of Coldness is perceived; the before-intense and acute Pain about the Head, or inferior Parts, suddenly ceases; the Mind before disorder'd, in some measure, resumes the Exercise of Reason; the Defect of Strength is increased, and the Pulse is either totally deficient, or highly unequal, contracted, and intermittent: The Patient, though before excessively costive, has his Body rendered soluble, or discharges his Excrements involuntarily; his Countenance is unseemly and pale, his Temples, Neck, and Breast, are moist, with chilly Sweat; his Extremities are cold, his Pulse begins to be palpably defective, Rumbling and Noise arise in his Belly; and when the Liquids he drinks descend, they make a Noise, as if they were poured into a deep Vessel: All these are Prognostics of a quickly approaching Death; because, in consequence of the Increase of the Sphacelus, the Tone of the Parts is incredibly destroy'd, and the Strength wonderfully impaired. When plethoric Patients suddenly die of an internal Sphacelus, a few Hours after their Death, their Abdomen becomes surprisingly tumid, large Vesicles arise upon the Surface of the Body, the Face becomes hard and green, the Corps is intolerably fetid, and an ill-smelling Blood is frequently discharged from the Mouth and Nostrils.

There is another Kind of Death incident to those who labour under violent Disorders of the Breast; and that is, Suffocation; which generally takes off those afflicted with a Quinsy, a Peripneumony, a suffocative Catarrh, a convulsive Asthma, and a Dropsy of the Thorax; for these Disorders not only totally intercept the free Ingress and Egress of the Air from the Lungs, but, also, destroy the Circulation of the Blood from one Ventricle of the Heart, thro' the Vessels of the Lungs, to the other. Thus an Angina, possessing the internal Muscles of the Larynx, when there is neither any Pain nor Redness in the Neck and Fauces, but, at the same time, an intense Pain, and violent Fever, quickly destroys the Patient by Suffocation. In this Case, as *Lommius*, in *Lib. 2. Obs. Medic.* has observed, the Eyes are distorted, red, and prominent; as in those who are strangled; the Voice is inarticulate, small, and resembling the Squeaking of Puppies; the Mouth gasps eagerly for the cold Air, a frothy Saliva is discharged from it, and the Tongue hangs out; Liquors drank regurgitate through the Nostrils; the Patient is totally uneasy, frequently leaps out of Bed, and at last dies of a Suffocation and Syncope. A Peripneumony, also, destroys the Patient by Suffocation; for, if nothing is expectorated, if there is a great Difficulty of Breathing, and Restlessness, if the Matter of the Spit is perceived to make a Noise in the Breast, if the Pulse is unequal and intermittent, if the Strength is impaired, and the Patient seized with a Flux, if what is thrown up on Coughing is frothy, and sometimes bloody, and sometimes yellow, if there is a continual Watching, if a Phrenitis succeeds, if the Desire of drawing in the cold Air is excessively great, if the Patient is fond of lying on his Back, and in an erect Posture; for when he lies reclined upon his Face, he is ready to be suffocated; and in this Case the Patient infallibly dies on the fifth, or, at most, on the seventh Day.

Those who die of a convulsive Asthma, are, also, destroy'd by Suffocation; for this Disorder generally arises from a Dropsy of the Thorax, suddenly produced by a Rupture of the Hydatides: When, for Instance, a large Quantity of Water, by its Weight, hinders the Motion of the Diaphragm, and the free Expansion of the Lungs, so that the Air can neither enter them, nor the Blood pass freely through them. A suffocative Asthma is, also, pro-

duced, when the interior glandular Coat of the Bronchia, which is furnished with many large Glands, is so contracted, that the Air contained in the Lungs can neither be expelled, nor fresh Air received. Convulsive Spasms, also, frequently contract the Bronchia so powerfully, that the Patient miserably dies of a Suffocation. In all these Disorders, there is the greatest Anxiety and Restlessness, a tremulous Breathing, an irregular and unequal Pulse, a Rattling and Noise are perceived in the Breast; the Patient cannot rest in one Place; a certain frothy, or bloody Matter is expectorated; and, at last, the Extremities becoming cold; the Patient dies of a Suffocation and Syncope. The like happens in a suffocative Catarrh, which is principally incident to old Persons, those of weak Habits, and Infants; and generally arises from a Palsy of the pneumonic Nerves. In this Disorder, also, the Breath is drawn with the greatest Difficulty and Uneasiness; the Bronchia are filled with an Humour secreted from the Blood; and, because no Spit is expectorated, the received Air makes a great Noise in the Breast, till at last the Patient is suffocated for want of Air. Besides the Signs already mentioned, there are; also, other infallible Marks of Death; such as an intermittent, small, and totally defective Pulse, which frequently happens a few Hours before Death. It, also, often happens, that a violent Uneasiness, accompanied with a Coldness of the Extremities, comes on. In Phthisical Patients, when a considerable Cavity, corroded in the Lungs, contains a large Quantity of Pus; and the Pus, in consequence of a Defect of Strength, ceases to be expectorated, Death soon succeeds.

Having considered those Disorders, which destroy by Suffocation, together with their mortal Signs, we shall now treat of some other acute Diseases, which destroy the Patient, both by Inflammation, and violent Spasms; and consider by what Signs Death may be foreseen and prognosticated in them. If, therefore, a white Purple Fever, which arises from an highly vapid and corrupted Lymph, appears in the End of other Fevers; the Measles; or Small-pox, or in Childbed, after the Lochia are suppressed, it is always dangerous, and generally destroys the Patient by an Inflammation of some of the internal Parts, especially of the Stomach and Intestines. It is a mortal Sign, when a violent Heat of the Præcordia, and a great Uneasiness, are succeeded by a Sense of internal Coldness, accompanied with a small, weak, and unequal Pulse; when the Purple Eruptions disappear; when the Patient faints away, has his Mind disturbed, and his Respiration difficult. I have rarely known any young Person to escape in the Small-pox, if the Disorder seizes him with a violent Pain of the Loins, and a Delirium; if, on the second Day, rough Efflorescences and Spots, like the Purple Fever, appear on the Skin; if, on the fifth and sixth Days, after a total Eruption, the Pulse is not more moderate, but continues equally quick; and if the whole Body is covered with Pustules. But, about the ninth Day, a burning intense Pain of the Hands, produced by the Exulceration, frequently changes all the Symptoms which promised the Recovery of the Patient; for this intense Pain, affecting the whole nervous System, produces the greatest Uneasiness, Tossings, and a subsiding of the Pustules; and afterwards a difficult Respiration, a Disturbance of Mind, Convulsions, and a small languid Pulse, coming on, soon put an End to the Patient's Life.

Those who die by any highly emetic, or purgative Poison, are destroy'd by a sphacelous Inflammation, as is obvious from dissecting their Bodies. The Signs of an approaching Death, in this Case, are, when internal Heats, and violent Uneasiness, are succeeded by a small, unequal, or totally defective Pulse, accompanied with a cold Sweat, a Delirium, and Convulsions; which, when brought on by a purgative Medicine, are by *Hippocrates*, in *Aph. 25. of Sect. 7.* and, in several other Parts, pronounced mortal. Those who die of the Stone, are generally taken off by an Inflammation of the Stomach and Meninges; for, if a Vomiting, and acute Pain, are succeeded by a Fever, accompanied with great Uneasiness, and an insatiable Thirst, and if afterwards an Hiccup, a Delirium, and a Coldness of the Extremities, come on, the Patient will not live long. In a Cholera, if acute Pains and Gripes happen; if Humours, especially of a green Colour, are imperiously discharged by Vomit and Stool, if there is an insatiable Thirst, if the Countenance is yellow or pale, and the Pulse small or contracted, the Disorder is not without Danger. But if the Pulse is totally defective, if the Legs are contracted, the Body covered with a cold Sweat, and the Patient seized with Deliquiums, these are pretty sure Signs, that the Inflammation is degenerated into a Sphacelus. Now the most certain Signs of a Sphacelus are, when the acute Gripes suddenly cease, when the Extremities become cold, and the Strength is greatly impaired. An Hiccup, a Cardialgia, Heat, and Uneasiness about the Præcordia, generally precede this Condition, and indicate a fatal Inflammation of the Stomach. In the Iliac Passion, where the Pains are intense, and accompanied with Costiveness, and a continual Vomiting of fetid Matter, if an Hiccup, a Delirium, cold Sweats, Refrigeration of the Extremities, and Convulsions of the Nerves, come on, these are certain Signs of an approaching Death, as *Hippocrates*, in *Sect. 7. Aph. 10.* has justly observed. Violent convulsive Colics take the Patient off in the same manner; for, in this Disorder, there is often such an intense Pain in the Intestinum Rectum, produced

produced by the stagnant hæmorrhoidal Blood, that this Intestine is not only seized with an Inflammation, but, also, a mortal Sphacelus; under which, in consequence of the putrid State of the Intestine, highly fetid Excrements are discharged; a frequent and weak Pulse, accompanied with a great Loss of Strength, succeeds; and the Sphacelus often spreads to the external Parts, and the Scrotum; after which, the Patient is seized with Delirium, and soon dies.

'Tis certain, that many Women die either during, or after Labour; for which Reason we shall consider some of the most fatal Presages and Prognostics, in Cases of this Nature. If, therefore, a Woman, in consequence of an unnatural Situation of the Fœtus, especially when too large, is, for some Days, successively racked and fatigued with violent Pains, accompanied with internal Heat, which may be known by the Celerity of the Pulse, it frequently happens, that in Labour, or after it, the Strength being suddenly lost, she falls into a kind of Delirium, or Disorder resembling an Apoplexy, and can by no means have Strength and Life restored to her: In such a Situation, it is a Sign of Death, when the Disorder lasts for some Hours, and the Patient cannot be roused by the most penetrating Medicines, such as Spirit of Sal Ammoniac, prepared with Quick-lime, and mixed with Oil of Rue, put into the Nostriils. If the Face, during the Paroxysm, remains red, it is a Sign, that the Blood, too impetuously convey'd to the Brain by the Spasms, has produced this Disorder, in every respect so like an Apoplexy; and, after the Death of the Patient, a bloody fetid Serum is generally discharged from the Mouth and Nostriils. If, after the Fœtus is dead in the Uterus, the Mother dies in Labour, the Child is frequently expelled, in consequence of the Relaxation of the Passages, and the internal fermentative Motion. Those Women who die in Childbed, for the most part, suffer great Pains from a Retention of the Lochia; but if these Pains are not succeeded by the Lochia, but rather accompanied with a Flux, a fatal Inflammation of the Uterus, and a Fever, generally succeed. Such an Inflammation is known from a burning Heat, reaching from the inferior Parts to the Region of the Heart; and, if it is accompanied with great Uneasiness, Loss of Strength, Restlessness, and a total Loss of Appetite; if afterwards there is an internal Sense of Cold, with an Horror, a frequent, small, and weak Pulse, and if the Sight begins to grow dim, these are Signs, that Death, proceeding from a Sphacelus, is not far off. Many Women in Childbed die with the full Use of their Reason, which frequently returns to them a few Hours before their Death; so that unskilful Persons conclude them to be in a fair way of Recovery, whilst the more skilful and judicious know, from the State of the Pulse, that Death is approaching. If, in consequence of a large Effusion of Blood, after Labour, and in Childbed, a slow Heat, accompanied with a frequent and weak Pulse, and which is not allay'd in the Morning after Sleep, is brought on, and attended with a total Loss of Appetite and Strength, the Patient generally dies of a Syncope, about the End of Childbed, that is, in the sixth Week.

In an exulcerated Cancer, scarcely any Patient is preserved, on account of the violent Corruption, which is indicated by the black, thin, and highly fetid Sanies. In this Case, the Patient is afflicted with a slow Fever, and the Strength daily decreases; the Sleep, also, is uneasy, restless, or none at all, till, at last, a Delirium and Death ensue. Persons are sometimes suddenly taken off by the Retrocession of Inflammations of the external Parts; such as Erysipelas, and the Gour, either in the Feet or Hands. Nor does this happen in any other manner, than by an Inflammation of the Stomach and Intestines. But 'tis still more dangerous, if, in the Plague, Carbuncles and Buboes recede, or are not sufficiently expelled; for, in this Case, the Death of the Patient is certain, since he is seized with an Horror, becomes restless and uneasy; an Heat seizes the Region of his Stomach, whilst his Extremities are cold; he has a Desire to vomit, or is seized with an Hiccup; after which, the Patient is afflicted with a Perturbation of Mind, and dies of a Syncope. If any one dies of an excessive Loss of Blood, which may happen in Miscarriages, a Spitting of Blood, a Vomiting of Blood, the Morbus Niger of Hippocrates, or violent Hæmorrhages in Fevers, such a Patient is taken off by a Delirium and Syncope. But 'tis to be observed, that, for the most part, Death is preceded by an insatiable Thirst, an Inclination to vomit, a weak and frequent Pulse, and Convulsions of the Extremities, which are Signs, that the Blood, stagnating in the internal Parts, such as the Head and Stomach, still excites some Spasms; for Thirst generally arises from a spasmodic Stricture of the glandulous Coat of the Oesophagus. The Disorders of which Children die, are generally of the spasmodic and convulsive Kind, and bring on an Inflammation and Sphacelus, especially of the Stomach, Intestines, or Head; for, in consequence of the acute Pains, they easily fall into Epilepsies and Convulsions, Fevers and Athmas. If one epileptic Fit succeeds another, and if the Patient was before very colic, he spontaneously discharges highly fetid and black Excrements: If the Voice becomes thrill and interrupted, and the whole Body is intensely hot, we may prognosticate, that Death is not far off.

We now come to consider the Presages of Death in some chronical Disorders, the most considerable of which are the Dropsy, a Cachexy, the Scurvy, a Consumption, an Hætic, a Phthisis, and a Tabes. Those who are destroyed by these Distempers, die slowly, but certainly; because, though the Corruption of the Viscera, from a Stagnation or Extravagation of the Humours, proceeds slowly, yet it cannot be removed by any means. The Signs of a Corruption of the Abdominal Viscera, and, consequently, of approaching Death, are, a Loss of Appetite, and a Loathing of such Aliments, as the Patient was fond of, when in Health. If the slow Fever increases, and the Pulse becomes quicker, these Signs always denote an internal Corruption; which is, also, indicated by a Loss of Strength, a great Difficulty of breathing, and restless Sleep, which rather weakens, than refreshes. If these Symptoms afflict the Patient long, and yield to no Medicine, they are certain Prognostics of Death, especially in old Persons, or those, who, in consequence of a previous Disorder, have fallen into such a chronical Disease. These are some of the most common Signs of Death in chronical Disorders. But we shall add some, peculiar to certain Diseases of the chronical kind. As for a Phthisis, then, the Signs of Death in this Distemper are; if the whole Body is consumed; if a continual Hætic Fever afflicts the Patient; if the Face is red, and the Body preternaturally soluble; if there are colligative Sweats, and oedematous Swellings of the Feet; if the Spit is suppressed, the Nails pale, the Eyes sunk, and the Nostriils sharp and pinched. In case a Dropsy succeeds a long-continued Asthma, and Palpitation of the Heart, or an Induration of the Liver, a Quartan, we may pretty certainly prognosticate, that the Patient cannot be preserved; and if the Urine is small in Quantity, turbid, and red, it is a very bad Sign. If the superior Parts become slender, and the Face assumes a yellowish Colour, we may pretty infallibly prognosticate Death some Months before it happens; but the Patient is infallibly destroyed, if the Fever is increased, and the Respiration rendered more difficult. Those who frequently, and especially after violent Exercise of the Body, or Commotions of Mind, perceive an obstinate Palpitation of the Heart, and afterwards fall into a convulsive Asthma, a Spitting of Blood, or a Dropsy, may have their Death prognosticated a long time before it happens, especially if they are afflicted with Deliriums; for the Cause of all these Disorders is a polypose Concretion in the Vessels of the Heart, which cannot be removed by any Medicine; and which, with the Concurrence of other Causes, generates these terrible Disorders; and if Deliriums, also, produced by the Polypus, happen frequently, and without any manifest Cause, the Patient generally dies suddenly. This Doctrine is, also, confirmed by the Authority of Hippocrates.

When a sphacelous and mortal Corruption affects the Liver, there is a great Loathing of Food, especially of Flesh; there is a frequent and insatiable Thirst, a Fever, a Loss of Strength, an Hiccup; now-and-then Serum, or yellow Bile, is discharged by Vomit, and the Body is gradually consumed. In such Cases, after Death, I have observed the Liver evidently sphacelous and black. An Exulceration of the Stomach, also, produces a long and mortal Disorder, and is known, if a great Uneasiness and Vomiting succeed Eating: And these Misfortunes are increased by any acrid and saline or spirituous Medicines; the Body is wasted, the Pulse is always quick, the Extremities seized with a Rigor, and sometimes with an Horror; Fontanels are dried up, and the Sleep is little and restless; such Patients die in the third or fourth Month, and their Death may be prognosticated a long time before it happens. In a Cachexy, if the whole Body becomes tumid, inflated, and pale; if there is a Loathing of Food; if the Patient frequently vomits a fetid Matter, and discharges little by Stool; if the Urine is crude, and in small Quantity; if the Respiration is difficult, and the whole Body fetid; if afterwards a frequent Pulse, and a more difficult Respiration, happen, the Patient's Death, in some Months, may be prognosticated; and it happens the more infallibly, the more Errors in Diet, or excessive Drinking, the Patient commits; or the more he is afflicted with long Grief.

We shall, farther, subjoin some useful Cautions with respect to forming Prognostics. Spasmodic chronical Disorders are, therefore, to be carefully distinguished from those of the acute Kind; for, in hypochondriac and hysteric Disorders, such Symptoms occur, as in acute Disorders prove mortal, but are less dangerous in the former; for nothing is more frequent in hypochondriac and hysteric Affections, than for the Patient to be afflicted with violent Uneasiness, a Difficulty of Breathing, a Coldness of the Extremities, a thin and watry Urine, a small and weak Pulse, and frequently violent Deliriums; which Symptoms are, however, soon carried off, without any Danger. The Stages of Distempers are, also, to be carefully distinguished; for, of all the mortal Signs already enumerated, if some, or even a considerable Number, should appear in the first Days of a Disorder, those would act inconsiderately, who should

should thence conclude, that Death was at hand. But it is otherwise, if, after the Strength is, for several Days, exhausted by excessive Heat, Want of Appetite, Anxiety and Pain, those fatal Spasms, and the Symptoms produced by them, appear; especially at those times, on which the Disorder is generally terminated in a salutary manner; which is, for the most part, on the odd Days, that is, the seventh, ninth, and eleventh Day. Great Regard is, also, to be had to the Habits of Patients, whether they are of weak and languid, or of vigorous and robust Constitutions, since the former are always in greater Danger, than the latter. Among the Weak, we reckon old Persons and Infants, those of spongy full Habits, those who have small Vessels, those sprung from weak and infirm Parents, and those weakened by previous Disorders, immoderate Hæmorrhages, long Hunger, the Affections of the Mind, Grief, Care, and Thoughtfulness. Among this Class we, also, reckon Childbed Women, and those, who, in consequence of a bad Regimen, and a Suppression of the Excretions, have contracted a Redundance of impure Juices in their Vessels; for, in all these tender Habits, the Pains and Inflammations easily degenerate into a mortal Sphacelus. We ought, also, carefully to observe, whether the Symptoms, which appear, are excited by external Causes, such as Anger, a Frigate, Refrigeration of the Body, improper Aliment, or Medicines of a drastic or virulent Quality; all which, in dangerous Diseases, and in Persons of weak Habits, are of such a Nature, as to prove mortal, and accelerate the Death of the Patient. But if, in less dangerous Diseases, and in robust Habits, these terrible Symptoms appear, they are not forthwith to be pronounced absolutely mortal. And, lastly, in order to form a right Prognostic, it is of great Importance, duly to consider the Beginning of the Disorder; for every Disease, which, in the Beginning, destroys the Strength, and is accompanied with a frequent Pulse, portends no Good; because it clearly discovers a Loss of Strength, an Impurity of the Juices, and a fatal Dyscrasy of the Blood. *Frederic Hoffman.*

PRÆSCRIPTIO. A Prescription.

PRÆSEPIA, or PRÆSEPIOLA. The Sockets in the Jaw-bones, in which the Teeth are contained.

PRÆSERVATIVA REMEDIA. Remedies, which preserve Health, and prevent Diseases.

PRÆSERVATORIA INDICATIO. The Preservatory, or Prophylactic Indication. See **INDICATIO**, and **FIBRA**.

PRAMNIOS, *πράμνιος*. A Sort of black and austere Wine, mentioned by *Hippocrates*, in his Treatise of the Disorders of Women.

PRASINUM VIRIDE, is the same as *Flus Æris*. See **Æs**.

PRASINUS, or PRASOIDES; the same as **PORRACEUS**.

PRASIS is explained by *Rulandus*, *Creta viridis*.

PRASITES. An Epithet for a sort of Wine described by *Dioscorides*, *L. 5. C. 58*. It is made by infusing the Leaves of Horehound in fermenting Must.

PRASIUS. *Offic. Charl. Foss. 33. Calc. Mus. 217. Kentm. 47. Boet. 203. Worm. 95. Aldrov. Mus. Metall. 897. Prasus sive Prasus. De Laet. 42. Lapis, Prasus dictus, aliis, Plasma, aut Nilium, aut Leda. Lapis Nebriticus viridis Mali Aurantii foliorum viride. Cup. Hort. Cath. Supp. 2. 51. THE GREEN STONE.*

It is green for the greatest Part of it, but is seldom without black, and sometimes white Spots. Many take it for the Mother of the Emerald, because this Gem is sometimes found in it. The *Prasus* has the Virtues of the Emerald, but in a lower Degree.

PRASION, *πράσιον*. White Horehound.

PRASUM, *πράσινον*. A Leek.

PREHENSIO. A Name for the **CATALEPSIS**.

PREMNON, *πράμνον*. The Extremity of the White of the Eye.

PRESBYTÆ. Vision is commonly divided into three Sorts; the good Sort, that of the Myopes, and that of the Presbytæ.

A Person is said to enjoy a good Sight, when he can see to read at a Foot Distance; In this Case the Crystalline Humour is in its most perfect State, and such People can distinguish distant Objects, like the Presbytæ, but more accurately. This Species of Vision has three Degrees, or Focuses; one at the Distance of half a Foot, another at a Foot Distance, and a third a little farther.

The Sight of the Myopes has a very short Focus; they can see distinctly, when the Object is near, and require little Light to read. At a Distance they see confusedly, and Objects considerably remote they cannot perceive at all. This Defect of the Sight is attributed to the too great Convexity of the Crystalline.

The Myopes have, also, three Degrees or Focuses. The first is, when they cannot read, without bringing the Book

close to the Nose; the second hold it two or three Fingers-Breadth farther; and the third hold it at half a Foot Distance, or more. In order to distinguish distant Objects, the Myopes should use concave Glasses.

The Presbytæ have their Focus very long; they observe remote Objects distinctly, but those which are near, confusedly: This Defect of the Sight is imputed to the too great Flatness of the Crystalline. The Presbytæ have, also, three Degrees or Focuses; one at the Distance of a Foot and an half; another at two Feet and an half; and the third at a greater Distance: Upon this account they cannot read without Spectacles. This Species of Vision is common among the Aged, and is directly contrary to that of the Myopes.

Of these three Species of Sight, two of them are subject to Alteration. The good Sort may sometimes be changed into that of the Myopes, especially in those who read much, or apply themselves to fine Work; and in Old-age it is liable to change to that of the Presbytæ. The Sight of the Myopes admits of no Variation; and that of the Presbytæ sometimes becomes good. These different Changes of Vision proceed from the different Degrees of Convexity, of which the Crystalline Humour is capable. When the nutritious Juice, necessary to maintain the Convexity of the Crystalline, is sufficiently fluid to pass through the Extremities of the finest Vessels belonging to it, then the Sight is perfect. But, if the Juice is too thick, it cannot enter these Vessels in a sufficient Quantity; for which Reason the Convexity will be diminished, in proportion to the Tenacity of the Juice. *St. Ives.*

PRESIS, or PRESMA, *πρῆσις*, or *πρῆσμα*. *Galen* explains this Word, Inflation.

PRESMUCHUM, or PRESMUKIS. *Ceruss. Rulandus.*

PRESSORIUM. A Press. *Rulandus.*

PRESSURA. Pressure, or Compression. *Pressura Gentium*, in *Paracelsus*, is the Venereal Disease.

PRESTER, *πρεστήρ*. The external Part of the Neck, which is inflated by Anger. *Goræus*. But *Prester* is, also, the Name of a Serpent, the same as *Dipsas*.

PRIAPEIA. A Name for the **NICOTIANA MINOR**.

PRIAPISCOS, *πριάπισκος*. The Name of a small Piece of Wood, which constitutes a Part of the *Scamnum Hippocraticum*. *Priapiscos*, also, imports a Tent made of Linen, rolled up in the Form of a **PENIS**. *Paul. Ægineta, Lib. 3. Cap. 24.*

PRIAPISMUS, *πριάπισμος*. A Priapism. See **SATYRIASIS**.

PRIAPOLITHUS. The Name of a Stone mentioned by *Borelli*, found about *Castro* in *Italy*, resembling in Shape the Penis.

PRIAPUS, *πριάπυς*. A Penis.

PRIMÆ VIÆ. The first Passages; that is, the Stomach, and Intestinal Tube.

PRIMITIÆ. The Waters which precede the Fœtus at the Birth.

PRIMORES. A Name for the *Dentes Incisores*, or Fore-teeth.

PRIMULA VERIS.

The Characters are;

The Root is perennial; the Leaves are oblong, and wrinkled; the Calyx is quinquefid, pentagonal, and soft: In this Calyx is seated a monopetalous Flower, shaped somewhat like a Salver, with its Margin divided into five Heart-shaped, bifid, Segments; this Flower is furnished with five Stamina, which arise from the Inside of its tubulous Part. The seminal Vessel is an oblong Shell, concealed in a Calyx, furnished with a long Tube, and gaping at its Apex; the Seeds are roundish.

Boerhaave mentions twenty Species of *Primula Veris*; the first twelve of which are of the Class of those which bear a single Flower on every Stalk, and are enumerated as follows;

1. *Primula Veris*; pallido flore; humilis. *Boerb. Ind. A. 198. Primula Veris. Offic. Primula Veris minor. Ger. 636. Emac. 781. Primula Veris vulgaris. Park. Theat. 535. Raii Hist. 2. 1080. Synop. 3. 284. Primula Veris, floribus ex singularibus, majoribus, simplicibus. J. B. 3. 497. Tourn. Int. 125. Verbasculum sylvæ majus, singulari flore. C. B. P. 241. THE PRIMROSE.*

The common Primrose has large wrinkled Leaves, of a dark Green above, and whiter underneath, broad and round at the End, and growing narrower towards the Roots; the Flowers arise directly from the Root on long slender Foot-stalks, consisting of single Tubes spread out at Top, and cut into five large, round Segments, of a pale-yellow white Colour, set in loose Calyces. The Root is small and fibrous. It grows in Thickets, and under Hedges, and flowers in *March* and *April*. The Flowers and Roots are used, though but seldom.

The Flowers are commended by some, as good against Disorders arising from Melancholy, and phlegmatic Humours; the Juice

Juice of the Root is sometimes used as an Errhine to purge the Head of tough slimy Phlegm. *Miller's Bot. Off.*

2. *Primula Veris*; Constantinopolitana; flore albo. *T. 125. Verbasculum Turcicum sive Carchiæc Turcarum. M. H. 2. 555.*

3. *Primula Veris*; Constantinopolitana; flore dilute carneo. *T. 125.*

4. *Primula Veris*; Constantinopolitana; flore dilute purpureo. *T. 125.*

5. *Primula Veris*; Constantinopolitana; flore majore purpureo. *T. 125.*

6. *Primula Veris*; Constantinopolitana; flore minore purpureo. *T. 125.*

7. *Primula Veris*; Constantinopolitana; flore miniato. *T. 125.*

8. *Primula Veris*; Constantinopolitana; flore luteo. *T. 125.*

9. *Primula Veris*; Constantinopolitana; flore hævescente. *T. 126.*

10. *Primula Veris*; Constantinopolitana; flore obsolete pallido. *T. 126.*

11. *Primula Veris*; Constantinopolitana; flore obsolete. *T. 126.*

12. *Primula Veris*; flore pleno. *H. Eyst. Vern. o. 1. F. 5. Fig. 3. Verbasculum, sylvestre, magno, plenoque flore. C. B. P. 242.*

The second Class contains those Species, which, on one Stalk, bear a Multitude of Flowers, disposed somewhat in the Form of an Umbella; they are as follows:

1. *Primula Veris*; umbellata; odorata; pratensis. *Boerb. Ind. A. 199. Paralysis. Offic. Paralysis vulgaris pratensis, flore flavo, simplici odorato. Park. Parad. 244. Primula Veris major. Ger. 635. Emac. 780. Raii Hist. 2. 1081. Synop. 3. 284. Primula Veris odorata, flore luteo simplici. J. B. 3. 495. Tourn. Inst. 124. Verbasculum pratense odoratum. C. B. P. 241. COWSLIPS, or PAIGLES.*

The Cowslip is well known to have somewhat soft, large, wrinkled Leaves, green above, and whitish and hairy underneath, and full of Veins, broadest at the End, and growing narrower towards the Stalk; among these arise one or two round smooth Stalks, five or six Inches high, bearing on the Top several yellow Flowers, in a kind of Umbel, each on a long Foot-stalk, and set in a loose whitish pentangular Calyx; the Top being round, and cut into five Segments, with Saffron-coloured Spots in the Middle of each; the Part inclosed in the Calyx being hollow, and Pipe-fashioned; they are of a pleasant sweet Scent. The Root is composed of several Strings or Fibres, arising from a small Head; it grows in moist Meadows and Marshes, and flowers in *April*. The Leaves sometimes, but the Flowers are mostly used.

They are accounted cordial and cephalic, and beneficial to the nervous System, and serviceable against the Epilepsy, Palsy, Apoplexy, and Pains in the Head; they are anodyne; and supposed to have a Tendency to procure Sleep, for which Purpose a Tea is sometimes made of the Flowers. The Leaves are used in warming, strengthening Ointments, particularly the *Unguentum Nervinum*.

Official Preparations from Cowslips are, the simple Water, the Syrup, and the Conserve. *Miller's Bot. Off.*

The Flowers of this Plant, being analysed, yield a good deal of Acid, a little urinous Spirit, no concreted volatile Salt, and a pretty deal of Oil and Earth; these Flowers have a volatile, aromatic, oily Salt, pretty much tempered. They are very aperitive, and good to restore the Course of the Spirits. In the Apoplexy and Palsy, *Tragus* prescribed the Conserve, or distilled Water, of these Flowers. To draw the Spirit from them, they must be sprinkled with common Salt, left to ferment some Days, and then distilled; this Spirit has the same Virtues. The Leaves and Roots are very aperitive. *Martyn's Tournefort.*

The Plant is heating and drying, and has something of an acrimonious and bitterish Taste; it is, also, somewhat astringent, and has an anodyne Virtue. The principal Uses, to which it is applied, are in cephalic Disorders, and the Arthritis, and other Pains and Affections of the Joints.

2. *Primula Veris*; pallido flore; elatior. *Boerb. Ind. A. 199. Tourn. Inst. 124. Herba Petri. Offic. Primula pratensis inodora lutea. Ger. 635. Emac. 780. Raii Hist. 2. 1081. Synop. 3. 284. Primula Veris caulifera, pallido flore inodora aut vix odora. J. B. 3. 496. Paralysis altera odorata, flore pallido polyanthos. Park. Parad. 244. Verbasculum pratense aut sylvaticum inodorum. C. B. B. 241. GREAT COWSLIPS, or ORSLIPS.*

They grow in Woods and Thickets, and flower in *April*. The Leaves, infused a Night in White-wine, are recommended against the Anasarca. *Dale.*

3. *Primula Veris*; geminato flore. *H. Eyst. Vern. o. 1. F. 5. Fig. 4. Verbasculum proliferum. C. B. P. 242. M. H. 2. 554.*

4. *Primula Veris*; Anglicana; flore pleno. *H. Eyst. Vern. o. 9. F. 3. Fig. 2. Verbasculum, bortenise, multiplex. C. B. P. 242.*

5. *Primula Veris*; hortensis; umbellata; caule & flore folioso, coccineo, majore.

6. *Primula Veris*; hortensis; umbellata; flore folioso; luteo, minore.

7. *Primula Veris*; umbellata; odorata; hortensis; simplicis varietas uberrima pro varietate jucundissima coloris multiplicis.

8. *Primula Veris*; umbellata; geminato flore abundans & grata ratione pigmenti discrepantis copia. *Boerb. Ind. alt. Plant.*

It is called *Primula Veris*, because it flowers in the Spring before all other Plants. It is recommended in a Palsy proceeding from Want of Spirits. The Leaves are eatable in Salads, or boiled with other Greens; and their expressed Juice is good against the Palsy, for it is restorative; the Flowers have a very sweet and innocent Smell, and are dissolvent, without Danger of an Inflammation. The Leaves and Roots are aperitive, and effectual in Apoplexies and Rheumatisms, being comfortable and strengthening to the Nerves and Joints; externally used, they are of Service in Tumors arising from the Bites or Stings of venomous Animals, and in the Gout. Vinegar impregnated with the Roots, and attracted into the Nostrils instead of an Errhine, is an admirable Remedy for the Tooth-ach. A Conserve of the Flowers is very good for the Palsy; *Willis* and *Sydenham* prescribe it in acute Diseases. The Flowers, when young and tender, are used instead of the Flowers of the Tilia; for they procure Sleep, and are of an anodyne Quality. *Hist. Plant. adscript. Boerhaav.*

PRINCEPS. A Name for the *Intestinum Rectum*. *Principes Dies* are Critical Days.

PRINCIPIA. The Principles, or Elements, of Bodies.

It is impossible to discover the Virtues of any Body, or how mixed Bodies of different Kinds stand related to the human Body, either for the Preservation of its Functions entire, the restoring them when lost or impaired, or for the total Destruction thereof, till we know the Principles of which they consist, and, likewise, the Mixture and Proportion of such Principles in Bodies, to which their Effects are principally owing. Wherefore, having discovered, by various Ways, the Parts into which a true chymical Analysis resolves Bodies, we must look upon such simple Parts, into which all mixed Bodies are capable of being resolved, and of which they seem to be compounded, as their true and genuine Principles. The Antients, having observed, that, in analysing all Bodies whatever, they obtained a Spirit, or Mercury, Sulphur, Salt, Water, and Earth, concluded the Number of Principles to be five.

If Wine, for Instance; be distilled in a proper Alembic, a burning Water, or Spirit, will first arise, next an insipid Water, which they call *Phlegm*, a thick, viscid Mass alone remaining in the Still. This they put into another Vessel, or Retort, which being exposed to a more intense Heat, a small Portion of Phlegm comes over first; then an acid Water, which, according to them, is still Spirit, or Mercury; next, a fat, oily Substance, called *Sulphur*. What remains still in the Retort, is burnt to Ashes in an open Fire. These Ashes are thrown into an earthen Vessel, with a proper Quantity of boiling Water, which they impregnate with Salt. This Water, being tread through Cap-paper, and afterwards evaporated, leaves the Salt at the Bottom. The other Part of the Ashes, which the Water does not take up, is termed *Earth*, or *Caput Mortuum*.

Of these five Substances the Chymists have reckoned two to be passive, Water, and Earth; and three active, Spirit, Sulphur, and Salt; and on these last they thought the whole Virtue and Efficacy of the mixed Body depended. In this Analysis we may observe, that there is a twofold Spirit; one oily and inflammable, which rises first by a gentle Heat, and is termed *Spirit of Wine*; another acid and penetrating, like that of Vinegar. Besides, these Chymists give the Name of *Spirit* to other penetrating, volatile, or urinous Liquors, obtained from the Parts of Animals, such as the *Spirit of Urine*, *Hartshorn*, *Blood*, and such-like Substances: But the later Chymists have banished these Spirits from the Number of their Principles, as being nothing else than Sulphur, or Salt, dissolved in Water. Thus Spirit of Nitre, and others of that Kind, are only acid Salts in Water; Spirit of Hartshorn, or Urine, alkaline Salts; and Spirit of Wine, or of Turpentine, an ethereal, attenuated Oil.

Some of the Moderns deny, likewise, that either Sulphur or Salt deserve the Name of Principles, or Elements; as not being the most simple Substances producible by Chymistry. For Sulphur, when treated with due Care, may be resolved into Salt, Water, and Earth; as is evident by distilling fetid distilled Oils several times with Quick-lime; which, by this Treatment, yield,

yield, in large Quantities, a volatile Salt dissolved in Phlegm, together with a Caput Mortuum, or Earth. Likewise ethereal Oils are only fat, thick Oils like that of Olives, attenuated by Salts, and dissolved in Water, as may be proved by the two following Experiments: If Oil of Olives, or any other of that kind, be mixed with a fermenting Liquor, such as a Solution of Honey in Water, the Whole will be converted into an inflammable Spirit. And if a Quart of Spirit of Wine, diluted with six Quarts of common Water, be exposed in a cold Place to the open Air, the volatile Salts will fly off, and leave Drops of Oil swimming at the Top, which are, in every respect, the same as Oil of Olives, or Almonds.

Salt has no better Title to a Principle, than Sulphur, because it may, by proper Management, be at length reduced to Earth and Water. Thus Nitre, by Distillation, may be almost wholly reduced to an acid Spirit; but, if it be burnt with Tartar, or Charcoal-dust, it becomes an alkaline Salt, called *fixed Nitre*.

This, if suffered to run per Deliquium, and afterwards filtered through Cap-paper, will leave a large Quantity of Earth behind; and, if the same Liquor be distilled to Driness, a large Quantity of insipid Water will come over, and the Salt remaining at the Bottom of the Retort will have lost a great Part of its first Quantity. If this Operation be repeated, nothing will at length remain, but Earth. Again, the Vitrification of alkaline Salts seems to be nothing, but the Conversion of them into Earth; for Glass has no Qualities different from those of Earth.

What we have proved by Experiments made by resolving Bodies, may be further confirmed by others relating to the Formation and Composition of them, and particularly by *van Helmont's* famous Experiment on the Willow, which has been often quoted by succeeding Authors. He took about two hundred Pounds of Earth dried in an Oven, and put it into a Vessel covered with an iron Lid full of Holes. In this Earth he set a Branch of Willow, weighing about five Pounds, which soon took Root, and grew so much, that in eight Years time it weighed an hundred and sixty Pounds, the Earth it stood in, having, during all this Time, lost only a few Ounces; so that the whole Increase of the Tree must have been owing to Rain-water, and a very small Proportion of Earth, and the Salts and Sulphur therein must have been composed of these two Elements alone. The Experiments of this kind, made by the illustrious *Mr. Boyle* on small Sprigs of Mint, Marjoram, Pennyroyal, Baum, and the like, set in Phials filled with clear Water, are more to be depended on. They increased in a short time to double their first Weight, and, being afterwards distilled, they yielded the very same Principles, as they would have done; had they grown in the most proper Soil; from whence it is plain, that Salt and Oil owe their Original to Water and Earth.

Water and Earth, in the strictest Sense, deserve the Name of Principles; but, in the Formation of mixed Bodies, a third Principle must necessarily concur with them; for as they are of themselves wholly inactive, something must be supposed to give them their Motion and Activity. Without this, Water would immediately turn to Ice; and as there are few Bodies, out of which Fire may not be drawn, it is evident, that there must be some active, moveable Principle in them all, to which the Motion of the other Parts is to be ascribed. Therefore, though this Principle should not fall under our Senses in the same manner as the others, that can be no Reason for doubting of its Existence, since it must concur in the Composition of all Bodies, which, if they were made of Water and Earth alone, would remain for ever without any Virtue or Energy. This they must receive from another Principle, and, according to the different Combinations of all the three, Bodies are formed with different Properties and Powers. We acknowledge, therefore, three simple Substances in Bodies, which are properly Elements, or Principles: One active, which may be termed *Fire*; and two passive, Water, and Earth. From the most simple Union, or Connection of these three, Salt arises, which is to be looked upon as the most simple of all mixed Bodies. The next to that is Sulphur, or Oil, made by the Union of the three Principles, and of Salt.

Thus far concerning the Principles of Bodies in general: We now proceed to consider each of them in particular.

FIRE CONSIDERED AS A PRINCIPLE.

We reckon elementary Fire the first Principle of Bodies, as being that, from whence all the rest receive their Activity. It is a simple and most subtle Body, in a continual swift Motion, filling, and easily permeating, the Pores of all other Bodies. Its immense Subtlety is evident from this, that it penetrates all Bodies whatsoever; and its swift Motion, from that Rapidity which it is capable of communicating to them. Its Force is in proportion to the Quantity of it any-where collected. In the Sun, which may be looked upon as a vast Congeries of this Substance, its Motion is most violent. In culinary Fires, the Quantity and Motion of it are not so great, but still greater, than in spirituous and volatile Liquors, where it is hardly to be

perceived, except when they are set on Fire. Not only all Motion, but, also, Heat, proceeds from it, which, as it exists in Bodies, is nothing but the excessive Motion of their Parts. It is, also, too subtle and active ever to be collected pure in Chymical Analyses; where-ever it is found, it is always united with Water and Earth, in Salts and Sulphurs; and is sometimes concentrated with Bodies in so great Quantities, as considerably to increase their Weight, as is evident in calcined Antimony, in which there is an Addition made of almost a Fifth Part.

WATER CONSIDERED AS A PRINCIPLE.

Elementary Water is a simple, liquid, insipid, inodorous, pellucid Substance. Its Fluidity is owing entirely to the Action of Fire, and, when that Action is very great, its Parts are actually divided, and the Whole turned to Vapour; but, when it is very small, they cohere strongly, and turn to Ice. This Element the Chymists call *Phlegm*, and it may be conceived to consist of small, smooth Particles, of an oblong or oval Figure, and perfectly rigid or inflexible. From the Minuteness of its Particles, it easily penetrates the Pores of almost all Bodies. An oval Figure seems more agreeable to the Fluidity and Motion of Water, than a spherical; and, likewise, to the Solidity we observe in Ice; the Points of Contact being too few, in spherical Bodies, to form so strong a Cohesion. Were its Particles angular and flexible, they would be too weak to penetrate and dissolve Salts; and would, likewise, be too much resisted; but, as their Surface is smooth, they can easily enter the Pores of Salt, and afterwards they easily separate their Parts, that is, dissolve them by their Rigidity, and oval Figure. The Want of Taste or Smell in Water seems to proceed from the Smoothness, Obtuseness, and Smallness of its Particles, which cannot vellicate the Nerves of the Tongue and Nostrils. The Fluidity of Water arises from the Smallness, Smoothness, and Figure of its Particles, and from the easy Motion thereof by the Fire contained in their Interstices. Without the Action of Fire separating these Particles, and keeping them in continual Motion, their Fluidity would presently be lost, how much soever their Structure may dispose them to it, and they would become one solid Mass. On the other hand, if the Action of Fire upon them be very great, they are farther separated from one another, and fly off in Vapour or Smoke. In fine, Water is transparent, because its Pores are so disposed, as readily to transmit the Rays of Light.

EARTH CONSIDERED AS A PRINCIPLE.

Elementary Earth is the same with the *Terra Damata*, or Caput Mortuum, of the Chymists; being a simple, friable, porous Substance, without Smell or Taste, consisting of Particles of no regular Figure, and altogether unfit for Motion. The Porosity of Earth seems to arise from the irregular Figure of its Particles; and as these Particles often touch one another only by their Angles, the whole Mass must necessarily be friable. The Want of Taste and Smell seems to be owing to their Inaptitude for Motion.

In the Analyses of Bodies, the last Thing is always this Principle of Earth; and, in their Composition, it seems to serve as a Basis or Foundation for the other Parts of the Mixture; and to it the Driness, Solidity, and Hardness, of Bodies are, in a great measure, to be ascribed.

SALT CONSIDERED.

Salt, as has been said, is a mixed Body; but I chuse to introduce it immediately after the Principles, because, in all the common Analyses of Bodies, it is obtained entire, and a great deal of Pains and Accuracy is required to decompose it, or reduce it to its Principles. It is, also, the sole Origin of the Taste, Smell, and many other Properties of Bodies. It may be defined to be a mixed Body, formed by the Concretion of Fire, Water, and Earth, into a solid rigid Substance, soluble in Water, and fusible by Fire. As its Particles may be conceived to cohere by large Surfaces only, Salt cannot be friable like Earth; but requires a considerable Force to separate its Parts, which fly off from one another, like those of Glass, with a sensible Noise. It becomes the Cause of Taste and Smell, because its Particles terminate in strong Points, which vellicate the nervous Membranes of the Tongue and Nose.

Salt is of three kinds, acid, acrid, or alkaline, and a third, compounded of the other two, called, in *Latin*, *Sal salsus*.

Acid Salt is a Congeries of inflexible solid Parts, of an oblong Figure, and pointed at both Ends. That its Particles are rigid and hard, appears from the Force, with which it divides and dissolves solid Bodies; and its Sharpness and Pungency are evident from the Effect it has on the Tongue, different from the Corrosion of acrid Salts. Acid Salt is easily dissolved by Water, and after this Solution its Particles are equally dispersed thro' that Fluid, and have the same Motion with it. Hence it appears, that the Particles of both Substances have nearly the same specific Gravity; and likewise that the Motion of the aqueous Parts is great enough to overcome the Cohesion of the Parts of Salt.

Concerning the Manner, in which the Particles of acid Salt are compounded of Fire, Water, and Earth; nothing can with Certainty be determined. It may be conjectured however, that several Particles of Water, being collected into one little Mass, are cemented together by some Particles of Fire and Earth, lodged in the Interstices left between them; and that all these, taken together, are disposed in an oval Form, or that of two Cones joined by their Basis. This Configuration, however, is not the same in all acid Salts; but the Differences may all be reduced to three; the nitrous acid, the muriatic, and the vitriolic.

The Word *Alkali* is derived from *Calī*, the Arabic Name of a Plant, from the Ashes of which a Salt is obtained, proper for making Glass: And thence it came to be used for all Salts, got from the Ashes of Plants, and afterwards for all Salts, and other Substances whatever, that ferment with Acids.

Acrid or alkaline Salt seems to be a Congeries of spherical Particles, with rough prickly Surfaces, because of their great Disposition to Motion, and their corrosive burning Taste, the Points of their Surfaces acting on the nervous Papillæ of the Tongue, like so many Files, whereas acid Salt is only pungent. But then, by these Points, a larger Surface is exposed to the Action of Fire, than could otherwise be; and thus the Particles of alkaline Salt are very volatile, or easily raised by a gentle Heat. The Origin of their Salt is probably from a certain Connection of acid Points, and terrestrial Particles, because, in many Operations of Chymistry, such Salts arise from the Mixture of acid Salts, and Earth; as we see particularly in the Preparation of fixed Nitre, and Fomentation of Urine. Nitre, being distilled, leaves a compound fixed Salt behind, of the same Nature with Sea-salt, out of which, by a nicer Distillation, an acid Liquor may be extracted, without any volatile Salt, or at least, but a very small Quantity; but if the same fixed Salt be previously fermented, and then distilled, it yields a large Quantity of volatile Salt, and very little fixed Salt, or Acid; because by Fermentation or Calcination the acid and terrestrial Particles are intimately mixed, the acid Spicula entering the Pores of the Earth, and so forming new Molecules, which are dense and close towards the Centre, and prickly on the Surface, by the acid Points sticking out. Such are the Particles of volatile Alkalī, of which if a great Number be joined together, they must cohere very strongly, by means of their Points, and form Molecules of irregular Figures, in the Pores of which watry, earthy, sulphureous, or acid Particles may be received and absorbed. Hence it is that acid Salts are seldom pure; and as they are very often filled with Particles of Earth, they resist the most violent Degree of Fire, and will sooner melt than be raised by it. This is the true Nature of fixed alkaline Salt, such as Salt of Tartar, or the Salts got from the Ashes of Plants called Lixivial Salts. If they be impregnated with sulphureous Particles, they continue very volatile, and are raised by a small Degree of Fire; as we see in Salt of Urine, Hartshorn, and others got from Animals. Acrid Salts easily melt, when exposed to a moist Air, because the Particles of Water contained in it readily enter their Pores. When thus melted, they become properly Lixivia, and are commonly termed Oils, as Oil of Tartar per Deliquium. Volatile alkaline Salts, diluted with Water, are called volatile urinous Spirits; such as the volatile Spirit of Urine, of Hartshorn, Blood, and others.

The *Sal Salsus*, or third Kind, is compounded of acid and alkaline Molecules united together; and the Figure of its Particles is principally produced by the Kind of Acid that enters its Composition. The Impression these Particles make on the Tongue, is more dull and languid, than that made by acid or acrid Parts alone; because the Molecules formed by the Union of these are larger in Bulk, and consequently less disposed for Motion; and therefore, though there is a greater Quantity of Aculci, or Points, in one of these Molecules than in the former, yet their Bulk makes them less capable of entering the Pores of the Skin, and vellicating the nervous Papillæ, than when they are in a disjointed State. The Taste of these Salts is termed saline, and varies according to the Thickness of the Spicula, their Number, and the other Parts that may be mixed with them. That this is the true Original of this kind of Salts, is evident, both from the artificial Composition thereof, from acid and acrid Particles blended together; and from the Resolution of them into the same. Thus, by pouring Spirit of Nitre, of Sea-salt, or of Vitriol, on Salt of Tartar, new Salts are produced exactly of the same Appearance with Nitre, Sea-salt, or Vitriol; and, by analysing these three Salts, the essential Salts of Plants, Sal Ammoniac, and others, an acid and alkaline Salt may be obtained, in some fixed, in others volatile.

OIL, OR SULPHUR, CONSIDERED.

What the Chymists call Oil, or Sulphur, is not a simple Substance, but a Body compounded of Fire, Water, Earth, and Salt; but we chuse to introduce it here, as it is most commonly separated entire in the Operations of Chymistry, and is not resolved without Difficulty into its component Principles. It may be defined to be a fluid, viscid, inflammable, transparent Body, without Taste or Smell, (though, by mixing it differently

with Salts, these sensible Qualities are produced) compounded of Fire, Water, Earth, and Salt; and it may be conceived to consist of many Flakes, or Flocculi, each of which is again made up of very small flexible Filaments, formed of the four Principles before-mentioned, by Fermentation, as well in the Bowels of the Earth, as in the Bodies of Vegetables and Animals: Thus an aromatic Plant, growing in Water, will, by Distillation, yield an Oil, which could never have been obtained from the Water, in which it stood; and all Oils may by Art be resolved into Water, Earth, and Salt. From these Filaments variously concreted arise the Flakes already mentioned, which are of different Thicknesses; and in the Pores thereof is lodged the Element of Fire, which, also, runs in Rivulets through their Interstices. Upon these depend the specific Levity, Inflammability, and Fluidity of Oil; but, as, notwithstanding the intestine Motion caused by the Element of Fire, the small Flakes still adhere, in some measure, together, this Fluid must be more viscid than any other.

From what has been said concerning the Nature of alkaline Salts, and the Figure and Structure of the oily Flocculi, it is easy to conceive, why all Alkalies dissolve Sulphurs; for since the alkaline Particles are spherical and prickly, they cannot enter the Interstices of the Flakes, without carrying away some of them from the rest; and thus, by degrees, thoroughly dissolving them. But the dense, rigid, and pointed Molecules of Acids, being forced into these Interstices, increase the Density, and strengthen the Texture, of the Flocculi; and from the Diversity of these, and of the acid Spicula mixed with them, arise the different kinds of Sulphurs. Sulphurs formed in the Earth of Fire, acid Salt, Water, and a very fine Earth, are termed Bitumens. Thus Bitumens dissolved in a large Quantity of Water form the mineral Oils, or Petrolea. But if they are mixed with Earth and Salt, the solid Bitumens are produced, differing from one another in Degrees of Purity, according to the Quantity or Grossness of the Earth, or different Degrees of Mixture. Thus fossil Coals, Jet, Amber, and the common Bitumens, and bituminous Earths, are produced. If there be but a small Quantity of Earth, and much acid Salt, the common mineral Sulphur, or Brimstone, is formed. If the mineral original Bitumen is joined to a fusible Earth, capable of Vitrification, it communicates to it a metallic Form; that is, the Sound, Brightness, Softness, Ductility, Malleability, and all the other sensible Qualities of Metals.

This Origin of mineral Bitumens may be confirmed by many Experiments: If a Mixture of equal Parts of Oil of Vitriol, and Oil of Turpentine, be digested together, for a considerable time, in a very gentle Heat, and afterwards distilled in a Retort, there will come over first a yellowish Liquor, resembling Petroleum, both in Smell and Consistence. What remains in the Retort, is, at first, a soft Bitumen, and afterwards turns into an hard black Mass, easily inflammable, and, when burnt, smelling exactly like a fossil Coal. But if the Distillation be continued, a white acid Liquor will next be obtained, which, by standing, lets fall a grey Powder, which is true common Brimstone, a yellow Substance of the like Nature adhering likewise to the Neck of the Retort; what is left behind being a black, shining, light Substance, disposed in thin disgregated Strata, like Talc, in which, by the Help of the Loadstone, Iron may be discovered. Thus, therefore, all these Bitumens may be artificially produced; and the Analysis of the natural ones further confirm the Manner of their Formation. Thus the Chymists have shewn, that Metals are nothing but bituminous Substances, which have undergone a long Digestion; for, by depriving them of their Sulphur, they are reduced to Ashes, and then to Glass. This is easily seen in the imperfect Metals; for if any of them be exposed to a long Heat, and especially to the Rays of the Sun, collected by a large Burning-glass, the sulphureous Principle flies off, and only a Calx, or Ashes, will be left behind, which, in a more vehement Degree of Fire, are presently vitrified; and, by restoring the Sulphur, this Glass may be again reduced to Metal.

The inflammable Substances in Animals and Vegetables consist of a different Combination of the Principle of Sulphur, and acid Salt; for the Oil, or Sulphur, in these, is formed by a small Portion of Earth joined to the elementary Fire, acid Salt, and Water: This Oil, when joined to an acrid Salt, produces Gums; when joined to a fine Acid, and a new Accession of fiery Particles, it produces essential Oils, and inflammable Spirits; but if the Acids are more gross, by reason of a larger Quantity of Earth joined to them, it forms Resins, as we learn from the artificial Composition of all these Substances. By mixing Spirit of Wine with volatile Spirit of Urine, we obtain a mucilaginous Concretion, or thin Gum. Oil of Olives, and Salt of Tartar, melted together, makes a kind of Soap, or thick Gum; and if Spirit of Wine be digested for a long time with Oil of Vitriol, and then distilled, an inflammable Oil is obtained, resembling in Smell, and other Qualities, the essential Oils of Plants, a true Resin being left behind in the Retort.

In Animals this same oleaginous Principle forms the Fat, and other glutinous or gelatinous Substances; these left being com-

composed of an acrid volatile Salt and Oil, as appears from their Analysis: But Fat is made of the same Oil, and acid Salt; for if Oil of Olives, and Spirit of Nitre, be mixed together, and digested, a Substance will be formed in every thing resembling the Fat of Animals.

Sulphureous Substances found in Bodies are either fixed, or volatile. The fixed Sulphurs are either solid, such as Fat, Resin, and the Bitumens; or fluid, as Oils. Volatile Sulphurs are such as fly off with a small Degree of Fire, and have an Appearance compounded of that of Oil and Water. Such are inflammable Spirits obtained from the Flowers and Fruits of Plants.

THE MIXTURE OF ELEMENTS.

All Bodies consist of the five Principles above-mentioned; and the Diversity of Bodies arises entirely from the different Combination of them. These Combinations, or Mixtures, of the five Principles are produced by Motion, and that Motion entirely by the Element of Fire. This Motion is sometimes slow and insensible, as in the Growth and Maturation of Fruits; more lively and quick, as in the Fermentation of Must; or very vehement, as in the Deflagration of Bodies. All these Motions go by the general Name of Fermentation; and if they tend to the Destruction or Dissolution of Bodies, they are termed Corruption.

The most simple, or least compounded, Mixture of Principles is seen in the Fermentation of Salts, which consist principally of Water, and Earth; next of Sulphur, made up of Water, Earth, and Salt; then of the acrid Salts, both fixed and volatile, with the essential Salts of Plants, and sulphureous Bodies, whether solid or liquid. The Manner how these Mixtures are brought about, and the Changes arising from thence, will best be understood by Examples.

The Fruit of the Vine, just beginning to put on the Form of Grapes, is insipid, or, at least, tastes only like Grass. As it grows, a certain Acidity is discovered in it, which at first produces an austere Taste; then an acerb one, in which State the Juice is termed Omphacium, which, in Distillation, yields a great Quantity of Water, some acid Liquor, and a small Portion of Oil, a large Proportion of Earth being left behind. In this Juice, therefore, the austere and acerb Tastes are owing to the acid Spicula, just breaking out through the earthy Parts, but not wholly disengaged from them. When the Grapes come to be fully ripe, the austere Taste is changed to a sweet one, because the Juice, being more thoroughly penetrated by the Element of Fire, is rarefied, and put in a more violent Motion, by which the Salts throw off their earthy Involucra entirely, and by a new Combination of these Salts, Water, and Earth, are formed Sulphurs, or Oils. But if any of the acid Salts remain after the Composition of the Sulphurs, they continue still entangled by the Filaments thereof; and their sharp Points, vellitating the nervous Papillæ of the Tongue, create that agreeable Taste, which is perceived in Must. This Must in Distillation affords a great Quantity of Phlegm, next a pretty large Portion of an acid Water, some acrid or volatile urinous Salt, and a Quantity of thick Oil, much beyond what was gained by the former Distillation. Lastly, from the Mass that remains in the Retort, an acrid fixed Salt may be obtained by the common Method. However, even in this Juice of ripe Grapes, or Must, the Salts and Oils are not carried to the greatest Degree of Fineness, and Part of them remain still involved in the earthy Involucra. But if a large Quantity of it be set to ferment, the igneous Particles begin to act again, and by them this intestine Commotion is continued, till all the gross Parts are either attenuated, or thrown out from the Liquor, and the Salts and Sulphurs perfectly set free from the earthy Parts, and intimately mixed with one another. The Liquor in this State is Wine, and the gross Parts, that fall to the Bottom of the Vessel, are termed Lees. The Briskness and penetrating Quality of the Wine seems to be owing to the large Proportion of the Element of Fire, which harbours among the Filaments of the sulphureous Flocculi; and this Liquor being distilled, we obtain, first, a great Quantity of inflammable Spirit, then a copious Phlegm, next an acid Liquor with some Portion of an oily Spirit, a thick Oil, and, lastly, a small Quantity of Caput Mortuum, which will yield a little fixed Salt. In this Distillation a far less Quantity of acid Liquor is obtained, than from Must, which, on the other hand, yields no inflammable Spirit. If the Lees of Wine be well dried, and then distilled, they yield a very large Quantity of volatile urinous Salt, the acid Salts, combined with the sulphureous and earthy Particles, being, by Fermentation and Heat, converted into alkaline Salts.

In the same manner, if green Peas or Beans be distilled, they yield a great deal of acid Liquor and Phlegm, with a small Proportion of Oil. If they are first fermented with common Water, an inflammable Spirit is got from them in the same manner as from Wine; and if they are kept for some Months in a dry Place, they yield a volatile alkaline Spirit, without any acid Liquor, or, at least, but very little. Whence it is evident, that acid Salt, by its Union with other Principles, is changed into Sulphur; and, by its Union with earthy and sulphureous Parti-

cles, becomes an alkaline volatile Salt; as, by being driven into earthy Particles, alone, by the Force of Fire in Calcination, it is changed into a fixed Alkali.

It may be proper, upon this Occasion, to observe, that the Salts of all Plants are not entirely alike, but differ from one another, not only as the Quantity of Sulphur, Water, or Earth, which is joined to the Acid, is greater or less; but, also, according to the original Nature of the Acid which enters their Composition. Acid Salts, as we have already said, are of three Kinds, muriatic, nitrous, and vitriolic. Muriatic Salts, such as Sea-salts, and Sal Gemmæ, being crystallized, put on a cubic Figure, the Particles thereof appearing to be formed of two quadrilateral Pyramids, joined together by their Bases. Nitrous Crystals represent Prisms with six Sides, formed by the juxtapositions of two triangular Pyramids; and Crystals of Vitriol seem to consist of two hexagonal Pyramids, as far as can be judged by the Particles thereof, when carefully separated from all Metals. These original Salts, combined with others, form compound Salts; of almost all Kinds. Thus, in the Vegetable Kingdom, the different Sorts of Vinegars are nothing but some original acid Salt dissolved in Phlegm. The essential Salts of Plants obtained without Fire consist of some Acid joined with Particles of Earth, or of the other Principles. Sal Ammoniac arises from the Union of acid and volatile alkaline Salts. Fixed Alkalies are only the acid Spicula struck into earthy Molecules; and volatile Alkalies consist of the same Acid, joined to very fine Particles of Earth and Sulphur, so as to form prickly Globules. Moreover, the same Varieties of acid Salts are to be met with in Vegetables, that are found in Minerals. Thus the essential Salts of Pellitory of the Wall, Borage, wild Cucumber, and the like, are nitrous; and, when thrown upon burning Charcoal, they fulminate like Nitre. The fixed Salts of Carduus Benedictus, Glasswort, and Spurge, are like Sea-salt, their Particles having the same cubic Figure; and, when thrown upon burning Charcoal, they decrepitate. The Crystals of Tartar are like those of Vitriol; and that they are formed by a vitriolic Acid, appears from the sulphureous Smell of Tartar, when artfully calcined. Besides the saline Compounds already mentioned, other Mixtures are formed in Plants, such as Gums, Resins, Honey, and the like. Gums are something between Acid and Oil, being an acid Salt, so fixed in the Earth, as that the greatest Part of it is changed to an Alkali, the other into Oil; so that the Mixture arising from thence is an oily Salt, resembling the saponaceous Concretes of the Chymists, made of Oil of Olives, and a Lixivium of Tartar, or the mucilaginous Bodies formed of Spirit of Wine, and the volatile Spirit of Urine. And thus we see, that all Seeds which are oily when ripe, are in the Beginning only a Mucilage, or imperfect Oil. Resins consist of Oil and Acid, and accordingly are artificially produced by mixing Spirit of Vitriol with Spirit of Wine, or of Turpentine. They are either solid, or liquid; but these differ from one another only in the Proportion of Earth, that enters their Composition. Melleous Juices, which either exude spontaneously from Plants, such as Manna, or are obtained by Art, as Sugar, are essential Salts, consisting of a Mixture of Acid and Alkali, with a large Proportion of Oil.

The Mineral Kingdom furnishes us with a great Variety of Instances, of the way how the Principles of Bodies may be combined together. The Lime-stone and Parget are so framed; that, by being calcined, a vast Number of Cells are opened by the Fire, into which Water easily enters, with an Hissing or Collision of the included igneous Particles. If the Water remain long in these little Receptacles, nitrous Parts are formed, as we see in old Walls, built with these Materials, from which Nitre may always be obtained. The greatest Part of this Nitre, by Distillation, is changed into an acid Spirit; but, by Calcination, turns to an alkaline Salt. And it may be, that the Nitre of the Antients, or that alkaline mineral Salt, which was dug out of the Earth in Egypt, and other Countries, and is obtainable by Art from mineral Waters, was nothing but Nitre calcined by the Heat of the Earth, and so converted into a fixed alkaline Salt. The vitriolic Acid, joined with different metallic Substances, produces all the Kinds of Vitriol; with an astringent Earth, it forms Alums; and with the Principle of Fire, common Brimstone, which, by Deflagration, may be again converted into Oil of Vitriol, the other Principles flying off. Brimstone may, likewise, be artificially produced by uniting the Principle of Fire to any vitriolic Acid.

The like Mixture of the Principles of Bodies may be observed in the Animal Kingdom. Chyle and Milk contain a latent Acid; which easily discovers itself by Putrefaction; but this acid Salt, having undergone a due Fermentation, or some other Action analogous to that in the animal Body, is changed into a volatile Alkali, obtainable in great Plenty from the Blood, Serum, Bile, Urine, and other Juices. In an healthy Body, however, these volatile Alkalies are never perfectly formed, the animal Salts being more of the Nature of Sal Ammoniac, with a Mixture of earthy and oily Parts, to which Mixture the glutinous Quality of the Blood and Serum is owing. By Putrefaction, or Calcination, all animal Liquors are changed, so as to afford

afford perfect volatile Alkalies, as has been evidently shewn by Experiment. *Geoffroy*.

PRION, *πρίων*. A Saw, or *Terebra*.

PRISIS, *πρίσις*, from *πρίω*, to saw. A Saw, or *Terebra* of the Trepan. A Sawing. Or a Grinding of the Teeth.

PRISMATA, *πρίσματα*, from *πρίω*, to saw. Saw-dust, or Rasps.

PROBARBIUM. The first Appearance of the Beard on the superior Lip.

PROBLEMA, *πρόβλημα*, from *πρόβαλλω*, signifying, among other Actions, to object, or lay some Hindrance in the Way, is any kind of Obstacle laid to obstruct an Entrance into any Place, or guard the Avenues leading to it. In this the Term *πρόβλημα* is used by *Hippocrates*, *Lib. πει γυναικ. φύσ.* and *Lib. 2. πει γυναικ.* to signify the Membrane which, growing to the Neck and Orifice of the Uterus, obstructs the Passage of the Semen, and so prevents Conception. This Membrane, he says, will offer itself to the Touch of the introduced Finger.

PROBOLE, *προβολή*, from *προβάλλω*, to project, is a Projection, or Prominence, of any kind. Thus, *Lib. de Artic. Hippocrates* observes, that, in other Cattle besides Oxen, *προβολή τῆς χεῖλεος λεπτή*, "The Prominence of the Lip is but thin," and the upper Jaw is but thin, and therefore they can feed upon short Grass; but in Oxen it is quite otherwise. And, *Lib. de Vulneribus Cap.* *προβολή τῆς κεφαλῆς ἐν τῇ ἐμπροσθεν*, "The Prominence of the Head towards the anterior Parts," is explain'd by the Author to be when the round Eminence [*ἐξέχων σφαιρῶς*] of the Bone juts out beyond the rest.

PROBOSCIS. The Trunk of an Elephant, and of some Insects.

PROCARDION, *περιγάρδιον*. The Pit of the Stomach.

PROCATARCTICA CAUSA. The antecedent, pre-existent, or predisposing Cause of a Disease. See **CAUSA**.

PROCESSUS, in Anatomy, is a Process, Protuberance, or Eminence of a Bone. In Chymistry, a Process is properly a Series of Operations, tending to the Production of something new.

PROCHEILA, *πρόχειλα*. The Extremities of the Lips.

PROCHYMA, *πρόχυμα*. Must which flows from the Grapes spontaneously, before they are pressed.

PROCIDENTIA. The falling of any Part out of its proper Place. It is the same as **PROLAPSUS**.

PROCLESIS, *πρόκλησις*, from *προκαλέω*, to provoke, call forth, signifies, in *Hippocrates*, a provoking or inviting the Senses to the external Parts, in order for their Gratification. Thus we read, *Lib. de Liquid. Usu*, *διὰ τὸ τοῦ καὶ ἀπὸ τοῦ θερμῆς ἡδοναὶ καὶ προκλήσεις*, ἀπὸ δὲ τοῦ ψυχρῆς ἀλγύνδους καὶ ἀποτρέψεις "For this Reason, hot Water gives Pleasures and Allurements to the Senses; but cold Water, on the contrary, creates Uneasiness and Aversions." Here *ἀποτρέψεις*, which import a Retreat, Shrinking back, and Retirement, as it were, of the Senses inwards, is set in Opposition to *προκλήσεις* in the Sense before given. The Word occurs, also, *Lib. περὶ εὐχην*. in the following Passage; *νομίζετο δὲ τὰτο βίη εἶναι ἐς πρόκλησιν βερεπνῆν*. "For he thinks this necessary towards the inviting or procuring Health." But it is here to be observed, that the printed Copies read *πρόκλησιν*, which cannot much alter the Sense.

PROCONDYLOS. The first Joint of every Finger.

PROCONIA ALPHITA, *περώνια ἀλφίτα*, *Lib. 2. πει γυναικ.* as explained in *Galen's Exegesis*, signifies Meal of Barley prepared while the Grain is new and tender; and the Reason why it was so called, was, because it was prepared *πρὸ τῆς τῆς κώνεος*, "Before the Erection of the Cone," or before the Barley was erected into Piles of a conic Figure. For *κόνος*, according to *Galen*, is a wooden Structure erected in Areas, and especially in humid Places, about which the Corn and Fruits were piled up in a tapering Figure, or in the Form of a Cone. Some, however, as *Galen* says, in *Exeges.* by *περώνια ἀλφίτα* understand *τὰ τῶν ἀρτύλων μόνον*, "Nothing but Meal made of Barley not torrefied."

PROCTOS, *πρωκτός*. The Anus.

PRODROMUS, *πρόδρομος*, from *πρὸ*, before, and *τρέχω*, to run. It imports the same as **PROCHYMA**. Certain Winds which blow before the Dog-days, are called *Prodromi*. See **ETESIA**. *Prodromus* is, also, any Circumstance which precedes a Distemper, and indicates its Approach.

PROEGUMENE. See **CAUSA**.

PROFLUVIUM. A Flux of any kind.

PROFUNDUS MUSCULUS. A Name of the Muscle otherwise called **PERFORANS MANUS**.

PROGERMINUS ABSCESSUS. An Abscess arising from a viscid, and almost corrupted Phlegm. *Castellus* from *Marc. Aurel. Severinus*.

PROGLOSSIS, *πρόγλωσσις*. The Tip of the Tongue.

PROGNOSIS, *πρόγνωσις*, from *πρὸ*, before, and *γινώσκω*, to know. The Prognostic of a Distemper. See **FIBRA**.

PROHIBENS. The same as **CONTRAINDICANS**. See **ANTENDEIXIS**.

PROJECTIO. Projection. A chymical Term, importing the casting of any Substance, to be calcined, into a Crucible, by a Spoonful, or a small Quantity, at a time. Projection is, also, an Addition of a small Quantity of something to a greater Quantity of a Metal, in order to meliorate the Metal. *Wilson's Chymistry*.

PROJECTURA. An *Apophysis*. *Blancard*.

PROLABIA. The same as **PROCHEILA**.

PROLAPSUS ANI. See **ANUS**.

PROLAPSUS UTERI. See **UTERUS**.

PROLECTATIO, is defined, an Extraction, by the Extension of the most subtle Parts, in such a manner, that these, being rarefied, separate spontaneously from the more gross Parts. *Rulandus*.

PROLEPTICOS, *προλεπτικός*. Anticipating; an Epithet of the Fever, the Paroxysms of which return sooner than they ought to do regularly.

PROMALACTERION, *πρωμαλακτήριον*. The first Apartment in the antient Baths, where the Body was softened, before going into the Bath.

PROMANUS. The Thumb.

PROMETOPIS, *πρωμετωπίς*. The Skin of the Fore-head.

PRONATOIRES. The Name of two Muscles of the fore Arm. One is the

PRONATOR TERES, SIVE OBLIQUUS:

This is a small Muscle, broader than it is thick; situated on the upper Part of the Ulna, opposite to the Supinator Brevis, with which it forms an Angle like the Letter V.

It is fixed to the internal Condyle of the Os Humeri, partly by fleshy Fibres, and partly by a Tendon common to it with the Ulnaris Internus; thence it passes obliquely before the Extremity of the Tendon of the Brachizus, and reaches to the middle Part of the convex Side of the Radius, where it becomes flat, and is inserted below the Supinator Brevis by an Extremity almost wholly fleshy.

It is called the *Teres*, to distinguish it from the *Quadratus*. The Name of *Pronator Superior* would be more proper, but that of *Pronator Obliquus* is the most proper of all.

This Muscle can have no other Action but that of Pronation, in the different Situations of the Radius, whether that Bone be in a middle State between Pronation and Supination, or in the greatest Degree of Supination: And, in this Case, though it is but a small weak Muscle, it overcomes the *Supinator Longus*.

PRONATOR QUADRATUS SIVE TRANSVERSUS.

This is a small, fleshy Muscle, nearly as broad as it is long, lying transversely on the Inside of the lower Extremity of the fore Arm.

It is fixed by one Side, or Edge, in the long Eminence, at the lower Part of the internal Angle of the Ulna; and, by the other, in the broad, concave Side of the lower Extremity of the Radius.

It is wholly fleshy, without any Mixture of tendinous Fibres. It is situated transversely, but that Extremity which lies on the Radius, is nearer the Carpus, than that on the Ulna. It is of a moderate Thickness, and the Fibres nearest the Surface are the longest, the rest decreasing in proportion as they lie near the Interval between the two Bones, and the interosseous Ligament.

It has a ligamentary, or tendinous Frænum, belonging to it, one End of which is fixed in the interosseous Ligament, the other in the inner Edge of the Basis of the Radius.

The *Pronator Quadratus* is capable of no other Motion but Pronation, and it acts with much more Force than its Congener, the *Pronator Teres*; both because of the Number and Direction of its Fibres; and because it acts upon the Radius near the lower Extremity, where its Effects, in Pronation, are, much greater, than if it acted near the Head of that Bone. The Fibres lie almost in the same Direction in which the Bone moves; and in this it has the Advantage, not only over the other *Pronator*, but over all the *Supinators*, the *Biceps* itself not excepted.

The Fibres, of which this Muscle is composed, are so disposed, as that the longest adhere to the internal Angles of both Bones of the fore Arm; the shortest lie nearest the interosseous Ligament; and the intermediate Fibres are longer or shorter, according to their greater or less Distance from the Ligament.

By these different Degrees of Length, the whole Number of Fibres is advantageously disposed, and their Action rendered uniform. In the greatest Degree of Supination, the Extremity of these Fibres, inserted in the two Bones, make a very oblique Plane, which becomes almost fruit, in the greatest Degree of Pronation. *Winslow's Anatomy*.

PRONERVATIO. A Tendon, or tendinous Expansion. *Castellus*.

PRONOMŒA, προνομία. The same as PROBOSCIS.

PROPHASIS, πρόφασις. The Cause, or Occasion, of a Disorder.

PROPHYLACE, προφυλακή; PROPHYLAXIS, προφυλαξίς; and PROPHYLACTICE, προφυλακτική, from προ, before, and φυλάσσω, to preserve. The Method of preserving Health, and averting Diseases. See INDICATIO.

PROPOLIS. Bee-bread. This is a rude, wax-like, and thick Matter, or Grew, found in the Entrance of Bee-hives. It is gently heating, abstergent, and attracting: It softens indurated Parts, alleviates Pains, and induces Cicatrices on Ulcers. Schrod. See AMBRA.

PROPOMA, πρόπομα, or προποτισμός. A Potion prepared of one Sextary of despumated Honey, and four of Wine, boiled together. Paulus Ægineta, Lib. 7. Cap. 15.

PROPTOSIS, πρόπτωσις. The same as PROLAPSUS; a falling out of the natural Situation; from προπίπτω, to fall out.

PRORA. The Occiput. Os Proræ is the Os Occipitis. Sutura Proræ is the Lambdoidal Suture.

PRORRHESIS, προρρησις, from προ, before, and ρέω, to tell. A Prediction, or Prognostic.

PROSARMA, προσάρμα, from προσάρισω, to offer. Aliment.

PROSARTHROSIS, προσάρθρωσις. The same as ADARTHICULATIO.

PROSCARABÆUS. Offic. Mouff. Insect. 162. Jons. de Insect. 74. Mer. Pin. 201. Scarabæus unctuosus. Schrod. 5. 345. Pinguiculum. Agricola. Meloan. Paracels. THE OIL-BEETLE.

It is to be found creeping about every-where by the Sides of Paths, and in Woods, in the Months of May and June; and the Parts used in Medicine are the Insect itself, and its oily yellowish Liquor.

The Oil-beetle is much of the Nature of Cantharides, forces Urine and Blood, and is of extraordinary Efficacy against the Bite of a mad Dog. Taken in Powder, or preserved, it cures the Vari, or wandering Gout, as we are assured by Wierus. The Liquor is, by some, esteemed of Efficacy in Wounds; it is an Ingredient, also, in Plaisters for the Pestilential Bubo and Carbuncle, and in Antidotes; an Oil is prepared by Infusion of the living Animals in common Oil, which some use instead of Oil of Scorpions. Dale from Schroder.

PROSCEPHALÆON, προσκεφάλαιον, from προς, to, and κεφαλή, the Head. A Pillow, to support the Head, or a disordered Limb.

PROSCLYSMA, πρόσκλυσμα. An Asperision, or Sprinkling, of any Part with a Fluid.

PROSCOLLEMA, προσκόλλημα. An Agglutination.

PROSCRIPTIO. A Retardation. Rulandus.

PROSECHES, προσεχής. The same as SYNECHES, or CONTINENS.

PROSERPINACA. A Name for the Polygonum Latifolium.

PROSERPINALIS HERBA. A Name, in Marcellus Empiricus, C. 10. for the Dracontium.

PROSOEMA, πρόσοιμα. The same as PROSARMA.

PROSOPITES, προσωπίτης. The same as ARCION. The Burdock. Paulus Ægineta, L. 7. C. 3.

PROSPHEROMENA, προσφερόμενα, (from προσφέρω, to bring, or offer; properly, in a medicinal Sense, Food, or Aliment) are usually spoken of such Things as are offered to the Sick for their Support and Nourishment; but, however, often signify the external Apparatus necessary to the due Treatment of a diseased Part; or, in short, whatever a Surgeon ought to be provided with when he undertakes a Cure. Hippocrates, Lib. de Medico. Προσφερόμενα, in the more usual Sense, as signifying Food offered, are also called προσοίσματα (Prosoismata), and προσοίσεια (Prosoisēia); as in that Passage, Lib. de Locis in Homine, καὶ ὅταν κενήνται τὸ σῶμα ὅτ' τῶν προσοισμάτων. "Whenever the Body is overcome by (is too weak to concoct) the Foods exhibited;" πρόσοισμα, a few Lines farther, is also spoken in the other Sense of a hot Bath; and Lib. de R. V. I. A. near the Beginning, παρυσία comprehends all manner of Assurances offered to the Sick, whether of Food, or Medicine. Again, Epid. 3. Sect. 3. we read, τοῖσι δὲ προσφερόμενοισι δυσκόλως ὑπακούοντα. "They [the Bodies of the Patients] were not easy to be affected, or wrought upon, by the Things which were exhibited;" where Galen, on the Place, says, that by προσφερόμενα we are to understand all manner of Helps, and Assurances, in general; and, particularly, Meats and Drinks. In 2 Aph. 33. προσφορὰ are expounded, by Galen, τῶν σιτίων προσφορὰ, "Exhibitions of Food."

PROSTASIS, πρόστασις, from προϊσάμαι, to preside in Power or Dignity, is used, by Hippocrates, in a particular Sense, for that Humour, which prevails and predominates over the rest. Thus, we read, 6 Epid. Sect. 5. Aph. 15. γλῶσση δὲ μύχρως τῇσι πρόστασις, "The Tongue is of the Colour of the prevailing Humour." Galen here confesses it to be an ob-

scure Word, but understands it of the Humour with which the Tongue appears, chiefly, impregnated. Prostatas, Lib. de Locis in Homin. as derived from προϊσθαι, to stand by, to adhere; signifies no more than an Adhesion, or Accrescence, in that Expression, αἱ τοιαύται κοῦσαι πρόστασις ποιεῖσιν τὴν σὰρκα πρὸς τὸ ὀστέον, "Often-repeated Sections cause Flesh to come, or grow up, about the Bone."

PROSTATÆ. The Prostate Glands; from προϊσάμαι, to be adjacent to. See GENERATIO.

PROSTETHIS, προσθεσις. The anterior Part of the Thorax; or the fleshy Parts in the Concavities of the Hands, and Feet, and betwixt the Fingers.

PROSTHESIS, πρόσθεσις, from προσθίμι, to add. That Part of Surgery which supplies what is deficient.

PROSTHETA, πρόσθετα, from προσθίμι, to apply, signify, in Hippocrates, subditious Medicines, whether Suppositories, or Pessaries. Prostheton, προσθῆτον, frequently signifies a Suppository; and προσθῆς, or προσθῆναι ἐν εἰρήῃ, is often spoken of a Pessary, applied in Wool, throughout the whole Treatise de Morb. Mul. Sometimes, instead of προσθῆτον, we read πρόσθεμα, in the same Sense; and once, Lib. 1. περὶ γυναικ. we meet with προσθῆσις, for προσθῆς; tho' προσθῆσις, in other Places, signify Exhibitions of Food; and προσθῆναι is often used with relation to the same.

PROSTHEMENE, προσθεμένη, in Hippocrates, is a Woman under the Application of a Pessary. Thus, 1 Epid. Ægr. 4. προσθεμένη δὲ ταῦτά μιν ἐκεῖσθαι; "Being treated with a Pessary, these (Symptoms) were alleviated." Galen, on this Place, says, "The Signification of this Word, προσθεμένη, when it is joined with βάλανθ (Balanus), a Glands, or Suppository, is obvious; but when it is used without an Addition, we are either to understand it of βάλανθ, as some will have it; or of a lenitive and antiphlogistic Pessary."

PROSTHION, πρόσθιον. The Penis.

PROSTOMION, πρόσθμιον. The Part where the Lips meet, when closed.

PROTARCHI MEDICAMENTUM. The Name of a Medicine, recommended by Celsus, against the Scabies, L. 5. C. 28. Sect. 16.

PROTASIS, πρότασις, from πρότεινω, to stretch, or put forth, or propose, is, properly, a Proposition, or Problem, offered to be discussed; but πρόστασις πνεύματων, Lib. de R. V. I. A. "Stretchings of the Spirits (Breath)," are expounded, by Galen, on the Place, by Obstacles and Interruptions of Respiration. For τὰ προτεταμένα πνεύματα, "Breath drawn out in Length," he says, ἀρὰ τὸ διονέγκοντο, "such as is, in a manner, interrupted;" and which, in another Place of the same Book, is described as πνεῦμα προσπίπτον ἐν τῇ ἀνω κορῇ, "Breath which strikes, or impinges, in its Passage upwards." It is to be observed, that all the vulgate Copies of Hippocrates read πρόστασις (Prostatas); but those of Galen have it, πρόστασις, (Protasies) as above.

PROTEUS. The Name of a Collyrium, described by Paulus Ægineta, L. 7. C. 16.

Proteus was represented, by the ancient Poets, as a God, the Son of Oceanus and Thetis, who could transform himself into any Shape. Hence Morton, in his Pyretologia, calls the irregular Appearances of intermitting and remitting Fevers, Proteiform. And certain it is, that, in consequence of the Violence of the Symptoms, when almost the whole System is briskly stimulated to a Conflict with the peccant Matter, these Fevers often resemble most other Diseases, especially of the acute Kind, but yield to the Efficacy of the Bark; tho', at the same time, they often prove fatal, if that Medicine is not exhibited: For, among the various Symptoms which generally accompany these Fevers, there is one, which does not, sometimes, rage with such Violence, as not only to endanger the Life of the Patient, but, also, so totally to conceal and oppress the Form of the Fever, in its various Stages, of Chills, Heat, and Sweat, that it can neither be distinguished by the Urine, the Temperament, the Pulse, or any other usual Method; but, appearing under the Mask, as it were, of a terrible Chills, an incessant Vomiting, a Diarrhoea accompanied with Gripes, a Cholera Morbus, a Colic of the Stomach, a periodic Hemicrania, an Apoplexy, a Syncope, a Rheumatism, universal Spasms, a Pleurisy, a Peripneumony, a punctory Pain of the Side, or some other Disorder, frequently misleads the Physician from the true Intention of Cure. In this Case, an Attempt may, indeed, be made, to remove the Symptoms, by proper Medicines, but all in vain; for, as the febrile Ferment is neglected, on the Approach of the next Paroxysm, the former, or worse Symptoms, unexpectedly recur, the Physician labours in vain, and the Patient falls a Victim, or, at least, sustains a considerable Injury, by the Ignorance or Carelessness of his Physician.

When, in consequence of the highly deleterious Quality of the Poison, the animal Spirits are so weakened, that they can by no means expand themselves, after the first Shock, the Shivering, which,

which, generally precedes the first Approach of these Paroxysms, is so long protracted, that the Patient, spent with frequently recurring Deliquiums, at last falls a Sacrifice to his Disorder. Internal and external Medicines, are, in the mean time, used in vain, to rouse the languid Principle of Life; but the Fever cannot, even by the most accurate Observer, be discovered, from any Signs, either in the Urine, the Heat, or the Pulse.

In like manner, when, in the first Stage of the Paroxysm, the poisonous Fomes only oppresses the Spirits, so that they cannot expand themselves beyond their usual Sphere, the Patient without any Signs of a present Fever, complains of a Nausea, Sicknefs, and Vomiting, till the Poison being subdued by the *Peruvian Bark*, or some other Antidote, the Spirits are restored to their natural State.

Sometimes, about the Beginning of the Paroxysm, the febrile Poison is convey'd to the Glands of the Intestines, and excites a Flux, accompanied with Gripes, or a Dysentery. But when the Spirits are long oppressed in an uniform manner, these Symptoms, though continual, are at stated Periods augmented, become periodical, without any manifest Signs of a Fever, and cannot be removed by the Efficacy of Opium and Astringents, till, by a Mixture of the *Peruvian Bark* with Laudanum, the Cause, or febrile Ferment, which contaminates the whole Mass of Blood, is removed, together with all the Symptoms arising from it.

When the Poison partakes of an emetic, and at the same time, a cathartic Quality, the Patient is seized with frequent Vomiting and Purging; and, unless the Spirits, by their due Expansion, throw off the Virulence of the Poison in the first Stage of the Paroxysm, a Cholera Morbus is by that means formed, whilst the Fever, in the mean time, can neither be discovered by the Pulse, the Urine, nor the Heat. The Stomach, in the mean time, or the Intestines, or both together, being sphacelated by the intensely poisonous Acrimony of the Humours, the Patient soon dies; or, at least, after a delusive and fallacious Respite, when the next Paroxysm approaches, the same violent Symptoms are again produced by the Poison, unless such a Misfortune is prevented by a seasonable Exhibition of the Bark.

By the like Degree of Virulence in this Poison, I have frequently observed Patients, especially such as laboured under long and confirmed Fevers of this Kind, after the Form of the legitimate Fever was lost, so spent with a perpetual Nausea, Sicknefs, Vomiting, colliquative Sweats, hysteric Suffocations, and other like Symptoms, affecting the nervous System, that they seemed just about to die; and these, though incurable by any other means, I have speedily recovered by a due Dose of the Bark.

Every one conversant in the Practice of Physic knows, that violent spasmodic and lancinating Pains, equal to those excited by Poison, frequently accompany the first Attacks of legitimate intermittent Fevers, especially those of the quartan Kind, during the Shivering and Rigor, till the Spirits, being forcibly expanded and agitated, become capable of eliminating the acting Poison. The febrile Flame being by this means roused in the Mass of Blood, the painful Spasms gradually cease. But, when the Spirits are not only depressed by the Force of the Poison, but, also, forced into a kind of explosive State, I have, in consequence of this, found the whole Body not only for a long time continually cold, and without any Mark of a Fever, but, also, vellicated and twitched by universal violent and flitting Spasms. Nor is it to be wondered at, if, as it often happens, the Patient spent with perpetual Sicknefs, Vomiting, and Deliquiums, soon becomes desirous of Death, unless languishing Nature is seasonably assisted by Art.

The Spirits, also, in consequence of their natural Weakness, an Obstruction, and especially Cold, or any other evident Cause, are frequently forced into a kind of explosive State; by which means, some particular Parts, especially those of the Thorax, such as the Pleura, the Diaphragm, or the Stomach and Intestines, are vellicated and afflicted with spasmodic Pains. The Patient, in consequence of the intense Pain, shivers perpetually, and is spent with frequent Deliquiums, Suffocations, and Vomiting, without any ardent Mark of a Fever; he discharges clear Urine, and without any Pulse he is at the Point of Death, till the Spirits, affected by the Poison, being expanded either by Nature or Art, again rouse the Principle of Life in the Body. This Disorder can only be distinguished from a Cholera Morbus, a Pleurisy, or a Peripneumony, by the want of a Cough, and the Privation of the Pulse, by the excessive Vomiting and Pain, by the Deliquiums, and the Coldness of the Extremities.

I have, also, frequently known Patients complain of a punctory Pain in one or other of their Sides: But, in these, I could not for several Days discover any of the Marks of a Fever, except that the Pulse was somewhat too quick. But after by Venesection, and the Use of Laudanum mixed with Alexipharmics, these Spasms were mitigated, and by that means the natural elastic Force of the Spirits increased, the Signs of a

febrile Flame in the Mass of Blood soon discovered themselves. The Urine was tinged and turbid, the Pulse became equally strong and quick, the whole Body was render'd hot, a violent Thirst seized the Patients, and Aphthæ covered their whole Tongues and Mouths. But directing my Intentions to the febrile Flame, and the Exacerbation of the periodically returning Pain, by a sufficient Quantity of *Peruvian Bark* mixed with Laudanum, and exhibited in the Intervals between the Paroxysms, I subdued the Poison, and totally freed the Patients from their Fever and Pain.

I have often with Surprise observed, that, after the subduing of the febrile Poison, in some measure brought about by the Expansion of the Spirits, when by a strong and quick Pulse, an intensely red and turbid Urine, the Heat of the Body, and other Signs, the Fever manifestly discovered itself, the Joints were affected with these spasmodic Pains, which returned at stated Periods, like a Rheumatism removed from Place to Place, and produced a Tumor and Heat in the Parts affected, by means of the Efforts of the Spirits endeavouring to expand themselves in these Parts: But I always happily removed these Pains by due Venesection, and a copious Use of the *Peruvian Bark*, exhibited between the Paroxysms.

Every Physician knows, that, on the first Approach of legitimate intermittent Fevers, the Brain is affected, not only from the Vertigo, and the Oppression and Disturbance of the Spirits by the active Poison, but, also, from the acute and violent Pains arising from the Effort of the Spirits endeavouring to expand themselves in the Membranes of the Brain. But sometimes the Spirits are at this Period of the Fever so oppressed and disturbed, that the Patient, like one under an Apoplexy, lies, during the whole Paroxysm, without any Signs of the Fever; and the same Symptoms often return with the succeeding Paroxysm. But, though we are to endeavour the Mitigation of these Symptoms by Venesection, Vesicatories, and the other Remedies appropriated to the Cure of Apoplexies, yet their Return cannot be prevented without the Use of the Bark.

I have, also, observed a periodic Hemicrania produced by an Effort of the Spirits to expand themselves in the Membranes of the Brain. But this Symptom I totally removed in two Days time by Venesection, and the Use of the Bark; though, for its Removal, I had, for some Weeks before, in vain used Venesection, Vesicatories, Emetics, Cathartics, Errhines, and Massicatories. *Morton. Pyretologia.*

The above-quoted Author gives a great Number of Cases, in Confirmation of this Doctrine, which are very much worthy of Perusal, because this Subject is of infinite Importance in the Art of Healing. See *Exercitatio 1. Cap. 9. and Exercitatio 2. Cap. 9.*

PROTMESIS, *πρωτισμος*. The Navel of a Child, when first cut. According to *Pallux*, it signifies the same as *Lumbus*, a Loin.

PROTOGALA. Beestings; the first Milk, after an Animal has brought forth Young.

PROTOPATHEIA. A primary, or idiopathic Affection.

PROTOPLASTUS. The first Man. *Paracelsus.*

PROTORRHYTOS. See *CAPNELÆON*.

PROTOS POROS, *πρωτος πορος*. The internal Mouth of the Uterus. *Ruffus Ephesius, de Appel. Corp. Human. Lib. 1. Cap. 31.*

PROTOSMA. The first Woman. *Paracelsus.*

PROTOSTACTON, *πρωτοστακτον*. A Lixivium from Ashes, with an Addition of Quick-lime.

PROTOTOMI, *πρωτοτομι*. The tender Stalks, or Asparagi, of Cabbages.

PROTROPON, *πρωτροπον*. The same as *PROCHYMA*.

PROULIMATESIS, in *Forestus*, is a Disorder of the Stomach, consisting in its Prominence, exciting an external Tumor. *Castellus.*

PROVOCATORII DIES are the same as the *Dies Intercalares*; that is, those which fall betwixt the Critical Days, and the *Dies Indices*. They are the third, fifth, ninth, thirteenth, and nineteenth.

PRUINA, in *Paracelsus*, is a sandy Sediment in the Urine. According to *Rulandus*, *Pruina* is the first Species of Tartar. *Pruina Chymica*, are Sublimates.

PRUNA. See *PRUNUS*.

PRUNELLA. *Offic. Ger. 577. Emac. 632. Raii Hist. 1. 551. Synop. 3. 238. Prunella vulgaris. Park. Theat. 526. Prunella flore minore vulgaris. J. B. 3. 428. Brunella major folio non dissecto. C. B. P. 260. Tournef. Inst. 182. Boech. Ind. A. 169. SELF-HEAL.*

The Roots of Self-heal are slender, creeping, and fibrous; the lower Leaves grow on long Foot-stalks, beset with a few Hairs, as is the rest of the Plant; they are broadest in the Middle, and narrower at both Ends, less than Betony, and not at all indented about the Edges. The Stalks are square, about a Foot high, with two Leaves set opposite at a Joint, which are not many on a Stalk; the nearer they grow to the Top, the shorter

shorter are their Foot-stalks. The Flowers are set on the Top of the Branches in thick verticillated Spikes; of a purple Colour, having an hollow Galea, and a three-lobed Labella, standing in brown flatish Calyces, six standing round the Stalk in a Whorle; each Flower is succeeded by four longish brown Seeds growing in the Bottom of the Calyx. It grows everywhere in Meadows and Pasture-grounds, flowering all the latter Part of the Summer: The Leaves and Flowers are used.

Self-heal is reckoned among the vulnerary Plants, and is accounted serviceable for all Sorts of Wounds, and putrid Ulcers. It is restraining, and good for inward Bleedings, and making bloody Water; and is much used in Gargles, for Ulcers in the Mouth, Throat, or Gums, either the Juice, or a strong Decoction. *Miller's Bot. Off.*

Self-heal gives a pretty deep red Colour to the blue Paper; it is of an herby, styptic, and glutinous Taste, mixed with a very little Bitterness; from which we may conjecture, that the acid Part of the natural Salt of the Earth is in this Plant disengaged from a good deal of the acrid Part; and that, being united with abundance of Earth and Sulphur, it produces there a Salt which resembles Alum. This Mixture of Principles renders Self-heal vulnerary, astringent, and deterfive; and is an Ingredient in the Arquebuse Water, and in vulnerary Potions. *J. Bauhine* esteems a Lotion of it for Gunshot Wounds. It is prescribed in Pisans, Broths, and Apozems, for spitting of Blood, for bloody Urine, for the too great or too frequent Flux of the Menes, for the Bloody-flux, and for all Sorts of Hæmorrhages. It is used by way of Injection in deep Wounds, and by way of Clyster in the Bloody-flux. For Diseases of the Throat, Gargarisms of it must be frequently used. They bathe the Gums of scorbutic Persons with it, adding some Grains of Mastich. The distilled Water of the whole Plant, and the Conserve of its Flowers, may be used for the same Purposes. *Cæsalpinus* used the Leaves bruised, and applied in form of a Cataplasm, to suppurate Boils, and to heal Wounds. He used the Juice for the Ulcers of the Mouth, and, in great Pains of the Head, he bathed the Temples with it, after having mixed it with Oil of Roses and Vinegar. *J. Bauhine* added to it a little Rose-water, and gave it to drink to those who had been bitten by any venomous Creature. *Martyn's Tournefort.*

Prunella absterges and consolidates; its principal Use is in Wounds, especially of the Lungs, and in Coagulations of Blood. It is, also, frequently employed outwardly in Wounds, and in the Quinsy, and other Affections of the Mouth and Fauces. *Buxb.* This Plant is, also, of excellent Virtue in all inflammatory Distempers, Hæmorrhages, and Dysenteries, and in spitting or pissing of Blood. *Hist. Plant. adscript. Boerhaave.*

PRUNELLUS. See PRUNUS.

PRUNUS.

The Characters are;

The Calyx is monophyllous and quinquefid; the Flower roseaceous, pentapetalous, and furnished with thirty or more Stamina. The Ovary in the Bottom of the Calyx becomes an ovated or globous Fruit, containing under a thin, smooth Membrane, or Skin, a soft Pulp, in the Middle of which is inclosed an oblong or oval flatish Stone, acuminate at both Ends, and containing a single Kernel; the Pedicle of the Fruit is of a good Length.

Boerhaave mentions seven Species of *Prunus*; which are,

1. *Prunus*; sylvestris. *Ger.* 1313. *Emac.* 1497. *Park. Theat.* 1033. *C. B. P.* 444. *J. B.* 1. 193. *Raii Hist.* 2. 1527. *Synop.* 3. 462. *Boerb. Ind. A.* 2. 241. *Prunellus sylvestris.* *Offic. Acacia Germanica.* *Schrod.* THE SLOE-TREE, or BLACK THORN.

This is a Bush, or small Tree, whose tough Branches are full of hard sharp Thorns, sending forth its white five-leaved Flowers early in the Spring, before the Leaves appear, which are small and oblong, finely indented about the Edges. The Flowers are succeeded by small round Fruit growing on short Stalks, green at first, but, when ripe, of a fine purplish-black Colour, of a rough, sour, austere Taste, and not fit to be eaten till mellowed by the Frosts. The Sloe-bush grows every-where in the Hedges.

The Fruit is principally used, being restraining and binding, and good for all Kinds of Fluxes and Hæmorrhages. It is, likewise, of Service for Gargarisms for sore Mouths and Gums, and to fasten loose Teeth.

The Juice of Sloes, being boiled to a Consistence, is the *Acacia Germanica*, *Off.* which is now used instead of the true, and put into all the great Compositions. It is of a darkish Colour on the Outside, and redish within. *Miller's Bot. Off.*

The Leaves of the Sloe-tree are bitter, a little styptic, glutinous, and give a faint Tincture of Red to the blue Paper; but the Fruits give it as deep a Red as Alum; they are a little sour, and extremely styptic: Thus it is likely, that the natural Salt of the Earth predominates in the Leaves, where it is mix'd with a little fetid Oil; but that its acid Part, being disengaged in the Fruits, is united with the Earth, and forms a Salt resem-

bling Alum. *Tragus* found by several Experiments, that the distilled Water of the Sloe-tree is an excellent Remedy for the Pleurisy, and for the Oppressions of the Stomach: When this Author had not the distilled Water of these Flowers, he gave Wine, in which they had been macerated, to be drank by his Patients, or else made use of the same Wine distilled in Balneo Mariæ. He affirms, that those Fruits, preserved with Honey, are very good for the Dysentery, and all Sorts of Loosenesses. The Wine made of Sloes has the same Effect. *J. Bauhine* says, that in *Assatia* they dry the Sloes in an Oven, and put them into their Must; and that renders them agreeable and astringent. *Matthioli* made use of the Decoction of the Fruits and Roots for Ulcers of the Mouth and Throat. The Juice of the Fruits asswages the Inflammation of the Eyes; the same Juice, thickened, is called *Acacia Recentiorum*, or *Germanorum*, because it is substituted in the room of the *Acacia* of the Antients, to cool and bind. *Wittichius* prescribes as a good Purgative, the Syrup made with several Infusions of the Flowers of this Tree. *Schroder* mentions it also. *Ettmuller* relates, that a very strong Vinegar is obtained from the Juice of the green Fruits by distilling them in Balneo Mariæ. *Martyn's Tournefort.*

2. *Prunus*; fructu cerei coloris. *T.* 622.

3. *Prunus*; fructu majore; rotundo; rubro. *T.* 622.

4. *Prunus*; fructu maximo; rotundo; flavo & dulci. *T.* 622.

5. *Prunus*; fructu parvo, ex viridi flavescente. *T.* 623.

6. *Prunus*; fructu parvo præcoci. *T.* 623.

7. *Prunus*; fructu magno, dulci, atro-cæruleo. *Tourn. Inst.* 622. *Boerb. Ind. A.* 2. 241. *Prunus Damascena.* *Offic.* *Prunâ, magna, dulcia, atro-cærulea.* *C. B. P.* 443. *Prunâ atro-cærulea, Theophrasto Bartyla, aliis Damascenâ dicuntur.* *Jonst. Dendr.* 77. THE DAMASK-PRUNE.

The best Plums, or Prunes, being formerly brought from *Damascus*, the Fruit has kept that Name ever since; though it is seldom or never brought from thence now, we making use of the Fruit that is brought from *France*, or the *Pruna Gallica*, *Offic.* which I take to be the Fruit of the *Prunus Damascena*, or Damson Plum; *Ger.* the great Damson or Damask-Plum of *Park. Parâd.* They are brought over dried in great Quantities from *France*, being a larger and sweeter Plum than the common Damson.

Prunes are cooling and moistening, rendering the Body loose and soluble; they assuage Thirst, and mitigate the Heat and Acrimony of the Bile. A good Quantity of the Pulp is put into the lenitive Electuary.

Medicines deriving their Name from Prunes, are the *Electuarium Diaprunum*, *Lenitivum*, & *Solutivum*. See DIAPRUNUM. *Miller's Bot. Off.*

Besides the foregoing Species of *Prunus*, *Dale* mentions the two following;

1. *PRUNUS GALICA.* *Offic. Prunus.* *C. B. P.* 443. *Prunus sativa.* *J. B.* 1. *Prunus domestica.* *Ger.* 1311. *Emac.* 1497. *Prunus vulgaris.* *Park. Theat.* 1511. *Prunus fructu parvo, dulci, atro-cæruleo.* *Tourn. Inst.* 622. THE COMMON PRUNE.

This Plant is frequently cultivated in Gardens, and flowers in April. It is transported dry to us from *Provence* and *Languedoc*, and its Gum is hard and pellucid. It is thought to be possessed of the same Virtues with the former. *Dale.*

2. *PRUNUS BRIGNOLENSIS.* *Offic. Prunus Brignoniensis fructu suavissimo.* *Tourn. Inst.* 632. *Prunus Brignoliensis aut Brignolensis.* *Raii Hist.* 2. 1526. *Pruna ex flavo rufescentia, mixti saporis, gratissima.* *C. B. P.* 443. THE PRUNELLO.

These are small yellow Plums, brought over from *France* in little long Boxes; they are moist, flat, and without Stones.

They are seldom prescribed by Physicians; but being of a pleasant grateful Taste, and not subject to purge, they are frequently eaten by Persons in Fevers. *Miller's Bot. Off.*

PRURIGO. The Itch. See LEPRO. Or an Itching.

PRURITUS. The same as PRURIGO.

PSAISTE MAZA, פסאיסט מזה, is expounded in *Galen's Exegesis*, by "a Maza worked up with Honey and Oil, because, says he, the Psaiста were so prepared." Now the *Psaiста*, according to *Hesychius*, were *Alphita* wet with Oil, or, as *Suidas* says, with Oil and Wine, which they burnt in Sacrifice to the Gods. *Psaiста* was, also, a Name for a sort of wide and round Cakes, by some called, also, פסא (psêstâ); agreeably to which, all the Copies read פסא פסין, *Lib. תעודת העשרה מאבין*, tho' *Calvus* seems to have read פסין, which occurs in another Place of the same Book, where we find פסא פסין דה פסין וס פסין, "a Maza very well work'd up with Oil and Honey;" but *Aldus* reads it here, too, פסין, as he does, also, in another Place of the same Book.

PSAGDAS, פסגדס, is expounded in *Galen's Exegesis* by פסגדס תרופה, "a kind of Ointment," which is, also, the Exposition which *Erotian* gives of it, and for which he quotes *Eupolis*. But some Copies of *Erotian* read פסדס; and *Hesychius* expounds פסדס, פסגדס, by פסגדס תעודת, "some fort

"Sort of Ointment." Upon the Whole, it seems to be a foreign and barbarous Term. *Foefius*.

PSALACANTHA. *ψαλακάνθα*. *Suidas* informs us, that *Ptolemaeus Cyptherius* wrote a Poem on the *Psalacantha*, which he said was an Herb possess'd of many extraordinary Virtues. *Photius*, from *Ptolemaeus Hephaestionis*, mentions it as an Egyptian Plant, with some fabulous Circumstances, not worth relating. Some, he says, represent it to be like the *Artemisia*; others like *Melilot*.

PSAMMISMOS, *ψαμμισμός*. A Sort of Cure of the Dropsy, by covering the Body with Sand.

PSAPHEROS, *ψαφρός*, is expounded in *Galen's Exegetis* by *ψαθύρος*, (*psathyrus*) and *ψαφρός*, *ψαφάρος*, are the same as *ψαθύρος*, *ψαφύρος*, *ψαφάρος*, *ψαφύρος* and all signify brittle, or friable, and are applied to such Foods as contain nothing of a fat or viscous Substance; but are tender, friable, or incoherent. *Galen*, *Lib. 3. de Alim.* The same Author, *Lib. 3. de Diff. Puls.* opposes their Signification to *γλισχρός*, (*glischros*) viscid, or glutinous; and, *Lib. 11. de M. M.* expresses it by *κραυρός* (*crauros*); as *Aristotle*, *Lib. 4. Meteor.* does by *θραυστός*, (*thraustos*), Words importing Friability, and Looseness of Contexture: *ψαφρός*, in *Coac. 608.* is joined with *μαλθακός*, and both are apply'd to Excrements of a loose and soft Contexture, which are condemn'd; *ψαφάρος διαχώνημα* is the same as *ψαφάρος*, and signifies loose, incoherent Excretions by Stool; and, in an Epithet, joined with *ξηρός*, dry, *ψαφάρος* is expounded also by *ξηρός*, *αυχμυρὸν*, *ασθενὲς*, *ελαφρὸν*, dry, squalid, weak, light. In *Coac. 583.* we read *ὕρον ὡς ὕδατος*, ἢ τρισαεταμίονον *ψαφρὸν*, *τριχύτην*. "Urine like Water, or disturbed with a loose, or rough, and sand-like Substance."

PSARON. The Name of a Powder described by *Aetius*. *Tetrabib. 4. Serm. 2. C. 36.*

PSATHYROS. *ψαθύρος*. The same as **PSAPHEROS**.

PSEGMMA. *ψῆγμα*. A Name for the *Flos Aëris*. *Dioscorides*, **PSELAPHIÆ**, *ψελαφίη*, (from *ψελαφάω*, properly, to touch the Strings, in playing on a musical Instrument, as *Eustathius* in *Iliad.* observes; but commonly signifying to feel or grope like Persons in a Delirium) in *Hippocrates*, *Lib. περὶ εὐσχημ.* signifies Friction with the Hands, and is reckoned Part of the Office of a Physician, which he should always be in a Readiness to perform, when the Subject requir'd it.

PSEUDES, *ψευδής*, False, or Bastard. Hence the following Articles, beginning with *Pseudo*, are derived.

PSEUDO-ACACIA.

The Characters are,

It has a papilionaceous Flower, from whose Calyx rises the Ovary, involved in a fimbriated Membrane, and becoming, at last, a flat Pod, opening into two Parts, full of Kidney-shap'd Seeds.

Boerhaave mentions two Species of *Pseudo-Acacia*; which are,

1. *Pseudo-Acacia*, vulgaris. *Tourn. Inst. 649. Boerb. Ind. A. 2. 39. Pseudo-Acacia. Offic. Pseudo-Acacia Americana Robini.* *Park. Theat. 1550. Acacia Americana Foliis coluteæ, monococcos, siliquis echinatis.* *Raii Hist. 2. 1719. BASTARD ACACIA.*

This Plant is naturally produced in America; but is with us found in the Gardens of the Curious. I know nothing of its Use and Virtues; at Paris, however, a distilled Water is prepared from its Flowers. *Dale.*

According to *Robinus*, the Leaves of this Plant when boiled and expressed, purge in the same manner with *Sena*. Others recommend a Decoction of the Leaves, for its corroborating and refrigerating Quality. It is exhibited in Dysenteries, but excites violent Pains and Flatulences. *Hist. Plant. adscript. Boerb.*

2. *Pseudo-Acacia*; siliquis glabris; *Acacia Virginiana, siliquis glabris.* *Raii Hist. 1719. Boerb. Ind. alt. Plant. Vol. 2.*

PSEUDO-ACORUS. See **ACORUS ADULTERINUS**.

PSEUDO APOCYNUM, *hederaceum, Americanum, tubuloso Flore phœnice, Fraxini Folio.* A Name, in *Boerhaave*, for the *Bignonia, Americana, Fraxini Folio*; *Flore amplo, phœniceo.*

Pseudo-Apocynum, Americanum, capreolatum, tetraphyllum, tubuloso Flore, Foliis longioribus. A Name, also, in *Boerhaave*, for the *Bignonia, Americana, capreolis donata, siliquâ breviori.*

PSEUDO-ASPHODELUS. *Ray*, in *Hist. Plant.* takes notice of three Plants under this Name. The first is the;

Pseudo-Asphodelus minor, sive Pumilio, Folio Iridis, sive 2 Cluf.

Pseudo-Asphodelus Alpinus, C. B. Minor, Folio Iridis. THE LESSER BASTARD ASPHODEL. *Park. Asphodelus Lancastrie, Lancashire Asphodil.*

I find no medicinal Virtues ascribed to this Plant.

The second is the,

Pseudo-Asphodelus palustris vulgaris nostras. Asphodelus Lancastria verus, Ger. Emac. descr. TRUE LANCASHIRE ASPHODEL. *Pseudo-Asphodelus primus, Cluf. Palustris Anglicus. C. B. Luteus, acrisolius, palustris Anglicus. Lobelii I. B.*

This is said to be an excellent Application for the Cure of Wounds. Women dye their Hair with the Flowers of this Plant, macerated in a *Lixivium*.

The third is the

Pseudo-Asphodelus palustris, Scoticus minimus. THE LEAST SCOTISH ASPHODEL.

No medicinal Virtues are ascribed to this Species.

PSEUDO-ASTHMA. An *Asthma* excited by an Abscess, or Vomica, in the Lungs.

PSEUDO-BUNIAS. See **BARBAREA**.

PSEUDO-BUNIUM. See **BUNIAS**.

PSEUDO-CADMIA. A Name for the **ANTICADMITA**.

PSEUDO-CAPSICUM. A Name for the *Solanum, fruticosum, bacciferum*.

PSEUDO-CHAMÆBUXUS. A Name for the *Polygala, frutescens, Folio buxi, Flore maximo*.

PSEUDO-CHINA. A Name for the *Senecio, Asiaticus, Jacobææ Folio, radice lignosa, China officinarum dicta nobis*.

PSEUDO-COLOCYNTHIS. A Name for the *Pepo, fructu ovato variegato*.

PSEUDO-CORALLIUM. A Name for the **CORALLIUM NIGRUM**.

PSEUDO-COSTUS. A Name for the *Pastinaca, Olusatris folio*.

PSEUDO-CYTISUS. See **CYTISUS**.

PSEUDO-DICTAMNUS.

The Characters are;

The Root is perennial; the Calyx is orbicular, open, and contains the ripe Seeds, under Covert, as it were, in a Sawcer. The Galea is erect, fornicated, or arched, and bifid; and the Beard tripartite. The Whorles of the Flowers, resemble those of white Horehound; and are disposed in close Order, with aculeated Apices.

Boerhaave mentions eight Species of *Pseudo-dictamnus*; which are,

1. *Pseudo-dictamnus, acetabulis moluccæ. C. B. P. 222. M. H. 3. 378.*

2. *Pseudo-dictamnus, verticillatus, inodorus. C. B. P. 222. Tourn. Inst. 188. Boerb. Ind. A. 173. Pseudo-dictamnus. Offic. Park. Theat. 27. Pseudo-dictamnus. Ger. 651. Emac. 797. Dictamnus adulterinum, quibusdam verticillatum, vel potius Gnaphalium veterum. J. B. 3. 255. Marrubium Pseudo-dictamnus dictum. Raii Hist. 1. 557. Gnaphalium veterum, Centunculus, Dictamnus adulterinum quibusdam. Chab. 410. BASTARD DITTANY.*

This Plant is cultivated in Gardens, and flowers in July. The Herb is only used, and as in external Appearance, so in Virtues, it agrees with Horehound. *Dale.*

The Virtues of this Plant are by some said to be the same with those of the Dittany; but this is by no means true, since the odorous Smell of the former is not so strong as that of the latter. It is by some thought to be the *Alypion* of the Antients, but unjustly. *Hist. Plant. adscript. Boerhaave.*

3. *Pseudo-dictamnus, Hispanicus, amplissimo Folio nigricante, & villosa. T. 188.*

4. *Pseudo-dictamnus; Hispanicus, Folio Scrophulariæ. T. 188. Galeopsis Anguillaria. 278.*

5. *Pseudo-dictamnus, Hispanicus, amplissimo Folio candicante & villosa. T. 188. Marrubium subrotundo Folio. Boc. Mus. 2. 167. Tab. 122.*

6. *Pseudo-dictamnus, Africanus, foliis subrotundis, subtus incanis. H. A. 2. 179. Marrubium rotundifolium, Africanum, Folio Hedera terrestris. Flor. 2. 67.*

7. *Pseudo-dictamnus, Hispanicus, Foliis crispis & rugosis. T. 188. Marrubium, Dictamni spurii Foliis & Facie. Par. Bat.*

8. *Pseudo-dictamnus, Hispanicus, Folio amplissimo, candicante & villosa. T. 188. Boerb. Ind. alt. Plant. Vol. 1.*

PSEUDO-DIGITALIS. A Name for the *Dracocephalon; Americanum*.

PSEUDO-FUMARIA. A Name in *Boerhaave* for the **CAPNOIDES**.

PSEUDO-GNAPHALIUM. A Name for the *Gnaphalodes, Lusitanica*.

PSEUDO-HELICHRYSUM. A Name for the *Helichrysum, sylvestre, latifolium, capitulis conglobatis*.

PSEUDO-HELICHRYSUM FRUTESCENS. A Name for the *Senecio, Africanus, Folio retuso*.

PSEUDO-HELICHRYSUM VIRGINIANUM. A Name for the *Senecio, Virginianus, arboreescens, atriplicis Folio*.

PSEUDO-HELLEBORUS. A Name for the *Helleboro-Ranunculus, Flore luteo globoso*.

Pseudo-Helleborus Ranunculoides. A Name for the *Populago, Flore majore*; and for the *Populago, flore pleno*.

PSEUDO-IPECACUANHA. See **APOCYNUM**.

PSEUDO-IRIS. See **ACORUS ADULTERINUS**.

PSEUDO-LIEN. A Name for certain Glands observed by *Ruysh* adjacent to the Spleen.

PSEUDO-LOTUS. A Name for the **GUAJACANA**.

PSEUDO-LYSIMACHIUM. A Name for the *Salicaria, vulgaris purpurea, foliis oblongis*; and for the *Veronica, spicata, longifolia*.

PSEUDO-MARRUBIUM. A Name for the *Lycopus, palustris, glaber*; and for the *Lycopus, Foliis in profundas laciniâs dissectis*.

PSEUDO-MELANTHIUM. A Name for the *Lychnis, segetum major*.

PSEUDO-MELISSA. A Name for the *Melissa, humilis, latifolia, maximo flore, purpurascens*.

PSEUDO-MOLA. A false Mole, form'd by a Piece of the Placenta, left in the Uterus after the Exclusion of the Fetus.

PSEUDO-NARCISSUS. A Name in *Boerhaave* for several Sorts of *Narcissus*.

PSEUDO-NARDUS. A Name for the *Lavandula*; *latifolia*; and for the *Lavandula*; *angustifolia*; *Flore albo*.

PSEUDO-ORCHIS. A Name in *Boerhaave* for the *Orchis*; *lilifolia*; *minor*; *jabuletorum Zelandia & Batavia*.

PSEUDO-PETASITES. A Name for the *Petasites*; *Africanus*; *Calthea palustris Folio*.

PSEUDO-POLYPUS. A Bastard Polypus.

PSEUDO-RHABBARBARUM. A Name for the *Thalictrum*; *majus*; *siliqua angulosa, aut striata*; and for the *Thalictrum*; *majus*; *flavum*; *staminibus luteis*; *vel glauco Folio*.

PSEUDO-RUBIA. A Name for the *Rubeola*; *latiore-Folio*; and for the *Rubeola*; *angustiore-Folio*.

PSEUDO-SALVIA. A Name for the *Phlomis*; *fruticosa*; *salvia Folio latiore & rotundiore*; for the *Phlomis*; *fruticosa*; *salvia Folio longiore & angustiore*; and for the *Phlomis*; *fruticosa*; *Folio subrotunda, brevior*; *Flore luteo*.

PSEUDO-SELINUM. A Name for the *Caucalis*; *Semine aspero*; *Flosculis rubentibus*.

PSEUDO-STACHYS. A Name for the *Stachys*; *Cretica*; *proPseudo-stachyde I. in prodromo describitur*; for the *Stachys*; *Alpina*; *magna*; *Flore ex albo rubescente*; and for the *Galeopsis*; *Alpina*; *Betonica Folio*; *Flore variegato*.

PSEUDO-STRUTHIUM. A Name for the *luteola Herba*; *salicis Folio*.

PSEUDO-SYCOMORUS. See *AZEDARACH*.

PSEUDO-VALERIANA. A Name for several Sorts of *VALE-RIANELLA*.

PSIDA. The external Rind of the Pomegranate.

PSILOTHRON. *ψιλοθρον*. A Depilatory.

PSIMMYTHION. *ψιμυθιον*. Cerufs.

PSINKUS. Cerufs. *Rulandus*.

PSITTACION. *ψιττακιον*. The Name of a discutient Plaster, described by *Paulus Aegineta*, *L. 7. C. 17*. *Scribonius Largus* describes a *Collyrium* by the Name of *Collyrium Psittacinum*. *N^o 27*.

PSITTACUS. The Parrot.

PSOÆ. *ψοα*. The Name of two Pair of Muscles of the Loins.

The first is the

PSOAS, five, LUMBARIS INTERNUS.

This is a long thick Muscle, situated in the Abdomen, on the lumbar Region, adhering to the Vertebrae of the Loins, from the posterior Part of the Os Ilium, to the anterior Part near the Thigh.

It is fixed above to the last Vertebra of the Back, and to all those of the Loins, that is, to the lateral Parts of the Bodies of these Vertebrae, and to the Roots of their transverse Apophyses. The Insertions in the Bodies of the Vertebrae, are by a kind of Digitations, and are very little tendinous.

From thence, the Muscle runs down laterally over the Os Ilium, on one Side of the Iliac Muscle, and passes under the *Ligamentum Fallopii*, between the anterior, inferior Spine of the Os Ilium, and that Eminence, which, from its Situation, may be termed *Ilio-Pectinea*.

Before it goes out of the Abdomen, it unites with the *Iliacus*, and is sometimes fixed by a few fleshy Fibres, in the Outside of the Eminence last mentioned. It afterwards covers the fore Side of the Head of the Os Femoris, and is inserted in the fore Part of the little Trochanter, by an oblique Tendon, which is folded double from behind forward.

This Muscle is sometimes accompanied by another smaller Muscle almost like it, called *Psoas parvus*, of which hereafter.

The *Psoas* bends the Thigh on the Pelvis, or brings it forward; it may, also, move the Pelvis on the Thighs, and hinder it from being carried along with the rest of the Trunk, when the Body is inclined backward, while we sit, having the lower Extremities fixed by some external Force. In this Situation it may, also, move the Vertebrae of the Loins. *Winflow's Anatomy*.

The second is the

PSOAS PARVUS.

This is a long slender Muscle, lying upon the *Psoas major*. It is sometimes wanting; and *Riolanus*, who met with it often in Men, takes notice of his having found it once in a Woman, as a Thing very extraordinary. As for my Part, I found it several times in Women, before I ever met with it in Men; and I still continue to observe it most frequently in that Sex.

It is fixed above by a short Tendon, sometimes to the last transverse Apophysis of the Back, or higher; sometimes to the first of the Loins, and sometimes to both: From thence it runs down wholly fleshy, and more or less complex, on the great *Psoas*, in a Direction a little oblique.

Having reached the middle of the *Regio lumbaris* or thereabouts, it forms a slender flat Tendon, which, gradually increasing in Breadth, like a thin Aponeurosis runs over the *Psoas major*, and *Iliacus internus*, at their Union, and from thence down to the Symphysis of the Os Pubis, and Os Ilium; and is inserted principally in the Crista of the Os Pubis, above the Insertion of the *Pectineus*, sometimes sending an Aponeurotic Lamina farther down.

Besides the *Psoas parvus*, there is another still smaller, between it and the *Vertebrae*, inserted much in the same manner. This Muscle I discovered in the Year 1713.

The *Psoas parvus*, when it is found, serves to sustain the *Pelvis*, much in the same manner with the *Musculi Recti* of the Abdomen, in climbing. But when we stand, we have no need of such a Support, the *Pelvis* resting then upon the *Os Femoris*, in such a manner, as that the largest Portion thereof, and that which supports the whole Body, lies behind that *Fulcrum*, and the smallest Part before. It may, also, serve to hinder the vertebral Pillar from bending backward on some Occasions. *Winflow's Anatomy*.

PSOMISMA. *ψωμσμα*. Meat which is put into the Mouth of a Child.

PSOPHOS. *ψωπος*. A Noise, a Sound. *ψωπος τῶ σῆθε*, are Noises, or Sounds, proceeding from the Breast, occasioned by flatulent Matter attempted to be expectorated. *Ψωπάδες* (*ψωφώδεις*) are those who start and tremble at every Noise; such are they who labour under a Phrensy or Delirium, *Prorrh^{et}*. 16. *Coac*. 96. where the *Ψωπάδες* are expressed by *ψωπαδισκῶν*, which *Galen* in his *Exegesis* expounds by *ψωπαδισκῶν* "Such as are very quick in their Perception of a Noise or Sound."

PSORA. *ψωρα*. A Species of Itch. See *LEPRA*.

PSORIASIS. A Species of Itch affecting the *Scrotum*. *Blancard*.

PSORICA. Medicines for the Itch.

PSOROPHTHALMIA. A *Psora*, or scurfy Disorder of the Eye-lids.

PSUCHAGOGICA. from *ψυχη*, Life. Medicines which recal Life in an Apoplexy, or Syncope.

PSYCHOTROPHON. A Name for Betony. *Dioscorides*, *L. 4. C. 1.*

PSYCHROLUSIA. *ψυχρολυσία*, or **PSUCHROLUTRON.** *ψυχρολutron*, from *ψυχρος*, cold, and *λutron*, to wash. Cold-bathing, or a Cold-bath. Sir *John Floyer* has given this as a Title to a Book wrote upon the Subject of Cold-bathing.

PSYCTICA. Refrigerating Remedies.

PSYDRACIA. A Species of Pustule, of which *Trallian*, *L. 1. C. 5.* gives the following Definition. These are small Tubercles of the Head, which resemble Pustules, and corrode the Skin; But *Exanthemata* are superficial Exulcerations of the Skin, of a reddish Colour, and rough to the Touch. Both these Disorders, especially when of the moist Kind, are cured by an Ointment thus prepared:

Take of Licharge and Cerufs, each four Ounces; of Alum, and the green Leaves of Rue, each two Ounces; and of Vinegar, and the Oil of Myrtle, a sufficient Quantity to make an Ointment.

PSYGMATA. *ψυγματα*. Refrigerating Medicines, either internal, or external.

PSYLLI. A People of *Africa*, celebrated by the Antients, for curing the Wounds of venomous Bites by sucking them; but *Celsus*, *L. 9. C. 27.* is of Opinion, that any one may do the same thing without any Injury to themselves.

PSYLLIUM.

The Characters are;

It agrees, in all respects, with the *Plantago*, and *Coronopus*; only the Stalks are leafy and ramous, or divided into a Multitude of Branches.

Boerhaave mentions four Species of this Plant; which are,

1. *Psyllium*; *majus*; *erectum*; *latifolium*; *annuum*. *Boerb. Ind. A. 2. 101.* *Psyllium*. *Offic.* *Psyllium vulgare*. *Park. Theat. 277.* *Psyllium majus erectum*. *J. B. 3. 513.* *C. B. P. 191.* *Tourn. Inst. 128.* *Psyllium sive Pulicaris Herba*. *Ger. 471.* *Emac. 587.* *Plantago caulifera Psyllium dicta*. *Raii Hist. 1.* **FLEAWORT.**

Fleawort has round hairy Stalks, a Foot or more high, beset at the Joints with two, and sometimes three, long, narrow, sharp-pointed, somewhat hairy Leaves, often lightly cut in about the Edges. From the Bosom of these, toward the upper Part of the Stalks, arise pretty long slender Foot-stalks, bearing at the Ends round short Spikes of small staminous Flowers, of four Leaves apiece, with Apices standing out, and somewhat resembling the Heads of the long Plantain; and are succeeded by round Seed-vessels, containing two round shining reddish-brown Seeds, that look like Fleas, whence it takes its Name. The Root is stringy and fibrous; it grows in the Southern Parts of *France*, from whence we have the Seed which only is used.

Some attribute a purgative Quality to this Seed, but we use it only to extract a Mucilage for sore Mouths and Throats, and to help Thrushes and Quinsys. It is, likewise, useful to obtund; sharp acrimonious Humours, which corrode the Bowels, and cause Dysenteries. Outwardly it is good for sore, inflamed, Blood-shot Eyes. *Miller's Bot. Off.*

The Salt of this Plant resembles that of Coral; but is mixed with a little Sal Ammoniac, a great deal of Sulphur, and terrestrial Parts.

By the chymical Analysis, it yields a great deal of Oil and Earth, no volatile concrete Salt, a little urinous Spirit, and several acid Liquors.

Psyllium-seed is used in the *Electuary de Psyllio*; but its purgative Virtue ought to be attributed to the Scammony, and the other Cathartics. The Mucilage of *Psyllium* is very lenifying, and good to allwage the Inflammation of the Eyes: It is given in a Clyster, for the Dysentery, and Inflammation of the Kidneys. *Martyn's Tournefort.*

2. *Psyllium*; majus; supinum; angustifolium & perenne.
3. *Psyllium*; maximum; ex Littore Veneto.
4. *Psyllium Indicum*; foliis crenatis. *J. B. 3. 514. Boerb. Ind. alt. Plant. Vol. 2.*

PSYTHIOS. An Epithet of Wine, importing Sweetness.

PTARMICA.

The Characters are;

The Leaves are serrated, crenated, dissected, and void of Smell; the Calyx is squamous; the Flowers are altogether white, and generally disposed in Umbellæ; the Seeds are very thin and slender.

Boerhaave mentions nine Species of *Ptarmica*; which are,

1. *Ptarmica*; vulgaris; folio longo, serrato; flore albo. *J. B. 3. 147. Boerb. Ind. alt. 111. Tourn. Inst. 496. Ptarmica. Offic. Ger. 483. Emac. 606. Raii Hist. 1. 344. Synop. 91. Ptarmica vulgaris. Park. 858. Dracunculus serrato folio pratensis. C. B. P. 98. Achillea foliis integris minutissime serratis. A&T. Reg. Par. Ann. 1720. 321. SNEEZWORT, BASTARD PELLITORY.*

From a woody, creeping, fibrous Root, of an hot biting Taste, this Plant sends out upright Stalks a Foot or more high, stiff, and not much branched, having long narrow Leaves, finely serrated about the Edges, growing on them without any Order: The Flowers grow Umbel-fashion, on the Tops of the Stalks, consisting of a Border of white Petala, set about a fistular Thrum; they are larger than the Flowers of Yarrow: It grows in moist Meadows, and in watery Places; and flowers in July.

It is of an hot biting Taste; and, therefore, it is sometimes put into Salads, to correct the Coldness of other Herbs: The Root, held in the Mouth, helps the Tooth-ach, by evacuating the Rheum, like Pellitory of Spain: The Powder of the Herb, snuffed up the Nose, causes Sneezing, and cleanses the Head of tough slimy Humours. *Miller's Bot. Off.*

2. *Ptarmica*; vulgaris; pleno flore. *Clus. H. 12. Dracunculus, pratensis, flore pleno. C. B. P. 98.*
3. *Ptarmica*; foliis profundè serratis, lætè viridibus; elatior. *H. L. 694. Flor. 2. 51. Dracunculus Alpinus, latiore folio serratus. Sch. B. P.*
4. *Ptarmica*; foliis profunde ferratis; minor & humilior. *Flor. 2. 51.*
5. *Ptarmica*; vulgaris; folio longo; serrato & humilior. *Flor. 2. 51.*
6. *Ptarmica*; Alpina; incanis, ferratis, foliis. *H. L. 694.*
7. *Ptarmica*; incana; humilis; foliis laciniatis, Absinthii æmulis. *H. L. 510. Absinthium Alpinum, umbelliferum, latifolium. C. B. P. 139.*
8. *Ptarmica*; Alpina, Tanacetii foliis, flore purpureo. *T. 497. Millefolium montanum, purpureum, Tanacetii foliis. M. H. 3. 39.*
9. *Ptarmica*; Orientalis; foliis Santolinæ incanis; flore pallido. *Vaill. Boerb. Ind. alt. Plant. Vol. 1.*

The first and second Species of this Plant are of an heating and penetrating Quality. The Antients exhibited it in all Disorders, where it was necessary to stimulate and open; for which Purposes it is very proper. By its Heat it corroborates the Stomach: Its Leaves, if chewed, procure a copious Discharge of Saliva; for which Reason they are beneficial in Tooth-achs: They are, also, exhibited in mucous and viscid Obstructions of the Fauces, where Sweats are to be excited. The Juice of this Plant, when boiled, is proper in all those Disorders for which Feverfew is recommended; but does not contain so large a Quantity of Oil, and, consequently, is not so adhesive. *Hist. Plant. adscript. Boerhaav.*

PTERIS, πτερίς. Fern.

PTERNA, πτερνα. The CALCANEUM.

PTERYGION, πτερυγιον. A Film of the Eye. See OCULUS.

But *Pterygion*, in *Celsus, Lib. 6. Cap. 19.* is a Disorder of the Fingers: The Description and Cure of which he gives in the following manner:

Old Ulcers of the Fingers are most commodiously cured by Lycium, or boiled Amurca, with an Addition of Wine to each. In the Nails there sometimes arises a Species of Caruncle, accompanied with great Pain, and by the Greeks called πτερυγιον. In order to cure this Disorder, we must dissolve round Melian Alum in Water, till it is of the Consistence of Honey. Then we must add a Quantity of Honey, equal to that of the Alum, and mix them with a Spatula, till the Preparation has assumed a Saffron-colour. With this the Parts affected are to be anointed. Some, for the same Purpose, rather choose a Decoction

of equal Quantities of dry Alum, and Honey, mixed together. If the *Pterygia* are not, by this means, removed, they are to be extirpated, and the Fingers are to be fomented with a Decoction of Vervain, and the following Medicine.

Take of Chalcitis, Pomegranate-peel, and the Squamæ *Æris*, each a proper Quantity: Mix them with a fat Fig; boil gently in Honey, and apply to the Part affected. Or,

Take of burnt Paper, Auripigmentum, and native Sulphur, each an equal Quantity: Mix with a Cerate, prepared of Oil of Myrtle, and apply to the Part. Or,

Take of the Powder of Verdegrise, one Dram; and of the Squamæ *Æris*, two Drams: Mix with a sufficient Quantity of Honey, and apply to the Part affected. Or.

Mix equal Parts of Lime-stone, Chalcitis, and Auripigmentum, and apply to the Part.

These Medicines, when applied, are to be covered with a Linen Cloth, dipt in Water. On the third Day, the Dressing is to be removed; the dry Parts, if any, are to be cut off, and the like Dressing is again to be applied. If the Disorder is not removed by these means, the Part affected is to be cleansed with the Knife, cauterized with small Irons, and cured like other Burns.

PTERYGOIDES, πτερυγοειδής, in *Hippocrates*, are those People whose Chests are narrow and flat, so that their Scapulæ are prominent, like Wings. Such Persons have been always esteemed subject to Consumptions.

PTERYGOIDES PROCESSUS. The Pterygoide, or Wing-like Processes of the Os Sphenoides. See CAPUT.

PTERYGOPALATINUS MUSCULUS. A Name of a Muscle of the UVULA; which see.

PTERYGOPHARYNGÆUS MUSCULUS. A Muscle of the Fauces. See OESOPHAGUS.

PTERYGOSTAPHYLINI MUSCULI. Some Muscles of the Uvula are thus called. See UVULA.

PTILOSI, πτελοσις, from πτελος, a Person who has lost his Eye-lashes. A Baldness of the Eye-lashes. *Paulus Ægineta, Lib. 3. Cap. 22.* says, the Ptilosis and Madarosis are Disorders of the external Margins of the Eye-lids. The Madarosis is only a Falling off of their Hairs, produced by a Defluxion of acrid Humours; whereas, in a Ptilosis, the Margins of the Eye-lids become thick and callous; so that it is a Disorder complicated of a Madarosis, and an hard Lippitude: For which Reason the Remedies proper for the one are, also, conducive to the Removal of the other. For procuring the Growth of the Hairs, and preventing an Itching and Corrosion of the Corners of the Eyes, the best Medicine is that of *Philoxenus*, distinguished by the Epithet dry. For removing a Dimness of Sight, the following Preparation is excellent:

Take of Cadmia, eight Drams; of Sal Ammoniac, two Drams; of Saffron, and Spikenard, each two Drams; and of white Pepper, one Dram: Mix all together for Use. Antimony, also, answers the same Purpose.

For a Corrosion of the Corners of the Eyes, and a Ptilosis:

Take of calcined Antimony, extinguished in Womens Milk, thirteen Drams; of Aloes, Myrrh, and Spikenard, each two Drams; and of calcined Barley, carefully triturated, four Drams: Mix, and use dry.

Another Medicine for a Ptilosis, and Corrosion of the Eye-lids, is thus prepared:

Take of the Marrow of an Ox's Right fore Leg, a sufficient Quantity; triturate it duly with Soot, and use it.

The Soot intended for this Purpose is to be thus prepared: Immerse a sufficient Quantity of Paper in the Oleum Sesamini: Put the Paper in a Lamp, kindle it, and hold above it a smooth Shell, or brazen Vessel, in order to collect the Soot, which, when triturated with the above-mentioned Marrow, is to be used. The Rennet of a Calf is, also, excellent for the same Purpose. For a Milphosis, an Increase of Flesh in the Corners of the Eyes, and other inveterate Disorders of them, *Sofander* directs the following Medicine:

Take of Cadmia, Antimony, crude Chalcitis, and crude Misy, each eight Drams: Bruise these; mix them with Honey, and torrefy them, after extinguishing them in Wine, and triturating them: Add to them, of Spikenard,

two Drams; of torrefied Saffron, two Drams; and of Pepper, one Dram: All these, when triturated together, are to be used.

The more simple Medicines contributing to the Cure of a Ptilosis, and a Corrosion of the Eye-lids, are boiled Amurca, Indian Lycium, and Armenian Stone, used by the Painters; which last, when mixed with Water, and used by way of Ointment, consumes the peccant Humours, and augments the natural Hairs; the Rust of Iron, triturated for many Days in the Heat of the Sun, and reduced to the Form of a Collyrium, with Wine and Myrrh; and Spodium, mixed with the Juice of Onions.

PTISSANA, *sive* **PTISANA**, *πισσάνη ἢ πτίσανη*, from *πισσάνω*, to decorticate, bruise, or pound. Ptisan, or Ptisan, is properly Barley decorticated, or deprived of its Hulls; or, as *Suidas* expounds the Word, *ἡ πεποιημένη κελθὴν*, "pounded Barley;" because the antient Way of clearing Barley from its Hulls was not by grinding, as it is now performed, but by pounding in a Mortar: For the Antients, in preparing their Ptisana, first sprinkled their Barley with Water; then left it to swell; afterwards dried it in the Sun; and then pounded it in a Mortar, with a wooden Pestle, till it was separated from its Hulls; and then reposit it. Some, after wetting their Barley, and drying it in the Sun; as before, pounded it in a Mortar till it was deprived of its Hulls; then ground it to a Meal; and, afterwards, boiled it for a very considerable Time, to deprive it, as they imagined, of its Flatulency; then they dried it, and reduced it into small Lumps, or Balls, with which they made forbile Liquors on occasion. Others, again, as we are informed by *Constant. Casar*, *Lib. 12. de Agricultura*, after macerating, cleansing, decortivating, and drying their Barley in the Sun, pounded it over-again; and, after giving it a second Drying in the Sun, before they reposit it, sprinkled it over with the thin Particles which they had beaten out in pounding it, because they had found them to contribute towards its Preservation.

Though Ptisana was properly prepared only of Barley, yet it used to be made, also, of other Grain, as of Wheat, Alica, Spelt, Rice, and Lentils; but, then, it was not called simply *Ptisana*, but with an Addition, expressing the Grain of which it was prepared, as, when they called it *πισσάνην αὐρίνην*, "Wheaten Ptisan;" *χορδὴν πτίσανην*, "Ptisan made of Alica;" *τὴν ἐκ ζείης ἢ ἐκ ῥυζὸς πτίσανην*, "Ptisan prepared of Spelt, or Rice;" and so of the rest. Ptisan; thus prepared, was reserved for Use, with a prudent Regard to Health, which deserves Imitation; and, when Occasion required, was ready at hand, to be boiled in Water. There were different Ways of boiling it; but the most common Method among the Greeks was that described by *Galen*, *Lib. 1. de Alimentis*, and is as follows: They boiled a Portion of Ptisan in ten; or, as *Paulus* says, in fifteen times the Quantity of Water, taking care to make it swell as much as possible, during the Time of boiling; for what readily swells, and that to a considerable Degree, is esteemed the best; as, on the contrary, what swells but little and slowly, is accounted the worst. When it is swelled up to a considerable Degree, they pour in a little Vinegar upon it, and then a little Oil; but this last may be added at the Beginning: When it is perfectly boiled, they sprinkle it with powdered Salt, without any other Addition, except, perhaps, of a small Quantity of Dill, or Leeks. Thus *Galen*. And this is the best Way of preparing Ptisan; and far to be preferred to that where many superfluous Ingredients are unskillfully added, in order to season it; for some added Amylum, others Sapa; and some put Honey and Cummin to it, making of it an Hotch-potch, rather than a Ptisan; and, perhaps, they had some Reason for thus preparing it, which might be with a View to attenuate its Grossness, correct its Viscidity, or discuss its Flatulences. We who far excel the Antients in Delicacy, and, in point of Cookery, outdo *Apicius* himself, (who, *Lib. 4. de Obsoniis*, speaks of those superfluous Seasonings) despise them all, and are contented with putting thereto some triturated Almonds and Sugar, with a moderate Quantity of Salt, which are indeed of some Efficacy against the Grossness, Viscidity, and Flatulency of the Barley; but far inferior, in that respect, to Leeks and Dill, which are not only grateful to the Palate, but not a little conducive to Health.

Ptisana, thus boiled, as aforesaid, is no longer called *Ptisana*, but *πισσάνης χυλὸς ἢ ῥόφημα*, "the Cream or Soup of Ptisan," or, what is the same Thing, *Ptisanae Jus vel Succus*, "the Broth, Gruel, or Juice of Ptisan." *Celsus* usually calls the Broth of entire Barley, boiled till it bursts, *Cremor Hordei*, "Cream of Barley;" and prescribes it in bilious and burning Fevers.

Πτίσανη, "Ptisan used simply;" *ἔλη πτίσανη*, "entire Ptisan;" and *πισσάνη κελθὴν*, "Barley Ptisan;" in

Hippocrates, signify all three the same Thing, that is, Ptisan not strained: For if, after boiling, you strain it, and set aside the Liquor, this Liquor is neither called entire *Ptisana*, nor *Barley Ptisan*, nor simply *Ptisana*, but only *χυλὸς πτίσανης*, "the Juice of Ptisan." Thus *Galen*, *Com. in Lib. de R. V. I. A. In Lib. 2. Epid.* near the Beginning, this entire or unstrained Ptisan is called *πισσάνη παχύν*, "thick Ptisan." *Goraeus*. *Foetus*.

See *Hippocrates's* Treatise, *de Ratione Victus in Acutis*, under the Article **ALCALI**.

PTOLEMÆI CHIRURGI MEDICAMENTUM. The Name of a Medicine mentioned by *Celsus*, *Lib. 6. Cap. 7*.

PTOLEMÆI EMPLASTRUM. The Name of a Plaster mentioned by *Marcellus Empiricus*, *Cap. 36*.

PTOLEMÆI EUERGETÆ STOMATICA. The Name of a Medicine calculated for the Mouth, and described by *Marcellus Empiricus*, *Cap. 13*.

PTOLEMÆI REGIS COLLYRIUM. The Name of a Collyrium; mentioned by *Aetius*, *Tetr. 2. Serm. 4. Cap. 110*.

PTOSIS, *πτῶσις*, from *πτίσω*, to fall. This imports falling down, and is a Disorder of the Eye-lid, consisting in the Descent of the superior Eye-lid, either on account of a Palsy of the Muscle, which should elevate it; or a Flux of Humours, which depresses it.

PTYALAGOGA, from *πτύελας*, Saliva; or Spittle; and *ἀγω*, to bring away. Medicines which promote a Discharge of Saliva.

PTYALISMOS, *πτύελισμος*. A frequent and copious Discharge of Saliva. *Hippocrates*. Among the Moderns, it generally signifies a Salivation excited by Mercury.

PTYAS. The Name of a Species of Asp. See **ASPIS**.

PTYELON, *πτύελον*. The Saliva, Spit, or Spittle. See **SPUTUM**.

PTYGMATA, *πτύγματα*, from *πτύσσω*, to fold. Folded Cloths. *Caelius Aurelianus*. Perhaps what we call *Stups*.

PTYSIS, *πύσις*. A Defluxion of Humours upon the Thorax, or Lungs. *Caelius Aurelianus*, *Chron. Lib. 2. Cap. 7*.

PTYSIS, also, implies Exputition, or Spitting.

PTYSMA, *πύσμα*. The Spit, or what is brought up by Spitting, or Expectoration.

PTYSMAGOGA. Medicines which promote a Discharge of Saliva.

PUBES. See **ABDOMEN**.

PUBIS OS. See **INNOMINATA OSSA**.

PUCHAMIAS. The Name of a Tree which grows in *Virginia*, bearing a Fruit like a Medlar, extremely astringent, whilst immature; but, when ripe, of a delicious Taste. *Raii Hist. Plant.*

PUDENDA. The private Parts in both Sexes.

PUDENDAGRA. The Venereal Disease.

PUERPERA. A lying-in Woman.

PUFFINUS. A Sea-bird, which the *French* call a *Macreufe*, that is reckoned in the Number of wild Ducks: It is dark-coloured, and flies heavily; but, when it has a mind to come hastily away from a Place, the Bird sustains itself upon the Ends of its Wings and Feet, and, in this manner, runs lightly and swiftly upon the Surface of the Water: This Bird feeds upon Insects, Sea-weeds, and Fish: Its Flesh is hard, and like Leather, especially when it is old; and, therefore, it should not be eaten but when young: This same Flesh tastes, also, of Fish; and the *Roman Catholics* allow the Use of it in Lent.

PUGILLUS. A Pugil. The eighth Part of an Handful.

PULEGIUM.

The Characters are;

The Flowers, which are very small, are disposed in close thick Whorles, and their upper Lip is entire: In other respects this Herb resembles the *Mentha*, or Mint.

Boerhaave mentions four Sorts of *Pulegium*; which are,

1. *Pulegium*; latifolium. *C. B. P. 222. Boerb. Ind. alt. 186. Pulegium*. *Offic. J. B. 3. 256. Raii Hist. 1. 533. Synop. 3. 235. Pulegium regium*. *Ger. 545. Emac. 671. Pulegium vulgare*. *Park. Theat. 29. Mentha aquatica seu Pulegium vulgare*. *Tourn. Inst. 189. PENYROAL*.

Penyroal has many creeping fibrous Roots; from which spring a great many smooth roundish Stalks, hardly able to support themselves, but leaning on the Ground, and sending out small Fibres, by which it roots itself in the Ground: It bears two small, round, but yet pointed Leaves, at a Joint: The Flowers grow towards the upper Part of the Branches, coming forth just above the Leaves, in thick close Whorles; they are of a pale-purple Colour, small and galeated, set in small, somewhat downy Calyces, in which grow four small Seeds. The whole Plant has a very strong Smell, and an hot aromatic Taste: It grows frequently upon moist Commons, and in Places where Water has stood all Winter, and flowers in July. But what we use in the Shops is generally cultivated in

in Gardens, where it grows tall and large: The whole Herb is use.

It is hot and dry, of very subtle volatile Parts, and is peculiarly appropriated to the Female Sex, being a good Uterine, provoking the Menfes and Lochia, expelling the Birth and Secundines: It, likewise, warms and comforts the Bowels, and helps the Colic and Jaundice, and is good against Coughs and Shortness of Breath: The Juice, or a strong Decoction of the Leaves, sweetened with Sugar, has been accounted a Specific against a whooping Cough.

Official Preparations are only the distilled Water and Oil. *Miller's Bot. Off.*

This Plant, which is very bitter, acrid, and of a very penetrating Smell, gives a deep Tincture of Red to the blue Paper; so that it is probable, it contains a volatile, aromatic, and oily Salt, loaded with Acid; whereas, in the artificial, volatile, oily Salt, this Acid is detained by the Salt of Tartar.

Thus this Plant is aperitive, hysseric, and good for the Diseases of the Stomach and Breast; since it evacuates those glutinous Sordes, which fill part of the Bronchia, and Vesicles of the Lungs; especially if it is boiled with Honey and Aloes; for then (as *Dioscorides* observes) it purges, and procures Expectoration. *Tragus* very much commends the Decoction of Penroyal in White-wine, for the Suppression of the Menfes, and Fluor Albus. The Juice of this Plant, according to the same Author, clears the Sight, and removes Lippitude. *Montanus* prescribes the Powder of Penroyal, mixed with equal Quantities of Vinegar, Honey, and Water, for the Diseases of the Eyes. The Conserve of its Flowers and Leaves is good for the Dropsy and Jaundice. *Ray* affirms, from *Mr. Boyle*, that a Spoonful of the Juice of Penroyal is a good Remedy for the Chin-cough of Children. *Chefneau* prescribes a Glass of its Decoction for Hoarseness; and advises to take it before going to Bed. *Martyn's Tournefort*.

2. *Pulegium*; angustifolium. *Ger.* 546. *Emac.* 672. *Raii Hist.* 1. 534. *C. B. P.* 222. *Boerb. Ind. alt.* 186. *Pulegium cervinum*. *Offic.* *Pulegium angustifolium* sive *Cervinum*. *Park. Theat.* 30. *Pulegium cervinum angustifolium*. *J. B.* 3. 257. *Mentha aquatica Satureia folio*. *Tourn. Inst.* 190. **HART PENYROYAL.**

This grows more erect than the common Penroyal, with much longer and narrower Leaves, somewhat like Savory; the Flowers grow in thick Whorles, like the former, and the Smell is much alike; but this is rather pleasanter. It grows in *Provence* and *Languedoc* in *France*, and in divers Parts of *Italy*.

It has the same Virtues with the common Penroyal, and is, by the Physicians about *Montpelier*, preferred before it; but is seldom or never prescribed here, or brought into our Shops. *Miller's Bot. Off.*

3. *Pulegium*; angustifolium; flore albo. *H. R. Par. Mentha, aquatica, Satureia folio, flore albo.* *T.* 190.

4. *Pulegium*; latifolium; hirsutum; flore cœruleo. *Boerb. Ind. alt. Plant. Vol. 1.*

Besides the foregoing Species of *Pulegium*, *Dale* mentions the following;

PULEGIUM ERECTUM. *Offic. An.* *Pulegium latifolium alterum*. *C. B. P.* 222. **UPRIGHT PENYROYAL.**

This Plant grows in marshy Places: The Herb itself is used, and in Virtues agrees with the common Penroyal. *Dale.*

PULEX. A Flea.

PULICARIA. A Name for the *PSYLLIUM*.

PULMO. The Lungs.

The Lungs are two large spongy Bodies, of a redish Colour in Children, greyish in adult Persons, and bluish in Old-age, filling the whole Cavity of the Thorax; one being seated in the Right Side, the other in the Left, parted by the Mediastinum and Heart, and of a Figure answering to that of the Cavity which contains them, that is, convex next the Ribs, concave next the Diaphragm, and irregularly flatted and depressed next the Mediastinum and Heart.

When the Lungs are viewed out of the Thorax, they represent, in some measure, an Ox's Foot, with the fore Part turned to the Back, the back Part to the Sternum, and the lower Part to the Diaphragm.

They are distinguished into the Right and Left Lung; and each of these into two or three Portions, called *Lobi*; of which the Right Lung has commonly three, or two and an half, and the Left Lung two. The Right Lung is generally larger than the Left, answerably to that Cavity of the Breast, and to the Obliquity of the Mediastinum.

At the lower Edge of the Left Lung, there is an indented Notch, or Sinus, opposite to the Apex of the Heart, which is, therefore, never covered by that Lung, even in the strongest Inspirations; and, consequently, the Apex of the Heart and Pericardium may always strike against the Ribs; the Lungs not surrounding the Heart in the manner commonly taught. This Sinus is expressed in *Eustachius's* Tables.

The Substance of the Lungs is almost all spongy, being made up of an infinite Number of membranous Cells, and of different Sorts of Vessels, spread among the Cells, in innumerable Ramifications.

This whole Mass is covered by a Membrane; continued from each Pleura, which is commonly said to be double; but what is looked upon as the inner Membrane, is only an Expansion and Continuation of a cellular Substance.

BRONCHIA.

The Vessels which compose part of the Substance of the Lungs, are of three or four Kinds; the Air-vessels, Blood-vessels, and Lymphatics: To which we may add the Nerves. The Air-vessels make the principal Part, and are termed *Bronchia*.

These Bronchia are conical Tubes, composed of an infinite Number of cartilaginous Fragments, like so many irregular Arches of Circles, connected together by a ligamentary elastic Membrane; and disposed in such a manner, as that the lower easily insinuate themselves within those above them.

They are lined on the Inside by a very fine Membrane, which continually discharges a mucilaginous Fluid; and in the Substance of the Membrane are a great Number of small Blood-vessels; and, on its convex Side, many longitudinal Lines, which appear to be partly fleshy, and partly made up of an elastic Substance of another Kind.

The Bronchia are divided in all Directions into an infinite Number of Ramifications, which diminish gradually in Size; and, as they become capillary, change their cartilaginous Structure into that of a Membrane. Besides these very small Extremities of this numerous Series of Ramifications, we find, that all the subordinate Trunks, from the greatest to the smallest, send out, from all Sides, a vast Number of short capillary Tubes, of the same kind.

VESICULÆ BRONCHIALES.

Each of these numerous Bronchial Tubes is widened at the Extremity, and thereby formed into a small membranous Cell, commonly called a *Vesicle*: These Cells, or Folliculi, are closely connected together in Bundles; each small Branch producing a Bundle proportionable to its Extent, and the Number of its Ramifications.

These small vesicular, or cellulous Bundles, are termed Lobules; and as the great Branches are divided into small Ramifications, so the great Lobules are divided into several small ones. The Cells, or Vesicles, of each Lobule have a free Communication with each other; but the several Lobules do not communicate so readily.

The Lobules appear distinctly to be parted by another cellulous Substance, which surrounds each of them, in proportion to their Extent, and fills up the Interstices between them. This Substance forms, likewise, a kind of irregular, membranous Cells, which are thinner, looser, and broader, than the Bronchial Vesicles.

This Substance is dispersed through every Part of the Lungs; forms cellulous, or spongy Vaginae, which surround the Ramifications of the Bronchia and Blood-vessels; and is afterwards spread over the outer Surface of each Lung, where it forms a kind of fine, cellular Coat, joined to the general Covering of that Viscus.

When we blow into this interlobular Substance, the Air compresses and flattens the Lobuli; and, when we blow into the Bronchial Vesicles, they presently swell; and, if we continue to blow with Force, the Air passes, insensibly, into the interlobular Substance. We owe this Observation to *M. Helvetius*.

All the Bronchial Cells are surrounded by a very fine reticular Texture of the small Extremities of Arteries and Veins, which communicate, every Way, with each other. The greatest Part of this admirable Structure is the Discovery of the illustrious *Malpighi*.

BLOOD-VESSELS.

The Blood-vessels of the Lungs are of two Kinds; one common, called the Pulmonary Arteries and Veins; the other proper, called the Bronchial Arteries and Veins.

The Pulmonary Artery goes out from the Right Ventricle of the Heart; and its Trunk, having run almost directly upward, as high as the Curvature of the Aorta, is divided into two lateral Branches, one going to the Right Hand, called the Right Pulmonary Artery; the other to the Left, termed the Left Pulmonary Artery. The Right Artery passes under the Curvature of the Aorta, and is, consequently, longer than the Left: They both run to the Lungs, and are dispersed through their whole Substance, by Ramifications nearly like those of the Bronchia, and lying in the same Directions.

The Pulmonary Veins, having been distributed through the Lungs, in the same manner, go out, on each Side, by two great Branches,

Branches, which open laterally into the Reservoir, or muscular Bag, of the Right Auricle.

The Ramifications of these two Kinds of Vessels in the Lungs are surrounded, every-where, by the cellular Substance already mentioned, which, likewise, gives them a kind of Vagina; and the Rete mirabile of *Malpighi*, described above, is formed by the capillary Extremities of these Vessels. It must be observed, that the Ramifications of the Arteries are more numerous, and larger, than those of the Veins, which, in all other Parts of the Body, exceed the Arteries, both in Number, and Size.

Besides these capital Blood-vessels, there are two others, called the bronchial Artery and Vein; the Artery has become very famous, of late, by the Description given of it by *M. Ruysch*. The Vein was doubted of, for some time; but it exists as really as the Artery, and may be easily demonstrated.

These two Vessels are very small, appearing only like very fine Arteries and Veins coming from the Aorta, Vena Cava, and their Branches; and they seem to have no other Use, but that of nourishing the Lungs.

The Varieties in the Origins of the bronchial Arteries and Veins, especially of the Arteries, their Communications, or Anastomoses, with each other, and with the neighbouring Vessels, and, above all, the immediate Anastomosis of the bronchial Artery with the common pulmonary Vein, are of great Consequence, in the Practice of Physic.

The bronchial Arteries come sometimes from the anterior Part of the Aorta descendens superior, sometimes from the first intercostal Artery, and sometimes from one of the Oesophagææ. They go out, sometimes, separately, towards each Lung; sometimes by a small common Trunk, which afterwards divides to the Right and Left, near the Bifurcation of the Aspera Arteria; and follow Ramifications of the Bronchia.

The Left bronchial Artery comes often from the Aorta, and the Right from the superior Intercostal, on the same Side, because of the Situation of the Aorta: There is, likewise, another, which arises from the Aorta posteriorly, near the superior Intercostal, and above the anterior Bronchialis.

The bronchial Artery gives off a small Branch to the Auricle of the Heart, on the same Side, which communicates immediately with the coronary Artery.

In the Year 1719, I observed a very plain Anastomosis between some Branches of the Left pulmonary Vein, and of one of the Arteriæ Oesophagææ, which came from the first Left Intercostalis, together with a bronchial Artery of the same Side.

In that, or the following Year, I likewise observed an Anastomosis between the Left bronchial Artery, and the Vena Azygos; and in April 1721, I saw an Anastomosis between a Branch of this Artery, and the Body of the just-mentioned Vein.

Sometimes one bronchial Artery gives Origin to several superior Intercostals, and sometimes several bronchial Arteries send off separately the same Number of Intercostals. The bronchial Veins, as well as Arteries, were known to *Galen*; these Veins are sometimes Branches of the Azygos, coming from the upper Part of the Curvature, or Arch. The Left Vein is sometimes a Branch of the common Trunk of the Intercost of the same Side; and sometimes both Veins are Branches of the Gutturalis.

NERVES.

The Lungs have a great many Nerves distributed through them, by Filaments which accompany the Ramifications of the Bronchia and Blood-vessels, and are spread on the Cells, Coats, and all the membranous Parts of the Lungs. The Nervi Sympathetici medii, and majores, commonly called Nerves of the eighth Pair, or the Intercostals, form, behind each Lung, a particular Intertexture, called Plexus pulmonaris, from whence nervous Filaments go out, which communicate with the Plexus Cardiacus and Stomachicus.

LYMPHATIC VESSELS.

On the Surface of the human Lungs, between the external and cellular Coat, we observe something that looks like lymphatic Vessels; but we ought to take care not to mistake, for such Vessels, a transparent reticular Substance, observable on the Surface of the Lungs, after blowing strongly into the Lobuli; this Appearance being entirely owing to the Air which passes through the bronchial Vesicles into the interlobular Cells, and which, by separating a certain Number of Lobuli, finds Room to lodge between them. The true lymphatic Vessels of the Lungs are most visible in Brutes; and in an Horse, particularly, I have observed one of these Vessels to run along a great Part of one Edge of the Lungs.

LIGAMENTS.

Under the Root of each Lung, that is, under that Part form'd by the subordinate Trunk of the pulmonary Artery, by the Trunks

of the pulmonary Veins, and by the Trunk of the Bronchia, there is a pretty broad membranous Ligament, which ties the posterior Edge of each Lung to the lateral Parts of the Vertebrae of the Back, from that Root all the Way to the Diaphragm.

TRACHEA, OR ASPERA ARTERIA.

The Bronchia, already described, are Branches or Ramifications of a large Canal, partly cartilaginous, and partly membranous, called Trachea, or Aspera Arteria. It is situated anteriorly, in the lower Part of the Neck, from whence it runs down into the Thorax, between the two Pleuræ, through the upper Space left between the Duplication of the Mediastinum, behind the Thymus.

Having reached as low as the Curvature of the Aorta, it divides into two lateral Parts, one towards the Right-hand, the other towards the Left, which enter the Lungs, and are distributed through them in the manner already said. These two Branches are called Bronchia, and that on the Right Side is shorter than that on the Left; whereas the Right pulmonary Artery is the longest.

The Trachea is made up of Segments of Circles, or cartilaginous Hoops, disposed in such a manner, as to form a Canal open on the back Part, the Cartilages not going quite round; but this Opening is filled by a soft glandular Membrane, which completes the Circumference of the Canal.

Each Circle is about the twelfth Part of an Inch in Breadth, and about a Quarter of that Space in Thickness; their Extremities are round, and they are situated horizontally above each other, small Interstices being left between them, and the lower Edge of the superior Segments being turned toward the upper Edge of those next below them.

They are all connected by a very strong elastic membranous Ligament, fixed to their Edges. I have observed the first three Segments united into one, bent alternately in two different Places, according to its Breadth: Sometimes two are continuous in the same Manner.

The Canal of the Aspera Arteria is lined on the Inside by a particular Membrane, which appears to be partly fleshy, or muscular, and partly ligamentary, perforated by an infinite Number of small Holes, more or less imperceptible, through which a mucilaginous Fluid continually passes, to defend the inner Surface of the Trachea against the Acrimony of the Air which we breathe.

This Fluid comes from small glandular Bodies, dispersed through the Substance of the Membrane, but especially from Glands something larger than the former, which lie on the outer or posterior Surface of that strong Membrane, by which the Circumference of the Canal is completed. The same Structure is observable in the Ramifications of the Trachea, from the greatest to the smallest.

All the Vessels of which the Lungs are principally composed, that is, the Air-vessels, or Bronchia; and Blood-vessels, that is, the pulmonary and bronchial Arteries and Veins; accompany each other through this whole Viscus.

They are disposed, commonly, in such a manner, even to the last Ramifications, as that a subordinate Trunk or Branch of the Bronchia lies between the like Trunks or Branches of the pulmonary Artery and Vein; the bronchial Vessels being immediately joined to the Bronchia. In some Places these three Kinds of Vessels touch each other, in such a manner, as to leave a triangular Space in the Middle.

The Bronchia are divided into a very great Number of Ramifications, and the last Branches are the Pedicles or Foot-stalks of the small Lobuli. All the Lobuli are angular, oblong, broad, and thin; the Foot-stalks send out other small membranous Pedicles, which are very short, and terminate in the bronchial Vesicles, or Cells, of which they are Continuations. The subordinate Trunks and Ramifications detach a great Number of these Pedicles from their convex Surface.

When we blow into the Lungs, the bronchial Cells, nearest their outer Surface, appear like small Portions of round Vesicles; and, from this Appearance, all the bronchial Cells have got the Name of Vesicles, though they are all angular, except those which I have now mentioned.

When we examine a Lung, without blowing it up, we find, that the cartilaginous Segments of the Bronchia lie so near, as to be engaged in each other; and, in drawing out any Portion of the Bronchia by the two Ends, these Segments are parted, and the whole Canal is increased in Length; but it contracts again, by means of its elastic Membrane, as soon as that Force is taken off.

When we open, lengthwise, any Portion of the pulmonary Artery and Vein, in the same Lung, we meet with a great Number of transverse Rugæ, which are destroyed when these Vessels are elongated: This is an Observation made by *Helvetius*.

By virtue of this Structure, all the Ramifications, both of the Bronchia, and pulmonary Arteries and Veins, have constantly the same Direction, whether the Lung be inflated; or collapsed; and they contract in Length, without being either contorted, or folded. In Expiration, these Vessels are elongated, and shortened in Inspiration.

These three Vessels lie in a sort of cellular Vagina, which accompanies all their Ramifications, and is a Continuation of the interlobular Cells, or cellular Substance in the Interstices of the Lobuli. The Pelliculæ which compose it, are, however, disposed there, in a more regular manner, and more longitudinally, than in other Places; and thereby appear to form a true Vagina.

When we blow through a Pipe, introduced so far as to touch immediately a Trunk of the Blood-vessels, or Bronchia, the Air runs, at first, through all the Cells that lie nearest that Trunk, or its Branches; but if we continue to blow, it insinuates itself through the whole interlobular Substance.

BRONCHIAL GLANDS.

At the Angle of the first Ramification of the Trachea Arteria, we find, on both the fore and back Sides, certain soft, roundish, glandular Bodies, of a bluish, or blackish Colour, and of a Texture partly like that of the Thymus, and partly like that of the Glandulæ Thyroides. There are other Glands, of the same Kind, at the Origin of each Ramification of the Bronchia; but they decrease proportionably, in Number and Size: They are fixed immediately to the Bronchia, and covered by the interlobular Substance; and they seem to communicate, by small Openings, with the Cavity of the Bronchia.

The Trachea has several Coats; the outermost, or common, Covering surrounds that Part of the Trachea which lies in the Thorax; but out of the Thorax, this first Coat is derived from the aponeurotic Expansions of the Muscles of the Neck; and it is between this, and the following Covering, that the Glands, already mentioned, are situated.

The second is a proper Coat, being a Continuation of the cellular Covering of the Lungs; and the Pellicles thereof, nearest the cartilaginous Segments, serve them for an external Perichondrium. The third Membrane lies on the Inside, adhering closely to the same Cartilages, and supplying, to these, the Place of an internal Perichondrium.

The fourth Membrane is that which completes the Circumference of the cartilaginous Circles of the Trachea: It consists, principally, of two Laminæ, or Strata, partly muscular, and partly tendinous; the external, or posterior, Lamina being made up of longitudinal Fibres; and the internal, or anterior, of transverse Fibres. This Membrane is perforated by the small Ducts of the above-mentioned Glands, which discharge a Fluid, when pressed; and, being examined through a Microscope, they appear vesicular, or folliculous, much like those of the Stomach.

The Ligaments between the cartilaginous Circles are very strong, and elastic; and each of them is confined to two Cartilages, without communicating with any of the rest; being fixed to the Edges of these Cartilages, much in the same manner as the intercostal Muscles are inserted in the Ribs.

As the Bronchia penetrate into the Substance of the Lungs, they gradually lose their Cartilages; but the muscular Lines, or Columnæ, of Morgagni appear as much, and sometimes more than before. The two Planes above-mentioned continue, likewise, to be visible; and we observe very distinctly, sometimes, even without a Microscope, a great many small Holes in the Pedicles of the Lobuli, and bronchial Vesicles, or Cells, which open from within outwards.

USES.

Respiration is performed by Organs of two Kinds, one of which may be looked upon as active, the other as passive. The Lungs are of the second Kind; and the first comprehends, principally, the Diaphragm, and intercostal Muscles.

As soon as the intercostal Muscles begin to contract, the Arches of the Ribs are raised, together with the Sternum, and placed at a greater Distance from each other; by which means, the Cavity of the Thorax is enlarged on the two lateral and anterior Sides.

At the same Instant, the Diaphragm is flatted, or brought toward a Plane, by two Motions, which are, apparently, contrary; that is, by the Contraction of the Diaphragm, and the Dilatation of the Ribs, in which it is inserted. The external Surface of the Thorax being thus, in a manner, increased, and the Cavity of the Bronchia being, at the same time, and by the same means, less resisted, or pressed upon, the ambient Air yields to the external Pressure, and insinuates itself into all the Places where the Pressure is diminished; that is, into the Aspera Arteria, and into all the Ramifications of the Bronchia, all the Way to the Vesicles. This is what is called Inspiration.

This Motion of Inspiration is instantaneous, and ceases in a Moment, by the Relaxation of the intercostal Muscles; the elastic Ligaments, and Cartilages of the Ribs, bringing them back, at the same time, to their former Situation. This Motion, by which the Ribs are depressed, and brought nearer each other, is termed Expiration.

The pulmonary Arteries and Veins, which accompany the Bronchia through all their Ramifications, and surround the Vesicles, transmit the Blood through their narrow capillary Extremities, and thereby change or modify it, at least, in three different Manners.

The first Change, or Modification, which the Blood undergoes in the Lungs, is to have the Cohesion of its Parts broken, to be attenuated, pounded, and, as it were, reduced to Powder. The second is, to be deprived of a certain Quantity of Serum, which transpires through the Lungs, and is what we commonly call the Breath. The third is to be, in a manner, re-animated, by the Impression of the Air, whether the whole Body of the Air enters the Blood, whether the common Air is only the Vehicle of some finer Parts which are conveyed to it, or whether the Air only compresses, or shakes the Blood, as it passes round the bronchial Vesicles in the reticular capillary Extremities of the Vessels.

The Cartilages of the Aspera Arteria, and Bronchia, serve, in general, to compose a Canal, the Sides of which will not sink in, or subside, by Compression, but will, nevertheless, yield to certain Pressures and Impulses, without breaking. As these Cartilages are not complete Circles, or Rings, and as their Circumferences are completed by elastic Membranes, they allow of these Dilatations and Contractions, which modulate the Voice; and as they are connected by elastic Ligaments, of a considerable Breadth, the alternate Elongation and Contraction of the Bronchia is facilitated, in the Motions of Respiration. *Winflow's Anatomy.*

PULMO MARINUS. *Offic. Aldrov. Exang. 577. C. B. P. 369. Jonsf. Exang. 56. Bellon. Aquat. 438. Gesn. Aquat. 760. Rondel. Aquat. 2. 131. Charlt. Exer. 68. SEA LUNGS.*

This Substance floats in the Sea; is of a pellucid bluish Colour, resembling, in some measure, that of Crystal; and is so tender, that it can hardly be taken out of the Sea entire. When recently triturated, and used by way of Ointment, it cures Gouts and Chilblains. *Discor. Dale.*

This Substance, according to Lemery, in his *Traité des Drogues*, contains a large Quantity of Oil, and of Salts, both of the volatile, and fixed Kind. It removes the Hairs, when applied to any Part covered with them. A Lixivium, prepared of calcined Sea Lungs, with a large Quantity of Water, if drank, is proper to dissolve the Stone, excite the Menfes, and provoke Urine.

PULMONARIA.

The Characters are;

The Calyx is like a Tube, pentagonal, and quinquefid. The Flower is monopetalous, cylindrical in its lower Part, and shaped like a Basen above, with its Margin cut into five round Segments. From the Sides of the internal cylindrical Part, which are neatly fimbriated, arise five Stamina.

Boerhaave mentions six Species of *Pulmonaria*; which are, 1. *Pulmonaria, vulgaris; latifolia; flore albo. T. 136. Boerb. Ind. A. 193. Pulmonaria maculosa. Offic. Ger. 662. Emac. 808. Raii Hist. 1. 488. Park. Parad. 448. Pulmonaria Italorum ad Buglossam accedens. J. B. 3. 595. Symphytum maculosum sive Pulmonaria latifolia. C. B. P. 259. SAGE OF JERUSALEM.*

The lower Leaves of this Plant are large and oval, five or six Inches long, growing on broad Foot-stalks, thick-set with fine Hairs, of a deep Green above, and spotted with white Spots; but of a paler Green, and unspotted, underneath. The Stalks rise to be near a Foot high, having several smaller Leaves on them; and on their Tops grow several Flowers together, each in a long hairy Calyx, having their Brims appearing but a little above it, of a reddish Colour, being single, and Cup-fashion, cut at the End into five round Segments; and are each succeeded by four rough Seeds, growing in the Bottom of the Calyx. The Root is small and fibrous. It is planted in Gardens, and flowers in May; the Leaves are used.

This is accounted a pectoral, balsamic Plant, and good for Coughs, Consumptions, Spitting of Blood, and the like Disorders of the Lungs: It is, likewise, put into Wound-drinks, and traumatic Decoctions; being agglutinating, and good to heal Wounds and Ulcers, and old Sores. *Miller's Bot. Off.*

The *Pulmonaria* has a saltish, herby, glutinous Taste, and reddens the blue Paper pretty much; it is very sweetening. It is used in Pisans, and Broths made of Calves Lungs, for the Diseases of the Breast, when the Spittle is salt, or purulent. *Martyn's Tournesfort.*

2. *Pulmonaria; Alpina; foliis mollibus, subrotundis; flore cœruleo. T. 136. Symphytum maculosum. Dod. p. 135.*

3. *Pul-*

3. *Pulmonaria*; foliis Echii. Ger. 662. Emac. 808. Raii Hist. 1. 489. Synop. 3. 226. Tourn. Inst. 136. Boerb. Ind. A. 193. *Pulmonaria angustifolia rubente cœruleo flore*. C. B. P. 260. *Pulmonaria angustifolia*. Park. Parad. 248. *Pulmonaria rubro flore, foliis Echii*. J. B. 3. 597. *Symphytum maculosum seu Pulmonaria maxima, foliis quasi Saccharo incrustatis*. Raii Hist. 3. 266. NARROW-LEAVED SAGE OF BETH-LEHEM.

This Plant is cultivated in Gardens, and flowers in May. Its Leaves are only used, and, in Virtues, agree with those of the Sage of Jerusalem. Dale.

4. *Pulmonaria*; folio non maculoso. Clus. H. 169. *Symphytum, minus, non maculatum, Germanicum, angustifolium, floribus è rubentibus cœruleis*. M. H. 3. 444.

5. *Pulmonaria*; major; non maculosa. J. B. 3. 493.

6. *Pulmonaria*; Orientalis; calyce vesicario; foliis Echii; flore purpureo, infundibuliformi. T. Cor. 6. Boerb. Ind. alt. Plant. Vol. 1.

This Plant contains a mild, benign Juice; but is no more efficacious in Disorders of the Lungs, than Borage, or Houndstongue, since it is equally proper in all Disorders where Medicines of a demulcent, emollient, and relaxing Quality, are indicated.

It is, like Mallows, of an emollient, conglutinating, consolidating, moistening, and inspissating Quality. The Flowers or Leaves are recommended in a Spitting of Blood, an Hætic, and a Phthisis. It is classed among the vulnerary Plants, and accounted highly beneficial in Hoarseness, and long-continued Coughs. Hence it is proper in a Pleurisy, a Peripneumony, and Hepatides, where Expectoration is required. It procures a free Breathing; and is beneficial to the Kidneys. Hist. Plant. adscript. Boerb.

PULMONIA. The same as PERIPNEUMONIA.

PULPA. The Pulp of Fruits.

PULPEZIA. An Apoplexy.

PULS. The same as ETNOS.

PULSATILLA.

The Characters are;

The Root is fibrous and perennial; the Leaves are jagged, and surround the Stalk like a Crown, as in the *Anemonoides*, and *Anemone*. The Apex of the Stalk is expanded into a Placenta, whose Base has its Bottom surrounded with a naked, hexapetalous Flower, furnished with very numerous Stamina, which arise from the Bottom of the Placenta within the Petals. The Ovary becomes a little globous Head, to which grow Numbers of little hairy Husks, furnished with a long hairy Sheath, ending in a sort of long slender Capillament, like a plumous Tail.

Boerhaave mentions two Species of *Pulsatilla*; which are,

1. *Pulsatilla*; folio crassiore; & majore flore. C. B. P. 177. Tourn. Inst. 284. Raii Synop. 3. 260. Boerb. Ind. A. 39. *Pulsatilla*. Offic. *Pulsatilla vulgaris*. Ger. 314. Emac. 385. Park. Theat. 341. Raii Hist. 1. 633. *Pulsatilla Anglica purpurea*. Park. Parad. 199. *Pulsatilla purpurea cœrulea*. J. B. 3. 409. PASQUE-FLOWER.

This Plant is so acrid, that the mere Vapour of its Leaves, rubbed between the Fingers, seems to burn the Nose, and penetrate to the very Brain: It might be made use of in the Lethargy; the Leaves bruised are applied to Ulcers, but especially to the Wounds of Horses.

By the chymical Analysis this Plant yields some Marks of Acidity, a great deal of Sulphur and Earth, and a little fixt, and no volatile concrete Salt. Martyn's Tournefort.

2. *Pulsatilla*; flore minore; nigricante. C. B. P. 177. Boerb. Ind. alt. Plant.

PULSATIO. Pulsation; that is, a morbid Sensation of something beating in any Part. Hence a sort of Pain, attended with this sort of Sensation, is called a pulsatory Pain.

PULSILOGIUM. A Pulse-watch, or Instrument to measure the Celerity of the Pulse. Sanctorius is said to be the first Inventor of this Machine; and Sir John Floyer has wrote a Treatise expressly upon this Subject.

PULSUS.

No Doctrine has been involved in more Difficulties than that of Pulses; since, in giving a physiological Account of them, Physicians have espoused quite opposite Sentiments; whilst some doubt whether the Pulse is owing to the Systole, or the Diastole; as, also, whether the Motion of the Heart and Arteries is one and the same for a Moment of Time: Others, especially among the Antients, mention an incredible Number of different Pulses, most of which can neither be felt by the Touch, nor comprehended by the Mind. Others run into the opposite Error, and will only admit of two or three different Kinds of Pulses. Others take different Kinds of Pulses for one and the same Species, whilst others assert, that their Distinction is absolutely necessary, to prevent Confusion and Blunders in Practice. Thus many of the Moderns affirm a quick and frequent Pulse to be the same; whilst others maintain, that the Distinction between

them is of the last Importance in Practice. A vehement, strong, large, and quick Pulse, are now-and-then said to be of the same Species; whilst others will have them to be entirely distinct: And, indeed, if we consult Experience, we shall hardly ever find two Physicians agreeing in their Appellations of the Patient's Pulse. The Opinions of the Learned are no less various, with respect to the Use of the Doctrine of the Pulses in Practice; whilst some assert, that they are highly fallacious Signs in most Disorders, and can only be of Use in some Fevers; whilst others assert the Knowledge of Pulses so necessary to a practical Physician, that he cannot, without it, form a certain Prognostic; especially with respect to latent Diseases; for which Reason, they, with the Chinese, greatly esteem the Knowledge of the Pulses; and maintain, that they ought to be, for a long time, accurately explored, in various Parts of the Body. But, in all Probability, the Origin of those Differences is, that the Antients were ignorant of the Circulation of the Blood, and invented different Species of Pulses, from the speculative and abstracted Differences of any solid Body, at different Times, variously impelled. But as the Moderns have rarely applied the Doctrine of the Circulation of the Blood to Pathology, and Practice, so they have rested contented with the Rules of the Antients, with respect to Pulses, without attempting a just Account of their Nature and Differences, from the Discovery of the Circulation of the Fluids. But, to lay a Foundation for Certainty in this Point, and prevent future Mistakes, I shall, from the Laws of Mechanics, and especially from the Circulation of the Blood, shew the Nature, Differences, and practical Use of Pulses.

But, before we proceed to this, we shall, for the sake of Accuracy and Connection, give the Physiology, or natural Constitution, of the Pulse; that the Truths connected with it may be the better discovered and explained. But here a Controversy occurs; which is, Whether the Motion of the Heart be the same with the Pulse; or whether, at the same time the Heart is in its Systole, the Arteries are so too, and the Systole of the Heart and Arteries is the true Pulse; or, rather, whether the Systole of the Heart, and Diastole of the Arteries, are not reciprocal; or whether, when the Heart is in its Systole, the Arteries are in their Diastole; and whether the Pulse is not the Systole, but, rather, the Diastole, of the Arteries. Sennertus, in his Institut. Lib. 3. Part 1. Sect. 4. Cap. 1. embraces the former of these Opinions; and informs us, that the Heart and Arteries are dilated; and contracted, at one and the same time; and that it is rash, not to acquiesce in the Evidence of Sense. He seems, indeed, in the Part now quoted, to oppose his own Opinion, by a Doubt conveyed to his Reader, in the following manner: "If, at the same time in which the Heart is contracted, and expels its Contents, the Arteries were also contracted, it would follow, that the Arteries could not receive the Blood; and, on the contrary, that at the time the Heart and Arteries are at once dilated, the Heart could not receive the Blood from the Arteries; because these mutual Attractions would hinder each other." Yet he answers this Doubt, in the following manner, by telling us, "That no Disadvantage arises from this, since the Arteries are not so compressed, and shut up, as that they are absolutely capable of receiving nothing; but still retain a sufficient Cavity for receiving that which is transmitted by the Heart; as, also, that the Heart receives Blood from the Lungs; and that the Arteries not only receive Blood from the Heart, but, also, from the adjacent Parts, and the Veins, in their Dilatation." But 'tis easy to perceive, that this Doctrine is entirely inconsistent with the justest Notions of the Circulation of the Blood; of which Sennertus was ignorant.

But it is surprising, that some, sufficiently acquainted with the Circulation of the Blood, should tread in the Steps of Sennertus, and assert, that the Motion of the Heart, in its Systole, is the same with the Motion of the Arteries perceived in the Pulse; and that the Systole of the Heart, by way of Eminence, denotes the Pulse: By this means, they pretend to refute those who assert, that the Motion of the Heart and Arteries is not the same, but alternate. It is, also, surprising, that so great Men as Galen, and Johannes Baptista Montanus, in Lib. 1. de Pulsibus dignosc. Cap. 5. should affirm, that the Systole, or Contraction of the Pulse cannot be perceived; but even reject the Opinion of those who believe, that when the Pulse vibrates, the Artery is in its Diastole. But we assert, with almost all the Moderns, that the Pulse is nothing but the Dilatation or Expansion of the Arteries by the Blood, protruded, by the Contraction of the Heart, from its Left Ventricle, into the Arteries, which are stretched and dilated by the Impulse of the Blood coming from the Heart, and communicated to the whole Fluids; then, after their Dilatation, they not only recoil, and are restored to their former Figure, but are, also, in some measure, farther contracted, and, with a new Impulse, propel the Blood more into the minute Arteries and Origins of the Veins: For, according to Bellini,

in *Tract. de Pulsibus*, the Arteries have a double Motion, the one a Dilatation, or the Impressions they make on the Finger; and the other a Contraction, or receding from the Finger; which, according to *Galen*, is not to be perceived without great Difficulty: For the Circulation of the Blood, on which Life depends, is carried on, without Intermission, by the reciprocal Motions of the Heart and Arteries: Nor, without these, can the Motion of the human Fluids be accounted for. When, therefore, the Heart is in its Systole, and expels its Contents, the Arteries are in their Diastole, and receive them. So, also, when the Arteries, in consequence of the large Number of spirital and muscular Fibres, of which they consist, contract themselves, the Veins and Heart are in their Diastole, and receive the Blood from the Arteries. *Galen* entertained the same Opinion, which excellently quadrates with the Circulation of the Blood. For, in *Lib. 7. Anatom. administr.* he tells us, *That the Pulsation of the Heart and Arteries is such, that when the Heart is filled, the Arteries are emptied; and when the Heart is emptied, the Arteries are filled.* *Fernelius* is, also, of the same Opinion: For, says he, *the Pulse consists of a Systole and Diastole; the latter is a Dilatation or Expansion of the Artery every Way; whereas the former is a Contraction or Subsiding of it in every Dimension.*

With respect to Pulses, there is no small Difference of Opinions and Sentiments; for almost all the Antients maintained, that all the Species of them were distinct, and different from each other; whereas some of the Moderns take the quick, and the frequent, Pulse for one and the same, as is sufficiently obvious from their Works. Others, fond of being thought uncommonly wise, dissent from them; and affirm, that there is so great a Distinction between them, that a practical Physician would look upon the Man as a Fool, who should give them out for the same Pulse. But, in order to get clear of all Doubts and Difficulties, we shall more accurately investigate this Matter. The Antients, then, were unanimously of Opinion, that since the Pulse was a local Motion, whatever was requisite to the latter, or could be affirmed or denied of it, was, of course, applicable to the former. Now, according to *Galen* and *Sennertus*, five Things are requisite to local Motion: First, a moving Cause. Secondly, the Space through which the Body is moved. Thirdly, the Time consumed during the Motion. Fourthly, Rest, when Bodies, moving in opposite Directions, meet. And, fifthly, the Instrument by which the Motion is performed. From these they deduce the simple Differences of Pulses. Upon the moving Cause depend Vehemence and Weakness; hence a vehement, or weak, Pulse are produced. On the Space or Quantity of the Distention, or Dilatation, depend the Greatness and Smallness of the Pulse. On the Time in which the Artery performs its Motion, depend the Quickness and Slowness of the Pulse. According as the Artery remains long or short in a State of Rest, the Pulse is said to be frequent, or rare. And from the Organ of the Pulse, which is the Artery, and which is sometimes harder, and sometimes softer, arises a soft and hard Pulse.

But though *Sennertus*, in his *Institut.* defines a quick Pulse to be, when the Artery, in a short time, performs its Motion; yet he afterwards confesses, that the Celerity of the Pulse cannot be estimated by Space, because that Space cannot be known by the Touch; for which Reason, in defining a quick Pulse, he orders us to regard the Quality of the Motion; whether, for Instance, it is brisk, or slow. Hence *Fernelius*, and some others, have defined a quick Pulse, such an one as, in a short time, distends the Artery; and a slow Pulse, that which produces the same Effect in a long time. *Bellini*, in *Tract. de Pulsibus*, informs us, *That it is a quick Pulse, which, upon the Application of the Finger, persists a very short time; whereas a slow Pulse continues longer.* According to *Sennertus*, *Fernelius*, and others, it is a frequent Pulse which has a short Time of Rest, or in which there is but a short Time interposed between each Diastole; a rare Pulse is that which has a long State of Rest, or in which there is a long Time between one Distention of the Artery and another; or a frequent Pulse is that which, in a short time, distends the Artery, and becomes perceptible to the Touch; whereas a rare Pulse only produces these Effects at longer Intervals. The Word Frequency cannot, however, be properly applied to Motion; but the Celerity or Slowness, the Intension or Remission, of the moving Force are properly competent to Motion; since every Degree of Motion is to be estimated by its Celerity or Intension, and its Slowness or Remission: But one Motion, considered in itself, cannot be said to be frequent, or rare; but this Difference only holds, with respect to the Plurality and Number of Pulsations happening in a certain determined Time. Thus, for Instance, the Motion, or Impulse, is said to be frequent, when, in half an Hour, Water is an hundred times forced from a Syringe; whereas the Motion is said to be rare, when the Water is forced from it only thirty times during half an Hour. Thus, when a Globe, for In-

stance, is impelled, the Celerity of the Impulse may justly take place, with respect to each Stroke; and yet these Strokes be applied more rarely, or at longer Intervals; and thus any Stroke, applied to a Globe, may be remiss, or small, with respect to Violence, and yet frequently repeated.

This Doctrine holds excellently in those Motions which are not continual, but have certain Intervals of Rest, and in which this Distinction is of singular Use; so that quick and frequent Pulses ought not to be joined and confounded with each other. But 'tis far otherwise in the Motion of the Arteries, which is continual, and requires no Rest, in order to carry on a continual Circulation of the Blood from the Heart to the Arteries, from these to the Veins, and from these to the Heart again. It is not to be imagined, that, when after the Pulse, or Dilatation of the Artery, no Motion or Stroke is perceived by the Touch, the Artery becomes inactive, and remains in a State of Rest, since we have already shewn, that, immediately after its Dilatation, it not only by its proper elastic Force, but, also, in consequence of the Influx of the Spirits into its muscular Fibres, recoils, and is contracted; by which Contraction the Blood is forced into the Veins, and a fresh Dilatation of the Artery immediately succeeds. Hence the Pulse may justly be compared to a Pendulum, which performs a continual oscillatory Motion from one Side to another, without any perceptible Rest. With respect to this continual Motion, which the Antients did not understand, but which is sufficiently comprehended by the Moderns, there arises a Dispute, whether Frequency, and Celerity, applied to the Pulse, are separate and distinct from each other. We shall now examine this Difficulty in order to prevent Mistakes: When, therefore, in a Quarter of an Hour, a Physician counts two thousand Pulses in a Patient, he calls the Pulse preternaturally frequent; when, during the same time, he in another Patient counts only a thousand Strokes, he pronounces the Pulse rare. Now, if another Physician, being call'd, should denominate the frequent Pulse quick, and the rare one slow, the Question is, Which of them is in the right? I answer, Both; for, since the Motions of the Heart and Arteries consists in their continual Systole and Diastole, it is impossible, that, during a small Portion of Time, the Number of Pulses should increase, and be observed greater, unless every Systole and Diastole of the Arteries should become more brisk and intense, that is, be performed in a shorter time; just as we observe in the Vibrations of Pendulums, which, the more numerous they are in a certain time, the more short and quick they must of course be; for 'tis to be observed, that the Celerity of one Pulse by itself cannot be perceived, because it hardly lasts an Instant. Hence *Sylvius*, that happy Practitioner, in *Prax. Med. Lib. 1. Cap. 19.* informs us, "That the Celerity of the Pulse can be conceived in the Mind, though not estimated by the Touch." *Bellini*, also, in *Tr. de Pulsibus*, speaks in the following manner: "A quick Pulse, because it affects the Touch but for an Instant, in a State but a little receding from a natural one, either does not happen at all, or, if it does, cannot be distinguished by the Touch, since the natural Dilatation of the Artery hardly lasts an Instant. Much less can the Celerity of the Pulse be perceptible in a preternatural State." Hence 'tis obvious, that a Pulse cannot be called frequent, unless it is, at the same time, accompanied with Celerity; nor quick, unless it is frequent; because one Stroke cannot be easily distinguished with respect to Celerity. Hence *Schellhammer*, in *Tr. de Pulsibus*, justly observes, that the Frequency of the Pulse is not to be found without a concomitant Celerity. Hence the Reason is obvious, why in physical Authors we never read of a frequent and slow Pulse accompanying each other, or of a quick and rare Pulse going hand-in-hand; which Species of Motions may easily be conceived to happen in an interrupted Motion, but can never occur in one of the continued and uninterrupted Kind. Hence it follows, that the various Species of Pulses are by no means to be refer'd to the Nature of any local Motion, or Impulse of a Body, so as to lay a Foundation for asserting that of the Pulse, which can be affirmed of such a local Motion; for the Antients were ignorant of the Circulation of the Blood, from which all the Species and Differences of Pulses ought to be sought, and accounted for.

'Tis sufficiently known, that almost all Physicians, both antient and modern, constitute a peculiar Difference between a quick and a vehement Pulse, since they call the former intense, quick, and brisk, and its Opposite remiss; and the latter strong and robust, and its Opposite weak and languid. And as they deduce the Celerity of the Pulse from its Motion performed in a short time, so they derive its Vehemence from the strong or weak Force of the moving Cause. But a considerable Difficulty occurs here; Which is, whether a quick Pulse may not, also, be called a vehement one, and accounted as such, since Celerity, in the Opinion of all Mathematicians, is nothing but an increased, or more intense, moving Force. But an Increase,

or an Intension of the moving Force, or Celerity, is capable of producing considerable Effects, or of overcoming a great Resistance. Now the Vehemence of Motion is only properly applied with respect to the Effects, when, for Instance, by the Action of the moving Cause, a large Quantity of moveable and resisting Matter is removed. Hence all who are Masters of statical and mechanical Learning, agree, that the Celerity of a small Body may be able to remove a large Weight or Bulk of Matter, since 'tis certain, that a Globe of a certain Diameter, moving with double Celerity, produces more considerable Effects, than a Globe of double the Diameter, moving with less Celerity.

Besides, 'tis remarkable what surprising Effects are produced by some of the most subtle Bodies, such as Air, Ether, and Fire, when in a quick and rapid Motion. *Galen*, in *Lib. 3. de Different. Puls. Cap. 5.* seems to think, that the Celerity and Vehemence of a Pulse are not much different from each other, as he informs us in the following manner: "The Word *Vehemence*, says he, is commonly used in order to express some strong, and, at the same time, quick Action; and the Persons who perform such Actions, are called *opodesi*." The same Author, also, informs us, in the Part last quoted, that if he had a Power of giving Names to the Pulses, he would call the simple Quality, or Difference, of such Pulses as resist the Touch, "*Force or Strength*, or some such thing; and the Difference compounded of this Strength, and the Celerity, *Vehemence*." But because the Word *Vehemence* is, by most Physicians, used to express one of the simple Differences of Pulses, he thinks it is to be retained, and not changed. But that this Affair may be rendered more clear and perspicuous, we are here, according to the Principles of Statics and Mechanics, to suppose that Vehemence may be considered in a double respect, either with respect to the Body in Motion, or with respect to the Augmentation of the moving Force. In general, Motion is said to be vehement, when it has great Force, produces great Effects, or overcomes much Resistance. Hence a Pulse is said to be vehement, which makes a strong Impression on the Hand which feels it; whereas, that is called *languid* and *weak*, which affects the Hand in a faint and languid manner. But Vehemence, with respect to the Body in Motion, is, when either its Quantity of Matter, or its moving Force, is great. Hence a Body of great Bulk, and moving Force, is of great Force when put in Motion, or produces a vehement Motion.

The Word *Vehemence* is, also, applied to the Increase of the Motion, that is, when it becomes brisk, intense, and quick. Hence 'tis obvious, that a very small Body may, by being put into a quick Motion, produce very considerable Effects; but that a still more considerable Efficacy is exerted, when the Quantity of Matter, and the Celerity of Motion, concur. Though, therefore, according to *Galen*, a quick Pulse, considered in itself, is never free from Vehemence, yet that Pulse is only properly and strictly called *vehement*, where a large Quantity of Spirits animate the Fibres of the Heart. This Pulse, when without Celerity, is called *strong*; but, when accompanied with Celerity, *vehement*, and at the same time large, when not a small, but a great Quantity of Blood is forced into the Arteries by one Systole of the Heart; and then, which is the Sign of a vehement Pulse, it beats the Finger strongly, and with a kind of Violence. But because it is not necessary, that under a quick Systole of the Heart there should always be a great Quantity of Strength or Spirits, nor that the Blood should always be expelled copiously, but few Spirits are often sufficient, hence the Artery is not in this Case forcibly struck, though the Pulse is at the same time quick.

Since the Antients, as we have already observed, deduced the Species of Pulses from the Nature of local Motion, and feigned as many Species of Pulses as there are Species of Motion; so there are, especially in *Galen*, numberless Differences of simple and compound Pulses described with respect to Time, Space, Instrument, Order, Equality, Proportion of Strokes, and moving Force. But afterwards, when they found these speciously contrived Differences either incomprehensible, or useless in Practice, they justly exploded and discarded them. Thus *Joh. Bapt. Montanus*, in *Consil. 256.* frankly confesses, that he was ignorant of the minute Differences of the Pulses; and tells us, that he believed *Galen* had something of the Greek Subtlety about him, and laugh'd in his own Mind, when he was reducing the Kinds of Pulses to their several Species. He afterwards adds, that though these Differences may possibly be conceived in the Mind, yet they are not all perceptible by the Touch. *Caspar Hoffman*, in *Institut.* speaks in the following manner: "The short Compendium of *Goldaldinus*, de *Pulsibus*, is, in my Opinion, preferable to the three Volumes of *Galen*, concerning the Difference, Causes, and Prognostics, of Pulses. These last Works I take to be *Herophillean* Subtleties, which he might have invented, not only when young, but, also, when he had the Advantage of Experience and Practice. This Opinion I was induced

to entertain by *Montanus*, in *Consil. 257.*" I was told by a Friend in *Italy*, who heard the Account from the Mouth of *Bartholomaeus Schwalbius* himself, a celebrated Physician of *Prague*, that this Practitioner was content with three Differences of Pulses, an equal, and an unequal; a quick, and a slow; a strong, and a weak. *Plempius*, also, in *Fundam. Medic. Lib. 5. Sect. 2. Cap. 2.* tells us, "That Physicians trifle egregiously about Pulses, since the Subtlety of some of their Minds had induced them to constitute Differences of Pulses, which could not be perceived by the Senses." The celebrated *Welschius*, in *Oper.* tells us, "That, in the whole Doctrine of Pulses, many things uncertain, superfluous, and imaginary, have long ago been discovered by the Learned, who have observed a quite different Motion in the Circulation of the Blood, which they ascribe to the Pulsation and vital Force of the Heart, whilst others attempt to account for it by Inventions of their own, rather than by mechanical Reasons." *Sylvius* has reduced the numerous Differences of Pulses invented by the Antients, to three Heads, that is, the Strength, the Largeness, and the Frequency, of the Pulse. By a strong Pulse, he means one of the vehement Kind, which with a certain Force strikes the Finger that touches it. The weak Pulse is, when it gently, or slightly, affects the Finger. The large Pulse is, when the Artery is dilated much; and the small, when it is only a little dilated, or expanded. The frequent Pulse is, when, in the same Space of Time, the Pulsations happen oftener than at other times, or more frequently than in other Patients. And the rare Pulse is, when the Strokes or Pulsations of the Artery, happen less often than they used to do.

But, that we may reduce things to the better Order, and establish the genuine Differences of Pulses, which occur in Practice, both in a natural and preternatural State, we must, first, from the Principles of Mechanics, suppose that all Motion is quick or slow; for Celerity and Slowness are genuine Properties of Motion. Hence *Galen*, in *Lib. de Pulsibus ad Tyrones, Cap. 3.* justly informs us, that Celerity and Slowness properly belong to Motion; that the former is a brisk, and the latter a slow and remiss Motion; and that from these we were to form a kind of comparative Judgment concerning the natural Pulse. Secondly, all Motion is performed in a large, or in a respectively small Space; and is consequently either vehement, or languid. Thirdly, with respect to Order, Motion is either equal or unequal; and the Equality is to be understood, both with respect to Time or Celerity, and with respect to Magnitude or Vehemence. And, fourthly, with respect to the moveable Body, Motion is either great or small.

Now we suppose, that the Motion of the Heart and Arteries is continual, and consists of the reciprocal Systole and Diastole, without any Interruption; for which Reason, every Pulse is either large or small. The large is, when much Blood is by one Contraction of the Heart thrown into the Artery; in consequence of which, its Dilatation is large and full. The small Pulse is, when, in consequence of little Blood forced into the Artery by one Systole of the Heart, the Expansion of the former is but small and inconsiderable. Besides, the Pulse is either quick or slow. The quick is produced, when the Heart quickly, and in a short time, contracts itself, and throws the Blood into the Artery. The slow, on the contrary, is, when the Contraction of the Heart requires a longer Time, or when the Conveyance of the Blood into the Artery lasts considerably long. But, as, in every Pulse, the Degrees of Celerity and Slowness cannot be accurately estimated and computed, because they happen in a Moment, hence, from the Frequency, that is, when, during the same time, the Expansion of the Artery is observed oftener than at other times, the Celerity of Pulses ought to be determined; but in such a manner, that the Frequency be only made the Sign, Characteristic, or Measure, of the Celerity, and the Rareness of the Slowness; because Frequency is not applicable to any Motion, considered in itself. But, in a continual Motion, which, however, consists of different Species, a Systole, for Instance, and a Diastole, where one is perceived, and the other not, we ought in Justice to make an Estimate of the Celerity from the large Number of the perceived Motions, or Strokes. Thirdly, the Pulse is either equal or unequal; equal, when there is an exact Equality with respect to the Celerity or Frequency of the succeeding Pulses, as, also, with respect to their Largeness and Smallness. The Pulse is said to be unequal, when one Stroke is large, and another small and weak; or when one is quick, and the other very slow; so that the Pulse seems to be intermittent, though the Intermision of the Pulse may be more properly referred to that Species of Inequality which consists in a great Slowness. Fourthly, the Pulse is either vehement and strong, or weak: The vehement Pulse is, when the Systole of the Heart is performed by a large Quantity of moving Force, or Spirits; and the weak, when the Heart is contracted by a small Quantity of Spirits.

The Differences, formed by the Antients, of the vermicular, formicating, tremulous, ferrated, and caprizating Pulse, depend partly on the Inequality of the Pulses, but, most of all, on the Convulsion of the Coats composing the Arteries; for which Reason they are almost always to be esteemed dangerous in acute Disorders. As for the hard and soft Pulse, these depend only on the State and Condition of the Artery; for, when, in consequence of an excessive Pain, Spasms, or Convulsions, the Coats of the Artery become hard, so that the Resistance makes a strong Impression on the Touch, the Pulse is said to be hard. The soft Pulse is, when the Fibres of the Coats of the Arteries are flaccid, relaxed, and moist. When a large and vehement Pulse concurs with such a soft State of the Arteries, it is called an *undulating Pulse*, which is the Forerunner of a profuse and copious Sweat.

From these simple Differences, we may easily discover what Species of Pulses may be joined with each other, and what not. First, then, there is a Pulse compounded of the large and quick; of the large and vehement; of the strong and quick; and of the vehement and small. Secondly, there is a Pulse compounded of the frequent and weak, and of the quick and small. There is, also, a slow and a large Pulse, such as that which happens in a natural State, and in plethoric old Persons, as, also, in some melancholic and scorbutic Patients. But there is never a quick and a slow Pulse, nor a slow and a rare, nor a vehement and weak Pulse, unless we intend to confound Words.

As the Motion of the Heart and Arteries depends, first, upon the Quantity and Strength of the spirituous, elastic, and expansive Substance, contained in the Blood, and nervous Fluid; secondly, on the due Tone of the muscular Fibres of the Heart and Arteries; and, thirdly, on the proper Temperature, Quantity, and Consistence of the Blood, so it is to be deduced and accounted for from these Sources. Now 'tis certain, that Life, Health, and the due Order of the whole Body, depend upon a proper and equable Circulation of the Blood and Humours through the solid Parts; so that the better regulated, and the more equable, the Circulation is, the more perfectly Nature preserves herself, and cures the Diseases incident to her; and, on the contrary, the more this Circulation recedes from a due and equable State, the weaker Nature is said to be, and the more subject to Misfortunes and Diseases. 'Tis, therefore, of the greatest Importance, that the Physician should know the Circulation peculiar to each Patient both in a natural and preternatural State, that he may be the better able to form a Judgment of their Disposition to Diseases, and of the Nature and Event of their Disorders. Now every one must own, that the Circulation of the Blood cannot be better investigated than by feeling the Pulse, not in a superficial manner, but frequently, and for a sufficient Time; for the Pulse not only discovers the Imperfections and Strength of the whole Body, but, also, the Nature of the Blood, and the State of the various Secretions. And, as a Pendulum of a Clock, by its equable and regular Vibrations, manifests the Worth of the Clock; so the Pulse discovers the Habit of the Patient, and the Vigour or Depravation of all his Functions.

We now come to inquire what a moderate, constant, and equable Pulse is, since it is, as it were, the Rule and Measure by which we are to judge of the rest. A moderate Pulse, therefore, is that which is large, but neither quick nor slow, hard nor unequal. This is the Pulse with which all others ought to be compared, and which denotes the best State of Health; the Absence of all preternatural and foreign Things, and a due and temperate Degree of Heat; for when such a Pulse is present, the Fluids are duly spirituous, the Fibres possessed of their natural Tone, the Blood temperate and fluid, and consequently the Transpiration free, the Nutrition good, the animal Functions vigorous, the Secretions duly carried on, and the Patient in a State of good Health. But when the Pulse is quicker, and consequently more frequent than usual, it indicates a preternatural Irritation of the Heart, as the Antients express it, unless it proceeds from external Causes; but if such a Pulse continues long, it infallibly denotes a Disorder accompany'd with an Increase of Heat, and even a Fever. It is generally produced by an inordinate intestine Motion of the Blood, and a Change induced on the Crasis of the Spirits by an Admixture of heterogeneous, and often caustic Particles. When the Pulse is vehement, and, at the same time, quick, it indicates a feverish Intemperature, an Admixture of something heterogeneous with the Blood, Lymph, and Spirits; but, at the same time, a large Quantity of Strength and Spirits. If a vehement and quick Pulse is, also, large, the Circulation of the Blood is brisk, the Heat and Thirst great, and the whole Habit red and turgid. Where the Pulse is small, and little Blood is conveyed from the Heart to the Arteries, and from the Veins to the Heart, the Circulation of the Blood is faint and languid. Hence the Transpiration and Secretions are but

small, and the Strength little: But, if a small Pulse is, at the same time, weak and frequent, or quick; it denotes a great Languor of the Strength, a preternatural intestine Motion, and a weak Circulation of the Blood; and, if this Species of Pulse continues long, it indicates Malignity, and great Danger.

A slow Pulse generally denotes a Viscidity, Thickness, and weak Circulation of the Blood, together with a Languor of the Secretions; but if it is at the same time weak, it is dangerous, and raises a Suspicion of a total Loss of Strength. But a Pulse which is slow and large, denotes sufficient Remains of Strength, Tension, and Thickness, of the Fibres, of the Heart and Arteries, and a viscid and tenacious Blood. All unequal Pulses are very bad, since they denote, that there is neither a due Influx of the Spirits, nor a proper and equal Mixture of the Blood; but, particularly, such Pulses always prognosticate unlucky Events, when they are weak. Intermittent Pulses are, also, of a bad Kind, or generally accounted the Presages of Death. But it is not universally so; for an intermittent Pulse frequently happens without Danger, where, for Instance, the Symptoms are of a bad Kind, and the Patient's Strength still entire. Hence this Species of Pulse frequently happens in hypochondriac and melancholic Patients, where the intestine Motion of the Blood is diminished by its Thickness. But when the Pulse is weak and quick at the same time, it generally prognosticates Death. An hard Pulse generally indicates Pains, Spasms, and Convulsions, because the Fibres of the Heart and Arteries are spasmodically constricted. The irregular, caprizating, and discontinued Pulses, denote a very bad State of the Body, both with respect to the fluid and solid Parts.

It is carefully to be observed, that one Kind of Pulse is not found in all Persons; for as the Pulse depends on the Tone of the muscular Fibres; on the Influx of the Spirits, and the Nature and Temperament of the Blood, and as all these are surprisingly various in human Bodies, with respect to Age, Sex, the Season of the Year, the Climate, the Method of Life, the Sleep, and the Passions of the Mind, so, also, the Pulses vary from each other according as these Circumstances differ. Thus Men generally have a large and vehement Pulse, and Women one of a more slow and weak Kind; for the former have stronger Fibres, and an hotter Blood, than the latter: For this Reason, also, the Circulation of the Blood is brisker in Men than in Women, and the former do not generate such Loads of redundant Blood and Humours, as Women, who are generally weaker, and more subject to Diseases. Choleric Persons, and those of sanguine choleric Constitutions, have a larger, quicker, and more vehement Pulse, than phlegmatic and melancholic Persons; for which Reason the Fluids move more quickly, the Excretions are made more expeditiously, and the Blood is more fluid, in the former than in the latter; for the Blood of the former is impregnated with a larger Quantity of oleous and sulphureous Parts, which are, as it were, the Source and Matrix of Heat, and a spirituous Quality. Thus, also, those of a slender Habit, who have strong Fibres, and large Vessels, have a larger and stronger Pulse, than those who are fat, have lax Fibres, and narrow Vessels. Hence they are, also, sounder, more robust, and more capable of enduring Fatigue. This is, also, the Reason, why those who are naturally thick and fat, are more readily seized with Sickness, and destroy'd by it, than those of slender Habits.

In Infants and Children the Pulse is frequent and soft, whereas in old Persons it is slow and large, whilst in young Persons, and those full-grown, it is large and vehement; for, generally, Infants and Children generate a large Quantity of Humours, which are necessary to their Growth, and collect a great deal of Sordes, which is the Reason why Infants and Children are more generally seized with Sickness, and more readily die of it, than Youths and Adults. Old Persons have thick Blood, but rigid Fibres; for which Reason their Pulse is hard, and makes a forcible Impression on the Touch. But in Infants and Children the Pulse is soft, on account of the Tenderness and Laxity of the Fibres. The Pulse is, also, changed by the Season of the Year, the Exercise of the Body, the Aliments, and the Affections of the Mind. In the Middle of the Spring, the Pulse is large and vehement; at this Season, also, the Strength is greatest; for which Reason Persons are at that time most rarely sick, and recover most easily. In the Middle of the Summer, the Pulse is quicker and weaker, because, by the intense Heat, the Strength is impaired, whilst the intestine Motion of the Fluids is greater than it usually is. In Autumn the Pulse is slower, softer, and weaker, than at any other Season, and in the Winter harder, a little more vehement, and slower. Among Kingdoms and Climates, those which are hot and sultry, may be compared to the Middle of the Summer; those which are cold, to the Winter; and such as are temperate, to the Spring.

Exercise increases the Pulse, and consequently the Circulation of the Blood, whilst an idle and inactive State renders the Pulse slow, weak, and languid, and diminishes the Circulation of the Fluids. Spirituous Aliments render the Pulse large, vehement, and frequent. The Pulse of such as are asleep is slow, small, and languid; but as soon as they awake, it forthwith becomes large, quicker, and stronger. The Pulse of those who are angry is large, vehement, and quick; that of such as are frightened, frequent, small, and inactive; and of those who are sorrowful, small, languid, and slow. So that, according to *Fernelius*, in *Lib. 3. de Pulsibus*, "The common, and ordinary Affections of the Body change the Pulse; so that, without duly adverting to these Affections, the Pulse cannot be certainly understood, nor can it be determined how far it recedes from a natural State, in consequence of Diseases." The natural Pulse is, therefore, to be felt and observed, not immediately after Exercise, Bathing, immoderate Eating, drinking Wine, or other Causes, which exagitate the Heart and Spirits; for we are to determine nothing about the Pulse, till the Force of external Causes has ceased, and all Perturbations of the Body are allay'd; for the Pulse is the most certain Sign and Criterion for judging of the Motion of the Heart and Blood. But if the Pulse alone is observed, without paying a due Regard to other Circumstances, it may lay a Foundation for forming a false Judgment; because, as *Celsus* says, in *Lib. 3. Cap. 6.* the Pulse may be disturbed by a thousand things.

There has almost always been a considerable Dispute among Physicians, what Pulse is essential to Fevers; or constitutes their pathognomic Sign. Many of the Antients, among whom *Galen* was the first, inform us in their Works, that a quick and frequent Pulse denotes a Fever. But many of the Moderns take a frequent Pulse for the genuine Sign and Characteristic of a Fever. Thus *Sylvius*, in *Prax. Med. Lib. 2.* speaks in the following manner: "A preternaturally frequent Pulse is the Sign, which, at all times, belongs to a Fever alone, and is consequently its pathognomic Sign; so that, when this Sign is present, a Fever is present; and, when it is absent, so is the other, also; nor is any other Sign universally proper to all Fevers, hitherto discovered by Practitioners." For all other Signs do not so properly denote a Fever, as the Species, the Degree, or the Time, of a Fever. *Ettmüller* tells us, "That a preternaturally frequent Pulse is, justly accounted the pathognomic Sign of Fevers, by *Sylvius*, both in his *Dissertatio de Natura Februm*, and in his *Praxis*, whatever *Deusingius*, in *Tract. de Disquisitione Antisyloana*, may affirm to the contrary." *Decker*, a practical Physician of *Holland*, in *Not. ad Barbette*, informs us, "That there is a Fever, where-ever a preternaturally frequent Pulse is observed." *Schellhammer*, in *Tr. de Puls.* tells us, that in all Fevers there is a frequent Pulse, which, when accompanied with Heat, is their pathognomic Sign. The celebrated *Bohnius*, speaks in the following manner: "In a frequent Pulse, the Strength of the Heart seems equal to the morbid Cause, if this frequent Pulse remains in an uniform manner, and is consequently the pathognomic Sign of Fevers; but if a Weakness of the Pulse is combined with its Celerity, it indicates Loss of the Strength more or less, as more or fewer and vehement Strokes are observed." Other Authorities would be of no Use; only we must observe, that, upon a false Hypothesis, not only the Antients, but, also, many of the Moderns, made a Distinction between quick and frequent; for they called the Pulse frequent, if within a certain time frequent Pulsations were made, whereas by a quick Pulse they meant one of the vehement Kind. Hence *Willis*, in *Tr. de Febris*, calls that a febrile Pulse, in which the Arteries vibrate vehemently and quickly; where he, also, asserts, that if the Pulse becomes more vehement, the Fever is augmented. *Caelius Aurelianus*, in *Lib. 1. Acut.* tells us, "That the Sign of Fevers is an intense Heat, and a vehement Pulse, unless it should be produced by some external Cause."

For these Reasons *Brown*, in *Observationibus Medicin.* every-where asserts, that a quick and a weak Pulse are contrary to each other; so that by the Word quick, 'tis obvious, he meant vehement. Tho' Authors hardly as yet seem to have formed distinct Notions of Pulses, yet all, both antient and modern, seem to agree in this, that a frequent Pulse in every Species of Fever, whether continual, or intermittent, whether benign, or malignant, whether in its Beginning, or at its Height, proves such a Fever to be present: Hence they always join the frequent either with the quick, or with the weak, Pulse; so that they agree, that the frequent Pulse is rather to be called the essential Sign of Fevers, than the quick, which none of them, will hardly assert to be found, either in the Beginning or Horrors of Fevers, or in any of the malignant Kind.

But, from what we have supposed, it is sufficiently obvious, that these Differences may be excellently reconciled, since the quick Pulse is nothing else but the frequent, which is the true pathognomic Sign of Fevers. But this Frequency is either greater or less, and associates itself with the great or vehement, or with the small and weak, according to the Diversity of Fevers, and the Times of the Disease. A frequent Pulse, when weak and small, is scarcely ever good, since it denotes a languid and slow Circulation of the Blood. But a frequent, large, or vehement Pulse, such as is generally observed in the Height of continual Fevers, denotes a brisk Circulation of the Blood, and an increased Heat of the Body. In investigating the Cause of a frequent Pulse, which is generally preternatural, and accompanies several Disorders, we shall follow the accurate *Bellini*, who, in *Tract. de Pulsibus*, accounts for the Motion of the Heart from the Influx of the Blood through the Coronary Arteries, and of the nervous Fluid through the Nerves into the Fibres of the Heart; from which he concludes, that the Muscles of the Heart are most frequently moved, when the nervous Fluid is most frequently convey'd into them, which happens when it is forced into them by a sufficient Quantity of Blood flowing forcibly into the Brain. Now, by a frequent Contraction of the Heart, a frequent Pulse is produced; which indicates, that a proper Quantity of Blood is convey'd to the Brain, and that the Brain is forcibly pressed; which will happen, either when the Blood stagnates therein, in consequence of an Obstruction of its Veins; or when the Blood contain'd in these Veins cannot flow into other Parts, the Blood, in the mean time, stagnating, either in the internal Parts, or in the Lungs; or when the Blood is thrown into a State of Effervescence, by which it assumes a Tendency to move in every Direction with a greater Impetus, and by that means presses the Brain more powerfully. The Muscles of the Heart, also, move more frequently, when irritated by any Stimulus. If, therefore, the Blood is too acrid, or hot, so as to stimulate the Sinuses of the Heart, the Heart will be more frequently contracted, and the Frequency of the Pulse will indicate a stimulating Quality in the Blood.

Since we have shewn, that from the Pulse we are to form a Judgment, not only of the Circulation and Temperature of the Blood, but, also, of the Motion of the Spirits, and the Strength of the Patient; so the Knowledge of the Pulse, and a due Attention to it, must be of singular Use to the Physician, not only in investigating the Natures of Disorders, and forming a right Judgment concerning them, but, also, in prescribing Medicines for their Cure. But it is to be observed, that the Pulse is to be carefully, and not superficially, consulted. The Physicians of *China* are far more careful in this respect, than those of *Europe*; for those often spend a whole Hour in feeling the Pulse, whilst the Physicians of our Country have hardly Patience to feel above two Pulsations; a Practice highly culpable, since after ten Strokes of the Artery, an Inequality, or Intermision, often occurs; which happens whilst the unequally mixed Blood passes through the Heart. The Pulse is, also, to be felt in both Wrists, in the Neck, and in the Temples, since 'tis certain from Experience, that the Pulse in the Wrists frequently varies; and may be more commodiously felt in one than in another. We ought, also, to advert to the Pulses of other Parts. Thus, sometimes, hypochondriac Patients perceive a large Pulse under the Ribs on the Left Side; which happens, when a quick and viscid Blood, exagitated by Heat, or any other Cause, endeavours to procure a quick Passage through the Pancreas and Spleen; but, stopping in their narrow Vessels, produces a Pulsation, and a kind of pricking Pain. Hence *Job. Ant. Vander Linden*, in *Select. Medic.* tells us, "That the Blood, in this Case, raises a kind of Tumult within, by pricking and striking on the Spleen." How intense the pricking Pains of the Spleen are, some sound Persons experience, as soon as they are over-heated. *Tulpius*, in *Cent. 2. Obs. 28.* mentions a Man who had a preternatural Pulsation in the Spleen. In continual and malignant Fevers, a large internal Pulsation in the Veins of the Head generally denotes a subsequent Delirium; since it is a Sign, that the Blood there congested circulates slowly, till at last, becoming stagnant, it produces a violent Inflammation of the Meninges. *Hippocrates*, in *Coac. Praenot.* informs us, "That if a large Pulse arises from an excessive Ebullition of the Blood, so that in Fevers the Veins of the Temples beat, and the Face is turgid, without a Softness of the Præcordia, there is Reason to suspect, that the Disease will be long, and that it will not terminate without a large Hæmorrhage from the Nose, an Hiccup, Convulsions, or Sciatic Pains." The Reason of this, in my Opinion, is, that the redundant Blood seeks for an Outlet, either by the Nose, or the hæmorrhoidal Veins; and the sooner this happens, the sooner the Patient is freed from his Disorder.

When a Pulsation is observ'd in any Part of the Body, where at other times it is not felt, we may certainly conclude, that the Part is inflam'd, and dispos'd to a Suppuration; especially when it is accompanied with Tumor and Pain. An hard Pulse is almost an infallible Sign of an Inflammation in the Membranous Parts; for this Hardness of the Pulse, or excessive Tension and Vibration of the Artery, indicates something of a spasmodic Nature, arising from the Consent of the Parts, and produc'd by the Inflammation and Pain. The Pulse of Persons labouring under Disorders of the Breast, or a Palpitation of the Heart, is generally frequent, unequal, and languid. But such a Pulse, unless when vehement, is accompanied with no preternatural Heat; and happens because the Blood does not pass thro' the Sinuses of the Heart, and the Lobes of the Lungs. In Weakness, and a Disposition to Syncope, the Pulse is generally small, rare, and languid; but if the Pulse is absolutely imperceptible, the Body cover'd with a cold Sweat, and the Functions of the Mind are not totally destroy'd, I have frequently observ'd, that the Patient infallibly dies in six Hours; and such a Situation I have seen twice produc'd by corrosive Poison. It is to be observ'd, that about the critical Times in Fevers, when Nature endeavours to throw off the superfluous and peccant Matter by Stool or Sweat, the Pulse, tho' languid, is yet more regular, and less frequent, which is a certain Sign of Recovery. But if the Pulse is soft and undulating, it is a Sign, that a salutary critical Sweat is just coming on.

It is, also, to be observ'd, that the Pulse is chang'd by Medicines. Thus, after drastic Purgatives, which procure too many Stools, the Pulse is generally preternaturally quick. After Venesection, especially in plethoric Habits, the Pulse becomes quicker, a Sign that the Circulation of the Blood, in consequence of its having a larger Space, is happily increas'd; since, by this means, a Suppression of the Menstrue or Hæmorrhoids is generally remov'd. 'Tis certain, not only from the Authority of Sydenham, but, also, from Experience, that after the Use of Chalybeates, the Pulse is quicker, the Face redder, and the Heat greater. Strong Sudorifics, compos'd of volatile oleous Substances, greatly increase the Pulsation of the Heart and Arteries. On the contrary, Anodynes, Opiates, Preparations of Nitre, precipitating Powders, Acids, and such things as diminish the intestine Motion of the Blood, and fix its Sulphur, render the Pulse calm and moderate in Pains, Inflammations, and a febrile Intemperature. Such an Effect I, also, once saw produc'd by a due Mixture of Nitre and Camphire. As Dr. Willis has justly observ'd in *Traët. de Febribus*, some very useful and important Rules for the Exhibition of Medicines are drawn from the State of the Pulse. Thus Purging and Vomiting are contra-indicated by a too quick and vehement Pulse; as, also, by a low and depress'd Pulse; for when the Blood is in a violent Motion and Ebullition, the Secretions are generally very languid. If the Strength is defective, which may be known by the languid State of the Pulse, Emetics and Purgatives diminish the Strength still more; so that the Physician ought to consult the Pulse, before he exhibits them; for when the Pulse is strong, and the Motion of the Blood regular, these artificial Evacuations are most beneficial, and succeed best. The same Caution is necessary in the Exhibition of Sudorifics, and all Analeptics, which convey Heat and Motion to the Blood; for if the Pulse is strong and frequent, such spirituous Substances do more Injury than Good, because they rarefy the Blood too much, and accelerate its intestine Motion; by which means a Delirium, and other Inflammations, are frequently brought on. Great Circumspection, and Attention to the Pulse, is, also, requisite in the Exhibition of Narcotics or Opiates; for as these are possess'd of a Power of stopping the Motion of the Blood and Spirits, and consequently of impairing Strength, so they ought never to be exhibited when the Pulse is weak, languid, and small, but are to be avoided like Poison. But if the Pulse is unequal and intermitting, Opiates readily procure a perpetual Sleep. *Fred. Hoffman.*

PULVERATIO, or PULVERISATIO, Pulverisation, in Pharmacy is the reducing any Substance to a Powder. See **TRITURATIO** and **PULVIS**.

PULVILLUS, in Surgery, is a Pledget, Bolster, or Compress.

PULVIS. A Powder.

The Operation of reducing Medicines into Powders is so very simple in itself, that it requires no other Skill, than having those Things which come under its Management, sufficiently dry, in order to be so divided.

In judging of the Fitness of Materials for this Treatment, only these two Considerations necessarily require our Attention. The first is, whether the Things themselves are thus reducible, without any previous Management, that may hurt their medicinal Virtues; and, next, whether their Virtues are conveniently preserved in this Form, when reduced into it.

Under the first of these, it naturally occurs, that viscid and oily Substances cannot be thus managed, without first reducing them to some Brittleness, which cannot be done without drying. If such things, therefore, cannot be sufficiently dried for Triture,

without exhaling their better Parts, or destroying that particular Quality, for which the Simple is valued in Medicine, as it happens with many Seeds and Gums, they are much fitter for some other Forms than for this; though these Inconveniences may be avoided, where such Things bear so small a Proportion to those which are very dry and brittle, that they are so lost, and, as it were, absorbed by them in Triture, that all pass the Sieve well enough together. But this, however, should make the Prescriber wary of crowding into any Composition, under this Form, too many Gums or Seeds; and the Preparer careful in giving them a requisite Brittleness by drying; which latter may, in some measure, be known by the Compositions preserving the Scent, or particular Qualities, of the Ingredients suspected.

The other Requisite in this Form, relating to the Preservation of Things reduced into it, directs not to prescribe Materials therein, which are volatile, or will any other way change in the open Air: Thus the finer Aromatics will decay, and every thing very volatile, as the Radix Ari; for which Reason it is now ordered to be mixed at the time of taking. All the alkaline Salts, likewise, are not to come into this Form, because they will dissolve in Air; on which Account the Salt of Wormwood is an improper Ingredient in the *Pulvis Radicum Ari compositus*. These latter Inconveniences may indeed be, in some measure, avoided, by keeping such Compositions as have in them these exceptionable Ingredients, in Vessels stop'd close from the Air: But the Necessity of frequently opening them in the Shops, for common Occasions, will subject them more to such Decay, than is consistent with keeping them any long time good.

Having a View of these two Requisites, we are better able to judge, both of officinal and extemporaneous Prescriptions in this Form: And, for our better Inquiry into the former, it may be, also, of Use, as is already done in some other Forms, to range them under such general Intentions, as they seem contrived, by their first Inventors to answer.

The *Species Diambrae*, *Pulvis Diacinnamomi*, *Species Dianthus*, and *Pulvis laticians Galeni*, seem, by most of their Ingredients, to be intended for Cephalics and Cordials, as they consist of the warmer Spices, and Simples of similar Properties; but in the *Pulvis Diacinnamomi* the Cassia is much inferior to the Cinnamon in Flavour, and gives a Sliminess to the moist Form; but the Elecampane-root is a powerful Detergent, and quire out of the Intention. The Sugar, likewise, occasions an unnecessary Bulk in a Dose, when given in Powder, an Electuary, or a Bolus; and therefore would be better omitted: In the *Species Dianthus*, the Liquorice is blameable, on the same Account as the Elecampane-root in the foregoing; and in the *Pulvis laticians Galeni*, the Rasure Eboris, Epithymum, Os Corde Cervi, and Margaritæ, are chargeable with contributing nothing to the main Intention of a Cordial, though the Leaf Silver and Gold are very beautiful Decorations, if rubbed but coarsely in at last, that they may be seen to Advantage; but the Camphire, it is to be feared, will render it not so fragrant while it lasts, though even very close Keeping will not long retain its Volatility.

Some others, near approaching to this Intention, take in Simples, that give them, also, an Astringency; such as the *Aromaticum Rosatum*, *Pulvis Granorum Kermes compositus*, and *Pulvis Cardiacus Magistralis*; none of which are chargeable with an useless or unsuitable Ingredient, unless the Bezoar be reckoned so in the latter: However, it is pretty certain, that its Virtues do not compensate for its Cost; and indeed not much can be said for the Saunders and Aloes-wood; but the Custom of mixing them with those things has long prevailed.

The *Pulvis Diacalamintus simplex*, thus intitled, in Distinction from a much larger Composition given in former Dispensatories, and the *Species Diatrium* and *Piperum*, seem principally intended for Carminatives; though the former hath something in it aimed, also, against Hysterical Affections, and is pretty much used in both these Intentions with Success. The *Pulvis de Guttura* was heretofore a Composition, consisting principally of such things, as were supposed to be very efficacious in some nervous Cases, by their specific and secret Virtues; as the Viscus Quercus, the Ungula Alcis, and Cranium Humanum; but there are now added many things of very manifest Properties, as the Radix Valerianæ, Contrayerva, and Serpentaria; but whether the calcined Hartshorn, Coral, Hyacinth, and Bezoars, will yet allow this to be duly reformed, and an uniform Composition, is much to be doubted; for if they can, with the Specific before-mentioned, be supposed to contribute any thing to the main End, yet it must be allowed to be so little, that they have not their Share, but are a Clog upon the Efficacies of some others, which, by these means, cannot be so conveniently given in their due Quantities. By long Experience, it has, likewise, been found, that Musk does Harm in many nervous Cases: Where, therefore, there is Reason to judge it proper, it is very easily ordered at the time of extemporaneous Prescription. The Leaf Gold, as was before observed, is an agreeable Ornament, and can do no Harm. The *Pulvis Cephalicus* is designed for a Snuff.

The next Class of alterant Species may be reduced under the Title of Alexipharmics, at the Head of which it may be thought Injustice not to put the compound Powder of Crab-claws: But the Lapis Contrayerva seems to come under the same Rank much more properly; which the present Practice acknowledges, by taking notice of it much oftener than the other, though the greatest Dependence upon this is from the Contrayerva-root, which, both in its Smell and Taste, manifestly discovers the Quality of an Alexipharmic, which principally consists in a volatile Pungency.

The *Pulvis Radicum Ari compositus* is the only Composition in this Form, that aims at being an antiscorbutic; but its principal Ingredients, as has been already observed, will not keep long in this Form; and, when mixed with Boluses, or Electuaries, the Oculi Cancrorum, and Sal Absinthii, soon make it ferment and sour.

Some of this Form are given for Emollients and Diuretics, as the *Species Diatrageanthæ frigidae*, *Pulvis Haly*, *Pulvis Saxifragia compositus*, and *Pulvis Dialthææ*. But the principal Ingredients of these, especially of the former three, which are the cold Seeds, those of Poppies, and the like, are not only difficult to powder, but, when so reduced, will soon grow rancid. The Starch and Sugar are, indeed, some Helps against the first Inconvenience, by assisting the oily Seeds to pass the Sieve, and they seem intended for no other Purpose; but they are not sufficient to preserve them, when so done. Besides, all these things are so much easier brought into Emulsions, and with such greater Advantages to the Patient, that these Forms are now little used. The *Pulvis Dialthææ* does not, indeed, take in so many of these oily Seeds, and is more agglutinant by reason of the Quantity of Gums in it; but it is not often met with in common Prescription.

All the rest of this Division of Compounds, unless the *Pulvis Antilyssus*, are Cathartics. The greater and lesser Compositions with Sena are so crouded with Seeds and Spices, under the Notion of Correctors, that a sufficient Quantity for a Dose makes the Bulk too large to take in any Form; which seems to be the Reason, why they are very seldom prescribed or made.

But the *Pulvis Diasenæ* takes in Diagrydium enough to avoid this Inconvenience. There hath been in some of the old Dispensatories a *Pulvis Artheiticus Turnerii*, of which the *Pulvis Diaturpethi compositus* seems to be a good Abridgment, as taking in some of the principal Ingredients, and leaving out many useless ones, with which that was crouded. The *Pulvis Cornachini*, and *Pulvis Comitissæ Warvicensis*, are exactly the same, except in the Proportion of Ingredients, in which respect they likewise differ but little. They are quick enough of Operation in small Quantities, which occasions them to be given frequently to Children.

What hath been already taken notice of, as necessary to be regarded in the Official Prescriptions of this Form, should, also, be equally attended to in the extemporaneous Practice; that is, not to direct any thing in a Powder, which will waste by its Volatility, or which is not reducible to it, without such previous Management, as will hurt its medicinal Virtues. All volatile Salts, in particular, ought to be avoided in these Prescriptions, as that of Hartshorn, Sal Ammoniac, and the like; though, in the Salt of Amber, there is somewhat so fixed, that it will remain a considerable time in this Form, without any discernible Loss. Some regard, also, in common Practice, is to be had to the Vehicle, with which some things have, and others have not, a peculiar Fitness for Moisture. Thus the Æthiops, and every thing that takes in Sulphur, when prescribed in Powders, should be ordered to be taken in a Syrup, or some Pulp, because it is very troublesome to mix with any thing thinner; its offensive black Colour is, also, best disguised with Prunes or any thing of like Kind. Every Powder, likewise, that takes in crude Antimony, any of the Mercurials, or Things of light Weight, must be trusted in thin Vehicles, because they will immediately settle, and, by reason of the small Quantities, be liable to be left, at the Bottom of what they are given in. Sufficient Notice hath been already taken of the Unfitness of all Salts, made by Incineration, for this Form, and every thing dissolvable, or any way changeable, by the Air. Powders, likewise, which take in any resinous Substances, as Scammony, Resin of Jalap, or any thing of like Texture, should be directed in Vehicles of some Consistence, and be carefully mixed, because in thin ones they are subject to run into Lumps, which are not easily again dissolvable.

The Doses of most Powders ought seldom to exceed half a Dram, because of the Difficulty of taking them; and, rather than to put things together, which have not sufficient Efficacy in that Quantity, it is more eligible to have recourse to things of like Intention in some other Form.

There is one Convenience, indeed, in this Form, which in common Practice may not be so duly considered as it deserves; and that is, where Persons have a great Aversion to many Medicines, they are sooner decoyed into a Compliance with Powders, than as many Boluses or Draughts, because they do not make so formidable a Saew; but in acute Cases, where the

Stomach has been dried with much Heat, too many of these, especially of the warmer Alexipharmics, as the Contrayerva and Snake-root, are not usually judged so proper as the liquid Forms, and the Virtues of the same things drawn out by Infusion. *Quincy's Prælect. Pharm.*

PULVIS ANTILYSSUS. See ANTILYSSUS.

PULVIS RADICUM ARI COMPOSITUS. See ARUM.

PULVIS CARDIACUS MAGISTRALIS:

The magisterial Cardiac Powder.

Take of oriental Bezoar, and of calcined Hartshorn, of each one Dram and an half; of white and red Coral prepar'd, white Amber, prepared Pearls, Armenian Bole, Japan Earth, and of Tormentil-root, of each two Drams; of Aloes-wood, Citron-peel, Angelica-root, and Zedoary, of each two Scruples: And make them into a Powder together.

PULVIS E CHELIS CANCROCORUM COMPOSITUS: See CANCER.

PULVIS CEPHALICUS:

A Cephalic Powder.

Take of the Leaves of Asarabacca; Marjoram; and Lilies of the Valley, each any Quantity: And make them into a Powder together.

PULVIS CORNACHINI.

Cornachini's Powder.

Take of sulphurated Diagrydium, ten Drams; of diaphoretic Antimony, six Drams; of Cream of Tartar, two Ounces and an half: Make them together into a Powder.

Schroder tells us, its Author was so fond of it, as to write a whole Treatise about it, wherein he recommends it in almost all Cases that require Purging. Its Dose is from eight Grains to one Dram.

PULVIS GRANORUM CHERMES COMPOSITUS:

Compound Powder of Cherries-berries.

Take of Cherries-berries one Dram, of Nutmegs, two Scruples; of Tormentil-root, and of yellow Sanders, of each half a Dram; of Cloves, prepared Pearls, and both Corals prepared, of each one Scruple. Let them all be made into a Powder together.

PULVIS DIACALAMINTHES SIMPLEX:

Simple Powder of Calamint.

Take of Mountain Calamint, Penny-royal, Origany, Seeds of Macedonian and common Parsley, and of Hartwort, of each two Drams; of Smallage and Thyme, of each half an Ounce; of Privet-seeds, and white Pepper, of each one Ounce: And mix them into a Powder.

PULVIS DIATURPETHI COMPOSITUS:

Compound Powder of Turpeth.

Take of Turpeth, Jalap, and Hermodactyl-roots, of Tartar of Vitriol, each equal Quantities; and make into a Powder, S. A. Its Dose is from half a Scruple to a whole Scruple.

PULVIS DIALTHÆÆ. See ALTHÆÆ.

PULVIS DIACINNAMOMI:

Compound Powder of Cinnamon.

Take choice Cinnamon, fifteen Drams; of Cassia-bark, and Elecampane-root, of each half an Ounce; of Galangal, seven Drams; of Cloves, Long-pepper, both the Cardamoms, Ginger, Mace, Nutmegs, and Aloes-wood, of each three Drams; of Saffron, one Dram; of white Sugar-candy, five Drams: Make them into a Powder.

PULVIS DIASENÆ. See SENÆ.

PULVIS ERYSIPELATODES. A Mynsichti.

Take of volatile Meal, half a Pound; of calcined Lead, and red Bole, each two Ounces; and of Mastich, Olibanum, and Cerufs, each one Ounce: Mix all together, and reduce to a fine Powder.

Pulverize together the Bole, and the Cerufs: Then pulverize separately the Olibanum in a Mortar, rub'd over with some Drops of Oil, and the Mastich moisten'd with some Drops of Water. Then mix these Ingredients, when pounded, with

with the calcined Lead, and the fine Meal, for a Powder, to be preserv'd for Use.

It is proper to dry and cure the Tetter or Ring-worm: A small Quantity of it is to be laid on the Part affected, and cover'd with blue Paper, after the Patient is blooded and purg'd. This Powder may cure a mild and simple Ring-worm: But, when it is obstinate and rebellious, much happier Effects will be produc'd by the following Powder;

Take of the volatile Meal of Barley, half a Pound; of dry Elecampane-root, one Ounce; of the Salt of Lead, and white Precipitate Mercury, each three Drams: Mix all together. *Lemery Pharmacop.*

PULVIS AD GUTTETAM. See GUTTETA.

PULVIS HALY:

Powder of Haly.

Take of white Poppy-seeds, ten Drams; Starch, Gum Arabic, and Tragacanth, each three Drams; the Seeds of Purslain, Marshmallows, and Mallows, each five Drams; Cucumber, Melon, Gourd, Citruls, and Quince-seeds cleansed, each seven Drams; Liguorice, three Drams; white Amber, two Drams; Sugar-candy, the Weight of the Whole: And make them into a Powder. It may be given from half a Dram to two Drams.

PULVIS LÆTIFICANS. GALENI:

Galen's Cordial Powder.

Take of cloved Basil-flowers or Seeds, Saffron, Zedoary, yellow Sanders, Cloves, Citron-peels, Galangal, Mace, Nutmegs, and Storax, each two Drams and an half; Ivory-raspings, Aniseeds, Thyme, and Dodder, each a Dram; the Bone of a Stag's Heart, Pearls, Camphire, Ambergrise, and Musk, each half a Dram; Leaf-gold and Silver, each half a Scruple: Make them into a Powder together, according to Art.

PULVIS MARCHIONIS. See MARCHIONIS PULVIS.

PULVIS COMITIS WARWICENSIS.

Earl of Warwick's Powder.

Take of Scammony, prepared with the Fumes of Sulphur, two Ounces; diaphoretic Antimony, one Ounce; the Crystals of Tartar, half an Ounce: Make them all together into a Powder. It is a smart Purge, and frequently given to Children, against Worms, from five to fifteen Grains; and, to Adults, from fifteen Grains to half a Dram.

PUMEX. Offic. Schrod. 355. Marth. 1371. Kentm. 37. Boet. 400. Gefn. de Lap. 31. De Laer. 130. Worm. 47. Charlt. Foss. 21. *Scyrus Lapis*. Aldrov. Mus. Metall. 696. *Lapis Pumex dictus*. Cap. Hort. Cach. Supp. 2. 53. THE PUMICE-STONE.

This is a porous and spongy Stone, full of small Cavities and Perforations, and found in Germany, whence it is transported to us. It is of a refrigerating, drying, and extenuating Quality. It gently cleanses Ulcers, and renders Cicatrices full and seemly. *Schrod.* In Mount *Vesuvius*, *Ætna*, and other burning Mountains, large Quantities of this Species of Stone are found with the Sulphur. The Uses of it are enumerated by *Wormius* in his *Museum*. *Dale*.

PUNCTA LACHRYMALIA. See FISTULA LACHRYMALIS, and OCULUS.

PUNCTICULARIS FEBRIS. An eruptive Fever, or a Fever attended with Purple Spots.

PUNCTUM SALIENS. The first Rudiments of the Heart in the Fœtus.

PUNCTURA. A Puncture. *Punctura aurea*. See HERNIA. PUNICA.

The Characters are;

The End of the Pedicle passes into an Ovary, on whose Top grows a monophyllous multifid Calyx, of a very florid red Colour, and shaped like a Bell. The Flower is rosaceous, polypetalous, growing on the Ovary within the Calyx, and furnished with very numerous Stamina. The Ovary, after the Flower is fallen off, and the Stamina wither'd, contracts the Calyx into an Umbilicus, and passes into a Fruit, resembling an Apple, and containing, under a very rough Rind, and vinous Pulp, a Multitude of Capsules full of numerous Seeds;

Boerhaave mentions three Sorts of *Punica*; which are,
1. *Punica*; quæ *Malum Granatum* fert. *Tourn. Inst.* 636. *Boerb. Ind. A.* 2. 250. *Granata*, *Mala Eunica*. Offic. *Malus Punica*. J. B. 1. 76. *Raii Hist.* 2. 1462. *Malus Granata sive Punica*. Ger. 1262. *Emac.* 1450. *Malus Punica sativa*. C. B. P. 438. *Park. Theat.* 1510. *Parad.* 428. THE POMEGRANATE-TREE;

This Tree grows not to be of any great Bigness, even in its native Countries, having on its Branches here-and-there a few Thorns; the younger Shoots are of a redish-brown Colour, and have their upper End pretty thick-set with long narrow smooth Leaves, two Inches in Length, to half an Inch in Breadth; among these come forth the Flowers, of a glorious scarlet Colour, consisting of five Leaves, set in a tough brown Calyx, which, in time, enlarging itself, becomes the Bark or Covering of the Fruit, having a Crown on its upper Part, being, in Shape and Bigness, like an Orange, but with a browner and harder Peel, in the Inside of which grows a great Number of corner'd Acia or Kernels, compacted close together in a regular Order, containing either a sweet vinous Juice, or one more acid and acerb, with a little Stone in the middle of each. Pomegranates grow in Spain, Italy, and many other Countries, and flower in June, and the Fruit is ripe in September. The Balaustines are the large double Flowers of the wild Pomegranate Tree; which differs not in its manner of Growth from the other. See BALAUSTIA.

The Balaustines, as well as the single Flowers, and the Bark, are very drying and restringent, good for all sorts of Fluxes, Hæmorrhages, and Bleedings, both inward and outward: They strengthen the Gums, fasten loose Teeth, help the Falling down of the Uvula, and cancerous Ulcers in the Mouth and Throat. The Fruit is grateful to, and strengthening of the Stomach; stops Looseness, and the immoderate Flux of the Terms; and is useful in hot bilious Fevers, and Gonorrhœas.

Official Preparations are only the Syrup of the Juice. *Miller's Bot. Off.*

2. *Punica*, fructu dulci. T. 636.

3. *Punica*; flore pleno; majore. See BALAUSTIA, and *Punica*; quæ *Malum Granatum* fert. *Boerb. Ind. Als. Plant.*

PUPILLA. The Pupil of the Eye. A Dilatation of the Pupil of the Eye is esteem'd a Sign of a general Relaxation of the Fibres; and a Contraction thereof, a Mark of Stricture. See OCULUS.

PUPPIS OS. The Os FRONTIS. The Suture in this Bone is call'd the *Sutura Puppis*.

PUPULÆ. The Extremities of the Fingers.

PURETTA. An heavy sort of Sand, or magnetic Powder, found near Genoa, on the Sea-shore. It is not us'd in Medicine.

PURGAMENTUM. The Lochia; or the Excrements discharg'd by Stool.

PURGAMENTUM STELLARUM. The same as COS-LIFOLIUM.

PURGANTIA. Purgative Medicines. See CATHARTICA.

PURGATIO. See CATHARSIS.

PURGATORIUM, in *Paracelsus*, is a Name for any Disease.

PURPURA. Offic. *Purpura nostras violacea*. Col. de Purp. 1. *Purpura violacea*. *Fab. Columnæ*. List. Hist. Conch. 4. Sect. 15. n. 1. *ex Terentino Sinu allatæ*. *Bonan.* 150. n. 172. THE PURPLE-FISH.

This Fish is frequently found in the Mediterranean Sea. In the Shops no Part of it is us'd, except the Shell, which is strong, furrow'd, striated, and rough, with short Tubercles. In former Ages the Sanies of this Fish was us'd for dying: The Shell is of an alkaline Quality, and in Virtues agrees with other testaceous Medicines.

In describing the Purple-fish, the Antients were so short and obscure, as to lay a Foundation for the Moderns to dispute what kind of Shell-fish they meant by that Name, since they describe various Species, the Sanies of which dyed a purple Colour. But *Fab. Columnæ* has determined the Controversy, by discovering the true Purple-fish. But tho' at present the true Purple-fish is hardly known in our Shops, yet, as Dr. *Martin Lister* observes, an Account of its Juice has been traditionally handed down from the earlier Ages to our own Times; but that this Juice was reckon'd among the Arcana, and carefully conceal'd, till Dr. *William Cole* discover'd it in *Act. Philosoph. Lond.* N° 178. Besides, Dr. *Robert Southwell*, President of the Royal Society many Years ago, informed Dr. *Lister*, that whilst his Mother liv'd in Ireland, she was famous for staining Handkerchiefs with the Juice of a certain Fish, the Colour of which could not be washed out. The Art of Dying Purple was, also, not only known, but highly esteem'd, in England, in the Times of *Bede*; for, says that Author, in *Hist. Eccles. Gentis Angliæ*, Lib. 1. Cap. 1. there are large Number of Shell-fishes, by means of which a purple Colour is dyed so strong and beautiful, that, instead of being tarnish'd by the Influence of the Sun, or the Injury of the Rain, the older it grows, the more beautiful it becomes. *Dale*.

PURPURA.

The Purples, a Disorder which at present rages universally, is a Disease of a peculiar Nature; proceeds from a Scurvy; and is accompanied with an Eruption of Efflorescences, on the Surface of the Body, sometimes with a pretty acute and malignant Fever, and, at other times, without such a concomitant Symptom, gently, though for a long time, disturbing the Functions of the Body.

As the Purples is a peculiar Species of Exanthematous Disorder, it is expedient to inquire, by what Circumstances it may be distinguished from other Diseases of the Exanthematous Kind. The peculiar and essential Characteristics, therefore, of the Purples are these following: First, the Papulæ, which appear, are accompanied with a Corrugation, Roughness, and Driness of the Skin. Besides, no Exanthematous Matter is so moveable, as that of the Purples, which frequently and quickly retire, to the internal Parts, and, after some time, appear again on the Surface of the Body. Nor is any of the Exanthematous Disorders so frequently attended with alternate Heat and Cold, Itchings, and pungent Pains. Besides, all the other Species of Exanthematous Disorders appear equally on all the Parts of the Body; whereas the Purples principally discover themselves on the Neck, Breast, Back, and Arms, rarely infesting the inferior Parts: By which peculiar Marks it may be easily distinguished from the Small-pox, Measles, Petechial Fever, scorbutic Spots, Chicken-pox, that Fever accompanied with Efflorescences resembling those excited by the Stinging of Nettles, the Herpes, the Itch, Phlyctenæ, and the Impetigo.

The Efflorescences of the Purples differ much with respect to Bulk, Figure, and Colour; for sometimes the Papulæ are red, and sometimes white. Hence the Purples are distinguished into those of the red and those of the white Kind. The former Kind has Vesicles more or less broad, which contain a Liquor; whereas the latter has no Vesicles, but only small Nodes, deep-seated in the Skin, resembling the Figure of a Grain of Millet, rough to the Touch, and infarcted with a thickish, and, as it were, purulent Humour. Hence the former Disorder is called the *white Miliary Purples*.

The Purples are, also, observed to be more or less benign or malignant; those of the malignant Kind are more acute than the other, accompanied with a continual Fever, and Symptoms highly offensive to Nature. But the benign Kind continues long without a Fever, is accompanied with Symptoms less offensive to Life, and seizes and proceeds principally with these Signs: This Disorder is preceded by a slight Horripilation; which is succeeded by an intense Heat, accompanied with a Languor, and Loss of Strength, which, in weak Habits, proceeds to a Delirium. The Præcordia are constricted, and the Breast oppressed. The Patient, is, also, afflicted with deep Sighs, Anxieties, Inquietudes, Watchings, or laborious and disturbed Sleeps; an Heat, and pungent Pain, are perceived in the Back, whilst the Heat and Cold are alternate, and most sensible, in the Palms of the Hands. In Child-bed Women, the Lochia are retained; and the Milk in the Breasts, being reformed, ceases to flow from them. These Symptoms are succeeded by a Roughness and Corrugation of the Skin, like that of a Goose, with innumerable Papulæ, either red or white, or both, mixed with each other, in Figure and Smallness resembling Millet-seeds; and which first appear on the Neck, then on the Breast and Back, and, last of all, on the Arms and Hands; and, upon the Eruption of these on the Surface of the Body, the Symptoms, which were before violent, especially the Anxiety of the Præcordia, the Cardialgia accompanied with a Syncope, the Inquietude, the Compression of the Breast, and the Difficulty of breathing, are considerably mitigated. The Pulse, which was before hard and quick, is now soft, free, and slow; the depressed Vigour of the Mind returns; the dry Skin becomes moist; and the Patient, who was before so costive, that he could discharge no Flatulences, has his Body rendered soluble; and sometimes not only the Flatulences, but, also, the Fæces, are spontaneously discharged.

There is a considerable Remission of the Symptoms, either in the red or white Purples, or in a Mixture of both, if they constantly continue after the Eruption; for the Vesicles, which are full of a fetid Ichor, are gradually enlarged; nor do they quit their Station, and retire: The Urine is, also, more saturated; the Sweat, which in this Disorder is highly fetid, breaks out; the Discharge of the Lochia returns; and the Milk is restored to the Breasts; the Body being either spontaneously soluble, or rendered so by a Clyster, or Suppository, the Fæces and Flatulences are discharged; and, in seven, or more Days, the Pustules disappear, with a considerable Itching of the Extremities, and the Patient is gradually restored to Health: For all these Circumstances indicate, that the Patient is not excessively weak; but that the solid Parts as yet retain their moving Force and Vigour; and that the whole Temperature of the Blood, and lymphatic Juice, is not destroyed; in consequence of which, the adventitious and unfriendly Matter is continually and equally separated from the vital Juices, and conveyed from the internal to the external Parts.

But it is otherwise in the malignant Purples, in which, after a sufficient Eruption of the Efflorescences, the Pulse is preternaturally quick; nor does the Sleep return, nor is the Inquietude allayed, nor the Respiration rendered free; besides, there are generally too copious Profusions of Serum by Sweat, which, if they happen in the Beginning of the Disorder, induce a great Loss of Strength, and, as it were, a paralytic Resolution of the Skin. Purples of the malignant Kind may be, also, known by the pale, thin, and copious Urine, or the continual Stimulus to discharge the Urine; as, also, when the Urine, which was before high-

coloured and saturated, suddenly becomes pale, limpid, and thin; in consequence of the spasmodic Stricture of the Kidneys, and urinary Passages.

It, also, frequently happens, as a bad Omen, that in the Purples the Pustules sometimes appear, and at other times disappear, whilst the Symptoms are always equally violent; all which evince, that the Force of Nature is impaired, the Strength diminished, and the Tone of the Skin, that nerveo-tendinous and porous Emunctory, through which the whole Mass of Blood and Humours is purged, is destroyed; so that its most external, nervous, and sensible Portion is sometimes spasmodically contracted, and sometimes relaxed. But it is still a worse Sign, if the peccant Matter, returning, is firmly lodged in the internal Parts, and resists all Attempts to expel it again to the Surface of the Body; by which means the Symptoms are rendered more violent; the Oppression of the Breast, and Sighing, are augmented; the Loss of Strength, and the Anxiety of the Præcordia, accompanied with Inquietude, increased; and all the other Circumstances rendered worse. Hence all, who are taken off by the Purples, die on account of the Recess of the peccant Matter, and the Increase of the Symptoms produced by that Cause; for tho', before the Eruption of the Purples, the Matter producing the Disorder is highly malignant and peccant, yet, when it is separated from the Mass of Blood, and placed without the Limits of the Circulation, it, by its Continuance, assumes a far worse Nature; and, if it returns to the Parts subservient to Life, especially those destined to the Purposes of Sensation and Motion, it operates in a manner resembling that of Poison. Hence, as, in all Exanthematous Disorders, such as petechial Fevers, Small-pox, Measles, Gutta Rosacea, Itch, Scald-head, Gout, and Arthritis, a certain Matter, unfriendly to Nature, and at the same time propelled to the external Parts, renders the Symptoms more violent if it returns to the internal Parts, and mixes with the vital Juices, so it is certain from Experience, that, upon the Disappearance of the Purples, the Sordes received into the internal Parts of the Body are of a like hurtful and prejudicial Quality.

That the Event will be fatal, and that the Death of the Patient is not far off, may be known from the following Signs: If, in consequence of a deleterious Matter firmly lodged within, the internal Parts are excessively hot, whilst the external Parts, being constricted, are covered with a profuse cold Sweat; or if an intense Heat of the external Parts, and a considerable Sense of Refrigeration in the Abdomen, are alternately perceived; if there is a subsultory Motion of the Tendons; if the Hippocratic Face appears; if the Defect of Strength increases; if an uneasy Despair disturbs the Mind; and if the Pulse is hard, unequal, and tremulous: For, if these Symptoms happen, the Patient is generally soon after seized with a Delirium, which proves mortal.

Though the Purples, with or without a Fever, is often a primary or idiopathic Disease, yet it is frequently, as a Symptom, complicated with other Disorders, especially continual Fevers, when near terminating, and is then not without Danger; for it very frequently happens, that the red or white Purples, or both together, happen in the Decline of the Small-pox, Measles, putrid Synocha, burning Fevers, petechial Fevers, and those resembling them, and other epidemical Disorders; on which Occasion they induce a new Fever, accompanied with a violent Train of Symptoms; so that when Persons, labouring under acute Fevers, are apparently out of all Danger, they are suddenly seized with an Horror, Uneasiness, Inquietude, Watching, preternatural Heat, and Loss of Strength, whilst the Purples, in the mean time, here-and-there appear on the Surface of the Body; and, by extinguishing the Strength exhausted by the preceding Disorder, generally put an End to the Patient's Life. I have, in a particular manner, often observed, that the symptomatic Purples were fatal to young Persons labouring under acute Fevers, who have before lived intemperately, indulged themselves in drinking to Excess daily, consumed their Strength in Venery, and induced a foreign Crasis and Disposition of their Humours; as, also, to Patients, who, during the Progress of the Disorder, have been so costive, as to discharge none of the Excrements for some Days; and to those, who have had too large Quantities of refrigerating and acidulated Medicines exhibited to them, such as Julaps and Potions. The Purples not only frequently appear in the Decline of acute Disorders; but, also, often, in the Beginning and first Days of the Disorder, something like the Purples appear with a kind of Roughness, especially in the Small-pox and Measles, tho' very rarely with an happy Termination of the Disease; for this Circumstance is an infallible Proof, that the Mass of vital Humours is filled and contaminated with various excrementitious Sordes. The Purples, also, accompanied with a Cough, and Difficulty of breathing, a Vomiting, or Flux, frequently attend the catarrhus Fevers of Children. In this Case, if the Disorder is in the Decline, the Purples are succeeded by a Swelling of the Feet, and sometimes of the Abdomen, with or without a Driness of the superior Parts; and the Purples, as is observed in the mountainous Parts of the upper *Black Forest*, are totally removed by Sweats, either arising spontaneously, or procured by Art.

The red Purples are, from the Beginning, always accompanied with a kind of febrile Commotion, which is perpetually exasperated towards the Evening: Yet, in Process of Time, the Fever, and Frequency of the Pulse, are mitigated; the Symptoms allayed; and

and the Disorder assumes a benign Nature. Hence, if, in the Beginning, this Disorder is imprudently treated, and if the Body is cacochymic, or full of impure Juices, it frequently continues for several Months, nor without great Uneasiness to the Patient, and fresh Returns of the Symptoms, though the Disorder generally terminates happily.

That the Purples are the Offspring of the Scurvy, we have already observed: But this will be more effectually evinced, if we diligently consider the material Cause of both Species of Purples, which, as well as that of a Scurvy, depends upon a Dyscrasy of the Blood. But, in assigning this Cause, I am of Opinion, that our Sentiments quadrate with Truth, when we affirm, that the red Purples arise from an impure, saline, acrid, sulphureous, and excrementitious Serum; and the white Purples, and an acute Miliary Fever, from the Lymph, and nutritious Juice, approaching to an acid, vapid, and putrid Nature; for both these Juices of the human Body are of a different Nature; for the Serum is called that Humour, which, being mixed with the Blood, and impregnated with many saline and mucid Parts, to be secreted and eliminated through numberless Emunctories and Strainers, is of a thickish Consistence, and of various Colours and Tastes. But the Lymph is that pellucid, inspid, and pure Liquor, the more subtle Part of which affords the Matter of the Fluid of the Brain, Spinal Marrow, and Nerves, as, also, of the seminal Liquor. The gelatinous Parts of this Fluid nourish all the Solids of every kind, and its finer aqueous Parts are, through the lymphatic Vessels, by means of the Valves, and conglobate Glands, again conveyed to the Heart; where, being again united with the sweet aereo-elastic Parts of the Blood, and, as it were, animated afresh, it is with it conveyed to all the Parts of the Body, for proper Uses. Hence, when these Fluids recede from their natural State and Disposition, they acquire a peculiar kind of Corruption; from which afterwards arises the different Genius of the Disease, the different Violence of the Symptoms, and the greater or less Danger.

That, in the white Purples, the Lymph is tainted with a kind of Acidity, is obvious from many Circumstances; and especially that a redundant Acid is contained in the Mass of Blood and Lymph, we may know from the excessive Secretion of Serum, usual, if not essential, to this Disorder; for such is the Force and Nature of an Acid, that, when it insinuates itself into the Blood, it coagulates its thicker Parts, and produces a Secretion of Serum; we may know by which means profuse Sweats are promoted, a copious Discharge of thin Urine occasioned, a Salivation excited, or aqueous Stools brought on.

Having premised these things, we now come to inquire, why the white Purples are most incident, and generally fatal, to Child-bed Women. As, therefore, in general, all those, whose Bodies contain a Redundance of lymphatic and aqueous Humours, as most Women do, are rather subject to an acid Vapescence, than a salino-sulphureous Corruption of the Humours; for which Reason they are principally seized with the white Purples; and this is, in my Opinion, the true Cause of the Frequency of this Miliary Fever in Child-bed Women; for, in the Uterus of pregnant Women, both the Progress and Return of the Blood, by reason of its too great Congestion in that Part, and the Distention of the Vessels, is very languid, slow, and difficult; hence, the Blood stagnating long there, the lymphatic Humour is copiously secreted into the Vessels destined for its Conveyance; and, remaining, as it were, pent up in their Cavities and Windings, by its long Continuance becomes vapid, is corrupted, and contracts an Acidity, whilst the more subtle spirituous Parts, the best Preservers of the due Mixture of the Fluids, fly off. When, therefore, after the Birth of the Fœtus, the Uterus collapses, and is contracted, whilst the squalid lymphatic Humour, and feculent Blood, are not discharged and eliminated, on the third Day, generally, after the Labour, a febrile Motion happens; by which the peccant Lymph and Blood are repressed into the larger Vessels, conveyed to the Heart; and thence, like a malignant Leaven, diffused through the whole Body in such a manner, as to infect and contaminate the whole Mass of Blood, Lymph, nutritive Juice, and nervous Fluid.

But if the Impurity and Dyscrasy of the Blood and Serum is of the saline, acrid, and sulphureous kind, the Symptoms are not so violent, but the Efflorescences are more chronic; the Face is inflated and high-coloured; the Eyes are sparkling; the itching Heat, and Sense of Puncture, in the Skin, are greater; nor is the Patient afflicted with so great Inquietude, Anxiety, and Difficulty of breathing; which Circumstances lay a Foundation for greater Hopes of Recovery. He may, also, be presumed to be in a fair way, unless the white Purples succeed those of the red Kind, or the red should be changed into white, which frequently happens in consequence of a bad Regimen, a preposterous Cure, or the Influence of violent Passions; whilst the superabundant Lymph is corrupted, and, at last, in the Fever, and hot intestine Motion of the Parts, the spirituous, fine, and sulphureous Parts, fly off, leaving behind those of a gross, acrid, and vapid Nature.

Besides, if we more narrowly consider the Origin and Nature of that Matter, which produces Purples of a chronic and less dangerous Kind, we shall find, for several Reasons, that it principally

consists of the salino-sulphureous and acrid Particles of the Serum, which are not eliminated through the Emunctories, especially the Skin, but remain in the Habit, and, by the hot intestine Motion, assume a worse Quality. This is confirmed by Experience, because the Purples of a chronic Kind generally seize those, whose Bodies abound with impure Blood, such as scorbutic Persons; old People; Women whose Menstrues are suppressed; Men whose usual hæmorrhoidal Discharge is obstructed; those who are accustomed to a saline, vinous Diet, coarse Malt Liquors, and smoking Tobacco; as, also, those, who have loose Habits of Body, and such as lead too sedentary Lives. Besides, the Cause of this Disorder is generally a sudden Suppression of Perspiration; and, by that means, a Repulsion of the Sordes; either by a cold Air compressing the Pores, drinking too cold Liquors, or sudden Frights. I have known Instances, in which Persons overheated, and covered with a profuse Sweat, have, after a Train of violent Symptoms, been seized with an Eruption of the Purples; many, also, upon exposing their Bodies to cold Northerly Winds, after they have been overheated in Bed, by the Heat of the Sun in travelling, or that of dry Baths. The cold and tempestuous Constitution of the Atmosphere long continuing, and obstructing Perspiration; is the Cause that the Purples so frequently recur, particularly after the Winter Solstice, especially in the Months of *January* and *February*. The surprising Influence of a cold and Northerly Wind, in intercepting and suppressing even the preternatural Excretions through the Skin, is, by a memorable Instance, confirmed by *Lazarus Riverius*, who, in *Obs.* 53. informs us, that a certain Boy was afflicted with an Imperigo, which discharged an ichorous Matter; but that Northerly Winds coming on, this fetid Matter was suppressed, conveyed to the Lungs, and excited an Asthma, which did not cease till the Return of Southerly Winds.

But nothing more effectually discovers the salino-sulphureous Substance, in the Purples of the chronic Kind, than that those Medicines, which involve and correct the saline Spiculæ, such as Whey, together with Goats and Asses Milk, mixed with the *Selterian* Waters, as, also, temperate Decoctions used for ordinary Drink, not only afford Relief, but, also, totally cure the Purples. Besides, though this Species of Purples is free from Danger, yet, if it is treated with too much external Heat, internal heating, or volatile Medicines, in the same manner as in the Itch, ulcerous Pustules, and other Defections of the Skin, arising from a peccant and saline Disposition of the Humours, the Heat, Pain, and Itching, are increased, and frequently a Thirst and Fever excited; because the Salts, being, by these means, rendered more acrid, insinuate themselves deeply into the small Fibres of the Skin, which they lancinate and vellicate.

This chronic Exanthematous Disorder is more uneasy, and accompanied with a far greater Itching and Heat, than the white Purples mixed with the red; which can only be ascribed to the saline and acrid Particles pricking the sensible Substance of the Skin. The saline Acrimony of the Humours is, also, evinced from this; that salutary, sweet Waters, free from a saline Element, and a purgative Quality, such as those of *Laubstad*, when drank by those afflicted with the habitual Purples, have rendered the Body remarkably soluble, procuring daily six or eight Stools, the Matter of which is so acrid, as to corrode the Anus; whilst, a few Days after, the purgative Effect gradually ceases; nor, if next Year the Drinking these Waters is repeated, does the same purgative Effect follow. It is, also, to be observed, that, in the Purples, especially of the obstinate, chronic, and scorbutic Kind, after the Use of Milk, or temperate mineral Waters, I have, with great Success, ordered a Bath of sweet Rain-water, by the repeated Use of which all the Puncture, Heat, and Itching, of the Skin were removed, and the Efflorescences disappeared; an infallible Proof, that, by correcting the Acrimony of the Humours within, and eliminating the acrid Recrements lodged under the Skin, through the Pores relaxed in the Bath, the Disorder is removed, and the Patient cured.

We shall now specify the Reasons, why no Exanthematous Disorder, when cured, so easily and frequently returns, as the red scorbutic Purples. This Effect, then, seems to be produced by two Causes: First, because, in this Disorder, the Tone of the Skin is considerably injured and destroyed; and, secondly, because the Subject and Seat of frequently returning Purples are the conglobate Glands; for as the Skin is an universal Emunctory to all the Humours, and of singular Use in the Preservation of Health, so the Injuries done to the Constitution by any Disorder in this Emunctory are certainly very great: But this Covering of the Body is easily injured by various Causes; since it is not only composed of the sensible Filaments of the Extremities of the Nerves, but is, also, totally tubulous and porous, because the small Mouths of the minute Arteries, which convey the subtle, exhalable Matter, terminate in it; for which Reason, both with respect to its Tubes and Pores, as, also, with respect to its Substance, it has not only a subtle Motion, and Tone of Dilatation and Constriction, but, also, an exquisite Sensation. Hence, the greater the Sensibility of the Skin is, the more subject to Injuries it is, and the more easily its due Motion is perverted. It is, in a particular manner, easily altered and constricted by cold Northerly Winds,

Winds, and relaxed by moist warm Southerly Winds; so that it constitutes a true microcosmical Hygrometer. External Causes, also, which hurt, prick, cut, or are possessed of a corrosive Acrimony, as, also, acrid Medicines, those of a too heating Quality, and refrigerating, pinguious, and inspissating Substances, are possessed of a singular Power, not only of impairing, but, also, of destroying, the Tone of this Integument. But when this Tone is changed and destroyed, the salutary Excretion of Perspiration through the small Orifices of this Strainer, must, at the same time, be greatly injured.

When, therefore, the vascular and fibrous Texture of the Skin is injured, and its Tone, by the Assistance of which the recrementitious Matter is eliminated by Exhalation; and laudable Juices restored, is destroyed, a bad Disposition and Weakness are induced, and more firmly take Possession of the Fibres; so that the impure Humours, easily conveyed thither, again act upon this weakened Part, and become stagnant. And certainly, this preternatural Disposition of the Skin to produce such Stagnations, and the Difficulty of removing them, are sufficiently obvious from the Gutta Rosacea, which, by injuring and depraving the tender and tubulous Texture of the Skin in the Face, by a copious Congestion of Ichôr, is not to be cured, and totally extirpated, without great Difficulty. Hence, since, by a frequent Approach of the purpuraceous Matter to the Skin, its Tone, Motion, Strength, and tubular Texture, are greatly changed and corrupted, it is not to be wondered at, if, the excrementitious Matter being again there collected, the same Disorder should again happen, and an Efflorescence of the Purples be produced.

Having thus explained what seemed necessary to point out the material Cause of both Species of the Purples, we now come to consider what Circumstances contribute, in a more remote manner, to the Generation of these Disorders. First, then, the Purples, especially of the chronical and protracted Kind, are most incident to those, who abound more with Serum than Blood, such as Infants, and Women of a spongy Habit, generally called *phlegmatic*; and the more the ferous Humours discharged recede from their natural Purity, and mild Temperature, and the more sordid they are, the more difficult is the Cure, and the more dubious the Success, of the Disease.

It is, also, certain from Experience, that the Purples, both chronical and acute, as, also, malignant Miliary Fevers, are most incident to Women of weak and delicate Habits, to such as have their Strength impaired by violent Passions, especially long Grief, or by profuse Hæmorrhages during Abortion, or an Excess of the menstrual Discharge, or by a long-protracted previous Disorder; for, in such infirm and weak Habits, the lymphatic, mild, and nutritive Humours easily contract a foreign Nature and Taint, because, in consequence of the weakened Strength of the Solids, the Circulation of the Fluids is restored slower, and, the Secretions and Excretions being hindered, Crudities and Sordes are generated and accumulated in the Body.

But a Fever, accompanied with Miliary Purples, is principally incident, and often fatal, to Child-bed Women. This generally appears about the third Day after Labour, when the Milk Fever generally comes on; but it, also, sometimes seizes on the seventh, and sometimes on the fourteenth Day. In order to investigate the Causes of this Disorder, we are to overlook no Circumstance which can lead us to understand its Origin and Generation. Now it is certain from Experience, that poor Countrywomen of robust Constitutions, and accustomed to Exercise, are not in Child-bed seized with this Fever, whereas rich, tender Women, addicted to a sedentary Life, much Sleep, Luxury, and high Living, as, also, those, who are of delicate Constitutions, and such as are subject to tumultuous Passions and Commotions of Mind, are easily obnoxious to the Purples after Child-birth: And it seems to be true, that, as rich and easy Living, which, excluding hard and saline Aliments, consists of light Aliments, farinaceous Substances, light Cakes, Sweetmeats, fermentable Substances, Summer Fruits, and palatable Meats and Drinks, as, also, an impure, vapid Air, impregnated with sordid and putrid Exhalations, arising from adjacent Marshes and Standing-water, together with the Impurity of the Water, contribute greatly to the Generation of all Diseases, so they, in a particular manner, induce the Purples. From these Circumstances we are to deduce the Reasons, why this Disorder rages so much at *Leipsic*, which is situated low; and, on account of the adjacent Marshes, affected by an insalutary Air, whilst, at the same time, the Inhabitants live in a delicate and luxurious manner. For these Reasons, also, in *England* this Disorder first appeared in *London*, where the State of the Air, and the Method of Living, are the same; nor is it to be doubted, but that, elsewhere, Women, who live in the same manner, and in unhealthy Places, are frequently subject to this malignant Fever.

It is, also, observable, that pregnant Women, who are costive, use a sedentary Life, and, neither in the middle nor last Months of their Gestation, diminish the Plenitude of the Vessels by Venesection, are, when in Child-bed, in a very bad Condition, and generally afflicted with the Purples: For, since almost all pregnant Women contain a Redundance of Blood, and since, by reason of the Distention and Relaxation of the Tone of the Vessels,

the Circulation of the Blood and Humours is slow, and the Evacuation of the Sordes, by Secretion and Excretion, scanty, they successively contract impure and peccant Humours; so, if improper Aliments are used, and the Elements necessary for the Support of Health, are peccant, a far greater Corruption is induced, insinuates itself into the internal Parts, and afterwards proves prejudicial to Health, and sometimes produces mortal Diseases.

The Purples, especially of the Miliary Kind, generally seize Child-bed Women, if, in the first Days after Labour, the Lochia are not duly discharged, but are either totally suppressed, flow too scantily, stop too slow, or are forthwith suppressed by a sudden Fright, or the free Admission of Cold; for, in pregnant Women, by means of the Redundance of Blood and Humours, the vascular and cellular Texture of the Uterus is surprisingly distended and obstructed by the Congestion of the Humours; so that the Blood circulates slowly and with Difficulty there; and, not being totally consumed for the Nourishment of the Foetus, stagnates in the uterine Vessels, and becomes thick and feculent, till at last, the Foetus being excluded, the Lochial Blood is discharged from the Veins, by which the Placenta adhered to the Uterus. If, therefore, from a peccant Quality of the Blood itself, or a Defect of natural Strength, the corrupted Lochial Blood is not sufficiently evacuated, but, by an inverted Motion, passes into the larger Vessels, and is conveyed into the nobler Viscera, such as the Heart, Lungs, and Brain, it is not to be wondered at, that Fevers accompanied with a great Impurity and Corruption of the Serum, such as the Purples are, and other violent Symptoms complicated with them, should, by these means, be produced.

Besides, 'tis constantly observ'd in Practice, that Women, in consequence of an Obstruction of their Menfes, are far more severely and frequently afflicted with Purples, both of the acute and chronical Kind, than Men; for the Uterus may be justly accounted the Source of this Disorder, since according to *Democritus*, in *Ep. de Nat. Hum. ad Hippocrat.* that Part is the Source of a thousand Woes to Woman; and the Purples rarely happen to Women, if their menstrual Discharge is regular, sufficient in Quantity, and continued for a due time; but, if otherwise, they are frequently afflicted with this Disorder. Hence 'tis certain from Experience, that Women who from advanced Age, or any other Cause, have their Menfes totally suppress'd, labour under this Disorder longer than other Patients. Besides, if in young Women the Menfes are not regular, or discharg'd too scantily, especially if other Causes concur, the Purples, accompanied with a Variety of Symptoms, are generally produced.

'Tis, also, certain from Experience, that Women subject to the Fluor Albus, when that Evacuation is too small, or check'd, or totally suppress'd, by improper Measures, have been seiz'd with the Purples; and, when these have been cur'd, the Fluor Albus has again appear'd; and, when this has been remov'd, the Purples have again succeeded. Hence 'tis sufficiently obvious, that this Exanthematous Disorder is the Off-spring of the Serum. Nor is it to be wonder'd at, if at present, when the Fluor Albus is more common than in former Ages, the Purples should, also, for that Reason be more frequent.

Though the immoderate Redundance of Blood in those in whom it is not lessened by the menstrual or hæmorrhoidal Discharge, or by stated Venesections, greatly contributes to the Generation, especially, of the chronical Purples; yet the Impurity of a copious Serum, arising from the Penury of laudable Blood, contributes still more to the Production of the same Disorder. It is, also, frequently observed, that by imprudent Venesection, or immoderate Hæmorrhages, in consequence of Abortion, especially with the Concurrence of a violent Fright, or Anger, Refrigerations of the Extremities, Deliquiums, Inflammations of the Stomach accompanied with Anxiety, an Oppression of the Breast, and an alternate Sense of Heat and Cold in the Surface of the Body, have been produced; which Symptoms, upon the Appearance of the Purples on the third or fourth Day, are mitigated, and allayed: For nothing more effectually destroys the Tone, Force, and Strength of the Solids, or has a more immediate Tendency to bring on a virulent Quality of the Fluids, already impure, than tumultuous Commotions of Mind, especially long-protracted Sorrow, and Grief: Hence, if pregnant Women, hysterical Patients, or those labouring under Irregularities of the Menfes, are afflicted with violent Grief, it is a pretty sure Sign, that they will, in Child-bed, be seized with Purples of a bad Kind: Besides, Purples of a mild and benign Nature, in weak Habits, and such as are often under the Influence of enormous Passions, easily acquire a great Degree of Malignity, and portend the greatest Danger; and it is certain from Experience, that studious Men, and those addicted to a sedentary Life, after obstinate Grief, have contracted the Purples, and struggled under that Disorder for a long time.

A bad State of the Air, the Use of which is continually necessary to Life, and an irregular Constitution of the Weather, contribute greatly to the Production of the Purples; for as the Influence of the Air is very great, in perverting the State and

Crafs of the fubtile, nervous, and membranous Fluids, and all the other Juices; fo it is, alfo, of great Efficacy, in modifying and altering the Tone of the Skin, and the falutary Excretion of Perfpiration: So that it is not to be doubted, but epidemical Difcafes, and Purples, more or lefs malignant, are produced by the Impurity of the Air. Thus, fome Years ago, the Purples, accompanied with a catarrhus Fever, raged epidemically, efpecially among the Children of the *Lower Saxony*; and this Diforder derived its Origin from a previous, long-continued, cloudy, and rainy State of the Weather, fucceeded by cold eafterly and northerly Winds; as we are informed by *Boettigerus*, in his *Differt. de Purpura rubra epidemica*. In *Miscellan. Nat. Curiof. Dec. 1. An. 6.* we are told, that, in the Spring fucceeding an open and cloudy Winter, a malignant Purple Fever arofe, which, through the whole Spring, had its epidemical Circuits, and was principally incident and fatal to Children. An impure Air, impregnated with foreign and active Exhalations, is, alfo, the Cause why this Diforder is not only more eafily generated, but, alfo, more obftinately fupported, in fome Places, than in others. Thus, in large Towns, where the Air is impure, Perfons feized with the Purples are often cured by removing to more falutary Places; and again afflicted with the fame Diforder, upon their Return to fuch Towns, and ftaying in them for fome time. Hence the Reason is to be deduced, why the Months of *March* and *April* fo much favour the Production of catarrhus, exanthematous, and purple Fevers; for during thefe Months the Weather is generally heavy, rough, and changeable, whilft the Atmosphere is impregnated and contaminated with noxious Exhalations, arifing from the Rains, and melted Snow.

We have already confidered the principal Causes, which, efpecially in chronical Purples, have a great Affinity with thofe which generate the Scurvy; for, in this laft-mentioned Diforder, there is an acrid, faline, and fulphureous Dyfcrafy of the Blood, which, in the Purples, is only more exalted, and fubtile. The Generation of the Purples is promoted by a lax Habit of Body, long Diforders of Mind, Obftructions of the natural Secretions and Excretions, a vapid Intemperature of the Air, moift and low-fituated Places, improper Aliments, and thofe of hard Digeftion, a Defect or a Redundance of Blood, and other Things of a like Nature. Hence a difficult Queftion arifes, which is, Why, tho' all the Circumftances requifite to the Production of the Purples were prefent, this Diforder only began lately to appear. In deciding this perplexing Queftion, it muft neceffarily be acknowledged, that the fame Diforder muft have the fame common Cause: Now we have already fhewn, that in the Purples, efpecially of the chronical Kind, there is an impure, faline, and excrementitious Serum; that in the miliary Purples there is a Redundance of putrid, vapid, and acrid Serum; and that this Matter, contained in the Blood, whether acid, or acrid and faline, by the hot inteftine Motion, acquires a worfe Nature, fo as violently to affeet and irritate the nervous Parts, and, at laft, to produce this Exanthematous Fever, accompanied with violent Symptoms. We muft, therefore, direct our Views to other Circumftances, and confider whether, in Diet and Regimen, which afford the Matter, Temperature, and Intemperature, of the vital Humours, there is not fome Error, which about forty, and fome more Years ago, was unknown, or, at leaft, not fo univerfally praftifed. This Error, therefore, is the almoft univerfal Ufe, or rather Abufe, of warm Liquors, and efpecially of Coffee and Tea; for, in fome Parts, efpecially in *Germany* and *England*, Women of all Conditions ufe this Liquor, both in the Morning and Afternoon; and think it unpolite to fend their Neighbours away without drinking large Quantities of it: And it is obfervable, that the Purples reign and increafe moft, fince the drinking of thefe Liquors became fo customary, and efpecially in thofe Places where it is moft frequently ufed.

Though this Obfervation is fo fupported by Experience, that it cannot be doubted; yet its Truth may poffibly feem to be weakened by this, that though in the hot *Afiatic* Countries Coffee is much ufed, the Purples are yet unknown in thofe Climates. But this feemingly fpecious Objection falls to the Ground, if we carefully confider, that in thefe Places the Regimen is quite different from what it is in ours; that their Inhabitants do not ufe coarfe, hard, and falted Aliments; that the Air is purer and hotter, and Perfpiration more copioufly and expeditioufly carried on; and, which is of all other Circumftances of the greateft Importance, that the Inhabitants have no fcorbutic Taint in their Blood; for that a fcorbutic and impure State of the Humours is to be clafs'd among the Causes which contribute to the Generation of the Purples, is fufficiently obvious from this, that the Purples rage moft in Places moft infefted with the Scurvy, fuch as *England*, *Holland*, *Sweden*, and *Germany*: Hence the Diforder is called the fcorbutic habitual Purples. It is, alfo, obfervable, that where the Purples already rage, and afflict the Inhabitants, the fcorbutic lacerating Pains of the Limbs, the malignant Ulcers, the putrid

and bloody Gums, the broad and livid Spots, which are the effential and peculiar Symptoms of a Scurvy, are rarely afterwards obferved; or, at leaft, they are lefs frequent and violent, as we fhall afterwards fhew.

As, therefore, thefe Things which happen in other Climates, under another Regimen and Conftitution of Body, cannot be transferred and accommodated to the Situation of *Eurpeans*; fo this Subject will be more perfpicuous, if, from this Source, we explain the Method in which the Purples are generated. Now it is fufficiently known, that the excrementitious Impurities of all Kinds, feparated from the Blood and Humours, efpecially the bilious Sordes, and the fermentable Juice of a falival Nature, fupplied from the pancreatic Glands; as, alfo, the mucid Humours fecreted from the Blood, principally in the large Inteftines, fall down into the Inteftines: It is, alfo, certain, that in this winding Canal Feculences are produced, from Aliments of various Kinds, fuch as improper Acids, fermentable and half-corrupted Subftances, and Fifh; and that thefe Feculences, when mixed and collected, ought to be difcharged by Stool, as unfriendly and prejudicial to the vital Fluids. Whatever Things, therefore, hinder the Difcharge of thefe Sordes, and occafion their again entering the Mafs of Blood, certainly greatly contribute to render the Blood impure, by conveying into it thefe Sordes, which may be along with it propelled to the Emunctory of the Skin; tho' they cannot, like the Matter of the Sweat, be quickly diffipated; but, on account of their acrid Nature, deftroy the fenfible Skin, and, lodging there, form Spots, or Puffules: For it is daily obferved, that if cachectic and fcorbutic Patients are coftive, Puffules, a Gutta rofacea, and ulcerous Defedations of the Skin, are produced. It is, alfo, obfervable, that, in acute and burning Fevers, Coftivenefs is fucceeded by the Purples; whereas thofe who in the Decline of fuch Fevers have a critical Flux, are not feized with this fatal Exanthematous Diforder.

Now, upon an accurate Inquiry, we find it confirm'd, by Experience, that all warm Liquors, Tea, as well as Coffee, by increafing Perfpiration, and provoking Sweat, render moft Perfons coftive; and that violent Fluxes are ftopped by Sudorifics, exhibited with a proper Regimen, and drinking fome warm Infufion. Hence, if Perfons whose *Prima Via* are loaded with Impurities and Crudities, which ought to be eliminated by Stool, frequently ufe large Quantities of Coffee or Tea, it is not to be wonder'd at, if the bilious, faline, and fulphureous Sordes, being attenuated by the Heat, and afrefh diffolved with an aqueous Liquor, fhould return through the lacteal and lymphatic Veffels, which every-where occur in the large Inteftines, to the Mafs of Blood, where, by reafon of their Continuance and Commixture, acquiring a worfe Nature, they induce a foreign and hurtful Intemperature of all the Fluids; unlefs, by covering the Body well, or by the Advantages of a warm and temperate Atmosphere, they are duly and quickly eliminated by Perfpiration. Hence we infer, that all Perfons, whether Men or Women, who are coftive, and drink thefe warm Liquors, efpecially Coffee, whilft the Skin, at the fame time, does not duly tranfmit the Sordes, receive great Injury from fuch Liquors; fince, in fuch a Cafe, they greatly difpofe to the Generation of the Purples, efpecially if there is a previous fcorbutic Difpofition of the Humours; or if the Patient is under the Influence of violent Paflions, efpecially long-protracted Sorrow and Anger, which greatly favour the Accumulation of bilious Sordes in the *Prima Via*. On the contrary, thefe Liquors are not only harmlefs, but falutary, to thofe whose Bodies they render foluble, and who are difpofed to Perfpiration; for, in fuch Perfons, they contribute to the Elimination of Sordes of various Kinds.

Befides, Coffee-berries, the Product of another Climate, contain fomething of a foreign Quality, unfriendly to the natural Temperature and mild Mixture of the Blood in our Parts of the World; and in burning thefe Berries, efpecially in a ftrong manner, which is ufual, they contract fomething of a faline, volatile, and empyreumatic Sulphur, which is unfriendly to the Tone and Motion of the nervous Parts. Hence it happens, that in fome the drinking of Coffee produces a Tremor of the Hands, and Anxiety; and thefe Effects are produced the more, the more the Water is infpiffed by the Powder of the Berries much burnt. Befides, in this Liquor much Sugar is ufed, which, lodging in the Inteftines, and not finding an immediate Difcharge by Stool, ferments, and increafes the mucous and acid Crudities. From what has been faid, it is not to be wonder'd at, if, by the common Abufe of Coffee, the natural Mixture and Crafs of the confluent Parts of the Blood are greatly changed, and a foreign State of the Fluids induced; which, being conveyed to the Infants in the Uterus, along with the Blood, lays a Foundation for the Purples.

Though this Doctrine, with refpect to the Origin of the Purples, feems to be overthrown by an Affertion of *Welfchius*, in *Differt. de Purpura Lipf.* that this Diforder was known at *Leipf.*

Leipsic above sixty Years ago, when the drinking Tea and Coffee was not used; yet it will be found not to be subverted by this means, when we assert, that warm Liquors, especially Coffee, do not concur materially, but rather formally, to the Generation of the Purples; whilst, by the frequent Use of such warm Liquors, the Impurities of the *Primæ Viæ*, in consequence of the Patient being rendered costive, insinuate themselves into the Blood. Besides, if we carefully attend to the Living, Diet, and Regimen, used by pregnant and Child-bed Women at *Leipsic*, at the Time this Disorder appear'd, we shall find, that it proceeded from the Cause assign'd; for it is certain, that the Women of that Town are much addicted to Pleasure, lead an idle Life, indulge themselves in sleeping long, and almost daily use Sweetmeats, Summer Fruits, and farinaceous Substances, fried with Butter and Sugar; in consequence of which, they are costive, and, during their Pregnancy, collect a Redundance of Impurities: For which Reason they are frequently afflicted with the Fluor Albus. It was at that Time, also, customary, not only to confine Child-bed Women closely to Bed, but, also, as it were, to macerate them in warm Rooms; and, during the first Days of Child-bed, to exhibit only boiling-hot Broths, and Drinks; whilst they did not venture to remove the costive State of the Patient, by a Clyster, or Laxative; nor to use Venesection upon a Suppression of the Lochia. Any one who duly considers these Things, and compares them with what has been already said, must readily perceive, that such Management was the Cause why, at *Leipsic*, this Exanthematous Disorder appear'd before the Use of Coffee. This was, also, afterwards confirm'd by Experience; for after they discarded the hot Regimen, with respect to Child-bed Women, and admitted the Use of Laxatives and Venesection, the Purples became far less frequent, less dangerous and fatal. Though, therefore, the Use of Coffee cannot be accused of generating the Purples in *Leipsic*; yet it cannot be denied, that the Purples, which for a Tract of Years were confined to that Town, upon the Introduction of Coffee appeared elsewhere: So that the more this Liquor was used, the more this Disorder raged, and spread itself; and, which was a singular Circumstance not before observ'd, it generally associated itself with acute Fevers.

These Things are sufficient to demonstrate, that warm Liquors contribute to the Generation of the Purples, or the Conversion of the Scurvy into the Purples. But this Doctrine will be farther illustrated by the following Observation: The City of *Hall*, in *Germany*, both on account of its low Situation, and the adjacent stagnant and saline Waters, which emit large Quantities of aqueous Vapours, is surrounded with a moist Atmosphere; for which Reason it appears all beset with Clouds, to a Person who views it at a Distance. Hence the Reason is to be deduced, why, from the remotest Times, the Scurvy has raged in this City, so that the Inhabitants are frequently afflicted with the wandering Gout which they call scorbutic, Colics, Tumors, and scorbutic Spots; together with other Symptoms peculiar to the Scurvy; especially the various Disorders of the Gums. This I learned, when young, partly from my Father, and partly from other Physicians of that Town, who hardly prescribed any Medicine in which there was not some antiscorbutic Ingredient. And I myself, in my future Practice, observed the same Method with those who committed themselves to my Care, whose Disorders, on account of a scorbutic State of the Humours, I happily removed by Antiscorbutics. But, as soon as the Inhabitants began to use warm Liquors, especially Coffee, the Scurvy disappeared, and the Purples, both of the malignant and benign chronical Kind, began to rage, and proved very fatal at first, when the Nature of the Disorder was unknown. The same Effects were afterwards produced, by the same Causes, in *East Friseland*; so that it is not to be doubted but the Scurvy lays a Foundation for the Purples.

The Scurvy is, also, frequently converted into the Purples, by means of a Regimen, or particular Choice of Aliments, which our Forefathers used, either not at all, or but moderately; for in our Days most Men, addicted to Idleness and Luxury, think of nothing but gratifying their Palates by Variety of new-invented Dishes: Besides, not content with the various Products of their own Country, they are foolishly fond of Substances brought, through dangerous Seas, from the remotest Parts of the *Indies*. Though I do not absolutely condemn exotic Aliments, yet I must find fault with the modern Taste, which relishes none but somewhat acid and gently-pungent Food; which must, consequently, be prepared with large Quantities of Salt, Aromatics, Garlick, Onions, Pepper, and the various Kinds of Funguses: For such Aliments, by imparting a grateful Acrimony to the Tongue, partly make Persons eat too liberally, and, by that means, produce a Redundance of Crudities in the *Primæ Viæ*, just as scorbutic Persons do, by the Use of coarse Aliments; and partly procure a greater Effervescence of the Blood; which greatly contribute to the copious

Generation of saline and sulphureous Particles: So that, with the Concurrence of other Causes, the Purples are easily produced. Besides, the Use of spirituous Wines is at present so frequent, that in some almost the whole Mass of Blood is, as it were, converted into Wine.

To this Luxury in eating and drinking it is to be ascribed, that various Hæmorrhages, especially the hæmorrhoidal Discharge, are so familiar to many. Hence some Physicians, being misled, derive the Origin of all chronical Diseases in Women from an undue Discharge of the Menfes; and in Men, from a Suppression of the Hæmorrhoids: For which Reason, if such Disorders happen, they order the whole Intention of Cure to be directed to reduce these Evacuations to due Order; and, particularly, frequently, or even every other Day, exhibit Pills made after the manner of the *Pilule Becherianæ*, with a small Quantity of Aloes. But though this Hypothesis is less agreeable to Truth, yet I shall not hesitate to affirm, that the frequent Use of these Pills, in other respects safe enough, in some Persons greatly contributes to the Generation of the Purples; for if there is no natural Propensity to any Excretion of Blood, especially by the hæmorrhoidal Veins, it must necessarily happen, that by these means the Mass of Blood must be exagitated, and thrown into Commotions, and, by an Increase of the intestine Motion, a greater Quantity of saline and sulphureous Particles produced, which are the material Cause of the Purples: Soon after, all the Circumstances concur which accumulate the saline and sulphureous Parts of the Blood, render them more acrid, and fix them deeper in the Fibrils of the Skin. Hence it is not to be wondered at, that the Scurvy, which is a saline Disorder, changing its Nature, should degenerate into another Disease, such as the Purples.

Though we have intermixed the Prognostics of both Species of the Purples with the History of the Disease; yet we shall subjoin some Things with respect to the chronical Purples. Since, then, this Disorder is not accompanied with a Fever, it is not dangerous, unless when cured in a preposterous manner: It is, however, an obstinate Disorder, and generally creates great Trouble both to the Patient, and the Physician; for if the Fomes of the Purples fixes its Seat in the solid or internal Parts, it does not easily quit the Body, but, remaining within, generates violent Disorders; if, on the contrary, it is too impetuously expelled, it produces no less terrible Misfortunes. But this principally happens to those who have weak nervous Systems; or who, in consequence of an unequable Circulation of the Blood and Humours, are disposed to spasmodic Strictures; by which it happens, that a Redundance of impure Blood is with Impetuosity and Danger congested sometimes in the Head, sometimes in the Breast, and at other times in the Joints; by which means, a Train of violent Symptoms is excited: For if the Matter of the Purples retained in the Habit is conveyed to the Head, it produces Cephalalgias, Ringing of the Ears, Weakness of Memory, an Aphony, and sometimes Madness, apoplectic Fits, and Lethargies. If it is conveyed to the sensible Membranes of the Lungs and Diaphragm, it produces spasmodic Asthmas, and pungent lancinating Pains of the Breast. If it is deposited on the Membranes of the Stomach, Anxieties of the Præcordia, and Cardialgias, arise: If it seizes the Intestines, it produces Gripes, and Inflations of the Hypochondria, accompanied with an uneasy Sensation of Heat: If it is lodged in the Joints, they are distorted by cruel and lancinating Contractions: And, lastly, if the malignant Matter acts upon the tendinous and nervous Ligaments of the Hip, ischiadic Pains are produced. But all these cruel Symptoms lay aside their Virulence, and become milder, when the acrid caustic Matter is expelled to the Surface of the Body.

THE METHOD OF CURE.

For preventing a Return of the Purples, whether of the chronical, or of the acute and miliary Kind, nothing is more effectual, than Abstinence from all kinds of Malt Liquors, which are improper in this Disorder; since all of them, when old, contract an Acidity, and become too spirituous; and, when recent, are not only feculent and fermentative, but, also, contain coarse and mucid nutritive Parts: But all such Substances are so far from promoting, that they rather obstruct the Depuration of the Blood and Lymph, on which, however, the Whole, both of the Prevention, and of the Cure, depends. Hence, in hot and Summer Weather, I advise the Use of temperate mineral Waters, such as the *Selteran* Springs, and those of *Wildungen*, mixed with a small Quantity of Wine; but in the Winter, and to such Persons as could not procure such medicinal Waters, I have ordered, for common Drink, either pure Spring-water, or Decoctions of the Roots of Vipers-grafs, *Sarsaparilla* and Succory, Shavings of Hartshorn, and clean Barley, with the Addition of a few Fennel-seeds; taking a Pint of Water for every Ounce of the Ingredients, adding a little Wine, if the Patient's Situation can afford it. I have, also, on account

count of Custom, permitted the Use of small and well-defecated Beer, in some Cases.

In Purples of the Chronical Kind, I order Exercise, Traveling, and Change of Air, by removing from low to higher Places, Diversion, and Tranquillity of Mind, a Freedom from Care, and profound Meditations: I, also, prohibit the Use of all such Things as render the Patient costive, obstruct Perspiration, and generate a Redundance of Blood. Nor is the Patient liberally to use Flesh, especially Pork; nor Aliments highly peppered, or prepared with aromatic Substances. In the Summer Months I have ordered the Cure to be totally performed by Asses Milk alone, or Whey of Cows, or Goats Milk, or by the *Selteran* Waters, mixed with a third Part of Cows or Goats Milk, and drank for a Month, or six Weeks, interposing, now-and-then, a Bath of sweet Water, or of the *Lauchstad* Springs. And this Method, if the Disorder has been deep-rooted, I have ordered to be persisted in for three Years. In some Men, of corpulent Habits, I have, also, ordered the Use of the *Sedlitz* Waters; by a moderate Draught of which, for seven or eight Days, in the Spring and Autumn, the Fomes of the Disease has been carried off by Stool. I have, also, ordered many, afflicted with chronical, scorbutic, and habitual Purples, to drink the Waters of *Lauchstad*, by which the Sordes were copiously eliminated, the Patient continuing the Use of them, till their purgative Effects ceased.

When the Chronical Purples have been produced by a Disorder of the Uterus, and an irregular Discharge of the Menfes, my principal Intention has been, to restore these to their natural State; for which Purpose, besides the Measures already prescribed, I have ordered the Powder of Rhubarb, the Elixir viscerale, and washing of the Feet, to be daily used, a few Days before the menstrual Eruption. But if, as it generally happens, they are accompanied with spasmodic Strictures, an Inflation of the Stomach, Anxieties of the Præcordia, and Pains of the Back, I have used Antispasmodics; such as the *Pulvis Marchionis*, mixed with a little Nitre and Cinnabar, a Grain or two of Castor, and of the Extract of Saffron: This Intention is, also, answered by the anodyne mineral Liquor, mixed with the Essences of Castor and Saffron, and the bezoardic Liquor. The Patient must, also, use Baths of sweet Water and Milk. In order to provoke the Menfes, I have ordered weak Essence of Amber, extracted with an alkaline Liquor, by which means the Disorder was removed. In order to prevent the chronical Purples in plethoric Persons not subject to the Hæmorrhoids, Scarifications and Venesections are of great Efficacy for diminishing the Redundance of Blood; as, also, repeated Purgings, which may be most commodiously obtained by a Solution of Manna, which is in a peculiar manner adapted to Diseases arising from a saline Acrimony, adding to the Solution a saline Stimulus; such as the *Terra foliata Tartari*. The Night-sweats, also, with which those disposed to the Purples are often much infested, I have happily removed, by frequent Purgings, brought on by gentle Laxatives; such as Raisins, Rhubarb, the *Terra foliata Tartari*, and Cream of Tartar.

In the Cure of the chronical Purples, I order, that from the very Beginning of the Disorder the Patient should not be kept in too hot a Bed, or Room, but in a moderate Heat, lying as little in Bed as possible; by which means, I have found the troublesome Sweats prevented. Besides the above-mentioned Decoction for ordinary Drink, I have found no Medicine produce better Effects than a diaphoretic nervous Powder prepared of Hartshorn, both calcined and not calcined, Crabs-eyes, Mother of Pearl, Amber, purified Nitre, and Cinnabar. I have, also, observed excellent Effects produced by the anodyne mineral Liquor; so that by these two Medicines, exhibited in proper Doses, either in Conjunction, or separately, without the Use of any other Remedy, I have happily cured Purples, both of the acute and chronical Kind.

We now proceed to the Method of preventing and curing that bad Species of Purples generally incident to Child-bed Women in the Beginning, or about the Middle, of their lying-in. The Cause and Origin of this we have already derived from the improper Regimen of pregnant Women, and Errors committed with respect to their Diet; for which Reason these are carefully to be guarded against. In order, therefore, to prevent the Purples in Child-bed Women, the first Intention to be pursued is, to take care, that, during Pregnancy, a Redundance of Humours, and much more an Impurity of them from their Stagnation about the Uterus, be prevented, and no Weakness induced on the nervous System. This Effect, if the Body is turgid with Blood, can in no manner be better obtain'd, than by Venesection three or four times, though not very copiously, performed in the superior Parts of the Body. The Patient must, also, abstain from Idleness, long Sleep, Commotions of Mind, Sweetmeats, fermentable and farinaceous Aliments; but she is to use Aliments of a laudable Juice, and a pretty large Quantity of some salutary Drink: She is, also, to use moderate Ex-

ercise, and keep her Body soluble, rather by Aliments, than Medicines; exhibiting Raisins impregnated with Rhubarb, and prepared with or without Manna; for these are of singular Service to pregnant Women. And since Refrigerations of the Lower Belly are considerably troublesome to pregnant Women, and have a Tendency to generate violent Disorders, I always advise them to fortify their inferior Parts against the Cold; and, for that Purpose, to wear Drawers. In order, also, to prevent noxious Stagnations of the Humours about the Uterus, it is expedient, sometimes, especially after the middle of Gestation, to anoint and rub the Abdomen, before a warm Fire, with the *Balsamum Embryonum*, or with old generous *Hungarian* or *Rhinish* Wine, made hot, dropping a few Drops of the Balsam of Life into it: And these Measures are carefully to be taken during Gestation.

We shall now inquire, what Measures are to be taken before and after the Labour, and during the first Days of lying-in, in order to hinder Women from falling into violent Disorders, and the Purples, both of the acute and chronical Kind. As, therefore, this Disorder is easily produced, and Women weakened, by the imprudent Management of Midwives, who before the due Time solicit the Pains, and for that Purpose exhibit hot and spirituous Substances, I injoin great Moderation, with respect to every thing, lest the Strength should be impair'd, the whole Mass of Humours surprisngly exagitated by the violent Pains, and the Use of Analeptics, and the seculent impure Humours about the Uterus put into a more violent Motion; but the Discharge of the Lochia, and other Excretions, are to be duly promoted, that the Disposition to Diseases may be as little as possible.

The second Day after the Delivery, when all the Pains are over, it is necessary the impure Blood, collected in the Uterus during Gestation, should be evacuated, and the vital Juices freed from the Cacochymy they have contracted. Hence the Excretions of all Kinds, especially those by Stool and Perspiration, are gradually, but not impetuously, to be promoted, and carried on; which may be most commodiously done by the following means: Let the Patient carefully avoid the excessive Heat, either of the Bed, or Fire; and let her Drink be neither too hot, nor cold, but tepid. Let her guard against all Commotions of Mind, especially Dread and Sorrow; let her, also, every other Day, for four times, take balsamic corroborative Pills; such as those of *Becher* or *Stahl*; for these not only evacuate the Sordes by Stool, but, also, provoke a Discharge of the Lochia, and bring on a Diaphoresis. But if, at the Beginning, all the Symptoms are not allayed, but a Quickness of the Pulse, and an external Heat, are perceived, these Pills may be mixed with a precipitating absorbent Powder, which, for a Dose, may contain four or five Grains of Nitre. In such a Situation it is, also, expedient, in weak Broth, to take such Medicines as allay the Spasms, resolve the grumous coagulated Blood, and procure a free Diffipation of the Sordes by Perspiration; which Intentions are excellently answered by *Sperma Ceti*, Oil of Sweet Almonds, Infusions of Elder-flowers, Chamomile-flowers, and the Tops of Yarrow; a temperate Essence of Orange-peel mixed with Essence of Saffron, the anodyne mineral Liquor, and the bezoardic diaphoretic Powders, to be exhibited in some analeptic Water. A Mixture, also, of the analeptic and pectoral Waters, prepared with distilled Vinegar, Crabs-eyes, and Syrup of Sorrel, is of singular Service, in resolving the grumous and stagnant Blood.

By a due Observation of these Cautions, no mortal Disease will readily attack Child-bed Women, nor are the Purples to be dreaded: But if, in consequence of a Neglect of these Rules, the Corruption of the Serum and Lymph is so increased, as to dispose to the Purples, whether of the red or white Kind, or if these Disorders are already present, I use the following Method, which I have often found successful. After injoining an equal and temperate Regimen, with respect to Heat, I order Child-bed Women, seized with the Purples, to use Water-gruel, with or without an Infusion of common Chamomile; and this I have found of very great Efficacy. In the malignant and white Purples, I do not render the Body soluble by stimulating Medicines; nor is it expedient to produce that Effect by Clysters. I, also, forbid, as much as possible, all Change of Apparel and Bed-cloaths; but rather advise, that such as are already used, be put on, after having been well dried, and warmed before a Fire. I, also, dissuade an erect Posture, or Rising out of Bed; because, by these means, the Patients easily fall into Deliquiums; and, the Motion of the Humours being directed to the internal Parts, the Efflorescences disappear, and the most terrible Symptoms are brought on, as is shewn in *Fred. Hoffmanni Dissert. de Situ erecto in Morbis periculosissimè valde noxio*.

After the Eruption, I exhibit, at different times, about a Scruple, or half a Dram, of the temperate bezoardic Powders, to which I sometimes add, a small Quantity of Saffron, or Castor, interposing now-and-then a Dose of the anodyne

mineral Liquor, which is of singular Efficacy in allaying Spasms, quelling the hot intestine Motion, and correcting the Acrimony of the Humours: But, if, for various previous Causes, the Retrocession of the Purples is to be dreaded, or has already happened, I mix with the anodyne mineral Liquor, a fourth Part of the bezoardic Liquor, prepared according to the Directions of *Bussius*, and described in under the Article *Bussius*: Which Mixture excellently promotes a Diaphoresis, and forces the peccant Matter to the Surface of the Body. For restoring the Strength, which, in the White Purples, is greatly impaired, I recommend an analeptic Potion, prepared of the Waters of Baum, Citron-peel, the Flowers of Lilies of the Valley, Primroses, *Egyptian Thorn*, and Cinnamon. This Potion must be impregnated with Juice of Quinces, adding a sufficient Quantity of Mother of Pearl, and Pearl-sugar, dropping into it a few Drops of the *Spiritus Nitri dulcis*. In this Mixture, as a proper Vehicle, the Powders may be exhibited, or a Spoonful of it may be frequently taken by itself.

As it often happens, that in the Milk, or Purple Fever, the Lochia are suppressed, and, in consequence of a Congestion of Blood to the Head, mortal Symptoms produced, it is a Question whether, if the Lochia are totally suppressed, or not sufficiently discharged, if a Fever is present, and if the Purples are apprehended, Venesection may be safely and usefully used. In *Fred. Hoffman. Dissert. de Venesectionis prudenti Administrat.* 'tis shewn, that Venesection is sometimes highly beneficial in Exanthematous Fevers, even when the Efflorescences appear; and I can affirm, that by Venesection alone, proportioned to the Circumstances of the Patient, and performed either in the Foot or Arm, Child-bed Women at the very Gates of Death, and labouring under spasmodic Strictures, by which the Blood is impetuously forced to the Heart and Brain, have not only been preserved, but, also, received speedy Relief. Hence, if Child-bed Women die of a Suppression of the Lochia, we may justly ascribe the Cause of their Death to a Neglect of Venesection. Nor are there wanting celebrated Authors, who agree with me in this Opinion; such as *Willis de Febribus, Cap. 16. Welschius, de Purpura Lips. Rolsinckius, Lib. de Ord. & Meth. Consult. Lib. 4. Sect. 2. Cap. 6.*

In both Species of Purples, whether benign or malignant, nothing is so prejudicial, or has such a direct Tendency to increase the Cause of the Disorder, heighten its Symptoms, and render it malignant, as an Excess either of Heat or Cold; for this, of all Disorders, can least bear Refrigeration, or excessive Heat, but, with respect to both, requires great Moderation: So that the Room in which the Patient lies, and the Air she breathes, are always to be kept in a due and equal Temperature; for, if the cold Air is freely admitted to the Surface of the Body; or if only the Arms, after being hot and moist in Bed, are stretched out, the whole Body is forthwith seized with Horror and Shivering; and, after great Anxiety and Languor, the Pustules disappear; and this happens more easily, and with the greater Danger, the warmer the Room is, or the more closely the Patient has been covered with a Load of Bed-cloaths. In like manner, in all Exanthematous Disorders, especially the Purples, nothing, especially in the Vigour of the Disease, is more prejudicial, than frequent changing the Degrees of Heat produced by the Fire in the Room, because the sudden Changes from hot to cold, and from cold to hot, violently affect the nervous and sensible Substance of the Skin, and surprisngly vary and disturb its Tone, Strength, and Motion; so that the Pustules either cannot appear, or, if they appear here-and-there, cannot long continue.

Great Injury is done to Persons labouring under the Purples, by an excessive Heat of the Room or Fire; as, also, by Heat raised by the Exhibition of hot Liquors, or Medicines of an heating Quality; since, by these means, all the Parts being agitated by a continual Heat, the Strength is not only impaired, and, the porous Substance of the Skin being too open, too great a Quantity of the Moisture dissipated, but the morbid Matter, by the hot intestine Motion, is, also, rendered more subtle, penetrating, and acrimonious; so that the Itching, Heat, and Anxiety, are so far from being diminished, that they are increased. Hence we often observe, that the Symptoms are augmented, and rendered more dangerous, by drinking large Quantities of hot Tea, or any other Infusions, or by eating hot Aliments, or using hot Liquors.

Much less can the Purples bear the internal Use of heating Medicines, Wines, spirituous Liquors, sudorific and expelling Substances, bezoardic Tinctures, and Essences, together with Alexipharmics, since, by means of these, the Disorder is always augmented. Thus I have seen chronical Purples of a mild Nature, and free from a Fever, and violent Symptoms, by external Heat, the Use of Antiscorbutics, and purifying Decoctions, and a strict sudorific Regimen, converted into Purples of the malignant Kind; so that the Patient has afterwards

been afflicted with febrile Heat, a Loathing of Food, a Languor of the Strength, and a Want of Sleep. It has, also, been found from Experience, that the sooner and more impetuously the Purples are expelled by Medicines, and an hot Regimen, the more easily they are repelled to the internal Parts, by the slightest Cause.

Besides, in the Purples, excessive and liberal Purging is highly prejudicial; for so peculiar is the Nature of this Disease, that it admits neither too great Costiveness, nor too great Solubility of Body, much less artificial Evacuations by Stool. Hence, if the Patient is for a long time costive, the pent up Recrements are convey'd to the Surface of the Body; and the bilious, mucous, and fermentable Scoræ, which ought, by means of the Liver, Pancreas, and glandular Coats of the Intestines, to be evacuated by Stool, are convey'd to the Skin; or, being collected, and mutually mixed, in the long and winding Canal of the Intestines, they are more corrupted by their Continuance there; and, being thence convey'd to the Mass of Blood, along with the chylous and nutritive Juices, lay a copious Foundation for the Disease, and the Increase of the morbid Matter. Hence, unless the Evacuation by Stool, and the other Excretions, are recalled and reduced to Order, the Disease is rarely perfectly cured, but either frequently returns, or is long protracted.

We are, also, to take care not to procure the Excretions, by acrid stimulating Medicines; for which Reason we are carefully to abstain from all, even the mildest Emetics, all Purgatives and Laxatives, tho' destitute of Virulence, as, also, from all saline Substances; nor is it always safe to render the Body soluble by a Clyster, or Suppository, especially before, and a little after, the Eruption of the Pustules; for, the internal Parts being stimulated by this means, the Motion of the Fluids to the Surface of the Body is forthwith disturbed, the Perspiration obstructed, and the Pores of the Skin contracted, so that the Efflorescences disappear.

Unseasonable Venesection, also, contributes a great deal to the dangerous Retrocession of the Purples; for as in all Exanthematous Disorders, so especially in the Purples, it is of the greatest Importance, that the Blood should be in a due Quantity and Proportion, and that it should be convey'd to the Surface of the Body; for either an Excess, or a Defect, is attended with Danger. If the Quantity of Blood is too great, from the spasmodic Strictures of the Parts, fatal Congestions of the Blood in the nobler Parts are to be dreaded. But, if the Quantity of the Blood is too small, it cannot be forced to the most minute Vessels of the Skin, and the Organs destin'd for the Secretion of the Sweat; and the peccant Matter is less duly eliminated through this capillary Strainer, but with the greatest Danger remains immoveable in the internal Parts of the Body. Hence hardly any thing is more to be dreaded in this Disorder, than the Danger arising from unseasonable Venesection. I myself have frequently seen the Practice of some, who, in chronical Purples afflicting hypochondriac Patients, subject to spasmodic Strictures, advised Venesection, so unlucky, that, the Exanthematous Efflorescences ceasing suddenly, an apoplectic Fit was brought on. In Cases of this Nature, I have, also, known the most violent Contractions of the Joints, and almost fatal convulsive Motions of the Parts, brought on by ill-timed Venesection.

In the Miliary Fever, some advise Vescicatories, if the Disorder proceeds from an acid corrupted Lymph, that by this means the peccant Matter may be extracted, and, at the same time, the oppressed nervous Fibres stimulated to a stronger Contraction. Thus *Hamilton*, in his *Treatise de Febre Miliari*, highly extols the repeated Application of them to the Scapulae, in the following manner: "The Serosity of the Humours is excellently lessen'd by Vescicatories; for, by their means, the morbid Matter being in some measure lessened, can more easily throw off the rest in the manner to which she is accustomed; so far are Vescicatories from hindering the Eruption of the Pustules." But, though this Method of affording Relief in the Pustules seems pretty consonant to Reason, yet, I confess, I never used it; and must, therefore, leave it to others to make Trial of it. *Frederic Hoffman.* See MILIARIS FEBRIS.

PURULENTIA. Purulence, or Suppuration.

PURULENTUS. Purulent, full of Pus, or Matter.

PUS. Matter. See ABSCESSUS, INFLAMMATIO, and SUPPURATIO.

PUSCA. The same as POSCA. *Blancard.*

PUSILLATUM, or PUSULATUM. A coarse, or grossly Powder.

PUSTA. A Digestion of Sanies. *Rulandus.*

PUSTULA. A Pustule. These principally appear in the Spring, and are of various Kinds; for sometimes a certain Roughness arises all over the Body, resembling that which is produced by the Application of a Nettle, or the Obstruction of Sweat,

Sweat, and are by the *Greeks* called *ἰκθυήματα*. These are sometimes red, and sometimes retain the natural Colour of the Skin; sometimes large Numbers of them appear of the Bulk of *Vari*, and sometimes larger. There are, also, Pustules of a livid, a pale, a black, or any other unnatural Colour, with an Humour contained in them. When these break, the adjacent Flesh appears, as it were, ulcerated. These are by the *Greeks* called *ελυκταίαι ἐλλοδῆς*, and are produced by Cold, Fire, or Medicines.

But the *φλυζάνη* (*Phlyzation*) is a Species of Pustule, somewhat harder, whitish, and rising in a sharp Point. But Pustules are sometimes converted into small Ulcers, either moist or dry, sometimes accompanied only with an Itching, at other times with Inflammation and Pain; and a Pus, or Sanies, or both, are discharged. This happens principally in Children, rarely in the Trunk of the Body, but frequently in its Extremities.

The worst Species of Pustule is, that call'd *ἐπιφυκτις*, which is generally of a somewhat livid, blackish, or even of a white Colour. Round about this Kind of Pustule, there is a violent Inflammation; and, when it is laid open, a mucous Exulceration of the same Colour, contained in the Pustule, is found within. The Pain accompanying it is far more intense than could be expected from its Bulk, which is no greater than that of a Bean. This Species of Pustule, also, arises on the Extremities of the Body, and generally in the Night-time; from which last Circumstance, the *Greeks* gave it the Name of *ἐπιφυκτις*.

In the Cure of all Pustules, the first Step to be taken is, to use much Exercise and Walking; and, if these cannot be practis'd, Gestation is their best Succedaneum. The second Step is, to diminish the Quantity of Aliments, and abstain from all acrid and extenuating Substances. The same Measures are to be taken with the Nurse, when a sucking Infant is affected with Pustules. Besides these Steps, when the Patients are robust, and the Pustules but small, they ought to sweat in a Bagnio, have Nitre sprinkled on the Pustules, and be anointed with a Mixture of Wine and Oil, after which they are to go into the Bath. If these Measures prove ineffectual, or if the Pustules are of a large Kind, Lentils are to be applied to them; and, when the Skin is removed, we are to have recourse to mild Medicines. After the Application of the Lentils, the *ἐπιφυκτις* is commodiously cured by Knot-grass, or green Coriander.

Ulcers formed from Pustules are removed by Litharge mix'd with the Seeds of Fenugreek, adding Oil of Roses, and the Juice of Endive, till the Preparation is of the same Consistence with Honey. The Pustules of Infants are very properly anointed with the following Preparation:

Take of the Stone by the *Greeks* called *πυλῆτης*, eight Drams; mix with fifty bitter Almonds; and add three Cyathi of Oil, in order to make an Ointment: Before the Use of which, however, the Pustules ought to be anointed with Cerufs. *Cels. Lib. 5. Cap. 28.*

PUTORIUS. The Fitchet. The Flesh of this Animal is said to be resoluteive, externally applied.

PUTREDO, or PUTREFACTIO. Putrefaction.

The happy Influence of Natural Philosophy and Chymistry upon Medicine is in no Instance more palpably evinced, than in the Doctrine of Putrefaction; the great Importance of which in Medicine, and its Necessity to the Physician, we shall prove from several Arguments, after having investigated its Nature, Causes, and Effects, from physical and chymical Principles, that its Use, in the Application of things of a medicinal Nature, may be the more apparent. The Putrefaction, therefore, of a Body, is nothing but an intimate Dissolution of the Parts of which a Body consists, from their Union and Connection, accompanied with a volatile and fetid Exhalation, and changing the whole Crasis, Properties, and Qualities, of the mixed Body.

The Dissolution of Bodies is justly distinguishable into superficial and intimate, or radical. In the former, the Body is only divided into its most minute Parts, every one of which still retains its peculiar Nature, Virtues, and specific Qualities. Thus, in a Solution of Gold with Aqua Regia, though the Gold is resolved into highly minute Atoms, as is obvious from this, that a few Drops of such a Solution are capable of giving another Taste to a whole Pint of Spirit of Wine, yet by a Precipitation made by some Salt, either of the lixivial, or volatile Kind, these Particles, or Atoms, appear to have perfectly retained the Nature of Gold. But an intimate, or radical Solution is that, in which the Parts of a Body are so removed from their Situation, and so resolved from their intimate Mixture, on which the specific Differences of Bodies depend, that, being absolutely transformed into another Texture and Disposition, they assume new Qualities and Virtues. Thus, in the Solution of the Aliments in the Stomach and Intestines, by the subtil and universal salival Menstruum of the Stomach, and the Influence of the animal Heat, the intimate Mixture and

Texture of the Aliments are so destroy'd, that their Taste, Smell, Colour, Consistence, and other Qualities, being destroyed, they produce Chyle and Fæces. Thus, also, in the Fermentation of Vegetables, the sweet Juices of Grapes, and Summer Fruits, by means of Fermentation, lose their sweet and temperate Nature, and are either changed into an acid, spirituous, or a vinous intoxicating Liquor; among these intimate Solutions, we ought, also, to reckon Putrefaction, the Nature and Effects of which consist in extinguishing the Mixture, Form, Qualities, and Virtues of Bodies.

The Cause of this intimate Dissolution, whether of the fermentative, or putrid Kind, is an intestine Motion of the moist Parts, and a copious Influx of a hot and violently agitated Matter; for as there can never be a Solution of a solid Body without Moisture, so without Water, the original Fluid, there can neither be Fermentation nor Putrefaction; for Water is the universal Menstruum, which not only deeply insinuates itself into the Pores of Bodies, but, also, because its Parts are in a continual intestine Motion, is able to disjoin and remove from their Situation the Parts of Bodies, which are variously mixed and united: But it produces this Effect most happily, when assisted with Heat; which is no more than the rapid Motion of an ethereal and celestial Matter, furnish'd with a great expansive Power, propelling from the Centre to the Circumference. The Moisture, then, when acting on Matter capable of Fermentation and Putrefaction, resolves the saline, sulphureous, and earthy Parts, receives them into itself, and carries them off with it in its Motion.

But though both Fermentation, and Putrefaction, are produced by an intestine Motion of the Moisture, and of the hot Principle, yet their Effects are very different, since, by Fermentation, a sulphureous inflammable Spirit, but, by Putrefaction, a volatile urinous Spirit, is produced; for which Reason Putrefaction is always accompanied with a fetid Smell. 'Tis, also, to be observed, that the Juices of Animals admit of no Fermentation, nor can any vinous inflammable Spirit be prepared from them, since these are the Properties of Vegetables alone; which, however, are capable of Putrefaction, as well as the Juices of Animals. The Reason why Animals, and their Parts, are only capable of Putrefaction, but can never, by Fermentation, yield an inflammable Spirit, is only to be sought for in the different Mixtures of Animals and Vegetables, since these last admit into their Mixture not only an Oil, but, also, an Acid, which in Distillation is obtain'd from them; whereas in Animals no such thing is found, since they are rather impregnated with an Oil, and a subtil volatile Earth, which, by the Action of the Fire, becomes saltish. In the Fermentation, therefore, of Vegetables, by the warm intestine Motion the tartareous Acid is first dissolved, by which, when it begins to act on the sulphureous and oleous Parts, an Effervescence, in consequence of this mutual Action and Reaction, is not only excited, but, also, a copious penetrating Vapour is raised, and carried off in the Air; and, lastly, by the mutual Combination of acid and oleous Parts in the Acid, a spirituous or vinous Liquor is produced. But in Putrefaction, where the Acid is defective, the oleous, sulphureous, and saline volatile Principles are forthwith carried off; and, being neither fixed nor corrected by the Acid, are freely dissipated in the Air with a nauseous and fetid Smell; which, according to indisputable chymical Experiments, is produced by an oleous, or sulphureous Principle, and a volatile Salt. A palpable Instance of this we have in mineral Sulphur, which, in its native State, is without Smell; but, when fused over the Fire with a lixivial Salt, assumes an ungrateful Odour. If, therefore, we intend to obtain a volatile oleous Salt from Animals, we must either subject them to Putrefaction, or burn them with a strong Fire; by which means both their oleous and volatile Parts are freed from the Contexture of other Parts with which they were entangled.

We have already observed, that Moisture and Heat were the principal Instruments of Dissolution, both in Fermentation and Putrefaction; so that, without the former two, neither of these can be performed. Hence it follows, that a Body, which has otherwise a great Tendency to Putrefaction, cannot be more effectually preserved from it, and kept sound, than by removing Heat and Moisture. For this Reason, Bodies sufficiently dried are never observed to be subject to Putrefaction and Corruption. Pork and Beef dried by Smoke, and the Influence of the Air, do not easily become putrid: But, if, by Maceration in Water, they receive a due Degree of Moisture, they soon become putrid in a warm Air. Such, also, is the peculiar Nature of Cold, that it preserves Bodies from Putrefaction, for no other Reason, than that by a certain rectilinear Motion it presses and conjoins the Parts, so that they are not easily disjoined, and put out of their Situation; whereas Heat, by its vertical Motion round its own Axis, expands and enlarges the Pores, and propels the Parts from the Centre to the Circumference.

But as there are various ways of removing Moisture, or Humidity, so there are as many Methods of preserving Bodies from Putrefaction. Thus 'tis certain from Experience, that highly rectified Spirit of Wine is very proper for preserving Bodies from Putrefaction, when kept in it, because it quickly imbibes and absorbs the Moisture of Vegetables and Animals from their internal Pores and Parts. Hence Bodies, before soft, are indurated: But the Experiment succeeds more happily, if fresh dephlegmated Spirit is frequently pour'd to them. And though by means of distil'd Oils, and liquid Balsams, the Embalming and Preservation of Bodies from Putrefaction may be obtained; yet highly rectified Spirit of Wine is far preferable to them all, because it is of a more penetrating Nature, and more easily enters the internal Parts of the Bodies, than resinous balsamic Substances.

There is, also, another Method of preserving Bodies from Corruption, which is by Salts; the most considerable of which are common Salt and Alum, which excellently imbibe the Moisture, by the Absorption of which the fleshy Fibres are rendered harder. The more pure and dry these Salts are, the more happily they produce this Effect. And as Alum, in consequence of its large Number of terrestrial Particles, is of an astringent Quality, by which the Parts are more intimately united and connected with each other, so by means of a Lixivium prepared of Alum, and common Salt, all the Viscera of the human Body may for several Years be preserved entire.

'Tis to be observed, that corruptible Fluids, if agitated with a continual Motion, do not easily become putrid; but that stagnant and putrescent Fluids, such as are observed in Marshes, are easily susceptible of Corruption: For Heat and Moisture, continually acting upon quiescent Particles, more easily dissolve and destroy their Mixture, than if they perpetually changed their Place and Situation, in which case the Action and Change of Heat is more transitory; whereas, in quiescent Particles, it is more durable and permanent. We, also, observe, that Vegetables abounding with Moisture, and collected in a large Heap, become more easily warm and putrid, than when they are scattered; in which Case, they remain free from Putrefaction: The Reason of which is this, that, when they are collected into an Heap, the Effluvia excited by the Motion of the Moisture, and the intestine Warmth, cannot be exhaled and dissipated in the Air; but, being pent up, and returning, as it were, on themselves, accelerate the intestine putridous Motion, instead of diminishing it. But nothing more effectually prevents the Corruption of corruptible Bodies, and dissipates it when beginning, than the Access of a free Air, especially of the dry and cold Kind. 'Tis, also, to be carefully observed, that a beginning Putrefaction is of a very multiplying Nature, and diffuses itself very quickly; for it acts like Leaven, which quickly puts the homogeneous, and especially the most adjacent, Parts into the like putridous Motion with itself; as we plainly see in fermentable Substances, where a little Leaven added to a farinaceous Mass, or the Juice of Vegetables, immediately throws them into the like fermentative Motion.

Having thus, from the Principles of Natural Philosophy and Medicine, investigated the Nature, Generation, and Effects of Putrefaction, it will be far more easy to apply what we have said to medicinal Purposes in the human Body, in which a singular and wonderful Phenomenon recurs to be explained, that is, why the Bodies of Animals, and the Juices contained in them, which in their own Nature are so prone to Putrefaction, when Moisture and Heat are present, do not, however, become putrid so long as the Animal is alive, but remain sound and entire; whereas they quickly become putrid after the Death of the Animal. And in this principally consists the Preservation of Life, the Causes of which ought to be carefully investigated by every Physician. Those are greatly deceived, who seek for the Cause of the Preservation in a certain vital Spirit, or Balsam, and the innate Heat, since, instead of specifying the true Causes, unmeaning Words which explain nothing, are only used. They are, also, no less deceived, who think that this Preservation is the Effect of the Salt and Sulphur contained in the vital Juices; for 'tis certain from Experience, that neither saline, nor spirituous Substances, nor balsamic Medicines, copiously exhibited, are of such Efficacy as to remove Putrefaction, since they rather contribute greatly to promote it; for we observe, that the Bodies of scorbutic Patients, whose Juices abound with saline and sulphureous Parts, easily fall into a sphacelous Corruption; so that other Causes must be assigned for this vital Duration, or Preservation. Now we observe, that so long as the Mass of Blood and Humours, of themselves very corruptible, is continually, by a progressive and circular Motion, carried through the vascular Structure of the Body, it remains free from Corruption; but so soon as these Humours, ceasing to move, or circulate, stop, or become stagnant, in the solid Parts, they soon become subject to Putrefaction, which immediately diffuses itself, and, spreading to the adjacent Parts, brings on a Mortification and Sphacelus of

them. Whenever, also, the Circulation of the Blood is totally removed, which happens in Death, Putrefaction immediately ensues, unless it is prevented by Cold, or some other external Cause.

Hence 'tis obvious, that the Circulation of the Blood is the Cause which defends the Bodies of Animals from Corruption; and so long as the Circulation is entire, the Body is free from all the Injuries of Putrefaction. But we must inquire, whether this Flux and Reflux of the Blood produces this Effect only by its progressive Motion, or whether other Causes, also, concur with it, which seems most probable; for, by means of this continual Circulation of the Blood, the hot intestine Motion of its constituent Parts is greatly increased, and the Juices not only consumed, but, also, gradually converted into a saline sulphureous Excrement. Hence 'tis obvious, that the Circulation has rather a Tendency to destroy than preserve the due Mixture of the Mass of Blood, as is obvious from the intense Heat of Fevers, where, in consequence of the brisk Circulation of the Blood, a greater intestine Agitation of the Parts is produced, and a more violent Heat excited, which not only consumes the Body, together with its Strength and Juices but, also, resolves these last into excrementitious Parts, which ought to be eliminated partly by Perspiration, and partly by Urine and Stool. Besides, with the Air, Aliments, and Drink, many Parts foreign to the Mixture of Blood, and highly subject to Corruption, are often mixed with the Blood; and, if these are retained in the Habit, they must naturally disturb and destroy the Nature and benign Mixture of the Blood. During the vital Action, and perpetual Motion, of the Fluids, we, also, observe, that a corruptible Matter fit for inducing Putrefaction, is generated in the Blood. Hence Reason dictates, that these Parts, so prejudicial to Life, by spoiling the due Crasis and Mixture of the Blood, should, with all Care, be separated, secreted, and eliminated from the Body.

Hence it is, that unerring Nature, in the curious Structure of Animals, has formed numberless secretory and excretory Organs; by means of which, not only the Excrements of a more fixed, but, also, of a more moveable, volatile, saline, sulphureous, aqueous, and aerial Nature, are continually and uninterruptedly separated from the Blood and vital Humours. This Purpose is excellently answer'd by that large Organ the Liver, which is continually employ'd in separating from the Blood the sulphureous Scorix, together with the hot, saline, and serous Parts. There are, also, here-and-there in the Body, numberless conglomerate Glands, which consisting of infinitely small Tubes, continually secrete a subtle and highly fermentable Fluid of a salival Nature, which, having performed its Office, is eliminated from the Body. The Skin, also, being full of Tubes and Pores, is, as it were, an universal and common Emunctory, through which the serous, sulphureous, saline, and excrementitious Parts of the Humours are eliminated. The Kidneys are the Organs through which a saline, sulphureous, and thick Serum is strained; and through the large Intestines the feculent Sordes and Fæces are evacuated.

For, in order to preserve the due Mixture of the vital Fluids, 'tis not only requisite there should be a perpetual Separation of the superfluous Parts, but 'tis, also, necessary there should be another Preservative of Life and Health, not mentioned by modern Writers; which is a fresh Accession of mild and temperate Juices, in the room of the corrupted Fluids, eliminated from the Body. Hence we see the Reason, why Men, and brute Animals, in order to prevent internal Putrefaction, and preserve Life, ought constantly to have due Supplies of Aliments, from which laudable, temperate, sweet Juices, fit for nourishing and increasing the Strength, such as the chylous and lacteal Juices are, may be again generated; for, without such a new Accession and Afflux of fresh Juices, Life and Strength cannot be long preserved; so that Life is excellently preserved, and a mortal Putrefaction prevented, in the Bodies of Animals, by means of Aliments, and due Excretion. It must, also, be observed, that in Adults, who stand in no need of having the Parts of their Bodies farther increased, the Excretions ought, in order to a due and equable State of Health, to be equal to the Aliments taken.

This firm and unshaken Foundation of Health, consisting in this, that every Substance approaching to Corruption, and capable of inducing Death and Destruction, ought carefully and perpetually to be abstained from, furnishes us with various Corollaries and Theorems, of singular Use in Practice: For, first, from what has been said, we may deduce the Nature and immediate Cause of Death, and the Putrefaction which succeeds it, and is, in its own Nature, highly unfriendly to Life: The Cause, then, of these Effects is a destroyed Circulation of the Blood, and the Putrefaction and Corruption arising thence, which, on the contrary, is generally the Cause of the Destruction of the Circulation, and, consequently, of Death; for, from a careful Dissection of those who have died both of acute and

and chronic Disorders, the Causes of Death are always manifest and conspicuous; since one or more of the Viscera, or more noble Parts, appear corrupted, putrefied, or sphacelated, by an Extravasation or Stagnation of the Humours: But in those who die suddenly, or of violent acute Disorders, which are not to be known without Difficulty, polypose Concretions, consisting of various Fibres and Membranes, are frequently found in the large Vessels; especially in the Ventricles of the Heart, and the Sinuses of the Dura Mater; which, by obstructing the free Circulation of the Blood, destroy the Patient.

Since, therefore, the whole Business of the Physician consists in procuring long Life, preserving the Body sound, and preventing untimely Death, and the Disorders which bring it on, he certainly cannot, in a more effectual manner, answer these grand Intentions, than by preventing and removing Corruption and Putrefaction, both in the internal and external Parts. But this End cannot be better obtained, than by preserving a free Circulation of the Blood through all the Parts of the Body, and removing every Cause which may in the least obstruct and hinder it.

But several Causes are capable of disturbing and hindering this Circulation; the most considerable of which is, a Redundance of Blood and Humours, which, by its strong Resistance and Expansion, impairs the Elasticity of the Fibres of the Heart, and its Auricles, so that the Circulation becomes very slow and languid: And this Circumstance, unless soon removed, produces Stagnations of the Humours, Infarctions of the Viscera, Obstructions, Indurations, Extravasations of the Humours, and putridinous or apoplectic Corruptions of the Parts. By this slow Circulation of the Blood and Humours, the Excretions are lessened, and particularly those made by Perspiration, and that of the bilious Humours, large Quantities of which are daily secreted in the Vessels of the Liver. Hence large Quantities of Impurities, of various Kinds, must necessarily be accumulated in the Mass of Blood.

But a Plethora so unfriendly to Health and Life is very incident to those, who, being of spongy Habits, live luxuriously, and indulge themselves in Ease and Quiet: But Women are still more disposed, than Men, to generate a larger Quantity of Blood than is necessary to Nutrition and Life. Left, therefore, this Redundance of Blood and Humours should injure Health, or threaten Death, the Structure of our Bodies is so artfully contrived, that the Vessels and nervous Parts have a peculiar Kind of Motion, by which they prevent Stagnations, and free themselves from the Load of redundant Blood, so unfriendly to Nature; in Childhood, generally by the Nose; in Women, by the Uterus; and in Men, by the hæmorrhoidal Discharge returning at stated Periods: When, therefore, the usual and salutary Excretions, destined for diminishing the redundant Blood, are, by any Cause, rendered defective, diminished, or violently suppressed, numberless Misfortunes are produced; and, unless Relief is soon afforded, the Body is rendered subject to Disorders of all Kinds, both of a chronic and acute Nature, as is shewn in *Medicin. rational. Fred. Hoffman. Tom. 2.* I have frequently seen plethoric Women, who, having their Menstrues suppressed by a Fright, upon the Access of Cold, or the Use of a drastic Purgative, have soon after died of a sphacelous Corruption of the Parts; and immediately after Death, their Bodies became tumid, and were seized with an highly fetid Putrefaction, large Blisters rising here-and-there upon them.

From what has been said, any one may conceive, that Putrefaction and Death may be generated only by a Redundance of laudable Blood: In order to prevent which, no Remedies are more proper than Venesection, or a Restitution of the usual Excretions of Blood: But if any one is unaccustomed to Venesection, and naturally abhors it, and at the same time feeds and lives in such a manner as is fit for generating large Quantities of Blood, whilst Nature is slow, or absolutely defective, in carrying on the Excretions; such a Patient is to be treated in another manner, and great Care taken, lest he fall into some violent, or, perhaps, mortal Disorder, arising from Putrefaction: For, according to his peculiar Circumstances, such Things as lessen the Redundance of the Blood and Humours, are to be used; such as proper Exercise, Abstinence, light Drink and Aliments, Bathing, Laxatives, Infusions, and a due Use of the Mineral Waters, both of the hot and cold Kind.

It is, also, certain, that a mortal Putrefaction may be produced, by a Penury or Defect of Blood: For though it is seemingly most probable, that different Causes must produce different and dissimilar Effects; yet it is certain, from various Instances, that, in the human Body, contrary Causes may conspire in the Generation of the same Disease: But we shall now content ourselves with shewing, in what manner both a Redundance and Penury of Blood may induce a mortal Corruption on the Humours, and solid Parts. We have already observed, that the redundant Blood easily stagnates in the Vessels,

and soon becomes impure, in consequence of the Diminution, occasioned by a Plethora, of the Secretions and Excretions, which ought to free the Blood from impure Sordes, and excrementitious Matter, which have a great Tendency to Corruption: The same, in like manner, happens from a Defect of laudable Blood; for, as, by a natural and due Quantity of Blood, all the Vessels are kept open, so, in consequence of a Penury or Scarcity of it, they collapse, and have their Diameters lessened, or, perhaps, are at last totally blocked up: Hence the benign and nutritive Juices can neither be conveyed to the solid Parts, nor a sufficient Quantity of the nervous Fluid be generated in the Brain; by which means the Strength is greatly impaired: Besides, as the Impulse of the Blood, by the due Diastole of the Heart and Arteries, such as is observable in the Pulse, depends upon a sufficient Quantity of Blood, it must necessarily happen, that, under a Defect of this Fluid, the Pulse must become very weak and languid, whilst the Blood itself is not duly propelled through the minute capillary Vessels of the Viscera, but stagnates here-and-there in the Viscera; such as the Lungs, Spleen, and Liver: And this State is succeeded by Corruptions, Cachexies, slow and hectic Fevers.

Now there is not a nearer Way to Corruption, and the Disorders arising from it, than when, after the Strength is consumed, by violent Hæmorrhages, severe previous Diseases, long-continued Passions of the Mind, Grief, or Hunger, Persons voraciously eat large Quantities of Aliments, which, as they cannot be sufficiently digested, and the useful separated from the useless Parts, on account of the weak and languid Force of Nature, so they not only generate a large Quantity of peccant Humours in the *Prima Viæ*, but the Vessels, also, in consequence of the obstructed Excretions, are filled with impure and corruptible Juices, and a great Disposition to malignant and putrid, or to slow and hectic Fevers is brought on; for it is certain from Experience, that terrible Camp Diseases, as malignant and petechial Fevers, the *Hungarian Fever*, Diarrhoeas, and malignant Dysenteries, afflict the Soldiers most, spread themselves farthest, and are most contagious, in the Autumn, and when they begin to leave the Camp, for no other Reason than that, during the Summer, under the long Heat, the Night-colds, the continual Fatigues and Watchings, or, perhaps, corrupted Aliments and Liquors, they have lost their Strength, and laudable Blood; instead of which they have their Veins and *Prima Viæ*, stuffed with large Quantities of corrupted Juices, which are highly subject to Putrefaction, and, in acute Fevers, generally induce a mortal Sphacelus on the internal Parts.

Having thus considered the Cause of malignant Disorders, which is a Defect of laudable Blood and Juices, and a consequent easy Transition to Putrefaction, every thinking and judicious Physician must certainly perceive, that nothing is more dangerous than to exhibit too much Aliments, especially of bad Juices, to Persons weakened by Diseases, or any other Causes; since such Persons are, according to *Celsus*, highly subject to putrid Diseases: But it is better, in such a Case, gradually, and by little and little, to restore the consumed Blood, to eliminate the Crudities attending such a State, either by Perspiration or Stool, by means of gentle Evacuants; and then to corroborate the Digestion, and concoctive Power of the Stomach, by temperate, corroborating, and stomachic Medicines, by which means the violent Disorders, to be dreaded from a Corruption and Putrefaction of the Humours, may be excellently prevented.

There is, also, another expeditious Method of bringing on a mortal Putrefaction, in sound vigorous Persons, in the very Flower of their Age; which is by the Exhibition of Poisons, especially those of a caustic Quality, such as the three Species of factitious Arsenic, highly acrid Purgatives, or drastic Emetics prepared of Antimony; for, unless the violent Operation of all these is soon stopt by proper Remedies, they quickly prove mortal, by inducing terrible Spasms of the nervous Parts, and a Putrefaction of the nobler Organs of Life. Upon dissecting Patients taken off by these means, sphacelous Spots of the Stomach and Intestines, accompanied with an intolerable Stench, present themselves to our View; for Poisons of this Kind, by constricting the nervous Parts, and Vessels of the Stomach, produce Inflammations, which degenerate into a Sphacelus, which is the more fatal to Life, because it seizes the nervous and membranous Parts, such as the Stomach and Intestines, which have an intimate Consent with those Parts, which are furnished with an exquisite Sensation, and a brisk lively Motion, and which they, also, draw into the like irregular Commotions: It is, also, observable, that cold Liquors drank by a Person over-heated, and covered with a profuse Sweat, are highly prejudicial, and, in their Operation, frequently imitate Poisons, by quickly inducing a Sphacelus and Death: And though the Effect is not always so fatal, yet we have Instances in which cold Liquors, drank by over-heated Persons,

Persons, have proved mortal; and, upon laying open their Bodies, their Viscera were found sphacelous. Thus, some Years ago, a young Man of eminent Distinction, in the Flower of his Age, being covered with a profuse Sweat, after violent Exercise, drank a large Quantity of cold Ale, at a Draught; in consequence of which, being seized with a great Languor, an Uneasiness about the Præcordia, a Desire of vomiting, and frequent Deliquiums, he died of Convulsions on the fourth Day; and, upon opening his Body, a Part of his Stomach was not only sphacelous, but his Spleen, and the Left Lobe of his Lungs, were found resolved into an highly fetid and putrid Mass, black as Ink: For as the Viscera consist almost entirely of a Congeries of highly minute Vessels, it is of course obvious, that they must readily be subject to Infarctions, and a Stagnation of Blood. When, therefore, a large Quantity of Liquor, actually cold, arrives at the Blood, which, in consequence of its Motion and Heat, is pretty thin and fluid; it is not surprising, that the Blood should be immediately coagulated, and, being firmly impacted in the Vessels, become putrid. In this Case there is not a more efficacious Remedy than speedy and seasonable Exercise and Motion, whether by riding on Horseback, or in a Chariot, after drinking a large Quantity of a warm Infusion of the Flowers of Daisies, common Chamomile, Carduus Benedictus, Paul's Betony, and Scordium; by which the Coagulation of the Fluids is prevented, and the free Circulation of the Blood, through the Vessels, promoted; Hence we see how simple, and yet how efficacious, the Remedies for preventing the most terrible of Deaths sometimes are.

Among the terrible Disorders arising from Putrefaction, we may justly class the *Morbus Niger* of Hippocrates; under which, Humours of a black Colour are not only vomited, but, also, highly fetid Excrements discharged by Stool. Here it is to be observed, that a Vomiting of bloody, or black, Matter rarely proves mortal; but if a large Quantity of Blood is, from the ruptured Veins of the Ileum, conveyed to the Fæces of the Colon, and is not immediately discharged, but, stagnating, is put into a putredinous Motion with the Fæces, accompanied with an highly fetid Smell, it soon kills the Patient: For, in my Opinion, those who die of this Disorder are not so much destroyed by the Effusion of Blood, which is not sufficient to destroy Life, as by the Putrefaction arising from the Mixture of the Blood with the Excrements; for this fetid Vapour is highly unfriendly to Nature, since, by its Subtlety, it penetrates to, contaminates, and totally destroys, that Fluid which animates the nervous and membranous Parts, and governs Sensation and Motion; because the Strength, the Origin of which is no other, than a pure and subtle State of the Humours, immediately begins to fail, and at last is totally destroyed, as we observe in a Sphacelus, and ulcerated Cancer of the external Parts, where the Putrefaction, penetrating into the internal Parts, proves the only Cause of Death, by destroying the Agility of the animal Spirits.

Among the putrid and malignant Disorders, the most terrible are the Plague, and petechial Fevers, which are sometimes more violent, though less contagious, than the Plague itself; for these Disorders are propagated, and conveyed to the Body, by a kind of Miasma, which is nothing but a putredinous Leaven; for as a small Quantity of any Mass already putrid, mixed with corruptible Substances, forthwith infects them, and surprisingly propagates itself, so highly subtle Vapours arising from Persons labouring under the Plague, or petechial Fevers, and received by the Air into other Bodies, partly by the Mouth and Nostrils, immediately reaches the Mass of Blood, and being partly swallowed with the Saliva, passes to the *Primæ Viæ*, quickly multiplies itself, and, at last, contaminates the whole Mass of Humours, producing the most terrible Symptoms. That the Nature and Essence of these Diseases consist in Putrefaction, is obvious from the uncommon Loss of Strength, the great Weakness and Inequality of the Pulse, the Conversion of the Carbuncles and Buboes into Abscesses, the highly fetid Exulcerations, the nauseous Scent of the Excrements, the black and livid Spots dispersed over the Body, which are only Species of Sphacelations, and the Smell of the Body after Death. And though these Miasmata infect sound and healthy Persons who contain a temperate Blood in their Veins, yet it is generally observed, that they exert a greater Force and Influence on Persons of cacochymic Habits, whose *Primæ Viæ* are full of peccant Juices, because they there meet with Humours already disposed to Putrefaction and Corruption; such as those of the salival Kind, which are easily thrown into a fermentative Motion: Hence the Reason is obvious, why the Plague rages most among poor People; and why those who are oppressed with Hunger, and live in an irregular manner, are most subject to those putrid Disorders. If a Dysentery, the Small-pox, the Measles, or a Purple Fever, are accompanied with Signs of a malignant Nature, and prove very mortal, they derive their malignant Nature from nothing but peccant Humours, and Juices dis-

posed to Putrefaction, and corrupted by a depraved Habit of Body.

Having thus investigated the Nature of the Plague, and of malignant Disorders and Fevers, which consists either in Putrefaction itself, or an easy Transition to it, it will be no hard Task for the skilful Physician to find out proper Remedies, and a due Method of using them, both for the Prevention and Cure of these Disorders; for nothing is more effectual for Prevention, than a good Diet, and a proper Regimen, taking care not to load the Stomach with too great a Quantity of Aliments, especially of a corruptible Kind. We must, also, take care, that the salutary Excretions, by which the Blood is excellently depurated, be duly and expeditiously carried on; for, by this means, the Miasma, not finding a Substance similar to itself, either does not operate at all, or renders the Progress and Termination of the Disease far more happy than they would have otherwise been. Under the Cure, those things are carefully to be avoided, which increase the intestine Motion of the Blood and Humours, such as all alexipharmic, hot, bezoardic, and spirituous Substances, which are so far from hindering the Putrefaction, that they rather accelerate and diffuse it: The Patient ought, also, to abstain from all alkaline, volatile, fetid, and oleous Substances, which are only the Produce of Putrefaction: On the contrary, Acids, which, by fixing the volatile and oleous Parts, strongly resist Putrefaction, are the best Medicines in the Plague. To this Class, also, belong earthy bezoardic Substances, and such as keep the Body in a gentle Diaphoresis; since there is not a more expeditious Method of removing a beginning Putrefaction, and evacuating the subtle fermentable Parts, than by the Emunctory of the Skin: And this Intention is best answered by such Analeptics as restore the Strength, and promote the Circulation of the Blood. Earthy and bezoardic Substances have this peculiar to themselves, that they, in some measure, preserve the Mixture of the Blood, and hinder its Dissolution.

To malignant Disorders, also, belong hectic Fevers, which arise not from so active, but a slow-proceeding Putrefaction, which preys upon the Strength: For, upon opening the Bodies of those who have died of hectic Fevers, they have been found to proceed from corrupt Abscesses, degenerating into a Sphacelus, in some of the Viscera, especially the Liver and Lungs. And this Corruption of the internal Parts is the Cause, why these Fevers are with Difficulty, if at all, susceptible of a Cure.

It is, also, to be observed, that most acute Fevers prove mortal by no other means than Putrefaction, as is obvious from dissecting those who die of them immediately after Death; on which Occasion an intolerable Stench, arising from nothing but the Putrefaction, is perceived; and, for the most part, the Stomach and Intestines, or some of the nobler Viscera, are found sphacelated: But as nothing more resists the Generation of Putrefaction, and the Sphacelation of the internal Parts, than hindering the Stagnation of the Blood, and preserving its equable Circulation, so the whole Business of the Physician is to prescribe such Medicines as preserve the Circulation of the Blood, restore Strength, and promote Perspiration; such as temperate bezoardic Mixtures, consisting of the Waters prepared from the Flowers of Egyptian Thorn, black Cherries, Cinnamon without Wine, Carduus Benedictus, and Roses, distilled Vinegar, Syrup of Citron-juice, the *Mixtura Simplex*, Crabs-eyes, diaphoretic Antimony, Hartshorn philosophically prepared, and native or common Cinnabar; the Use of which is to be long persisted in. Nor are we to suffer the Patient to be long coctive, because the putrid Sordes, when translated from the whole Body to the Intestines, and there fermenting together, prove the Fomes of Putrefaction: For the Prevention of greater Mischief, the *Primæ Viæ* are to be carefully cleansed. But, for this Purpose, we are never to use drastic stimulating Medicines, since only gentle Laxatives, and mild Clysters, are to be prescribed, not in every Period of the Disease, but in its Remission.

We now come to consider, whether Camphire, which so powerfully resists Putrefaction, that nothing is found more effectual against an external Sphacelus and Gangrene, and, for this Reason, is called the best of Alexipharmics, may be safely used, to check a Putrefaction. Now, tho' Camphire is an highly subtle, though coagulated, and very evaporable Oil, yet it differs from other distilled Oils in this, that these induce a much greater Heat on the Blood, than Camphire, which soon transpires; whereas the others, in consequence of their viscid Nature, and tenacious Texture, continue longer in the Pores and Parts: This may be confirmed by an Experiment; for half a Dram of Camphire, dissolved in one Dram of Brandy, and taken internally, by a sound Man, produces rather a Sense of Cold, than of Heat, in the internal Parts; nor is the Pulse increased, or the Urine tinged of a red Colour: But if twenty Drops of the Oil of Cinnamon, or Cloves, are diluted in Brandy,

P U T

Brandy, and taken, there is a remarkable Increase; not only of the Pulse, but, also, of the Heat. For this Reason, in malignant Disorders, I greatly recommend the internal Use of Preparations of Camphire, both for the Cure of Inflammations and malignant Fevers: And in this I do not rely upon Speculation only, but, also, upon Fact and Experience, by which we ought to conduct ourselves in the Use of all powerful and efficacious Medicines. In the Height and Exacerbation of the Disease, if the Skin, and all the Parts subservient to Excretion, are spasmodically constricted, and the internal Parts excessively hot, especially if the Patient is young, and accustomed to spirituous Liquors, it is expedient to abstain from Preparations of Camphire, which are most commodiously used in the Beginning, after cleansing the *Primæ Viæ* by a Vomitus, if necessary, in Conjunction with cinnabarine bezoardic Powders, and a few Grains of purified Nitre, using at the same time a sudorific Regimen. I know some Persons, who, by certain Signs, appearing to be infected with a contagious malignant Fever, have, by the seasonable Use of Preparations of Camphire, once or twice exhibited, had a profuse Sweat excited, and been perfectly freed from their Disorder. In the time of the Remission, when the Skin is moist, the Pulse weak, and the Strength low, Camphire, with the Addition of bezoardic acidulated Substances, is an excellent Preservative against Malignity; and in violent Deliriums, no Medicine is more efficacious than Nitre, mixed with a small Quantity of Camphire. When the Strength is so far exhausted by the Violence of the Disease, that it begins to be insufficient, as it were, for promoting the Circulation of the Blood, it is excellently restored by a few Grains of Camphire, dissolved in Oil of sweet Almonds. And, lastly, in Fevers, arising from Inflammations of the internal Parts, half a Grain, or a Grain, of Camphire, mixed with Nitre, and frequently exhibited, is of singular Service: This Powder I have, also, used with Success, in violent Peripneumonies.

We now come to inquire, why scorbutic Patients, and those wasted with Age, are, generally, so subject to a fatal Sphacelus, from the slightest external Cause, or some Fault of the Blood: This, then, happens, in consequence of the Propensity of the Blood to a putridous Corruption; for a Scurvy is an excessive Impurity, or Cacoehymy, of the Blood, arising from a Redundance of saline and sulphureous Particles, which, in consequence of the diminished Secretions, not only remain in the Habit, but, also, contaminate the benign and temperate Humours, whose due and natural Mixture they destroy. A Blood, therefore, impregnated with Impurities of this Kind, easily degenerates into a State of Putrefaction; for which Reason scorbutic Patients are often afflicted with ichorous fetid Exulcerations of the Mouth, Fauces, and other Parts, whilst the Gums become tumid and putresced, with an intolerable Stench of the Mouth, and the inferior Parts of the Body are covered with Spots of a livid bluish Colour; which are the Signs of a slight Sphacelation. It is not, therefore, to be wondered at, that, from the slightest Cause, the Blood, becoming stagnant in the Parts, should degenerate into a sphacelous mortal Putrefaction; as, also, that a Sphacelus, arising from an internal Cause, is incapable of being cured; for the Blood, already greatly disposed to Corruption, is soon so infected by the Putrefaction already began in one Part, that the Danger cannot be averted by the most efficacious Medicines. Sphacelations, both of the internal and external Parts, are, also, very familiar to old Persons, because they have many Circumstances in common with scorbutic Patients; for, in consequence of the Thickness and Rigidity of the Fibres, contracted by Age, all the secretory and excretory Ducts become narrower, and have their Diameters lessened: Hence the Secretions of the laudable Humours, the Application of the nutritive Juice to the minute Vessels of the Parts, and the Influx of the nervous Fluid into the Nerves, are diminished, the Strength of the whole Body, and all its Parts, impaired, and the Constitution rendered dry, parched, and wasted, by a slow Consumption: But as in this Decline of Age, in consequence of the contracted Emunctories, and diminished Excretions, saline and acid Sordes are accumulated in the *Primæ Viæ*, hence the Blood of old Persons is full of scorbutic Salts: Hence it is, that Itching, a dry Scab, red Urine, calculous Concretions in the Kidneys and Bladder, and staphaceous Concretions in the Gout, Catarrhs, Coughs, Rheumatisms, Stranguries, and Exulcerations of the Parts, are so frequent and familiar to old Persons: Hence appears the Reason why they have this in common with scorbutic Patients, that both their internal and external Parts are highly subject to a Sphacelation. I have seen the slightest Injury of the external Parts, the Sting, for Instance, of a Wasp, a gentle Contusion, or the unskilful Paring of a Corn in the Foot, produce a Sphacelus in old Persons. I have, also, seen very old Men die of a Cardialgia, or Colic, brought on by some slight Error in Regimen; for no other Reason, than that

P Y R

in those Parts, which were afflicted with Pain, a sphacelous Stagnation was brought on.

Since, therefore, cacoehymic, scorbutic, and old Persons, are so subject to violent, putrid, and dangerous Diseases, those who intend to keep themselves free from those Disorders, ought carefully to abstain from every thing which can render the Blood impure. But, in particular, old Persons, who are already half scorbutic, ought carefully to abstain from all such Things as are fit for generating the Scurvy; such as all Sea Substances, which do not afford laudable Juices; Flesh, and other Aliments, indurated in the Smoke, salted Substances, all rancid, corrupted, and semiputrid Substances; Aliments of strong Juices, such as Pulses; a sedentary Life free from Exercise; a foggy, cold, moist, and heavy Atmosphere; heavy, sharp, or semiputrid Waters; living, and sleeping, in moist Places; long-protracted Care and Grief; a Neglect of usual Evacuations; the too great Use of acid and spirituous Substances; all which, as they are never beneficial, but highly injurious, to weak Habits, so they ought carefully to be avoided by old Persons. *Frederic Hoffman.*

PYCNOCOMOS. A Name for the *Scabiosa*; *integri-folia*; *glabra*; *radice præmorsa*.

PYCNOTIS. *πύκνσις*. Condensation.

PYCNOTICA. Incrassating Medicines.

PYCTE. *πύκτις*. A Mixture of Curds, and Honey.

PYE. *πύς*. The same as **PHTHISIS**. *Arctæus, de Caus. & Signis Diuturn. Lib. I. Cap. 8.*

PYELOS. See **CHOANA**.

PYGÆ. *πύγαι*. The Buttocks. *Ruffus Ephesius, de Appel-lat. Part. Corp. Human. Lib. I. Cap. 15.*

PYGARGUS. A Name for a Sort of wild Goat; for the Heron; and for a Species of Eagle.

PYLORUS. The Right Orifice of the Stomach is thus called.

PYODES. *πυώδης*. Purulent.

PYON. Pus.

PYOPCEUS. *πυοποιός*. Suppurative.

PYOSIS. *πύσις*. Suppuration; Or an *Hypopyon*; a Disorder of the Eye.

PYR. *πῦρ*. Fire.

PYRACANTHA. A Name for the *Mespilus*; *spinosa*; *Pyræ Folia*.

PYRACEUM. Perry. See **POMACEUM**.

PYRAMIDALES MUSCULI. The Pyramidal Muscles of the Abdomen. See **ABDOMEN**.

PYRAMIDALIA CORPORA. Two Protuberances of the Medulla Oblongata, are thus called. See **CEREBRUM**. By some Authors the Spermatic Vessels are thus named.

PYRAMIS. A Cone. In Chymistry, used for making Regulus of Antimony.

PYRAMISTA. An Insect, very subject to fly into the Fire, or a Candle. The Poets make frequent Allusions to this in their Love Songs; but it is of no other Use, that I know of.

PYRENOIDES. *πυρηνόειδης*, from *πύρην*, a Nucleus, or Kernel. A Name for the Tooth-like Process of the second Vertebra of the Neck.

PYRETERION. The Part of a chymical Furnace, which contains the Fire.

PYRETHRUM. Offic. *Pyrethrum Officinatum*. Ger. 618. Emac. 758. *Pyrethrum vulgare Officinatum*. Park. Theat. 858. *Pyrethrum flore Bellidis*. C. B. P. 148. *Bellis montana frutescens acris*. H. Monsp. 31. *An Buphthalmum Canariense Leucanthemum*. Pluk. Almag. 73. Phytog. 272. 6? **PELLITORY OF SPAIN.**

The Roots of the common Pellitory are about a Finger thick, hard, and of a yellowish-brown Colour on the Outside, and whiter within; of a very hot burning Taste; from which arise Stalks about a Foot high, much branched, and clothed with large winged Leaves, in Shape like those of Chamomile, but larger, and thicker: Among these grow several Flowers, much like the Flowers of Chamomile, but larger, set upon long Foot-stalks. It grows in Spain, and other warmer Countries, flowering in June and July. The Root is used.

The Root of Pellitory of Spain, held between the Teeth, helps the Tooth-ach, by drawing forth the cold watry Rheum: It, also, helps the Palsy of the Tongue, and the Loss of the Voice consequent therefrom: It is put into Masticatories for that Purpose; as, also, into drawing Cataplasms and Plaisters, particularly the *Emplastrum Cephalicum*. *Miller's Bot. Off.*

Pyrethrum has its Name from *πῦρ* (*Pyr*), Fire, because of the igneous Heat of its Root: It differs from the *Anthemis*, or *Chamæmelum*, by the Largeness of its Flower, and the acrid and fervid Taste of its Root.

It is imported from the Eastern Parts. *Matthioli* says, that it grows on some Mountains of Italy; but is there less acrimonious.

It stimulates to Venery, cures a Quartan, and gives Relief under an Hemicrania. *Schroder.*

Morison, or *Eobart*, affirm this Plant to be the genuine *Pyrethrum*; for what is esteemed by some the *Pyrethrum verum*, is an umbelliferous Plant. Authors were imposed upon by a corrupt Reading of *Discozides*, where, in the Description of the Flower, some Copies, for *ἀνέμω*, erroneously substitute *ἀνθε*. *Hist. Oxon.* 3. 34.

PYRETHRUM VERUM. Offic. *Pyrethrum sylvestre.* Ger. 618. Emac. 758. *Pyrethrum umbelliferum.* C. B. P. 148. Raii *Hist.* 1. 462. *Pyrethrum umbelliferum primum.* Park. Theat. 891. *Pyrethrum umbelliferum Matthioli.* J. B. 3. 20. TRUE PELLITORY OF SPAIN.

The Roots and Leaves are like those of the *Cotula foetida*; the Umbella is supported by a Multitude of Pedicles, proceeding, as it were, from one common Centre, after the manner of the *Pecten Veneris*, or *Anethum*; the Flowers are white, and of a fervid and bitterish Taste; to these succeed round blackish Seeds, larger than Aniseeds: The Roots are an Inch, and sometimes two Inches, thick, a Foot in Length, run deep under Ground, are of a brown Colour, inclining to yellow on the Outside, black within, and of an hot and acrimonious Taste.

Guilandinus cultivated this Plant in his Garden at *Padua*, and presented it to *Lobel*, by the Name of the *Pyrethrum verum*. The *Pyrethrum* of *Cæsalpinus*, which bears a round compressed Seed, of the Figure of a Lentil, belongs to another Genus.

The Root of this *Pyrethrum* is often, and with good Success, held in the Mouth for the Tooth-ach, which it removes, by attracting a Multitude of Humours into the Mouth, together with the Spittle: It excites, therefore, a Salivation, which, perhaps, it would excite in a more plentiful manner, and of longer Duration, if it were taken inwardly, in small and repeated Doses. *D. Soame & Sylvii Lib.*

Besides this Species, *Ray* mentions the

PYRETHRUM umbelliferum alterum. Park. *Foliis Anethi.* C. B. *Gesneri.* J. B.

It has a long simple Root, moderately fibrated, creeping, of the Thickness of a Finger, of an hot and burning Taste; the Leaves are like those of *Anethum*; and the Stalk like that of Fennel, and the Flowers grow in Umbellas exactly circular. *Raii Hist. Plant.*

This *Pyrethrum* is cultivated in the Gardens of the Botanists, and flowers in Summer.

It is used in lethargic Affections, the Palsy, and the like Disorders. The *Pyrethrum* sends forth a Stalk and Leaves like the *Daucus Sylvestris*, or Fennel, and has the circular Umbella of the *Anethum*. The Root is long, an Inch in Thickness, and of a very hot Taste. *Dale* from *Discozides*.

PYRETICA, according to *Blancard*, are Febrifuges.

PYRETOLOGIA, in Pathology, is the Doctrine relative to Fevers.

PYRETOS, πυρετός. A Fever.

A Fever is a very frequent Disorder, inseparably attended with an Inflammation, the Cause not only of many Diseases and Death, but, also, frequently of an happy and successful Cure.

As the Nature of this Disorder is of an highly latent and concealed Kind, so we ought the more carefully to guard against Mistakes and Errors in investigating it.

But, in a Research of this kind, Errors are easily fallen into, in consequence of the large Train of Symptoms, with which this Disorder is generally attended, and without which, however, there may still be a Fever.

That such Errors may be avoided, it is necessary, from among numberless Symptoms, to select those Phenomena alone, which always accompany every Fever; from the Presence of which Physicians know, that a Fever is present; and from the Absence of which they conclude, that a Person is free from a Fever.

Then, from these Symptoms and Phenomena, duly discovered, and maturely weighed, the particular Nature of the Fever is to be found out.

All Fevers, arising from an internal Cause, are accompanied with Horripilation, a quick Pulse, and Heat, at different Times, and in various Degrees of the Disorder.

The Fever in which the Horripilation, quick Pulse, and Heat, proceed with Velocity and Danger, is called an Acute Fever.

The Fever, on the contrary, in which these three Symptoms proceed slowly, either with or without Danger, is called a Slow Fever.

Both these Species of Fevers are either common and epidemical, or only affect particular Persons.

Those are called Acute Febrile Disorders, which are accompanied with an Acute Fever; whereas those are called Chronical Febrile Diseases, which are attended with a Slow Fever.

Hence it is, that all these febrile Disorders are not to be explained, without a previous Knowledge of the Nature of that Fever with which they are accompanied.

Now the Nature of the attendant Fever is to be estimated from the three common Symptoms before-specified; which are, Horripilation, a quick Pulse, and Heat.

Though these three Symptoms are present, at some time, in every Fever, yet the Velocity of the Pulse is the only Symptom which continues from the Beginning to the End of the Disorder, and by which the Physician judges, that a Fever is present.

In consequence of this, whatever Knowledge a Physician has of a Fever, depends entirely on the Velocity of the Pulse.

The proximate Cause, therefore, of this Velocity of the Pulse is, in like manner, the proximate Cause of the Fever, thus known from its Symptoms.

This Cause may, therefore, be a too quick Contraction of the Heart, or a too speedy reciprocal Influx of the nervous Fluid, conveyed from the Cerebellum into the Muscles and Cavities of the Heart.

Almost all Fevers hitherto observed, arising from an internal Cause, begin first with a Sense of Cold, Concussion, and Horripilation; and this Sense is greater or less, shorter or longer, internal or external, according to the Diversity of Patients, Causes, and Fevers.

In the Beginning, therefore, of every Fever arising from an internal Cause, the Pulse is quick, small, and frequently intermittent; whilst there is often a Paleness, Coldness, Rigor, Tremor, and Insensibility of the Extremities.

Hence it is obvious, that in this Period of the Disorder the sanguineous Humours become stagnant in the Extremities of the minute Vessels, whilst, at the same time, there is a Cause irritating the Heart to a stronger Contraction.

From these two Circumstances we discover the Cause of all the Symptoms which appear on such an Occasion, and are before enumerated.

In all Fevers where these Symptoms have preceded, there arises an Heat, which is greater or less, shorter or longer, internal or external, according to the Diversity of Fevers.

As this Heat succeeds the Fever already produced, it is obvious, the former must be rather the Effect, than the Cause and Essence, of the latter.

Hence, a quick Contraction of the Heart, and an increased Resistance of the Capillary Vessels, are Circumstances which account for all acute Fevers. Both of these Circumstances may, in a live Animal, be produced by numberless and infinitely various Causes; and as they may happen either jointly or separately, so when one is produced, the other easily follows.

For this Reason, the proximate Cause of a Fever, which consists in the quick Contraction of the Heart, and the increased Resistance of the Capillary Vessels, may itself have an almost infinite Number of proximate Causes, which are either singular, and peculiar to some Persons; or universal, and common to many: And these depend on the State of the Air, the Quality of the Aliments, and the Patient's Method of Life.

The Causes, therefore, of a Fever, are either particular, or epidemical.

The proximate particular Causes of a Fever may be reduced to five Classes; which are, first, Acrid Aliments, Drinks, Sauces, Medicines, or Poisons, when either possessed of such a Property as that they cannot be digested, moved, and evacuated; or when taken in such a Quantity as to irritate, suffocate, and obstruct the Vessels, by their Putrefaction. Secondly, The Retention of such Things in the Habit as ought to be evacuated, in consequence of Cold, Unctions, gloomy Dispositions of Mind, improper Aliments, Drinks, Medicines, Poisons, a cloudy and foggy Air, Ease, a Remission of usual Exercises, Obstructions of the Vessels by their Contents, or Compressions of them by surrounding Substances. Thirdly, Too much Exercise of the Mind, or Body; and acquir'd Heat. Fourthly, External Applications of an acrid, pungent, corroding, lacerating, caustic, and inflammatory Nature. And, fifthly, Such Substances as induce a great Change in the Humours and their Motion, such as many external and internal Things; Hunger; excessive Evacuations; the Pus, Water, and Ichor, in a Dropsy and Empyema; an acrid Serum collected in any Part; an hot State of the Bile; an Inflammation; a Suppuration; a Gangrene; a Cancer; long-protracted Watchings; intense Study, of any kind; and excessive Venery.

The Effects of a Fever are, a brisk Expulsion and Propulsion of the Fluids; an Agitation of their stagnant Parts; a Mixture of all their Particles; a Prevalence over the resisting Matter; a Concoction of the Humours; a Secretion of the concocted Parts; and a Crisis of that which, by its stimulating and coagulating Quality, produced the Fever; a Change of Health and Soundness into a morbid State; a Change of Health into a Disposition fit for bearing those Things to which the Patient was little accustomed before; an Expression of the most fluid

fluid Parts of the Humours; and an Inspissation of the rest; Thirst, Heat, Pain, Anxiety, Weakness, Lassitude, a Sense of Weight, and Loathing of Food.

The sooner the Viscidity of the Juices is resolved, and the more expeditiously the Irritation is allayed, the slighter, shorter, and more salutary, the Fever is; and, on the contrary, it is the more violent, long, and injurious, the longer it is before the Viscidity of the Humours is resolv'd, and the Irritation allay'd. Fevers are, also, various, according to the several Degrees and Conjunctions of this Irritation and Viscidity.

Hence it is, that Fevers often exert the same Efficacy with Medicines, with respect to other Diseases.

Hence, also, the Beginning, Increase, Height, Decrease, Crisis, Change, and Cure of Fevers are various, in acute and particular Fevers.

A Fever terminates in Death, some other Disorder, or in Health.

It terminates in Death, when the Solids are destroyed by a Force acting too strongly on them; or when the Fluids are so depraved and peccant, as to obstruct the vital Vessels, or those through which new Fluids ought to be conveyed, in the room of those lost. Hence arise Inflammations, Suppurations, and febrile Gangrenes, in the vital Viscera, the Heart, Lungs, and Cerebellum; or aphthous Ulcers in the Primæ Viæ, the frequent Causes of Death in Fevers.

A Fever terminates in other Diseases, when either, by a too violent Agitation, it injures the Vessels, and, dissipating the more fluid Parts of the Humours, inspissates the rest; or when, by a too weak Action, it is unable, by its Force, to resolve the coagulated Parts of the Fluids; or when it deposits the critical Matter in some obstructed, dilated, or ruptured Vessels. Hence arise red Spots, Pustules, Erysipelas, Measles, Small Pox, Phlegmons, Bubos, Inflammations of the Parotid Glands, Abscesses, Gangrenes, Sphacelus, and Scirrhus.

A Fever terminates in Health, first, When by its Force it subdued, resolves, renders moveable, and carries off, by insensible Perspiration, the material Cause of the Fever; and, at the same time, checks its Impetus, by restoring an equable Circulation. This universal Resolution almost resembles the Resolution in the Inflammation of a particular Part. Secondly, A Fever terminates in Health, when the Matter of the Disease, being, by the Force of the Fever, subdued, resolved, and rendered moveable, yet retains a certain Quality, by which it resists the equable Circulation of the Blood, stimulates the Vessels, and, by exciting some sensible Evacuation, is expelled. Hence Sweat, a Discharge of the Saliva, Vomiting, a Diarrhoea, and copious Discharge of Urine, happen critically, after the Concoction of the Matter, and the State of the Disease, generally within fourteen Days.

A Fever, also, terminates in Health, when the Matter of the Disease being, by the Force of the Fever, subdued, resolved, rendered moveable, and again assimilated with the sound Humours, circulates without any Crisis, or the Induction of any other Disease.

The Genius, Difference, and Duration, of Acute Fevers, when observed from the Beginning, through the Increase to the Height of the Disease, enable us to prognosticate its Event, several Changes, and final Termination.

From all the Circumstances, therefore, already enumerated, the general Diagnostics and Prognostics of Fevers may be easily deduced.

The general Cure of Fevers is most effectually obtained, first, By preserving and supporting that Strength on which Life depends. Secondly, By correcting and expelling the acrid irritating Matter. Thirdly, By dissolving and expelling the viscid Juices. And, fourthly, by mitigating the Symptoms.

The Strength on which Life depends, is supported by Aliments and Drinks of easy Digestion, opposite to Putrefaction, allaying Thirst, fit for increasing the Appetite, and contrary to the known Cause of the Disorder.

The Aliments are to be exhibited at the time the Fever is absent, or, at least, when its Force is least.

The Aliments are to be exhibited in a small Quantity, tho' at frequently repeated Intervals, lest the Viscera should be oppressed, or a Change induced on them.

The Quantity and Quality of the Aliments are to be estimated and determined, first, From the Probability of the Duration of the Fever, whether for one, four, seven, nine, eleven, fourteen, twenty-one, thirty, forty, or sixty Days; for as much Aliments ought to be exhibited as are sufficient for supporting the Strength, and rendering it fit for the Purposes of Concoction, and a Crisis: The shorter the Disease, the less and the weaker the Aliments ought to be; whereas the longer the Fever, the more and the stronger they ought to be. Secondly, From the Age of the Patient; for the younger and the older Persons are, with the greater Difficulty they bear Hunger. Thirdly, The Height and Vehemence of the Disorder, when

known, require Aliments of various Virtues, and exhibited in different Quantities. In the Height, a small Quantity of light Aliments are to be used; but, in the Increase and Decline, the more and the stronger the Aliments ought to be, the more the Disease is distant from its Height. Fourthly, From the Place in which the Patient lives: For those who live near the Equator, commodiously bear light Food, which does not so well agree with those who live near the Poles. Fifthly, From the Season of the Year; because the Summer requires light, and the Winter stronger Aliments. Sixthly, From the Custom and natural Constitution of the Patient: For the Person who, when in a State of Health, using delicate Aliments, has them easily dissipated, requires a pretty large Quantity of Aliments, because the Vessels and Viscera were accustomed to them before. And, seventhly, From the Sense of Lightness or Weight succeeding the Use of the Aliments.

Any external irritating Substance, such as the acute Fragments of Glass, Metal, Wood, Stone, and Bones, stimulating, corroding, vesicating, caustic, septic, and poisonous Substances, or such as produce a Redness of the Parts, are, with all Expedition, to be removed; and the Parts in which such Substances were lodged, and are injured by them, are to be fomented with viscid, mucous, mild, oleous, anodyne, and gently aperient Fomentations. Thus,

Take six Quince-seeds; and of the distilled Waters of Rose and Elder-flowers, each three Ounces: Make into an Emulsion, to which, when pure, add half an Ounce of rectified Spirit of Wine, and one Dram of the Tincture of Opium.

This Intention is, also, answered, by the Unguentum Aureum, Basilicon, Diapompholygos, the Unguentum Nutritum, Ointment of Poplar, and Ointment of Roses.

The acrid irritating Substance lodged internally, such as the Acrimony of an Inflammation, Suppuration, Gangrene, Sphacelus, Cancer, carious Bone, Ichor, Pus, and acrid or stagnant Lymph, is to be removed, or corrected, by the Methods prescribed under their respective Articles.

An acrid irritating Quality, induced on the Fluids, may and ought to be corrected by the Use of the six Nonnaturals, and various Remedies adapted to the known State and Nature of the Disorder. This Intention is excellently answer'd,

First, By Rest, both of the Body and Mind; Abstinence from too much Exercise; by moistening, diluting, mild, and lenient Substances, such as Ptisans, and laxative Decoctions.

Secondly, By temperating the excessive Heat of the Air, by cooling Exhalations, especially those of Plants proper for this Purpose; by drinking subacid, gently-nitrated Water, with a small Quantity of subacid Wine; by subacid, gently demulcent, and a little salted, Aliments; and by Medicines of a similar Nature. Thus,

Take of the Decoction of Barley, twenty-five Ounces; of pure Nitre, one Dram; of Rhenish-wine, six Ounces; of the Robs of Currans, and Elder, each two Ounces: Mix all together, and let the Patient take an Ounce or two every Quarter of an Hour.

Take of the distilled Waters of Succory, Fumitory, and Baum, each three Ounces; of the Spirit of common Salt, one Dram; of the Syrup of Mulberries, two Ounces; and of pure Nitre, half a Dram: Mix all together, and let the Patient take a Spoonful every Half-hour.

Take of the Crystals of Tartar, two Drams; and of pure Nitre, half a Dram: Reduce to a Powder, of which let the Patient take half a Scruple every three Hours, in some proper Pisan.

Thirdly, By correcting the excessive Moisture of the Air, by large Fires of aromatic and resinous Woods, and by the Exhalations of aromatic Substances. Thus,

Take of the recent Herbs of Marjoram, curled Mint, Origanum, and Rosemary, each two Handfuls; of the Flowers of Roman Chamomile, red Roses, Tansey, and Lavender, each one Handful; of Syrian Marum, half an Handful; of the Roots of Florentine Orris, Garden Angelica, and Masterwort, each three Ounces; of the Shavings of Sassafras, two Ounces; and of bruised Celeriseeds, three Ounces: Cut all down, and reduce to a Powder, to be sprinkled in the Room where the Patient is.

Fourthly, By correcting the putrid State of the Air, by throwing Nitre, Gunpowder, Vinegar, and Salt, upon live Coals.

Fifthly,

Fifthly, If a Fever is excited by Affections of the Mind, the Passions of the Mind are to be regulated by Reason, and contrary Affections; by Variety of Objects, Anodynes, and Opiates.

Sixthly, When a Fever proceeds from acrid acid Aliments, this Acrimony is to be diluted, check'd, absorb'd, and changed into a compound Salt; and this Effect is produced by the aqueous and gelatinous Parts of Animals, by oleous and cretaceous Substances, Shells of Fishes, Crabs-eyes, pinguious Earths, alkaline, fixed, volatile, simple, and compound Salts.

Seventhly, When the Fever arises from acrid saline Aliments; this Acrimony is to be diluted by aqueous Medicines, and evacuated at the same time; tempered by mild oleous Medicines; and corrected by lixivious Preparations of Quick-lime.

Eighthly, When the Fever proceeds from acrid, aromatic, and heating Aliments, the Acrimony is to be diluted by aqueous Fluids, corrected by Acids, resolved and deterged by saponaceous Acids, and tempered by mild glutinous Substances. As calefcent acrid Substances belong to this Class, so we hence learn the Method of treating Fevers produced by them.

Ninthly, When a Fever is produced by the calefcent Parts of Animals, it is to be cured by the Measures directed under the Article ALCALI.

Tenthly, When a Fever proceeds from too large a Quantity of Aliments, or the use of such as constrict the Stomach, it is to be cured by Dilution, Fasting, Vomiting, and rendering the Body soluble. Gentle Vomits may be prepared, in the following manners:

Take of light Bailey-water, thirty-six Ounces; of Oxymel of Squills, three Ounces; and of vitriolated Tartar which is not acid, two Drams: Mix, and let the Patient take two Ounces every Half-hour. Or,

Take of the Rob of Elder, three Ounces; Vinegar of Squills, one Ounce; and distil'd Baum-water, six Ounces: Mix all together, and let the Patient take half an Ounce every Half-hour. Or,

Take five Grains of Emetic Tartar, for one Dose. Or,

Take one Ounce and an half of Emetic Wine for a Dose. Or,

Take of white Ipecacuana-root, one Scruple: Reduce to a Powder, to be taken for one Dose. Or,

Take of the Powder of Ipecacuana-root, four Scruples; and of White-wine, three Ounces: Boil in a long Phial, for four Hours; and exhibit the Liquor, when strain'd, for one Dose. Or,

Take five recent Leaves of Asarabacca, cut down; pour upon them boiling Water; let them infuse for half an Hour; and exhibit the express'd Juice for one Dose.

Eleventhly, A Fever brought on by acrid, fermented, or fermenting Liquors, acid, oleous, aromatic, or distil'd Fluids, or a simple Acrimony, is to be removed by the same Remedies with those mentioned above in N^o 5. 6. and 8.

Twelfthly, A Fever arising from excessive Watching is cured by the same Methods with those recommended above in N^o 1, 2. and 5.

Thirteenthly, If a Fever arises from an alkaline, acid, oleous, or saponaceous putrid Acrimony, contracted by a Retention of the excrementitious Humours, these must be rendered moveable, their Passages must be lubricated, and their proper Emisseries opened; mean time, the vital Powers, which expel them, must be stimulated, and augmented: And this is to be done both by internal and external Remedies.

The principal excrementitious Humours, which, if retained, are capable of exciting a Fever, are the Fæces of the Belly, the Urine, the Lochia, the hæmorrhoidal Blood, and the perspirable Matter.

The Emisseries are opened by resolving the Matter fixed therein, and by relaxing the obstructed Emisseries: This is done by Baths, Clysters, Frictions, Abrasions of the Hairs, and cleansing of the Skin.

What stagnates at the Extremities of the conical Vessels, on account of too great a Quantity of Blood, by which the Vessels are compressed, is reduced to a State of Fluidity, by diminishing the Quantity of Blood by Venesection; and we learn, that this is the Case, by the Signs of a PLETHORA, specified under that Article.

What adheres to the Extremities of the Capillary Vessels, on account of spasmodic Contractions of their Fibres, by which their Capacities are diminished, is resolved by relaxing the

Fibres, and removing the Acrimony which causes their Contraction; for the Methods of doing which, see the Articles FIBRA, and OBSTRUCTION.

What adheres on account of its own Viscidity and Lentor, is resolved by various Remedies, the principal of which consists in a due Moderation of the Fever itself, in such a manner, that by means thereof the Coagulation may be resolved. It is, therefore, necessary to regulate the Fever in such a manner, first, that no Inflammations, Suppurations, Gangrenes, or Sphacelations, may be produced; the Danger of which is evinced, by the Violence of the Symptoms, particularly Heat, compared with the Strength of the vascular System.

Secondly, That the most fluid Parts of the Blood may not be dissipated by too violent a Motion thereof; the Signs of which Dissipation are; a Dryness of the Nostrils, Eyes, Throat, and Tongue; an Hoarseness, a Dryness of the Skin, a diminished Excretion of Urine, and a small, quick, and unequal Pulse.

Thirdly, That, before the Concoction of the febrile Matter, the Fever may not languish too much, so as to be incapable of subduing, moving, secreting, and excreting the Cause of the Disease. This State is distinguished by an universal Languor of all the vital Actions, before the Signs of Concoction appear.

In case the febrile Motion is exorbitant, (*See the Dissertation on Disorders arising from an Excess of the Circulation, under the Article SANGUIS*), it must be moderated by Abstinence, or an extremely thin Diet, by aqueous Drinks, by a somewhat cool Air, by calming the Passions of the Mind, by Venesection, refrigerating Clysters, and by mild, aqueous, glutinous, refrigerating, anodyne, and opiate Medicines.

Refrigerating Clysters may be prepared in the following manner:

Take of pure Nitre, two Drams; of Honey of Roses, one Ounce; and of recent Whey, twelve Ounces: Mix for a Clyster. Or,

Take of common Vinegar, one Ounce; of Native Nitre, three Drams; of solutive Syrup of Roses, with Sena, two Ounces; and of a Decoction of Barley, twelve Ounces: Mix for a Clyster. Or,

Take of Butter-milk, ten Ounces; and Syrup of pale Roses, two Ounces: Mix up, for a Clyster. Or,

Take of the common emollient Decoction, eleven Ounces; of pure Nitre, three Drams; and of Honey of Mercury, one Ounce and an half: Mix for a Clyster.

If the Fever is too languid, it must be raised by a cardiac Regimen, consisting of the more generous Sorts of Food and Drink; by respiring a somewhat warm Air; by exciting the Passions of the Mind; by acrid, volatile, aromatic, fermented Medicines; by Frictions, Heat, muscular Motion, Baths, and Fomentations.

FORMS OF MEDICINES IN A FEBRILE LANGUOR.

Take of Oxymel of Squills, three Ounces; of *Matthioli's* Spiritus Vitæ, three Drams; of distilled Mint-water, four Ounces; and of distilled Cinnamon-water, one Ounce: Mix all together, and let the Patient drink an Ounce every Hour.

Take of the Diascordium of *Sylvius*, one Scruple and an half; of the Theriaca Andromachi, one Dram and an half; of the Syrup of the Five aperient Roots, two Ounces; and of the distilled Water of Carduus Benedictus, six Ounces: Mix all together, for the same Use.

Take of the Confection of Alkermes, one Dram; of candied Ginger, six Drams; of the Roots of Contrayerva, and *Virginian* Snake-root, each one Dram; and of the Syrup of the Five aperient Roots, a sufficient Quantity for making a Conserve: Of which let the Patient take half a Dram every four Hours.

Take of the Countess of *Kent's* Powder, one Scruple and an half: And exhibit it for a Dose every four Hours.

Take of White Ginger, *Winter's* Bark, of the Roots of Zedoary, Contrayerva, and *Virginian* Snake-root, each one Dram; and of the Troches of Vipers, two Drams: Reduce to a fine Powder, to be divided into Doses of one Scruple and an half; one of which is to be taken every four Hours.

Take of the Salt of Carduus Benedictus, half a Dram; of burnt Hartshorn, one Dram; of red Coral, two Scruples;

ples; and of the distilled Oils of Cinnamon, and Citron-peel, each three Drops: Reduce to a Powder, to be divided into ten Doses, for the same Use.

Next to the due Regulation of the febrile Motion, the most important Remedy against the Viscidity of the Juices is, the Restitution of the elastic Force of the Vessels, by diminishing the Quantity of Fluids, by copious Venesection, performed with Expedition, and from a large Wound; and immediately after, or at the same time, increasing their Motion by stimulating Remedies.

Lastly, The viscid Juices are render'd fluid, by diluting with aqueous Drinks, Baths, Fomentations, and Clysters; using, at the same time, Frictions. And these have a much better Effect, if taken warm; if resolvent Salts, as Nitre, are mix'd in a due Proportion with the aqueous Fluids; and if gently aromatic, bitter, and lactescent cooling Vegetables are boiled in them.

The bitter lactescent cooling Vegetables hinted at by the Author, are the

Chondrilla. Gum Succory.

Cichorea. Succory.

Hieracia. Several Species of Hawkweed.

Intubus. Endive.

Lactuca. Lettuce.

Scorzonera. Vipers-grass.

Sonchus. Sow-thistle.

Taraxaca. Several Species of Dandelion.

Tragopogon. Goats-beard.

But, that these may operate well, expeditiously, safely, and with Efficacy, Venesection is to precede their Use; for this facilitates their Ingress, their Mixture with, and Action upon, the Blood.

So soon as, by these Remedies, the morbid Viscidity is dissolved, by a Continuation of the same, and sometimes augmenting their Actions, it is forced through the Vessels, and expelled: Sometimes, however, it may be so far subdued and amended, as to be rendered similar to the healthy Juices, and require no Expulsion.

The usual Symptoms, accompanying an acute Fever, are, Cold, Tremors, Anxiety, Thirst, Nausea, Eructations, Vomiting, Weakness, Heat, Exesuation, Dryness, Delirium, Coma, Watchings, Convulsions, Sweats, Diarrhoeas, and inflammatory Pustules.

All these Symptoms arising from, and caused by the Fever, cease spontaneously, when that is removed: For this Reason, they require no particular Method of Cure, provided they can be supported without endangering Life, till the Termination of the Fever.

But it must be remarked, that these Symptoms frequently arise from an Attempt of the vital Powers to form a Crisis, and expel the critical Matter; and then they precede, accompany, and follow the Crisis; in which Cases, nothing must be done to moderate them, which can in any Degree interfere with the salutary Work carrying on.

But if any of these Symptoms are unseasonable, or too severe to be supported without the Hazard of Life; if so troublesome, as to render the Patient insupportably uneasy; or if there is Danger of their producing some more formidable Disorder; in such Cases they must be mitigated by Remedies adapted to them; always having due Regard to the Cause and State of the original Distemper.

FEBRILE SYMPTOMS; and first of

FEBRILE COLD.

Cold, in the Beginning of Acute Fevers, arises from a decreased Attrition of the Liquids with each other, and with their respective Vessels; a Diminution of the circulatory Motion; a Stagnation of the Liquids at the Extremities of the Vessels; a diminished Contraction of the Heart, and only a partial Evacuation of its Ventricles; and a less copious Influx of the Spirits conveyed from the Cerebellum.

This Cold, if of long Duration, causes polypose Concretions in the larger Vessels near the Heart; and in the small Vessels an Evacuation of the Fluids they ought to contain, in consequence of their Contraction; and in both these Cases many and severe Disorders are excited.

Hence the Reasons are evident, why intense Coldness, in the Beginning of Acute Fevers, is of very bad Prefage; why the Fever is dangerous, in Proportion to the Cold perceived upon its first Attack; and why, in the Beginning of the Plague, an excessive Sensation of Cold is succeeded by as excessive a Degree of Heat.

If any Attempts are made to remove the Coldness in the Beginning of Acute Fevers, by any Remedies which stimulate briskly, under whatever Denomination, a Foundation is frequently laid for an incurable Inflammation in the Sequel. For

this Reason, all kinds of acrid saline Medicines, aromatic and oleous Substances, and Veficatories, are to be condemned, in these Cases, as highly pernicious.

But a much more safe, and effectual Method of Cure, may be pursued, by exhibiting warm aqueous Drinks impregnated with Nitre, a little Honey, and Wine; by Baths, Vapours, Fomentations, and Lotions, made of the same Sorts of Liquors; and by moderate Frictions: For these, applied at first, are capable of curing and preventing very great Disorders.

Take of Barley-water, thirty Ounces; of pure Nitre, two Drams; of simple Oxymel, three Ounces; and of distilled aromatic Clove-water, two Ounces: Mix all together, and let the Patient, every Quarter of an Hour, drink two Ounces, pretty warm.

Take of the Four greater and lesser cold Seeds, each two Drams: Make into an Emulsion with Water, with three Pints of which mix, of distilled Fennel-water, four Ounces; of Sal Prunellæ, two Scruples; of the Syrup of the Five aperient Roots, two Ounces; and of the Syrup of Violets, half an Ounce: To be exhibited for the same Purposes with the other.

Take of distilled Borage-water, one Pint; of the distilled Water of Rose-flowers, one Ounce; of distilled Elder-flower-water, eight Ounces; of Distilled Cinnamon-water, one Ounce and an half; of *Matthioli*'s Spiritus Vitæ, half an Ounce; and of *Fernelius*'s Syrup of Mugwort, two Ounces: Mix all together, and exhibit for the same Use.

Coffee, Decoctions of Sassafras and Sanders, together with others of a like Nature, are of singular Service in the cold Fit, especially if towards the End of their Preparation a small Quantity of some aromatic Substance is added. Thus,

Take of the White, Yellow, and Red Sanders, each one Ounce: Boil in Water for a Quarter of an Hour: Then add, of the Roots of Fennel, four Ounces; of the Shavings of Sassafras, two Ounces; and of Liquorice, half an Ounce: Let them boil for a Moment, and strain off four Pints; for the same Use with the others. *Boerhaave*.

PROGNOSTICS FROM COLDNESS IN ACUTE DISEASES.

A Coldness of the Body, which may rather be called a *Coldness*, or moderate *Heat*, after some good Evacuation, by which the Pulse is rendered better, and stronger, is a very good Sign, as it indicates a critical Solution of the Fever: That *Coldness*, also, which is the Consequence of refrigerating or allaying the Heat of a Fever, and is attended with Signs of Concoction in the Urine, Spit, or Stools, (where the Disease has affected the Nervous System, spirituous Parts, or Belly) and an Alteration of the Pulse for the better, is a very good Symptom, and signifies a safe and speedy Return of Health. A *Coldness*, also, is sometimes observed to be critical, or preceding a very good Crisis.

Though a *Coldness* thus qualified, as before described, is to be esteemed salutary; yet it rarely happens that we can draw any good Prognostic from a *Coldness* of the Body. This *Coldness*, to proceed, is observed either in the whole Body, or in the external Parts; in continual Fevers it is generally mortal, but in very robust Constitutions it portends not Death, but the long Continuance of the Disease. Under great Weakness it is always mortal, that is, where the Disease has been great and violent; when it is the Consequence of an Extinction of the Faculty, it shews Death to be very near: But that it proceeds from such a Cause, will be indicated by other preceding destructive Signs.

Some who labour under an Anasarca, but especially under an Ascites and Leucophlegmatia, have a *Coldness* almost of the whole Body; and the same is observed in Persons affected with inward Suppurations when dying; such have a *Coldness* or Chilness in almost every Part, either from an extraordinary Refusion of the natural Heat, or a Redundance of cold Humours.

A *Coldness*, however, of this Nature, in the extreme Parts, affords not always sure Grounds for Prognostication; for in some Patients, not under any acute Distemper, such a *Coldness* is not much to be feared. In Diseases, says *Galen*, not attended with a Fever, which happen in Winter, and to old Persons, for the extreme Parts of the Body, as the Ears, Nose, Feet, and Hands, to be cold, is not at all surprising; since, as he attests, in his second Comment on the *Prognostics*, those Parts are naturally bare of Flesh, and, also, at a great Distance from the Viscera.

But a *Coldness* of this Sort, in Acute Diseases, is no small Evil; for, by means hereof, through Weakness, the natural Heat is prevented from penetrating to the extreme Parts of the

the Body; besides, under acute Disorders, through the Violence of the Inflammation infecting the Viscera, the Blood is distributed but in small Quantities over the Body. In these Kinds of Disorders; therefore, for the Body to be cold, and chilled, and not only in the Extremities; but in every Part together, is very pernicious, unless occasioned by the Approach of a Fit; for it indicates the natural Heat to be either extinguished, or to labour under a Suffocation from the Multitude of Humours; but such a Coldness is attended with many other mortal Signs. Many dying Persons appear cold, with Desudations, or cold Sweats, and an extreme Languor; and they appear not only to be excessively cold, but, also, hard; whence we read, 1 *Prorrh.* 77. "That a Refrigeration with an Hardness, is a destructive Sign." But we shall proceed to examine more accurately into the Prognostics, which may be drawn particularly from a Coldness of the extreme Parts.

OF PROGNOSTICS FROM A COLDNESS OF THE EXTREME PARTS OF THE BODY.

The extreme Parts of the Body, which *Hippocrates* in his *Prognostics* calls the *Head, Hands, and Feet*; *Galen* on 7 *Aph.* 1. more distinctly, the *Nose, Hands, and Feet*, are affected with a Coldness in acute Diseases; when the natural Heat is either contracted, resolved, oppressed; or suffocated; or, in the last place, extinguished. The natural Heat is contracted inwardly to the Viscera, relinquishing the extreme Parts of the Body, and possessing the middle Parts; the Thorax, and the Belly, either on account of a violent Inflammation, or Erysipelas, affecting the Viscera, and, as *Galen* says, by its Heat attracting the Blood, in manner of a Cupping-glass, to the affected Part, or from a severe Pain in the Stomach, or its Mouth, or in the Colon, small Intestines, Uterus, or Kidneys; or, lastly, on occasion of the Fit, when Nature is at Work in the internal Parts, and makes its utmost Efforts to expel the redundant Humours with which it is oppressed; from which we prognosticate sometimes Death, sometimes Recovery, according to the present extraordinary Degree of Strength or Weakness of the Patient.

The natural Heat is resolved, either by the Violence of the febrile Estuation, or some vehement Pain, or immoderate Evacuation, or some poisonous Juice offending the Heart, and the Mouth of the Stomach, or by a sudden and immoderate Fit of Mirth.

The natural Heat is oppressed or suffocated in the Viscera; whence the remote Parts, being left destitute of their wonted Supplies of Heat, are refrigerated, when the Mouth of the Stomach is either overloaded with an immoderate Quantity of Food, or strongly vellicated by mordacious Humours, as *Galen* expresses it, *Com. in Lib. de R. V. I. A.* or when, the Viscera are infected with a Multitude of corrupt or crude Humours, by which the natural Heat is either suffocated, or remarkably oppressed, in the same manner as when by heaping great Quantities of green Wood upon a Fire, the same is so far from being increased, that it is quite suffocated, or, at least, much diminished, by so doing. Thus is the Heat shut up, and confined, within the Viscera by the Redundance and Coacervation of the Humours, so that it cannot penetrate or expand itself to the exterior Parts; the Veins and Arteries, by which it was diffused from the Viscera, being obstructed by those crude or corrupt Humours. A Fever proceeding from such a Cause is, by some, called *Lipypria*, [*λεπυρία, λιπύριον, λιπυρία*] by others, *Asaphodes*, that is, obscure and latent [see *ASAPHES*]; by others is described as mild and gentle externally, but violent and tumultuous within: The Reason is, because the Fever owes its Original to a Multitude of putrid Humours, or a Redundance of cold, crude, and gross Humours, by which the Heat is suffocated; or to a Phlegmon affecting the Viscera, or to a malignant and poisonous Putrefaction; in all which Cases there is a Coldness, or, at least, a Coolness, and Absence of Heat, in the extreme Parts.

The natural Heat is not only destroyed or diminished by Strangulation or Suffocation, but is even extinguished by an intense Coldness, or an occult poisonous Quality, by which the vital Parts are corrupted; as may be observed in the Effects of cold Poisons, and such things as are mortal from a Property inherent in their whole Substances, as *Galen* expresses it.

Again, the natural Heat, which has its Seat in the solid Parts, according to *Galen*, may be wasted, resolved and dissipated, by a greater or flameous Heat consuming the humid Parts, by which the natural Heat itself is preserved, and lives. Thus it happens in hectic Disorders, and under violent Pains of the Viscera, by which the natural Heat of those Parts is corrupted and resolved; on which account, *Hippocrates* had Reason to pronounce, 7 *Aph.* 26. a Coldness of the extreme Parts, under a violent Pain in the Parts of the Region about the Belly, a bad Sign.

In the last place, a Coldness may be generated, or Heat be destroyed, by an immoderate Evacuation, either spontaneous, or procured by Art; the Consequence of which, when extreme, is a mortal Syncope; in which the Patient dies under a Coldness of the extreme Parts: And the Symptom is occasioned by a Resolution of the Heat from opening an Artery.

We have hitherto been employ'd in examining into the Causes of this Coldness, or Extinction or Diminution of Heat, in the extreme Parts, and proceed now to the Prognosis, or Signs, afforded by it for our Observation; from whence we may predict a good or bad Event in an acute Disease.

In the first place, then, a Coldness of the extreme Parts, when Nature makes Attempts towards a Crisis, with other good Signs, must be esteemed salutary. But at the periodical Return of a Fit, or under a long Disease, such a Coldness affords no certain Prognostic; neither is it to be accounted a mortal Sign in old Persons, and in the Winter-season.

"A Coldness of the extreme Parts (with the before-mentioned Exceptions) in acute Diseases is, as *Galen* says, *Com. in 7 Aph.* 1. no slight Disorder, but a very pernicious Symptom, as it is the Consequence of a violent Inflammation of the Viscera." But here we are to except, also, a Coldness of the Extremities from unseasonable Eating, and what is occasioned by a Paroxysm, in which, says *Galen* on the *Prognostics*; not only the extreme Parts, but the Skin about the Ribs and Belly, are rendered cold.

A Coldness of the extreme Parts sometimes begins at the same time with the Disease; and this Symptom was observed by us one Year in many wandering malignant Fevers, which derived their Original either from a most intense Degree of Putrefaction; by which the Viscera are affected, as it were, with Poison, and the natural Heat on that Account very much resolved, or else retracted inwards, or almost suffocated by the Redundance of the highly putrid Humours; or, which is the last Account to be given for it, the Fever was kindled up, and took its Rise, from crude and pituitous Humours, as we observe in a *Febris Amphemerina*, or Quotidian.

A Coldness of the Extremities, in continual Fevers, is always bad, and imports Death, or Malignity, but most commonly Death. When this Symptom appears in the Beginning, together with the Fever, and not in an extraordinary Degree, it foreshews only a Malignity; and is accounted by Physicians a pathognomic Symptom of malignant Fevers, in which the Patient is often not very thirsty, nor has his Tongue very much dried; and this Coldness is sometimes equal, or of one Temperature, during the whole Course of the Disease, and sometimes unequal, or more or less increased and diminished.

A Coldness of the extreme Parts, not in the Beginning of the Disease, but on a critical Day, with critical Signs, indicates a Crisis, or a Change of a continual Fever into an Intermittent. But an intense Coldness of the Extremities, and of long Duration, with bad Signs, is always bad, and worst of all on a critical Day.

An almost invincible Coldness of the extreme Parts is a mortal Symptom: And this is confirmed by *Hippocrates* in his Observations, 1 *Epid. Sect. 1.* on a very mortal epidemic Fever, in which the Patients, he says, "were very subject to Refrigeration of the extreme Parts, into which it was very difficult to recal the Heat." And by what he tells us, 3 *Epid. Sect. 3.* in his Account of the Symptoms of an epidemic, and very malignant burning Fever, among which was "a remarkable Coldness of the Extremities of the Feet and Hands, and especially about the time of the Paroxysms, into which the Parts the Heat returned but by slow Degrees, and not in a kindly manner." To the same Purpose he says, of some who died of a Tabes, that, towards their End, "they were much affected with Coldness, and were hardly capable of receiving Heat." In *Prorrh.* 65. we read, that "Refrigerations after a Rigor, which are not succeeded by a Return of Heat, are bad." Thus they proved, for Instance, in the Case of *Philiscus*, 1 *Epid. Sect. 3. Aeg. 1.* "whose extreme Parts [the Day before he died] were cold on every Side, and never recovered any Heat afterwards." The same happened to *Silenus*, *ibid. Aeg.* and others mentioned in the *Epidemics*, not long before their Death.

In Persons very near Death, there is observed a Coldness of the extreme Parts equal to that of a Marble-stone, and often attended with an Hardness and Lividness. Now an Hardness, with an intense Degree of Coldness, is accounted a mortal Sign, as we read 1 *Prorrh.* 77. on which *Galen* says, "If the Coldness be so intense as to cause a total and absolute Refrigeration, with an Hardness, it is a Sign of Extinction," or that the natural Heat is extinguished.

A Coldness of the extreme Parts, attended with a Lividness, is no less mortal; for this latter is of all Symptoms the most pernicious, and shews Death to be at the Door. For a livid Colour

Colour in those Parts indicates an Extinction of the natural Heat, as we are taught by *Galen*, who, in his Comment on the third Epidemic, tells us, that a Coldness of the extreme Parts, attended with a Lividness, is an evident Sign of Death. And this is confirmed by *Hippocrates*, *Lib. Prognost.* where it is said, that, "If, besides this dead Heaviness of the Body, [before mentioned] there be, also, a Lividness of the Nails and "Fingers, nothing is to be expected but immediate Death." And, in what follows, we read, "That for the Fingers and "Feet to be quite black, is less pernicious than for them to "be livid;" and not without Reason, since a Lividness of these Parts always proceeds from an Extinction of the natural Heat, but a Blackness is not always from that Cause; for it may be owing to a black Humour settled in those Parts. We may conclude, therefore, that if to a Coldness of the extreme Parts there accedes a Lividness of the same, it is a most mortal Symptom, and shews Death to be near at hand. This we have abundantly confirmed by *Hippocrates* in his first and third Epidemics, by Instances in *Philiscus*, *Silenus*, the Woman who lay ill of a Quinsey at the House of *Aristion*, 3 *Epid. Sect. 1. Agr. 7.* the Daughter of *Euryanactes*, *ibid. Agr. 6. Erasimus*, and the young Man who lay ill in the *Forum Mendacium*, in all whom this Symptom was observed as they lay dying.

A great Coldness, or Chilness, of the extreme Parts, attendant on an intense Thirst, with a vehement Heat in the Thorax or Belly, is esteemed very pernicious, because it indicates a violent Inflammation of the Viscera, and is, as *Galen* says, *Com. in 7 Aph. 1.* an usual Symptom of the same. This is asserted, also, by *Hippocrates*, *Prognost.* where he says, that "For the "Head, Feet, and Hands, to be cold, whilst the Belly and "Sides are in an Heat, is bad;" and *Galen*, in his Comment, says, "it is not only bad, but mortal." The Sense of this Passage is very well and fully expressed by *Cornelius Celsus*, in the following Words: *Cui Febre aque non quiescente exterior Pars friget, interior sic calet, ut etiam sitim faciat, lethale:* "A Coldness of the exterior Parts, where the Fever ceases "not in Proportion, and an Heat in the interior Parts so great "as to cause a Thirst, is mortal."

A Coldness of the Extremities is accompanied with other pernicious Signs, besides those mentioned; such as a violent and continual Pain of the Head or Viscera, Want of Sleep, a Coma, a furious or gentle Delirium, Dotage, Loss of Memory, Deafness, Blindness, Convulsions, Tremor, Loss of Voice, Hiccup, Restlessness, Anxiety, difficult Respiration, and cold Expiration from the Mouth and Nostrils, turbid Urine, which will not become clear, black Urine, with a black ENÆOREMA, [see that Word] white, aqueous, lucid Urine, and Suppression of Urine, Drops of Blood from the Nose, virulent Vomitings, bad and copious Stools, which give no Relief, and other Symptoms of the like Kind. Any of those, appearing with a Coldness of the extreme Parts, portends Death; and the more there are of them, the more certain and speedy is the fatal Event. This is illustrated by *Hippocrates* in the Case of *Silenus*, so often quoted, of whom he observes, that "On "the sixth Day he had a thin small Sweat about his Head, "his extreme Parts were cold and livid, he was very restless, "voided nothing by Stool nor Urine, and had an high Fever." And of *Pythion*, 3 *Epid. Sect. 3. Agr. 3.* who died in *Thasos* in ten Days, it is observed, that "On the second Day about "Noon, his extreme Parts, and especially his Head and Hands, "were affected with a Coldness; he was speechless, and lost "his Voice, fetched his Breath short, and at long Intervals, "βραχύνοντες ἐν χεῖρσι ποναῖν. We have here, with *Galen*, "and some few Copies, joined the three last Words with the "first, and not with ἀνθερμάνον which follows them. See "BRACHYPNOEA; his Heat returned with a Thirst, he had "a quiet Night, and sweated a little about the Head." From these Instances, with what has been said, it appears, that a Coldness which is perpetual, or in a very high Degree, or attended with an Hardness, or Lividness, is a very pernicious Symptom, as indicating an Extinction of the natural Heat.

We may form Prognostics of a bad Event, also, from a Coldness, with respect to the preceding Symptoms, as, for Instance, when it succeeds a Rigor, and is not removed, according to 1 *Prorrh. 65.* where we read, that "Refrigerations "succeeding a Rigor, and not followed by a Return of the "Heat, are bad."

For the extreme Parts to be much chilled after bad Evacuations, is pernicious, and especially if these Evacuations themselves are of the Number of mortal Signs; such as Blood falling by Drops from the Nose, cold Sweats, Desudations in the Head, Urine aqueous, livid, icteric, turbid, depositing no Sediment, black, with a black Enæorema, a Suppression of Urine, Stools fat, liquid, very fetid, too frequent, or immoderate in Quantity, Spit black, livid, viscid, expectorated with much Difficulty, or quite intercepted. A Coldness, or Refrigeration

of the extreme Parts, succeeding any of these bad Symptoms just enumerated, is pernicious.

A Coldness of the Extremities is known to be destructive, not only by preceding, but by concomitant and subsequent bad Signs. A Refrigeration, or Coldness, of the extreme Parts is usually followed by many other Symptoms of mortal Signification. And here, with respect to the Coldness itself, if this be first moderate, but increases afterwards to a violent and intense Degree, it is pernicious, because, as we have said out of *Galen*, it indicates an extreme Languor of the Faculty. It is no less fatal, in the second place, if this Coldness of the Extremities be succeeded by little or no Degree of Relaxation; as we find it confirmed in the Case of dying *Philiscus*, 1 *Epid. Sect. 3. Agr. 1.* of whom *Hippocrates* observes, "That his extreme Parts were cold on every Side, and never afterwards "recovered their Heat;" and of *Silenus*, "who, it is said, "on the seventh Day was speechless, and could never from that "time have the Heat recalled into his extreme Parts."

A Part, after extreme Refrigeration, becomes livid, and sometimes hardens, in which Circumstance, if it long continues, Death, as was said, is at the Door. The same Event may be predicted from a subsequent Coma, Dotage, Forgetfulness, Deafness, Blindness, Loss of Voice, Convulsions, Tremor, cold Sweats, especially in the refrigerated Parts themselves, (which kind of Sweats seems indeed proper only to a Syncope and Death) Evacuations not good, no way relieving the Patient, or suppressed, Difficulty of Respiration, and the like Symptoms, many of which were observed by *Hippocrates* in dying *Silenus*, after a Refrigeration of the extreme Parts, and described by him as follows: "On the sixth Day he sweated a little about the Head, his extreme Parts were very cold, "and grew livid, he was very restless, had no Excretion by "Stool nor Urine, and was in an high Fever. On the seventh "Day he was speechless, his extreme Parts recovered no more "Heat, and he made no Water. On the eighth he had a "cold Sweat over all his Body, and, with the Sweat, an Eruption of small, round, red Exanthemata, resembling *Vari*, "which settled without forming an Abscess; he voided, with "little Provocation, much thin, and, as it were, indigested "Matter by Stool, and with some Difficulty; his Urine was "sharp, and excreted with Pain; his extreme Parts recovered "some little Heat; his Sleep was but slight and comatous; "and his Urine was thin and pellucid. On the ninth Day "the Symptoms were much the same. The tenth he refused Drink, was affected with a Coma, and slept in a "slight manner, his Stools were the same, but he discharged "Plenty of thickish Urine, which deposited a white and branny "kind of Sediment; his extreme Parts were again refrigerated. "On the eleventh Day he died." We conclude, then, upon the Whole, that a Coldness of the extreme Parts, preceded, attended, or succeeded, by any of these before-mentioned, or the like pernicious Symptoms, gives just Reason for predicting a fatal Event in acute Diseases.

OF PROGNOSTICS FROM A CHANGE OF HEAT TO COLD, AND OF COLD TO HEAT, IN ACUTE DISEASES.

It often happens in acute Disorders, that the whole Body changes from hot to cold, and from cold to hot, sometimes slowly, sometimes suddenly. A sudden Change to Cold, unless occasioned by a Paroxysm, is always bad; since, as it has been observed, it indicates the natural Heat to be either resolved, or by the Multitude of crude Humours oppressed and suffocated to such a Degree, as to be incapacitated, the Vessels being obstructed, for expanding itself externally; or that it is entirely collected in the inward Parts, on account of some malignant Humour, or violent Inflammation, infesting some of the principal Viscera.

We conjecture the natural Heat to be resolved, if there has appeared some preceding Cause of a Resolution; such as a violent and continual Fever, continual Watchings, severe Pains, and immoderate Evacuations of Blood or Humours.

A Suffocation is indicated by a Plethora, in which the Veins and Arteries are obstructed by the Multitude of crude Humours.

That the natural Heat is not expanded externally, we know by all those Signs which indicate the Redundance of the Humours; and that it is retracted inwardly by some acrid or malignant Humour infesting the Mouth of the Stomach, the Heart, or some other noble Part, we conclude from Pains about the Region of the Part affected, Loathing, ANGOR, [see that Word] Nausea, virulent or bilious Vomitings, Despondency of Mind, Anxiety, Watching, the Pulse highly irregular, weak, and low, and the like, as may be observed in those who have the Mouth of their Stomach vellicated by Worms, or some acrid Juice.

When

When some internal Inflammation is the Cause that the Heat retires inwards, it is known by the Heat of the inward Parts; and, by proper Signs, which *Celsus*, as above-quoted, has expressed from *Hippocrates*, where he says, "That a Refrigeration of the extreme Parts, where the internal Parts are parched with Heat in such a manner as to excite a Thirst, is mortal;" for such a Refrigeration has for its Cause an internal Inflammation, and that in a very violent Degree.

In whatever manner, as we said, the Body is refrigerated, it is never good; but it is often highly pernicious, and most of all, if the Coldness, or Refrigeration, be long and intense, or, if an Hardness, or Lividness, accede thereto; for then Death, as was observed, is very near. A sudden and immediate Refrigeration of the actually warm Parts is, also, constantly bad, except that Refrigeration of the extreme Parts, which is occasioned by Nature in her Attempts towards a critical Excretion of the Humours; for it often happens against a Crisis, from the impetuous Course and Conflux of the malignant Humour to some noble Part, that the extreme Parts are refrigerated, and never, or but very seldom, and by slow Degrees, recover any moderate Degree of Heat; after a Propulsion of the Humour to some more ignoble Part of the Body.

On the contrary, for refrigerated Bodies to recover Heat by equal and slow Degrees is a very good Sign; for it shews, that no inward, latent, acrid, or malignant Humour infects a noble Part, that there is no Inflammation in those internal Regions, nor any thing to prevent or intercept the Heat from diffusing itself over all Parts of the Body.

For the Parts to be unequally heated, is never good, and is sometimes esteemed a very bad Sign; but for the outermost Parts of the Body to be suddenly and frequently changed from hot to cold, and from cold to hot, in malignant Diseases, is pronounced by *Hippocrates* very pernicious, and is indeed esteemed more dangerous than the like Mutations in other Symptoms. To the same Purpose we read in 1 *Prorrh.* 43. "That sudden Mutation of the remote Parts to either Extreme is bad, as is, also, a Thirst of the like Nature;" that is, subject to the like Permutations. Here *Galen*, in his Comment on the Place, says, that in Diseases highly malignant there is a Mutation of these Qualities into their Contraries in the Space of one Hour, in such a manner, that the Patient shall at one time feel himself as cold as in Winter, and, soon after, as hot as in the Summer-season; and the Reason is, he says, because he has no Heat of his own, but is heated by that of the Fever, which, beginning at the Middle of the Body, and like a Flame spreading itself every-where, kindles an Heat in the extreme Parts, which being spent and transpired, those Parts grow cold again, because the natural Heat is extinguished.

Such swift Mutations of Heat and Cold, and, also, of Colour, and every other Symptom, frequently indicate a Complication of Affections in the Body, which requiring a considerable Length of Time for Nature to subdue, shews, that the Disease will be long and tedious; as is expressly affirmed by *Hippocrates*, 4 *Apb.* 40. where he says, that "Mutations in the whole Body, as when the same is refrigerated, and then again heated, signify the Length of the Disease."

In very acute and violent Disorders such sudden Mutations are a Sign that Nature is stinted in its due Time by the Violence of the Disease, and is in imminent Danger of being extinguished before it can put itself in a Posture of Resistance. Upon this Consideration it is, that we are told by *Galen* on the *Prorrhetica*, that Mutations of this Kind in highly malignant Distempers, are mortal, and that they are occasioned by an Extinction of the natural Heat.

Mutations of this Kind, or sudden Changes in other Symptoms, as from a Thirst to an utter Extinction of the same, from a placid Stillest to Restlessness, from Watching to profound Sleep, from the perfect Use of Reason to Deliriousness, or the Reverse of all these, are generally, also, of fatal Signification.

A Change of Symptoms in such a manner as, for Instance, there shall be a Pain of the Head, soon after of the Belly, then of the Legs, and soon after a Cessation of Pain, followed in a short time by a Delirium, which quickly gives place to another Symptom, has for its general Cause a *Metaptosis*, that is, a Transflux of the Humours; for Migrations of the Humour from one Part of the Body to another, or Turgescencies of the Humour appearing successively in different Parts, have the Name of *Metaptosis*, which of itself bears no other Prognostic than does the turgescent Humour. Every Turgescence or Orgasm of the Humours is, however, to be dreaded, since it threatens an Injury to some principal Part; for which Reason *Hippocrates*, 1 *Apb.* 22. *Galen*, and indeed all other Physicians, in Turgescencies, or Orgasms of the Humours, have immediately prescribed Purging even in the Beginning, when all things are in a crude State.

Permutations of Heat, Cold, Colour, and other Symptoms and Qualities, appearing with Signs of Concoction, indicate a

critical Perturbation of the Humours. And in this Sense, perhaps, we are to understand, *Coac.* 125. where it is said, that "Frequent Changes of the Colour with the Heat are of Service."

In malignant Diseases these Mutations are of Use, if made for the better, according to that of *Hippocrates*, 6 *Epid.* Sect. 6 *Apb.* 16. ἐν τοῖσι παλιμβέλοισι αἱ μεταβολαὶ ὠφελεῖσι, τῶν τοῖσι μεταβάλλειν πρὶν κακῶσαι ἐς τὰ πρόποια, "In deceitful (malignant) Diseases, Mutations are serviceable, if directed to proper Places, before they have received some Injury." [*Forsius* for παλιμβέλοισι reads παλιμβέλοισι, which he owns to be an obscure Word, and renders it in his Notes by *inconstantibus*, inconstant; and in this Sense, which seems most probable, the Sentence may be otherwise translated, thus, "In mutable, and inconstant Diseases, Changes are beneficial, if made in proper Places, and before any Malignity is contracted."] *Prosper Alpinus de Præfag. Vit. & Mort.*

FEBRILE TREMOR.

A Tremor is a Vacillation of the Muscles betwixt the State of Tension, and that of Relaxation, the distending and relaxing Causes suddenly, and involuntarily, succeeding each other; which supposes an alternate Cessation, and Repetition of the Influx of the arterial, and nervous Fluid into the Muscles: In the Beginning of a Fever, therefore, it arises from a partial Stagnation of both the above-mentioned Fluids; but, in the latter End of a Fever, a Deficiency of them, after they have been too much dissipated.

A Tremor, if of long Duration, causes Impediments to the Circulation of the vital Humours, and all their fatal Consequences.

Hence the Diagnostic and Prognostic of a febrile Tremor may be understood; and hence 'tis evident, why a Tremor joined with Coldness, and why a very great Tremor, are of extremely bad Presage: Why a Tremor accompanies very great Affections of the Mind: Why a Tremor happens about the time of Death: Why it is excited by exorbitant Evacuations of any kind: And why, when the Body has been habituated to a too copious Use of Liquors of any Sort whatever, a Depletion of the Vessels, by Abstinence from these Liquors, is accompanied with a Tremor.

A febrile Tremor is cured by restoring an equable Influx of the arterial Fluid into the Arteries, and its due Pressure upon them, and of the Spirits of the *Cerebellum* into the moving Fibres. This is done in the Beginning of the Fever, by such Remedies as dissolve Viscidities, and restore the Strength, which are specify'd above: But at the latter End of a Fever, by whatever expeditiously recruits the dissipated Liquids, and corroborates the Fibres and Viscera. See *FIBRA.* *Boerhaave.*

PROGNOSTICS FROM A TREMOR.

In treating of this Subject, we are first to shew what a Tremor is; and, next, from what Causes it proceeds. *Galen*, *Com.* 1. in 3 *Epid.* makes a Tremor a Diminution not of natural, but voluntary Motion; in which the Will or Faculty endeavours to move the affected Part, but fails of its Purpose, through the Imbecillity or Oppression of the same Part, which makes a Motion contrary, at least in some respect, to what was intended.

This kind of Affection differs from a convulsive Motion, which several have mistaken for a Tremor in Acute Fevers, under a Persuasion that *Hippocrates* makes a Tremor to be a convulsive Motion in many of his Patients, particularly in the fair Daughter of *Nerius*, 5 *Epid.* T. 50. of whom it is said, ἡ σπασμὸς, ἡ τρομῶδης ἦν. There were Convulsions, also, and she was affected with a Tremor. On some such Consideration, perhaps, it was, that *Sabinus* and *Metrodorus*, two ancient Physicians, said, that a Tremor was a small Convulsion; intending, by this Expression, it is supposed, an Affection complicated of a Tremor and Convulsion; which kind of Tremor is, also, among Physicians, usually called a convulsive Motion, and *Convulsio ex Materia non proportionata*.

Others think that *Hippocrates* sometimes by Tremor means a Rigor; particularly 4 *Epid.* T. 13. where he relates of the young Stranger Patient, that on the sixth Day he had a Crisis; on the seventh the feverish Fit returned, and went off with a Tremor; that is, as they would have it, with a Rigor. In this Matter, however, they seem to be mistaken, since we persuade ourselves that *Hippocrates* means a real Tremor, and not a Rigor; if for no other Reason but that the Crisis, on the sixth Day, was not a perfect one, but effected partly by an Excretion, partly by a Translocation of the morbid pituitous Matter upon the Nerves and Muscles, which was the Occasion of the Tremor.

But we have said enough on this Point, and proceed to shew the Generation of a Tremor. And here we are told by *Galen*, *Lib. de Trem. Rig. Palp. & Convuls.* that a Tremor is occasioned

tioned by Weakness, or an Imbecility of the motive Faculty, which is sometimes infirm of itself, as in old Persons; and sometimes accidentally from other Causes; particularly, as the same Author proceeds, from want of Aliment, from a violent Flux of the Belly, or a profuse Hæmorrhage; also, from long Fasting; by which the Aliment is consumed, and, consequently, the Faculty weakn'd; or from a Resolution of the vital Force, as the Case is in Stomachics, Cardiacs, in Faintings, violent Colds, and a Plethora oppressing the Muscles and Nerves. And he seems to speak much to the same Purpose, *Com. 1. in 3 Epid.* when he makes the Cause of a Tremor to be the Imbecility of the muscular Force, which is occasioned either on its own Account, or from an oppressive Redundance of Humours, or by Hunger, Lassitude, Watching, Cares, or immoderate Venery; all which resolve the natural Heat, or Strength. But let us hear the same Author more explicitly declaring the Cause and Generation of a Tremor, as follows, in the Place just before quoted. A Tremor, he says, is occasioned not only when the Muscles and Nerves are disorder'd, but when they are in a sound State; when any Person undertakes to heave, or carry in his Hands, something above his Strength. Thus some very strong young Men, in carrying some very heavy Burden, and especially when they have tried to ascend with it by Steps, have been observ'd to tremble in their Legs; and what happens to them from an extraordinary Weight, the same is occasion'd in old and weak Persons by a Weight which is lighter; for that is heavy to them. And a little after, comprehending under one all the Causes of a Tremor, he says, *We had the greatest Reason, therefore, in our Treatise de Tremor. Convuls. & Rig. for ascribing always a Tremor to Imbecility.*

But since the Virtue, or Faculty, is sometimes weak of itself, sometimes from some Passion of the Mind, and sometimes not at all from itself, but from a Load which oppresses it; hence there are three different Causes of a Tremor; which are, a Disorder in the Organs under the Command of the Faculty, the Passions of the Mind, and an heavy Load.

First, then, a want of due Temperament, or a Distemperature, whether hot, cold, dry, or moist, may render the Muscles so weak, as to occasion a Tremor in their Parts: For Heat, if excessive, resolves or dissipates the natural Strength; violent Cold, on the other hand, extinguishes the natural Heat; Humidity, when imbibed in an excessive Degree, oppresses the Muscles; and immoderate Dryness consumes the Humid, which preserves and maintains the natural Heat: Hence some mortal Phrenesies are observed to end in Tremors, from an excessive Diccation of the Origin of the Nerves, as well as of the Nerves themselves.

Secondly, The Passions of the Mind, as Fear, Sorrow, immoderate Joy, and others, which dissolve the Strength: Or, Lastly, An heavy Burden, by which the Muscles, being oppressed, are disabled from moving according to the Directions of the Will, may be the Causes of a Tremor.

These things being premised, we proceed to the *Prognosis*: And here, first, we observe, that some Tremors affect the Patient in the Beginning, others in the End of the Disease. As to the former, we learn from *Galen, Com. 2. in 3 Epid.* they never appear but in a violent Disorder: Tremors, we have said, are occasioned either from Hunger, Lassitude, Watching, immoderate Venery, or an oppressive Quantity of Humours; in which last Case they afford nothing certain alone on which to ground a Prediction in the Beginning, but are only Indications of the Violence of the Disorder; because all Redundances of Humours render a Disease dangerous. Of this Nature was the Tremor of *Pythion, 3 Epid. Ægr. 1.* who was taken the first Day with a Tremor of the Hands, an high Fever, and Delirium. Such, also, was the Tremor of *Charion* observed on the third Day, *3 Epid. Ægr. 5.* But though Tremors, in the Beginning of Diseases, indicate only a Redundance of Humours oppressing the Nerves and Muscles, unless they proceed from Hunger, Lassitude, Watching, or immoderate Venery, or are excited by some Passion of the Mind, the Patient, however, will not be free from Danger, if he be visited with a severe, malignant, or even long Distemper, since not only such, but every other, Disorder is to be dreaded in a Patient by any means debilitated. These Tremors, as we said, are no sure Grounds alone for predicting any thing of Certainty concerning the Fate of the Patient; but if they are accompanied with other severe Symptoms, the Case will be dubious, as it was, for Instance, in the Wife of *Eumyris, 4 Epid. Tr. 40.* "who, it is said, look'd like one free from any Distemper, and had no Fever; but lost her Wits, and was afterwards seized with a Tremor of the whole Body, attended with a Colliquation, Loathing, Thirst, and a Coldness." The same is further illustrated in the Case of the old Man, *4 Epid. Tr. 41.* who, after a Relapse, fell first into a Tremor of the Lips and Voice, at which time the Skin of his Body was observed to be more tense, and his extreme Parts were cold; he dy'd, as no less could be ex-

pected, tho', perhaps, his Tremor might proceed from Worms; as it was thought to do in some other Instances.

And thus much may be prefiged from Tremors in the Beginning of Diseases; but when they appear without any other Disorder accompanying or immediately succeeding them, they are usually Signs of an Apoplexy: This Prefage is hinted to us by *Hippocrates, 4 Epid. T. 36.* where it is said, "That some were seized at the Beginning with a Tremor of the Fingers, and of the Lips in speaking, and, also, of other Parts; but had their Tongue more ready, and Speech more fluent, than usual: They were more remarkable, also, for a Redness of the Face. These, also, drank Wine to a Degree of Intebriation, or were swelled by Vomiting."

Having thus shewn what may reasonably be predicted from Tremors, in the Beginning of Diseases, what we have to say of those which are observed afterwards is, that some of them indicate a critical Translation of the Humours, when Nature propels Part of the noxious Humours from the Viscera to the Muscles: And such Tremors are very good, provided they are attended with Signs of Concoction. Such was the Tremor of the young Stranger, *4 Epid.* before-mentioned, whose Fever went off on the seventh Day with a Tremor, the noxious Humours being critically translated from the principal Parts to the Muscles: It often happens, also, that at the Approach of a Crisis, by Vomiting, there is a Tremor of the lower Lip, which *Galen, Lib. 3. de Cris. Cap. ult.* reckons among the Signs of a critical Evacuation by Vomit.

These, then, are the Tremors observed in Diseases after their Beginning, which we have not the least Reason to dread; but, on the contrary, those which attend burning Fevers, and Inflammations of the Brain, when the Nerves are dried, or when the Origin of the Nerves, that is to say, the Brain, are all mortal. Tremors, from a Dryness of the Nerves in Phrenesies, are mortal, and seem to be proper to deadly Phrenesies. Justly, therefore, was it said by the Author of the *1 Prorrh. T. 9.* "That phrenetic Affections end in Tremors," or Tremors follow mortal Phrenesies. *Galen*, also, in his Comment on the Place, says, "That a Tremor succeeds mortal Phrenesies; for Infirmities of the Nerves are of very long Continuance in Phrenesies, on account of the Dryness of the Affection, the Faculty being worn out with Watching, and much Motion, and the Nerves immoderately dried, which are the Causes of Tremors." In a Phrensy, therefore, you see, all Tremors are mortal; and much more, if they appear attended with Convulsions, which are, also, the usual Attendants of vehement Phrenesies. But, in the Beginning of a Phrensy, a Tremor is not mortal; for a Trembling of the Tongue and Speech are then only Prognostics of a Delirium, as we are taught by the Author of *1 Prorrh. 19.* In obscure and mild Phrenesies Tremors are, also, usually observed, from a Resolution of the animal Faculty, and are all pernicious: Of these Kinds of Phrenesies we have the Author of *1 Prorrh. pronouncing, T. 34.* where he tells us, that "Tremulous, obscure, mild, and tractable Deliriums, are very phrenetic; as was the Case of *Didymarchus*, in *Coos*." For these are occasioned by a Resolution of the Faculty. In the last Place, a Tremor, from a considerable Injury of the Brain, by which the motive Faculty, for the Reason given before, is debilitated, is mortal in the highest Degree; of which we have an Instance in the fair Daughter of *Nerius, 1 Epid. T. 50.* *Prosper Alpinus de Præ-sag. Vit. & Mort. Ægrot.*

FEBRILE ANXIETY.

Anxiety is caused by some Impediment to the Egress of the Blood from the Heart; and, in consequence of this, from an Impossibility of its due Circulation through the Ramifications of the Pulmonary Vessels, and those of the Aorta: And these arise either from a spasmodic Contraction of the small Vessels, or an inflammatory Spissitude of the Blood, which renders it incapable of circulating through the proper Canals. Or the same Symptom is produced by an Impediment to the Passage of the Blood through the Vena Portæ, from the same Causes: Since, therefore, all the Blood conveyed to the Abdominal Viscera by the Coeliac and Mesenteric Arteries, and thence to the Vena Portæ by the Veins, cannot pass farther, it must there stagnate, distend the Vessels, and resist the fresh Influx of Blood into the Arteries last-mentioned, thereby producing the most fatal Consequences. On this account it is absolutely necessary, in all acute Distempers, to observe, with the utmost Diligence, the Causes of both these Species of Anxiety; and, by all possible means, to remove them.

If such an Anxiety continues long about the Heart, and vital Parts, it will produce polypose Concretions, Inflammations, and sudden Gangrenes, accompanied with intolerable Uneasiness, and soon succeeded by Death: But that, whose Cause is situated in the Hypochondria, will produce an excessive Sick-

ness at the Stomach, the other Viscera, mean time, having not so acute a Sensation: This is succeeded by sudden Putrefactions of the Blood, contained in the large and weak Vessels about the Liver; whence Gangrenes, Putrefaction of the Liver, and a fatal Dysentery, arising from such a Putrefaction.

From what has been said, the Physician may understand the Cause and Nature of such an Anxiety, and what Presages may hence be drawn; and, at the same time, he will distinguish betwixt that Species of Anxiety, excited by some nervous Disorder only, without a Fever, and that which is caused by an acute Inflammation, previously discovered by its proper Signs. And by comparing this with the Violence and Duration of the Symptom, and the Part where the Disorder resides, he will be enabled to discover its Nature; and to learn why, in all Diseases, at the Approach of Death, the last Scene is closed with extreme Anxiety; why a convulsive Anxiety is not attended with much Danger, but an inflammatory Anxiety with a great deal; and why Uneasiness, Restlessness, Sighing, Anhelation, and obstinate Want of Sleep, in suppuratory or inflammatory Distempers, are the Forerunners of Death.

Hence, likewise, it is evident, that various Methods of Cure are required, in order to mitigate the Severity of this Disorder; in the Discovery and Application of which the Physician will be duly instructed by a previous Knowledge of the particular Nature of the Symptom.

When, therefore, it is discover'd, that the Affection is excited by Spasms, it is to be removed by rendering the acrid, irritating Matter, of whatever Nature, mild; by expelling it, by means of Vomits, Cathartics, Sudorifics, Diuretics, and Abstersives; by diluting with warm aqueous Fluids; by calming the Affections of the Mind; by relaxing the Fibres, Vessels, and Viscera; and by moderating the Tumult of the nervous Fluid with Anodynes and Narcotics.

Boerhaave recommends the following Medicines, as Vomits, proper in Fevers.

Take of Oxymel of Squills, three Ounces; and of distilled Succory-water, five Ounces: Mix for a Draught.

Take eight recent Asarabacca-leaves; infuse for four Hours, in the distilled Water of Carduus Benedictus; and exhibit five Ounces, of the expressed Tincture for a Draught.

Take of white Vitriol, twenty-five Grains: Reduce to a Powder, to be exhibited in a small Quantity of Beer.

Purgatives proper in Fevers are these following:

Take of the Crystals of Tartar, five Drams: Reduce to a Powder, and exhibit in warm Whey.

Take of the Crystals of Tartar, two Drams; of Sal Prunellæ, twelve Grains; and of Sal Polychrestum, sixteen Grains: Reduce to a Powder, to be taken for a Dose.

Take of Scammony, seven Grains; and of distilled Succory-water, half an Ounce: Make an Emulsion; to which add twelve Drams of the solutive Syrup of Roses, with Sena, to be taken for a Draught.

Take of Tamarinds, three Ounces; of the Troches of Agaric, three Drams; of Sena-leaves, one Dram; and of Figwort, half an Ounce: Boil in Water, and to eight Ounces of the expressed Liquor, add half a Dram of Sal Prunellæ, and an Ounce and an half of solutive Syrup of Roses, with Sena: Of this let the Patient take two Ounces, every Half-hour, till he begins to be purged.

Take of Prunes, four Ounces; of Tamarinds, one Ounce; of Sena-leaves, two Drams; and of Figwort, six Drams: Boil with Water for half an Hour; express through a Cloth, and, with twelve Ounces of the Liquor, mix two Ounces of the Syrup of Succory with Rhubarb: Of this Preparation let the Patient take three Ounces every Half-hour, till he begins to be purged.

Take of the Electuarium Diaprunum of *Sylvius*, one Dram and an half; and of the Powder of Sena-leaves, one Scruple: Make up for a Bolus.

The same Intention is, also, answer'd by the following Medicines, exhibited in the Doses specified. The Electuarium Diaprunum, or Cholagogum, of *Sylvius*, half an Ounce; the Confectio Hamech, four Drams; the Hiera Picra of *Galen*, one Dram and an half; Lenitive Electuary, one Ounce; and Electuary of the Juice of Roses, half an Ounce.

Sudorifics proper in Fevers are always of a diluting and acient Nature, and may be prepared in the following manner:

Take of the Roots of Smallage, half an Ounce; of the Roots of Burdock, and China-root, each one Ounce; of the Roots of Succory, Grafs, Navew, Parsley, Rapes, and Butchers-broom, each half an Ounce; of Sarsaparilla, one Ounce; and of Vipers-grafs, half an Ounce; of the Leaves of Sorrel, Succory, Endive, and Dandelion, each one Handful; of Elder-flowers, two Ounces; and of the bruised Seeds of Smallage, and Parsley, each one Ounce: Boil in three Pints of Water, of which the Patient is every Quarter of an Hour to drink three Ounces warm, till a gentle Sweat is excited.

After this Formula a great many more may be prepared.

Diuretic Medicines, proper in Fevers, are these following:

One Part of recent Milk, mixed with three Parts of Water. Whey; Buttermilk; the Juice of the Birch-tree; the recent Juices of mature Summer-fruit, diluted in Water; Nitre; antimoniated Nitre; Sal Polychrestum; and the preceding sudorific Decoctions, used with a diuretic Regimen.

Absterfives Medicines, proper in Fevers, are the same with those already mentioned.

If the Anxiety is excited by an inflammatory Viscidity of the Blood, this Viscidity must be dissolved and diluted; the Vessels must be relaxed; and the Impetuosity of the vital Fluid must be checked. With these Views, let the Patient drink copious Draughts of aqueous Liquors, in which farinaceous Vegetables have been boiled, impregnated with Honey and Nitre, somewhat accecent, and slightly aromatic. Let Fomentations, Cataplasms, Epithems, and Plaisters, composed of diluting, relaxing, emollient, and anodyne Ingredients, be applied to the Region affected. Let Clysters, at the same time, made of the like Ingredients, and small in Quantity, be frequently injected, and, if possible, be retained a long time. And let the Vapour of warm Water, mixed with Emollients, be perpetually drawn into the Lungs, through the Mouth and Nostrils.

And let it be remarked, that this Symptom, above all others, requires a safe and immediate Cure, on account of the Severity thereof, and its Consequences. *Boerhaave*.

PROGNOSTICS, OR PRESAGES, FROM AN ANXIETY.

There occur in the *Prognostics*, *Prorrhetica*, and all the Books of *Hippocrates*, relating to Prediction, four synonymous Words, ἀλυσία (*Alyce*), ἀλυσμός (*Alysmus*), ἀπορία (*Aporie*), and ἀσθενία (*Ase*), or ἀσθένια (*Ase*): These all signify the same thing which we express by *Anxietas* (Anxiety), *Inquietatio* (Restlessness), *Implacabilitas* (Uneasiness), and *Jactatio* (Jactation, or Tossing). [To these may be added *δυσσώπια*]. Some indeed would have *Alyce* to have respect to an injured Respiration, when it is too frequent and irregular; but it appears from *Galen*, to have relation to a vitiated Decubiture, for, *Lib. de Humoribus*, he says, "He (*Hippocrates*) called it *Alyce* (an Anxiety) though many call it *Dysarephia* (a Self-dispiciency), for they say, those Patients are under an Anxiety (ἀλυσία), who cannot continue in one Posture of Decubiture, but are continually changing their Position, because the present is always uneasy to them." And he repeats the same in his Comment on 7 *Aph.* 56. By these Terms, then, we understand no more than a vitiated Decubiture, when, through the Violence or Malignity of the Disease, the Sick is perpetually shifting his Position, and cannot in the least rest in one Place, but moves, tosses, and throws himself about, in various manners; sometimes raising himself up, then sinking down, sometimes on one Side, sometimes casting himself on his Belly, and sometimes on his Back, but never resting in one Place or Figure of Decubiture.

An Anxiety proceeds either from the Stomach, labouring under some Disorder, or oppressed with Food, and under a Nausea; or from a great Inflammation of one of the internal Viscera; or an Imbecillity, incapable of sustaining the Disease; or from an occult Malignity infecting the Heart, as in a pestilential Fever; or from an Agitation of the Matter in the turgent Veins about the Præcordia; or, lastly, from a critical and violent Perturbation, occasioned by an Intumescence of the Humours, tending to an Excretion.

First, then, an Anxiety may be owing to some Indisposition of the Stomach, or an Oppression of that Part by an immoderate Quantity of Food, as appears from *Hippocrates*, *de R. V. I. A.* and *Galen's* Comment on that Book. Thus, when the Patient, after long Abstinence, the Disease not being past its Height, feeds too freely; or when the Mouth of the Stomach,

as *Galen* says, *Com. in Aph. & in Lib. de Humor.* contains some Humour particularly offensive, which Humour is not much in Quantity, nor diffused in the open Cavity of the Stomach, but immersed in its Coats; or, lastly, which is perhaps the same, when, as that Author says, *Com. in Prorrh.* the Mouth of the Stomach is vellicated by depraved Juices: An Anxiety, he there tells us, is known to proceed from the Stomach by the Attendance of a Nausea.

In the next Place, as Anxiety is produced by the Violence of the Disease, in hot and burning Fevers, especially at their Height, when the Sick becomes restless and impatient, through the Vehemence of the febrile Heat, and, what is no small Sign of Malignity, has his Anxiety occasioned by a Corruption of the bilious Humours swelling and estuating in the larger Veins. This Anxiety is most apparent, when one of the Viscera is affected with a great Phlegmon, or Erysipelas; in which Circumstance the Patient is not very hot in his outward and extreme Parts, but burns inwardly.

An Anxiety may, also, be owing to Weakness, as we are told by *Galen*, *Com. in 1 Prorrh.* when the Faculty is oppressed by the Body; as when immoderate Evacuations have preceded, or the Faculty is extinguished by the Malignity of the Distemper.

Lastly, The Patient becomes seized with an Anxiety, from a Commotion of the Humours vellicating the Parts, in order to a critical Excretion: Hence we are told by *Hippocrates*, 2 *Aph.* 13. "That they who undergo a Crisis, have a severe Night before the Fit." For when Nature intends an Excretion of the Humours, she raises a Commotion and Perturbation in the whole Body, which must, of Necessity, create a Restlessness and Anxiety in the Patient. To this we may add, that those who labour under a Suppuration, are often molested with this Symptom, either from a Decay of Strength, and Depression of Nature, or from the Use of Respiration much injured; or an Estuation in the Thorax; or from the Acrimony of the Pus corroding and vellicating the sensible Parts; or from an acrid Distillation from the Head upon the Mouth of the Stomach.

We have given you the Causes of an Anxiety, and proceed to speak of the Prognostics, which may be formed from this Symptom: And, in general, we say, with the Author of 1 *Prorrh.* 39. 76. and in other Places, that an Anxiety is always bad, except when it is critical, or precedes a happy Crisis: There are, however, some Anxieties from which nothing certain can be prognosticated; such are those occasioned by some Disorder of the Stomach, which, though bad, never afford, by themselves, any sure Prognostic of the Death or Recovery of the Patient. And indeed such an Anxiety as is excited by some Affection of the Stomach, is distinguished, according to *Galen*, *Com. in 1 Prorrh.* from other Anxieties by *vauſin*, a Nausea, and *épuſe*, Vomiting; because they who are molested with this Sort of Anxiety have a continual Nausea, and Inclination to vomit; whence it is justly said, by the Author of the *Coaca Præſagia*, that an Anxiety, with a Loathing and Nausea, indicates an Affection of the Stomach. Now in Intermittent Fevers, and in many other Diseases, an Anxiety, or Inquietude, with a Loathing and Nausea, is far from being malignant, since the Anxiety is often removed by Vomiting. Of this we have an Instance given us by *Hippocrates*, 7 *Epid.* T. 102. "The Wife of *Theotimus*, he says, labouring under a Semitertian, was seized with an Anxiety, Vomiting, and Horror, all at once; and as the Fit came on with a Thirst, in the Progress of the Fit, the Heat increasing with the Fever to a vehement Degree, she drank Hydromel; and, after Vomiting, was freed from the Horror and Anxiety together." An Anxiety and Inquietude, therefore, attended with a Loathing and Nausea, are not much to be dreaded, and least of all, when, by the Benefit of Nature, or the Assistance of Art, a Vomiting excited, relieves the Patient from them; as, on the other hand, an Anxiety which is increased by Vomiting, is not usually void of Malignity. Thus, also, in the Height of burning Fevers, under the greatest Estuation, an Anxiety is not to be feared, because it is a proper Symptom of that kind of Fevers. Anxieties of a good Sort are, also, frequently observed before an happy Crisis; for, at the Approach of a Crisis, the Patient grows restless and turbulent, and for very good Reasons, since the whole Body is then thrown into a Commotion and Perturbation, while Nature attempts an Excretion of the morbid Humour: But such critical Anxieties and Inquietudes are distinguished from others by critical Signs, and chiefly by a supervening Rigor, succeeded by a copious Sweat, or by plentiful Vomiting or Purging, or a copious and critical Hæmorrhage. With Respect to this Subject, we read, *Coac.* 19. that "Such as labour under an Horror, Anxiety, and Lassitude, with a Pain in the Loins, fall into a Flux of the Belly." And *ibid.* 111. "They, who, after Watchings, are seized with an Anxiety, may expect an Hæmorrhage

"from the Nose." An Anxiety, also, often happens, when Nature makes Efforts to propel the putrid and malignant Humours to the Skin, as in an Expulsion of Exanthemata, after whose Appearance the Anxiety ceases.

These, then, are the Anxieties from which we have no Reason to be apprehensive of any Danger in a Disease. But, as an Anxiety under a burning Fever, especially at the Height, and utmost Intensity and Estuation, at which time it is common to all, merits not our Concern, so, on the other hand, a malignant Anxiety observed in Fevers, where the outward Parts are in no extraordinary Degree of Heat, whilst the internal Parts and Viscera are in a burning State, is justly to be dreaded. Such an Anxiety seems to be a proper Symptom of malignant Fevers, which are mild and gentle, as to outward Appearance, but full of inward Perturbation and Uneasiness, occasioned, as we said, either by some violent Inflammation of one of the Viscera, or by an Erysipelas, or by an Estuation and Effervescence of the highly putrid Humours in the Veins about the Præcordia, or from mere Weakness, or from an extraordinary Redundance of crude Humours, with which Nature seems to be oppressed: In such a Circumstance the Patient in a Fever labours under a remarkable Anxiety, which we take for no slight Indication of Malignity.

But the "worst of all Anxieties, according to *Coac.* 2. are those which are attended with Refrigerations," particularly of the extreme Parts, the Feet, Hands, and Ears. To this Purpose we find *Hippocrates* thus speaking, in his Book of Prognostics: "If the Patient, he says, lies with his Feet bare, and not very hot, and throws about his Hands, Neck, and Legs, in an unequal and disorderly manner, it is a bad Sign; for it indicates an Anxiety."

An Anxiety, under Refrigerations of the extreme Parts, where Heat is not to be recalled, is mortal in the highest Degree, and shews Death to be at hand: Thus it proved in the Case of *Silenus*, 1 *Epid.* Sect. 3. *Ægr.* 2. and of the Woman who lay ill in *Fora Mendacium*, 3 *Epid.* Sect. 2. *Ægr.* 12.

No less pernicious is accounted an Anxiety which appears attended with bad Sweats, on a critical Day. Bad Sweats, according to *Hippocrates*, are all such cold Sweats, as in a continual Fever appear on the upper Part of the Body, as the Head, Neck, and Clavicles. Of such an Anxiety we read, 1 *Prorrh.* 27. where it is said, "That a Restlessness and Uneasiness [*δυσκοπία*] with Refrigerations, and a Sweating of the upper Parts, where the Patient is not free from a Fever, prognosticate a Phrensy and Death, as in the Instance of *Arifagoras*." And it was observed, by *Hippocrates*, of *Silenus* before-mentioned, "That on the sixth Day he sweated a little about the Head, his extreme Parts were cold and livid, and he was under a great Anxiety." And of the Woman mentioned, also, before, he says, "On the seventh Day she had a new Fit of a Rigor, succeeded by an high Fever, and an intense Thirst, with an Anxiety: Towards Evening she had a cold Sweat over all her Body, with a Coldness of the extreme Parts, and no Return of Heat." Anxieties, therefore, under Refrigerations, attended with bad Sweats, are destructive; which is the same thing as if he had said, that Anxieties, with bad Signs, are bad; and with pernicious Signs, pernicious and deadly. Now, that cold Sweats of the Head, and Refrigerations of the extreme Parts, are pernicious Signs, we are taught by *Hippocrates*, *Coac.* 572. 573. *Prognost.* & *Lib. de Crisibus*.

Anxieties on critical Days afford surer Prognostics, and are esteemed very bad, when succeeded by no salutary Evacuation, as by an Hæmorrhage from the Nose, or by Stool, Vomit, or Urine, but especially by Sweat. For Confirmation hereof we read, 1 *Prorrh.* 61. "Refrigerations of the whole Body, attended with an Anxiety, but no Sweat, are bad Signs." And of Anxieties, attended with bad Evacuations by Stool, we are told by *Hippocrates*, *Lib. de R. V. I. A.* "That such Stools [spumous, and saturated with pure Bile] were very pernicious on many Accounts, as not extinguishing, but increasing the burning Heat of the Hypochondria, and exciting a Restlessness, Anxiety, and Jactation of the Members." Which *Galen*, in his Comment, tells us, are Symptoms of an Inflammation, affecting the Hypochondria themselves. Of the same Symptom, in Conjunction with Vomiting, it is said, 1 *Prorrh.* 62. "Pure and unmixed Vomiting, attended with Anxieties, are bad."

An Anxiety under an utter Decay of Strength, from immoderate Evacuations, is pernicious in the last Degree. Such a Sort of Restlessness and Uneasiness is observable in many dying Persons. We have an Instance, 7 *Epid.* T. 12. in the Person of *Chartades*, who (after vast Hæmorrhages by Stool) was affected with an Anxiety about the Mouth of the Stomach, [*ἐπὶ τῇ καπνίᾳ*] a slight Sweating in almost every Part of his Body, and a slow Fever. At first he seemed to have the free Use of his Reason; but, as the Day went forward,

ward, the Anxiety and Uneasiness increased upon him, and he fetched his Breath somewhat shorter: He was more hearty and obliging in his Salutations, and Receptions of Persons, than Occasion required, and some Symptoms of a Lipothymy appeared, which were not at all relieved by drinking Ptisan, or Barley-water [*τὸ ἀπὸ κριθῶν ὕδωρ*]: Towards Evening he drew his Breath very thick, with much Agitation and Tossing, and Turning from Side to Side, without the least Intermission, or Rest."

In acute Diseases, if a Pain, affecting some ignoble Part, ceases, and the Patient is afterwards taken with an Anxiety, it is of bad Prognostication. An Instance of this we have in the bald Man of *Larissa*, 3 *Epid. Sect. 3. Aeg. 5.* "Who, *Hippocrates* says, on the third Day, was freed from the Pain in his Thigh, but was under much Perturbation and Deliriousness, with great Jactation and Uneasiness; and the fourth Day about Noon he died."

For a Person, after receiving a Wound or Blow, to be under an Anxiety, or very restless and uneasy, is, also, a bad Sign; as was observed by *Hippocrates*, 5 *Epid. T. 59.* in one who received a Stroke on the Head with a Stone; and in another, who had his Liver pierced with a Dart. *Ibid. T. 61.*

Anxieties, also, are often observed attendant on mortal Phrenesies, as we learn from the Author of 1 *Prorrhet. 12.* where he says, "That in the Beginning of a Phrensy for the Patient to be mild and gentle, but often shifting from Place to Place, is a bad Sign."

We conclude, therefore, from the Whole, that all Anxieties are bad, except those which precede a salutary Crisis, and such as proceed only from an Affection of the Stomach, and are not preceded, accompanied, or succeeded by other pernicious Signs; or such as were observed in the Cases of *Silenus*, the Woman in the *Forum Mendacium*, the bald Man of *Larissa*, and *Chartades*, before-related. *Prosper Alpinus, de Prasag. Vit. & Mort. Aegrot.*

FEBRILE THIRST:

Thirst is excited by a Dryness of the Solids, an Immeability of the Fluids, and a saline, alkaline, or bilious and oleous Acrimony.

Thirst, therefore, always witnesses that some one of these Causes is present; and, on this Account, it prognosticates all the Evils which are capable of being produced by such Causes.

Care must, therefore, be taken, to remove immediately this Symptom of Thirst, particularly in Acute Distempers.

Thirst is removed, first, By drinking frequently, and in small Quantities at a time, aqueous, subacid, nitrous, demulcent, warm Liquors; of which kinds are the following.

Take of common simple Barley-water, forty Ounces; of the Rob of Currants, four Ounces; as many Drops of the Spirit of Salt, as is sufficient to procure a grateful Acidity; and of distilled Cinnamon-water, one Ounce: Mix, for ordinary Drink.

Four Ounces of the Robs, Jellies, or Syrups, of the following Fruits taken as above, may be used: The Robs, Jellies, or Syrups, for Instance, of Currants, Quinces, black Cherries, Barberries, Mulberries, Raspberries, Pomegranates, Lemons, Citrons, common and China Oranges. Thus,

Take of the Jelly of Quinces, one Ounce; of the Diamoron of *Nicolaus*, two Ounces; of the Syrup of Citron-juice, one Ounce; of the distilled Waters of Borage, and Baum, each four Ounces; of common Water, twenty-four Ounces; and of Rhenish-wine, three Ounces: Mix all together.

Drinks proper in a febrile Thirst are, also, these following: Milk and Water, Whey, Butter-milk, Small Beer, Coffee, and one Part of Wine mixed with twelve Parts of pure Water; and a little Lemon-juice.

Secondly, Thirst is removed, by washing the Nostrils, and gargarizing the Mouth and Fauces, with the same kinds of Fluids as those above recommended.

Thirdly, By applying Fomentations, Epithems, and Cataplasms, of the same Nature; to the Region of the Hypochondria.

Fourthly, By the Use of similar Clysters, retained a considerable time.

But if a very great Thirst is accompanied with extreme Weakness, it will be safe to exhibit vinous, or more spirituous Liquors, mixed with those above recommended. Thus,

Take two of the best Citrons; take out the Seeds; pare off the yellow Bark, throw away the whole fungous Substance, and, bruising the yellow Bark and the Pulp to-

gether, put them in thirty-two Ounces of simple Barley-water; to which add, of the Syrup of Mulberries, an Ounce and an half; of Rhenish-wine, eight Ounces; and of toasted Bread, two Ounces: To be preserved in a close earthen Vessel. Or,

Take of the Syrup of Lemons, three Ounces; of the best Spirit of Wine, one Ounce and an half; of Rhenish-wine, four Ounces; and of pure common Water, fourteen Ounces: Mix all together, for ordinary Drink, *Boerhaave.*

PROGNOSTICS FROM THIRST IN ACUTE DISEASES.

It is natural for Persons under acute and burning Fevers to be molested with Thirst, as conflicting with a hot and dry Distemper, since it is much worse for the Patients, in such Cases, not to thirst at all, as it is, also, for them to have their Urine of no Colour, but thin and aqueous. It is best, therefore, on all Accounts, since the Reason of the thing requires it, that Persons under hot Distempers should be affected with Thirst: But immoderate and intense Thirst in no Case is good; as indicating a vehement and burning Heat in the internal Viscera; but, on the contrary, is, for the most part, a bad and dangerous Symptom, and signifies that the Disease is very strong and urgent upon the Patient, and difficult to be subdued; and that Nature is in Danger of sinking under the Weight which oppresses it. We may, therefore, safely pronounce an immoderate Thirst, as it is an Indication of the extraordinary Strength of the Disease, a dangerous and formidable Symptom in acute Disorders, but most pernicious, and fatal, when it precedes, accompanies, or follows other very bad Signs; in which Case it is a certain Preface of Death.

But from a Thirst alone, as well in acute as other Diseases, we can prognosticate nothing with Certainty, but regard it only as a Sign of the Strength and Violence of the Disease. With Respect to this Subject may be considered, what *Hippocrates* writes, 1 *Epid. Sect. 2. Stat. 3.* where he says, *That the burning Fevers (of that Constitution) afforded Signs in the Beginning in what Subjects they would prove mortal; for the Patients were first seized on a sudden with a high Fever, attended with a small Degree of a Rigor, they were incapable of sleeping, were very restless, and afflicted with a Thirst and Nausea.* Such was the Case of *Philiscus*, 1 *Epid. Sect. 3. Aeg. 1.* of whom we read, *That on the third Day in the Morning, and till the Middle of the Day, he seemed to be free from a Fever; but towards Evening he was seized with a high Fever, attended with Sweat; and a Thirst, a Dryness of the Tongue, and a Blackness of the Urine.* In this Case, a Thirst, attended with black Urine, and other bad Symptoms, signified that the Disease would prevail over Nature, and prove mortal. The like Thirst was observed by *Hippocrates* in *Pythion*, 3 *Epid. Sect. 3. Aeg. 3.* who, he says, *was seized with a vehement Rigor, succeeded by a high Fever, a Dryness of the Tongue, a Thirst, Redundance of Bile, black Urine, which had an Enæorema [see the Word], but no Hypostasis.* This Thirst continued upon him till the fifth Day, accompanied with other pernicious Signs, particularly a Coldness of the extreme Parts, and a Loss of Voice: We conclude, therefore, that an intense Thirst, accompanied with other bad Signs, is of the most fatal Consequence. Of this Nature, perhaps, was the Thirst which the Wife of *Hermopolemus* endured, 7 *Epid. T. 13.* who, it is said, *was affected with a Trembling of the Hands, and a Shaking of the Head, a depraved Cast of the Eye, with a violent Thirst; and as soon as she had drank, still craved for more Drink; and snatched the Cup from the Attendant, and took large Draughts, and would not suffer the Cup to be pulled from her; her Tongue was dry, and very red; and, when under a Tremor, she would put both Hands to her Mouth, and chew them.* Like to this was the Thirst of *Aristocrates*; who died in four Days of a pestilential Carbuncle. We conclude, upon the Whole; then, that an immoderate Thirst in acute Diseases is never good, oftentimes bad; and, when attended with other bad Signs, most pernicious and fatal.

WHAT IS TO BE PROGNOSTICATED FROM A REMOVAL OR ABSENCE OF THIRST IN DISEASES.

A moderate Thirst in Diseases is always good; and to thirst more or less, as the Reason of the thing; and the Nature of the Disorder, with respect to Heat, require, can be no bad Sign. But for the Patient to be molested with an intense and continual Thirst, is never a good Prognostic; as, on the contrary, not to have the least Desire of drinking, when labouring under a hot and dry Distemper, is highly pernicious, and fatal; and the more, when the Thirst, with which they were before afflicted, ceases, without any Reason to be given for it. The Author of 1 *Prorrhet. 57.* tells us, that "a Thirst in acute Diseases, which ceases for no Reason, is bad." And *Galen*, in his Comment on the Place, endeavouring to account for it, has

these Words: "When, therefore, it happens, that the Thirst cannot be removed, either by Vomiting, Sweating, or Purging, or by a critical Abscess, so as that the Disorder itself is not mitigated, but that the Sense thereof is blunted or abated, this is no good Sign; but if the Thirst ceases whilst the Tongue continues dry, and the Urine crude, this is a surer Evidence of the Malignity of the Disease; and still the more, if no refrigerating or moistening Remedies have been outwardly applied; a proper Use of which Medicines, in acute Diseases, is not so much to extinguish a Thirst, as to abate it. But in acute Distempers, if the Thirst be perfectly removed, it is pernicious in the highest Degree." From this Passage of Galen it is obvious to every one, that it is highly pernicious, in acute Disorders, for a Thirst to cease for no manifest Cause, as, for Instance, a beneficial and salutary Evacuation or Purgation, but in a crude State of the Distemper.

But this want of Thirst, in such Cases, is most fatal and deadly, when attended with other destructive Symptoms. To this Purpose we find Galen discoursing, in his Comment on the first of the *Epidemics*: "As an Accumulation to all those pernicious Symptoms under which the Patients laboured, must be reckoned, that though they were afflicted with a violent Heat, and Estuation, they had no Thirst; but as for those who were at first molested with a violent Thirst, and were afterwards freed from it, such an Event must be necessarily owing to one of these two Causes; that is, either a Solution of the Disease, or an Extinction of the Faculty, in such a manner, that the Sick are no longer sensible of the Evils under which they suffer: But the first was not the Case in those Disorders, since these Symptoms prov'd mortal in the Event."

They who labour under acute Diseases, are not thirsty; first, On account of a cold and moist Humour distilling from the Head upon the Stomach; whence Hippocrates justly says, 4 *Aph.* 5. that they who are molested with a Cough, are not very thirsty, because the Phlegm, which distils from the Head upon the Stomach, takes off the Thirst: And this want of Thirst is observed in some pleuritic and peripneumonic Patients; from which, however, nothing can be prognosticated with Certainty, since the Sick, in such Cases, are distinguished from others, who are not afflicted with Thirst by their Tongue, which is not dry and parch'd, but moist and soft, from the Phlegm which moistens it.

Secondly, A want of Thirst in very hot Distempers, where the Patient is in a very high Estuation, proceeds either from a Delirium, which renders him insensible of what he suffers; or an Extinction of the appetitive Faculty of the Stomach, or from both Causes. Of Persons in a Phrensy, the Author of 1 *Prorrh.* 16. says, *Little Drinkers, who are startled at the least Noise, are subject to Tremblings.* And Galen, in his Comment, tells us, that *Phrenetic Patients are σπασμωδικοί, that is, have little Desire to drink, though their Disorder be of a hot and dry Nature, and their Tongue rough with excessive Dryness.* But we are taught by Hippocrates, that such Patients are disorder'd in their Senses, 2 *Aph.* 6. where he says, *They who are affected with Pain in any Part of the Body, and yet have but little Sense thereof, have their Reason disturbed.* Hence he says of those Persons who labour'd under a Phrensy, and whose Cases he describes, 3 *Epid.* Sect. 3. that they were all free from a Thirst. And he gives a particular Instance of this kind in the same Book, Case the last, of the young Man of *Melibæa*, who labour'd under a Phrensy, unattended with a Thirst.

In such Cases as these, then, not to thirst, is a bad Sign; and, if attended with others of the like Nature, mortal; but without these nothing certain can be prognosticated from it: For there are many Persons in a Delirium who never call for Drink, and yet recover, though, it is true, they are such as have no violent Delirium, nor other concomitant destructive Symptoms, particularly, which is much to be regarded, a Dryness of the Tongue. But where that Part is not only very dry, but, also, black and foul, not to thirst is mortal in the highest Degree, as it shews, that the Disease is very strong and urgent upon the Patient; and that Nature is ready to sink under its Burden.

In a very hot Distemper, not attended with a Delirium, but a great Dryness and Adustness of the Tongue, a want of Thirst is infallibly mortal, as it demonstrates the Faculty to be extinguished; and with the more Certainty, if the Thirst, under which the Patient laboured before, ceases unaccountably, and for no Reason; for this is a sure Indication of the Extinction of the Faculty. And we have very good Reason to assert it fatal, since it is impossible for Nature to be oppressed, and totally subdued, by the Disease, without the Appearance of several other mortal Signs. Thus it happened in the Case of *Erasmus*, 1 *Epid.* Sect. 3. *Ægr.* 8. "who had a continual Fever, with Sweating; an Elevation and painful Tension of the Hypo-

chondria; black Urine, which had a round Encephaloma, but no Hypostasis, a great Dryness of the Tongue, but no extraordinary Thirst." Another Instance is in *Hermocrates*, 3 *Epid.* Sect. 1. *Ægr.* 8. "whose Tongue at first was parch'd with Heat, and soon after he was seized with Deafness, and was incapable of sleeping, but not very thirsty." And a little after we read, "On the twentieth Day he had an Aversion to all Food, had the perfect Use of his Reason, but could not speak; his Tongue was very dry and parch'd, but he had no Thirst; and he slept, but labour'd under something of a Coma." The same was observ'd in the Virgin Daughter of *Euryanax*, 3 *Epid.* Sect. 2. *Ægr.* 6. who through the whole Course of her Fever, of which she died, had no Thirst, but abhorred Food. From these, and the like Instances, we conclude, that in acute Diseases it is always a bad Sign for the Patient to be without a Thirst, when he has been freed from it in an unaccountable manner; but when a Thirst ceases for good Reasons, which may be given, such a Cessation is so far from being bad, that, on the contrary, it is a very good Sign; as it proved, for Instance, in the Person who lay sick in the Garden of *Dealces*, 3 *Epid.* Sect. 1. *Ægr.* 3. who had several times, in the Course of the Disease, been thirsty and delirious, but was, at last, for a very good Reason, which was the Solution of the Disorder, freed from his Thirst. On the twentieth Day, says Hippocrates, he fell into a Sleep, was restor'd to the perfect Use of his Reason, sweated, and was freed from his Fever and Thirst. This Person underwent several Crises, which were preceded by a Thirst, a Dryness of the Tongue, and a Delirium; and these Symptoms were all alleviated, and the Thirst, in particular, diminished, after a Crisis, as the Reason and Nature of the thing required: But a want of Thirst, contrary to Reason, or just Expectation, and attended with other pernicious Signs, is destructive and fatal, in the highest Degree. *Prosper Alpinus, de Præ sag. Vit. & Mort. Ægrot.*

A FEBRILE NAUSEA.

A Nausea is an ineffectual Effort to vomit, accompanied with an Idea of Horror; it is, therefore, excited by slight Convulsions of the muscular Fibres of the Fauces, Oesophagus, Stomach, Intestines, and abdominal Muscles: These are caused, first, By an acrid, putrid, and bilious Matter, received into the empty Stomach, thence ascending into the Fauces, which, together with the Stomach, it vellicates, and irritates. Hence the Parts above-mentioned are drawn into Consent, and excited to similar Motions: And that a Nausea is thus caused, we distinguish, by previous Fasting, by a putrid Breath, and Sordidness of the Mouth, and Fauces. Or, secondly, By a tenacious, viscid, fluctuating Matter, residing in, and vellicating the same Parts. This Species of Nausea is distinguished by the previous Signs of such a Viscidity. See LENTOR. Or, thirdly, by a slight Inflammation of the Stomach, Oesophagus, Intestines, and adjacent Viscera: This is distinguished by the proper Signs of such Inflammations.

Fourthly, By the Remembrance of something, which, formerly taken into the Stomach, excited such a Nausea.

Fifthly, By an inordinate Motion of the nervous Fluid, excited by any Cause whatever: This is distinguish'd by *Deliria*, *Spasms*, a *Vertigo*, and *Tremor*.

If a Nausea persists long, it produces Emptiness, Abstinence from proper Drinks and Medicines, Vomiting, and many Misfortunes which may hence be excited; the principal of which are, Weakness, an alkaline putrid Acrimony, and universal Dryness.

A Nausea, from the first Cause, is to be cured by the Use of acid, nitrous, aqueous Drinks, Aliment, and Medicines, which are the same as those recommended against febrile Thirst; by the Exhibition of a lenient Purge of the same Kind; by acido-austere Medicines, which corroborate the Fibres; or, if these do not succeed, by a Vomit.

The second Species is to be remov'd by diluting, attenuating, purging, and Emetics. The Medicines here proper are the same as those recommended in a febrile Anxiety.

The third Species is only to be removed by curing the Inflammations which excite it.

The fourth Species is cur'd by forgetting and avoiding the Ideas which cause it.

The fifth Species is remov'd by austere Remedies, Rest, Narcotics, and cold Water. Thus, for Instance,

Take of the Rob of Quinces, four Ounces; of the Syrup of Lemons, two Ounces; of *Matthioli*'s distill'd Aqua Vitæ, one Ounce; of distill'd Cinnamon-water, six Drams; of the distill'd Water of Citron-peels, six Ounces; and of the Tincture of Opium, sixty Drops: Mix all together, and exhibit one Ounce for a Dose, till the Nausea is remov'd.

Take of strong distill'd Mint-water, a sufficient Quantity : And let the Patient drink an Ounce of it cold, every Quarter of an Hour.

Take of the Rob of Quinces, a sufficient Quantity : Of which let the Patient take one Dram every Half-hour.

Take of recent Lemon-juice, half an Ounce ; and of Rhenish-wine, one Ounce : Mix both sufficiently together ; add one Dram of the Salt of Wormwood ; and exhibit during the Effervescence.

Take thin Slices of Lemon, sprinkled with Sugar : To be kept lying on the Tongue.

Most Patients receive Relief from Epithems, Fomentations, Cerates, and stomachic Applications ; especially when there is no Inflammation. Thus,

Take of the aromatic Powder of Roses, of Diagalanga, and the Diarrhodon Abbatis, each one Ounce : Mix all together, sew up in a Piece of Muslin, and apply to the Epigastrium.

Take of the stomachic Cerate of *Galen*, a sufficient Quantity for making a stomachic Plaister, to be spread upon Leather. This Plaister affords Relief, so long as it adheres.

Take of *Matthioli*'s Aqua Vitæ, one Ounce ; of the Spirit of Angelica-roots, of the carminative Spirit of *Sylvius*, and of the Spirit of Mint, each two Ounces : Let a small Slice of toasted wheaten Bread, well soak'd in these, be applied warm to the Epigastrium, applying over it a Swine's Bladder moisten'd with Oil, and secur'd by a Bandage. This Dressing is to be renew'd every twelve Hours.

Hence we learn why, in acute Diseases attended with a *Nausea*, a Purge, or an Emetic, exhibited in the Beginning, are of such great Service ; and in what sort of acute Distempers : Why Patients, under acute Fevers, abhor pinguious Aliments, Flesh, Eggs, and Fish : And why, on the contrary, they covet Water, Acids, ripe Fruits, and cooling Liquors :

Why Medicines can be of no Service, unless the *Nausea* is first cur'd :

Why the Symptom of a *Nausea* is often incurable :

And why Diseases, attended with a *Nausea*, are generally, when they cease, succeeded by a sudden, unusual, and surprising Appetite.

FEBRILE ERUCTATIONS, AND FLATULENCES.

Eructations are caused by an elastic Matter, dilatable by Heat, Effervescence, or Fermentation ; which one Moment is confin'd, and the next set free, by a Relaxation of the Part which confines it, and is forcibly exploded, with a Noise.

Thus Air, opposite Salts, ripe Fruits, putrefying Humours, and fermenting Vegetables, afford Matter for Eructations and Flatulences ; the Force and Fetidness of which vary, according to their different Natures.

These, however, if suffer'd to pass off freely, are productive of no forcible Explosion : It is evident, therefore, that Spasms of the *Sphincter* of the *Oesophagus*, of the *Oesophagus* itself, of the superior and inferior Orifice of the Stomach, and of the Intestines, concur, and are alternately relax'd, in order to produce Eructations, Flatulences, Explosions of Wind from the Anus, and Murmurs of the Intestines from Wind confin'd.

If the two Causes above-mention'd, that is, a Production of Flatulences, and their Confinement by Spasms, concur, act strongly, and continue long, then the elastic Matter, dilated by Heat, Motion, and its own proper Force, and confin'd in a Cavity, the surrounding Fibres of which are spasmodically constricted, distends, stretches, and excites Pain in the Membranes which confine it ; and compresses the adjacent Parts : Hence Pains, and intolerable Anxieties, are excited, which cease upon the Emission of the Flatulences. To this, if the Force of a Fever is added, it is evident, that insupportable Torments may be produced.

The Cure of these Disorders consists,

First, In removing the Matter which excites them, by diluting Remedies ; by warm, aqueous, and somewhat aromatic, dissipating Drinks ; by Remedies which render the effervescing Salts perfectly neutral ; such as correct Putrefaction, and put a Stop to Fermentation.

Secondly, In mitigating the Convulsions by proper Remedies ; among which are, those which destroy Acrimony, and compose the Spirits ; the principal of which are, Opium, and mild Antihysterics.

Thirdly, In the Application of warm, relaxing, anodyne, and somewhat aromatic Clysters, Fomentations, and Epithems ; and of Cupping-glasses without Scarification, to the *Abdomen*.

Hence we understand what sorts of Meats, Drinks, Aliments, and Medicines, are flatulent ; why Flatulences happen particularly in the Stomach, and superior Intestines, when empty ; in the Intestines, when wounded ; when the Abdomen is, by any means, compressed ; and why they accompany hypochondriac, hysterical, convulsive Disorders, and the Colic.

FEBRILE VOMITING.

Vomiting is a violent Expulsion, first, of the Contents of the Stomach ; then of those of the Intestines ; and, lastly, of those of the Viscera, which evacuate themselves into the Intestines. The proximate Cause of Vomiting is, a convulsive Motion of the muscular Fibres of the *Fauces*, *Oesophagus*, Stomach, Intestines, Diaphragm, and abdominal Muscles ; the remote Cause, whatever is capable of stimulating the Fibres above-mention'd, or the easily-irritable Viscera, to spasmodic Contractions.

Vomiting is sometimes excited by a primary Disorder of the Stomach, upon the Access of a Fever ; as, if it is affected with Convulsions, Inflammation, Suppuration, or Scirrhus ; or if any Part of it is become cartilaginous ; in these Cases it is excessively obstinate, and may be distinguished by the Signs of the Distemper which produces it ; and when that is remov'd, it ceases spontaneously.

But, frequently, Vomiting is caused by similar Disorders in the Viscera, and circumjacent Parts, when they are irritated by the Stomach distended with Aliment, especially upon the Access of a Fever. In such Cases, it is extremely obstinate, and the Cause is sometimes not easily discovered.

Or a Vomiting may be excited by every Cause of a considerable *Nausea*, mentioned above, from the Doctrine of which this Species of Vomiting may be distinguish'd ; and hence, also, we may learn how to treat, and cure it.

If the Symptom of Vomiting continues long, it produces an Atrophy, the Iliac Passion, Convulsions, and all the Effects of a great and obstinate *Nausea*, mention'd above.

The Cure of that Species of Vomiting which is excited by primary Disorders of the Stomach, and those of the adjacent Parts, is to be learnt from the History of those particular Diseases.

That Species which is produced by the same Causes as a *Nausea*, is to be cur'd by the Remedies recommended for a *Nausea*, diligently applied ; especially Opiates, and corroborating, attracting, and dissipating Epithems.

Hence the Reason is evident, why Vomiting is so difficult to be check'd in many acute Diseases ; and hence we learn the Falsity and Danger of the Maxim, *that Vomiting is cur'd by Emetics*. This Doctrine of Vomiting farther teaches us, why Sudorifics sometimes remove Vomiting, as in the Plague ; why it often ceases, immediately after a Crisis, as in the Small-Pox ; why it is frequently cured by Bleeding, as in acute inflammatory Distempers ; why those who vomit perpetually in the Beginning of acute Distempers, without any Inflammation of the Stomach, or adjacent Parts, have a Crisis by way of Diarrhoea, which may be prevented by an Emetic exhibited in the Beginning of the Distemper ; and why a Discharge, by Vomit, of whatever is taken into the Stomach, as soon as receiv'd, is one of the worst Symptoms that can happen in acute Distempers.

An Hiccup may be excited by the same Causes as a Vomiting, and is to be cur'd by the same means.

Predictions from VOMITINGS ; and first of those of a salutary Kind.

Since it is certain, that the Humours may suffer a good or a bad Expurgation by way of Vomiting, the Events of Diseases may, therefore, in a great measure, be prognosticated from such Excretions ; from those which are bad, otherwise call'd *symptomatical*, we may predict either Death or a long Disease ; and from the good we may venture to foretel the Recovery of the Patient.

Vomiting in the Beginning of acute Distempers, is excited by an Irritation of the Stomach, through the excessive Quantity, or depraved Quality of the Food, or Humour contained in it ; or from an Exudation of a Humour, either from the circumjacent Parts, the Liver, for Instance, when under an Inflammation, or from the whole Body, and a *Catachymy* of the Blood and Juices ; but Vomitings, in the Increase and Progress of the Disorder, are produced by the Redundance or Malignity of the Humours stimulating the Stomach to Excretion. Vomitings, thus occasion'd, are by Physicians call'd *symptomatical*, and bad ; because they are seldom or never succeeded by a Recovery, or, at least, not till after a long time, much Pains, and frequent Relapses. It is usual, also, for the Patient, in the Height of the Disease, or a little before, when Signs of Concoction have preceded,

preceded, to be suddenly taken with Vomiting in a plentiful manner; and this Vomition they call *critical*, because it is the Work of Nature prevailing over the Disease, and employ'd in cleansing the Body; on which account it is most salutary, and indicates a safe and speedy Crisis and Solution of the Disease.

Of the Signs which indicate Vomiting, we have the following Account from Hippocrates in the *Prognostics*: If a Person, he says, not seized with a mortal Fever, tells us that his Head aches, or that a Mist appears before his Eyes, or that he has a gnawing Pain at the Mouth of his Stomach, bilious Vomiting are at hand. If he be, also, under a Rigor, with a Coldness of the Parts about the Hypochondria, the Vomiting may be expected still sooner; and if he eats or drinks at this juncture, he will vomit immediately. And 1 *Epid. Sect. 2.* we are told, that they who were affected with burning, or other epidemic Fevers incident to that Constitution of the Seasons there described, and were oppressed with a Heaviness of the whole Head, attended with a Cardiomus, and a Nausea, had those Symptoms succeeded by a Vomiting of bilious and pituitous Matter. Galen, in his Book of *Crisis*, says, that the Signs of Vomiting are, a gnawing Pain at the Mouth of the Stomach, with a Pain of the Head, a Scotomy, an Agitation of the lower Lip, and a Flux of much thin Spittle from the Mouth; and these not attended with Signs of an Hæmorrhage, Sweat, Flux of the Belly, or an extraordinary Flux of Urine, the Menes, or Hæmorrhoids. But the Author of the *Coac.* 142. gives us only three Signs of Vomiting; which are, a Nausea, Cardiomus, and Ptyalismus, or Flux of Spittle. In a Phrensy Galen affirms, that frequent Spitting alone foretells Vomiting.

These, then, are the Signs which indicate Vomiting; and so, without insisting more largely or accurately on this Head, we proceed to what we principally intend here, which is, to give the proper Marks and Characters by which we may distinguish those Vomitings which are good, useful, and salutary.

For lean or thin Bodies, which are prompt and easy to vomit, Expurgations by Vomiting, in the Summer Season, are useful and proper; as we are taught by Hippocrates, 4 *Aph.* 4. 6. especially in Disorders of the Parts seated above the Diaphragm, *ibid.* 18. where we read, that Pains above the Diaphragm indicate Purgation by Vomiting; Pains below that Part, Purgation by Stool.

As to Substances discharged by Vomiting, we read, in the *Prognostics*, that Vomiting is most serviceable when the Matter evacuated is mostly a Mixture of Bile and Phlegm, and not very thick, nor much in Quantity. Galen, *Com. in 4 Lib. Aph.* says it is good for bilious Vomiting to succeed a Rigor; because they indicate a Solution in a burning Fever, from an Expurgation of the Cause; whence not all Vomiting are good and serviceable, but only such as critically discharge a Multitude of bilious Humours. And not only bilious, but pituitous Vomiting, if critical, are beneficial; since Hippocrates, 6 *Epid. Sect. 1. Aph.* 5. commends pituitous, as well as æruginous Vomiting, in Pains of the Kidneys: And Galen, *Com. in 5 Aph.* 1. assures us, that æruginous Vomiting have proved salutary in Convulsions; and speaks of a young Man, who under violent Vomiting was convulsed in all Parts of his Body; but as soon as he had discharged an æruginous Matter, his Fever and Convulsions immediately ceased. Hippocrates, in his Book de *Prisica Medicina*, touches very elegantly upon the Benefit of this Expurgation of bilious Humours. "When a kind of Bitterness, he says, which we call yellow Bile, is effused, what Anxieties, burning Heats, and unruly Disorders, immediately arise! But when we become free from this Humour, and the same is discharged, either spontaneously, or by the Help of Medicines, provided it be done either way in Season, we find manifest Relief from our Pains and Heat." And a little after, "When Persons are molested with a sharp, acrid, and æruginous Bile, what furious Passions, what Gnawings of the Viscera and Thorax, with Desperation and Despondency of Mind, seize upon them! Nor are any of those Symptoms removed before the peccant Humour is purged off, subdued, and mixed with others."

Hence we conclude, that all Vomiting, which duly evacuate the Humours, which are the Causes of Diseases, are good: They are, also, as we before observed, called *critical*; the proper Marks or Qualifications of which are, that they appear when the Disease is in a State of Concoction, that is, when Signs of Concoction have preceded; that they happen on critical Days; that they be conformable to the Nature of the Disease; and, above all, that they entirely remove the Symptoms of the Disease; or, at least, alleviate and diminish them. And this agrees with what Hippocrates has determined, 1 *Aph.* 2. where we read, that "spontaneous Evacuations by Stool or Vomit, if the Matters discharged are such as require an Expurgation, are beneficial, and easily supported; if otherwise, the Effect is contrary." Of the Marks or Signs of

critical Excretions, we find the Author of the *Coac. Prien.* thus speaking, *T. 77.* "In a continual Fever, if the Patient lies speechless, with his Eyes shut, and now-and-then twinkling, if he be seized with an Hæmorrhage from the Nose, or with Vomiting, succeeded by a Return of his Speech and Senses, he recovers."

Those Vomiting, also, are salutary, which are attended with other good Evacuations: Of this Nature was the bilious Vomiting of the sick Woman in the *Strand*, who was three Months gone with Child, 1 *Epid. Sect. 3. Agr.* 13. on the fourteenth Day of her Illness, and attended with a Sweat, succeeded by a perfect Crisis, and Removal of the Fever.

Vomiting without Signs of perfect Concoction, though they may be good, and alleviate the Disease, and diminish its Symptoms, yet they promise no Recovery till after a long time, and many Relapses. Such was the Vomiting of the Wife of Epicrates, 1 *Epid. Sect. 3. Agr.* 5. who "on the fifteenth Day was seized with frequent Vomiting of bilious, yellow Matter; sweated, and was free from a Fever; but towards Night had a high Fever, and discharged a thick Urine, with a white Hypostasis." Here the Crisis and Recovery were delayed till the eightieth Day.

Vomiting of a pernicious Tendency, such as the black, pure, and others, if the Disease under which they happen be pretty favourable, portend not Death, but a long Disease, and Relapses. Thus of the Patient last mentioned it is said, that "about the twentieth Day, in the Morning, she had a small Return of a Rigor, lay under a Coma, slept quietly, and vomited bilious and black Matter, in small Quantities." Another Example we have in Cleonærides, 1 *Epid. Sect. 3. Agr.* 6. who, also, recovered not till the eightieth Day; and was observed by Hippocrates, "on the twenty-fourth Day to be affected with a Pain in the Extremities of the Hands, and to vomit up a yellow, bilious Matter, at pretty frequent Returns, and, a little after, virulent Matter, by which all the Symptoms were alleviated." These Vomiting, as they indicated some sort of Concoction of the Urine, which, it is said, "was during all the time thin, but not colourless," since it was of a good Colour, (which, according to Galen, in his Comment on the Case of the Virgin of Abdera, 3 *Epid. Sect. 3. Agr.* 7. is the greatest Sign of Recovery in those who labour under a Redundance of Humours) and alleviated the Disease, and its Symptoms, were justly to be accounted salutary, and procured a salutary, though imperfect Crisis, from which might be prognosticated a future Recovery, though at a good Distance of time.

We conclude, then, that all Vomiting in acute Distempers, which alleviate the Disease, and render it more supportable to the Patient, are salutary; but those which are not good in their own Nature, such as pure, æruginous, black, fetid, virulent, scanty, and particoloured Vomiting, if the Disease be of the milder sort, and not in an absolutely crude State, are Prognostics that the same will be long, if not mortal, and attended with much Pain and Trouble, and frequent Relapses.

A spontaneous Vomiting, succeeding upon a long Diarrhoea, is said by Hippocrates, 6 *Aph.* 15. to remove the Disorder; and bilious Vomiting, in a Woman of a bilious Constitution, whose Menes flow'd in less Quantity than was requisite, are by the same Author, 1 *Epid.* pronounced good.

Of destructive Vomiting portending Death.

Vomiting of a bad Kind, portending a fatal Event, happen in the Beginning of the Disease, or soon after; and are attended with none, or, at least, very obscure Signs of Concoction; for, at such times, Nature, as has been observed, makes no due Excretions, according to that 2 *Epid. Sect. 1.* "Critical Symptoms determining for the better appear not presently." The Nature of destructive Vomiting, then, appears, in the first Place, from their happening in the Beginning of a Disease, and being attended with Signs of Crudities.

Secondly, Excessive Evacuations by Vomiting, which exhaust the Strength, indicate a depraved Excretion; and copious Discharges this way, under a violent Disorder, if they relieve not, in some measure, the Patient, portend his Death; and with the greater Certainty, if accompanied with other pernicious Signs; but most certainly and infallibly, when they are in their own Nature destructive; as when they are porraceous, livid, æruginous, black, particoloured, virulent, fetid, pure or unmixed, and scanty, or discharging small Quantities of Matter; of which we are to treat singly: These Kinds of Vomiting were observed by Hippocrates in the phrenetic Patient, 3 *Epid. Sect. 3. Agr.* 4. the Woman who lay ill in *Foro Mendacium*; *ibid.* *Sect. 2. Agr.* 12. and the Son of Hægetorides, 7 *Epid. sub T.* 61. a little before their Death.

Small and scanty Excretions by Vomiting in acute Diseases, are one of those Signs, which, as Galen says, *Com. 2. in 1 Prorrh.* *T. 47.* are in the Whole to be regarded, as of bad Signi-

Signification. For an Evacuation truly critical ought not to be in small Quantities, since a scanty Discharge, of what Kind soever, indicates either an intolerable Redundance of the morbid Matter, too copious to be suffered by the affected Parts, or the Imbecillity of Nature, which proposes to itself an Excretion of Superfluities, but is too weak to effect it. Hence it appears, that scanty Vomitings are of the Number of critical Signs which determine nothing, and always indicate a difficult and dangerous, and generally a mortal Crisis, or Turn of the Disease, especially if they are, besides, bad in their own Nature; and are so far from relieving the Patient, that they reduce him to a worse State than he was in before.

Pure, sincere, or unmixed Vomitings, in acute Diseases, are very bad; because the excreted Humour is not only crude, but indigestible, as excluding not only the Act, but the Power of Concoction. Hippocrates, *Lib. Prognost.* bestows the Epithet of ἀγνός [from a Negative, and κερδννύμι, to mix] on whatever Humour is void of Mixture, or every crude and fervid Excretion which is not diluted with its proper Serum, but owes its Generation to the Disorder of some Part, or to the Fervor of the febrile Heat, by which the aqueous and serous Part is consumed. This Kind of Excretion, therefore, by Vomiting in acute Fevers, indicates a violent internal Heat, and such as generally proves too strong for Nature. If it be attended with other bad Signs, it is of fatal Prognostication: Hence the Author of 1 *Prorrh.* says, that "Pure and unmixed Vomitings, attended with much Nauseating and Anxiety, are bad." And Hippocrates, *Prognostic.* tells us, that "The purer or more unmixed Vomitings are of the worst Sort."

The same Author, in the Treatise just mentioned, passes his Judgment on bad Vomitings, with respect to their Colours, where he says, "If the Matter discharged by Vomiting be porraceous, or livid, or black, any of these Colours is to be esteemed bad; but if the Excretions be of all these Colours, it is a most fatal Prognostic; but if the Matter be of a livid Colour, and, also, fetid, it shews Death to be very near." All these Colours in Excretions by Vomiting are very bad; but porraceous, æruginous, livid, black, and fetid Substances may sometimes be vomited critically, though never but in a concocted State of the Disease, that is, at its Height or Decline; and then they will be sure to effect an entire Solution of the Fever, or at least an Alleviation of it and its Symptoms. However it seldom happens, that Substances are critically excreted of these Colours; and therefore, in a violent continual Fever, where no Signs of Concoction have as yet appeared, they are to be esteemed most certain Signs of Death.

Vomitings of different Colours are, in their own Nature, very bad, because, as Galen says, they indicate a Variety of Disorders affecting the internal Parts: Whence the Author of 1 *Prorrh.* T. 60. tells us, that "Vomitings of various Colours are bad; and especially if they are discharged at short Intervals," that is, as Galen says, follow fast one upon another.

Virulent, also, or æruginous Vomitings are, for the same Reason, mortal in acute Diseases, and most of all in a Phrensy, because they indicate the Brain to labour under a deadly Inflammation from an adust Bile. To this Purpose is the Observation of Hippocrates, 1 *Epid. Sect. 2.* where we read, that the epidemic Phrenesies ended in Convulsions, and æruginous Vomitings, under which some of the Patients died suddenly. And of the phrenetic Patient, 3 *Epid.* that "On the first Day of the Decubiture, he vomited much thin virulent Matter, and had a Fever, attended with an Horror." For æruginous, which we suppose we may, also, call virulent Vomitings, to happen after bad and destructive Signs, portend Death unavoidable; for mortal Signs, succeeding one upon another, shew the Case to be desperate. These kinds of Vomitings, attended with Pains of the Head, Watchings, or Deafness, which are Signs of an Inflammation of the Head, indicate an approaching Mania, 1 *Prorrh.* 10. From the Premises we infer, that æruginous or virulent Vomitings indicate, in the first place, the near Approach of a destructive Disorder, as Delirium, Madness, and Mania, or Melancholy, attended with a Ferocity, and, at last, Death with Convulsions; since, as we have elsewhere declared, it is the Nature of these Kinds of Deliria, on account of an extraordinary Dryness, occasioned by an intense Degree of Heat, to end, at last, in Tremblings and Convulsions.

Fetid Vomitings seem to indicate no less Danger, but are rather most certain Prognostics of Death, as being, in their own Nature, extremely bad and destructive, according to the *Prognostics*, where it is said, "That Vomitings of a livid Colour, if they have, also, a fetid Smell, portend very speedy Death; and all subputrid and fetid Smells in Vomitings are bad." The Woman who lay ill in *Foro Mendacium*, 3 *Epid.* before her Death, vomited black and fetid Matters.

All bilious, that is to say, yellow, croceous, portaceous, and all Vomitings accompanied or preceded by bad Signs, are pernicious; and if reducing the Sick to a worse State than before, destructive: Those of the former kind are to be esteemed among those Pseudo-critical Signs, which determine nothing, but indicate a doubtful future Crisis; and, in the last Case, they appear to portend nothing but Death; and with the more Certainty, if they happen to be malignant. To this Purpose is that in 1 *Prorrh.* 62. before-quoted, "Pure or unmixed Vomitings with Anxieties are bad." And, *ibid.* 72. "They who vomit up black Matters, and are affected with a Nausea, accompany'd with a Delirium, and a slight Pain in the Pubes, who have a fierce Look, and shut their Eyes, ought not to be purged, because Purging would prove destructive to them." And a little after, T. 79. we are told, that "Scanty and bilious Vomitings are bad; and especially when attended with Watchings: Blood falling by Drops from the Nose, in this Case, is, also, bad." Of this Nature were the Vomitings observed by Hippocrates, in the sick Woman in *Foro Mendacium*, 3 *Epid. Sect. 2. Ægr. 12.* "Who, he says, on the twelfth Day vomited much black fetid Matter, and was much affected with the Hiccough, and a troublesome Thirst: On the thirteenth she brought up great Quantities of black virulent Matter, had a Fit of a Rigor, and about Noon was speechless."

All Vomitings which give no manner of Relief to the Patient, are bad; but those which render his State worse, are very pernicious, though they happen not to be malignant: Thus they proved in the Case of the Woman before-quoted, of whom we read, that "On the eighth Day, about Noon, she recovered Heat, was thirsty, under a Coma, with a Nausea, and vomited small Quantities of a bilious yellowish Substance; at Night was very ill, took no Rest, and made great Plenty of Water, which flowed from her imperceptibly." This Woman, if her bilious Vomitings had been good, should have rested, and found herself better; and thus it ought to have been, also, after the Vomitings on the ninth Day; whereas, on the tenth, the Fever was exasperated: And on the eleventh Day, after some bilious and virulent Vomitings, she was taken with a Rigor, her extreme Parts were cold, and she fell afterwards into a cold Sweat; and though she had vomited plentifully that Day, yet she had a very troublesome Night. All these Vomitings were of deadly Signification, as appearing not only in a violent Disorder, but attended with other bad Signs, and producing a Mutation in the State of the Patient for the worse; which last is the proper Character of all useless and remarkably bad Signs.

In Wounds of the Head, also, bilious Vomitings are bad, according to Hippocrates, 6 *Aph.* 50. "A Cut received by the Brain is necessarily succeeded by a Fever, and Vomiting of Bile."

Vomitings in the Iliac Passion are, also, very pernicious, as appears from 7 *Aph.* 10. where we read, that "Vomitings, the Hiccough, a Delirium, or Convulsions, succeeding the Ileos, are bad." Here Galen, in his Comment, says, "That in the Ileos nothing descends to the lower Parts; and that this is an inseparable Property of that Disorder. But Vomiting is not always a Symptom; but when the Disease is mortal, and the Patient violently racked, the Excrements ascend, and a Hiccough succeeds." And *Lib. 6. de Loc. affect.* he says, that "He never knew one who vomited up his Excrements ever recover."

These, then, are the Vomitings which are justly to be dreaded in acute Diseases, the immoderate, scanty, yellow, red, porraceous, æruginous, livid, black, fetid, pure, particoloured, which happen in the Beginning of Diseases, where no Signs of Concoction have preceded. In such a Circumstance they are generally mortal; and if the Disorder be violent; and if other bad Signs appear together with them, or precede, or follow them, they are to be regarded as certain Prognostics of Death; especially when, as we observed, they in no manner relieve the Patient, but rather alter his Case for the worse. *Prosper Alpinus, de Præfag. Vit. & Mort. Ægror.*

FEBRILE DEBILITY.

Great Debility arises from an Impediment to the Influx of the nervous Fluid into, and its Pressure upon, the Muscles.

This Impediment may be, an Emptiness of the Canals, when the Fluid they should convey is exhausted; or an Imbecility of the Fluid; or an Obstruction, or Compression of the Canals, especially near their Origins in the Cerebrum, or Cerebellum; or a Weakness of the Heart, thus rendered incapable of furnishing the Brain with a Quantity of Blood, sufficient for the due Secretion of the nervous Fluid.

That the Impediment to the Influx of the nervous Fluid into, and its Pressure upon, the Muscles, and the consequent Weak-

Weakness, arise from the Emptiness of the Vessels; is known from the preceding or present Symptoms of large Evacuations, and from the long Duration of the Disease they accompany or succeed; from morbose or artificial Hemorrhages; Sweats; a Diabetes; Salivation; or Diarrhoea; from a Defect of Aliment, with Respect to its being taken in, its Retention, Digestion, and Conveyance to the Blood; from Paleness, a Smallness of the Pulse, collapsed Vessels, and flaccid Muscles.

That they arise from an Immeability of the Fluid, may be distinguished from what has been said under the Article LENTOR.

That they are caused by Obstructions, may be known from the Doctrine of Obstructions, given under the Article OBSTRUCTION.

We distinguish, that a Compression of the Cerebrum and Cerebellum is the Cause of Debility, when we perceive those Functions injured, which depend upon the Integrity of these Organs; as in case of Deliria, profound Sleep, Tremor, Vertigo, and Ringings in the Ears.

That Debility arises from a Weakness of the Heart, is known by the Signs of a languid and deficient Circulation. See PLETHORA.

Liquid Aliments, nearly approaching the Nature of the Blood, which are previously digested by Art, gelatinous, and mild, and artfully impregnated with vinous and aromatic Substances, if exhibited frequently, and in small Quantities at a time, serve excellently to fill the exhausted Vessels, gentle Frictions of the Extremities being used at the same time; particularly if these are prepared of proper Materials, opposite to the Nature of the Disease.

Among these Aliments are the Broths made of Beef, Veal, Mutton, and Fowls of the gallinaceous Kind, either separate, or mixed together, with the Addition of Salt, and Lemon-juice; new Milk; and the Decoctions of Bread, mentioned under the Article FIBRA.

That Species of Debility arising from an Immeability of the Fluid, is to be cured by the Methods recommended under the Articles LENTOR, and OBSTRUCTION.

That caused by an Obstruction of the Canals, is to be relieved by the Methods considered under the Article OBSTRUCTION.

That Species which arises from a Compression of the Cerebrum, and Cerebellum, is generally cured by such Applications near the Part affected, as are capable of removing the impacted obstructing Matter, and of deriving the Force thereof to other remote Parts. The Nostrils, therefore, Head, Face, Mouth, and Neck, are to be moistened with mild Fomentations; and Epispastics are to be applied to the Feet.

The debilitated Heart usually recovers Strength very slowly: But the general Methods of removing Debility, recommended above, may do some Service.

From what has been said, we may learn, how little the Use of Cardiacs in acute Diseases is understood: And that Debility, in Fevers, is frequently an insuperable Symptom.

FEBRILE HEAT.

External Heat may be determined by a Thermometer; internal, by the Sensation of the Patient, and Redness of the Urine.

A greater Quantity of Fire is always present in that Part which is most hot.

This increased Quantity of Fire arises from a more violent Attrition of the fluid Parts of the Body on each other, and on the Vessels, and of the Vessels reciprocally on these.

This violent Attrition is caused by a strong Motion of the Fluids from the Heart, and a great Resistance of the Vessels to the Force of the Heart.

This Motion is to be estimated, by the Density of the Blood impelled from the Heart, and its Velocity through the Vessels.

The Density of the Blood is known by examining the Blood taken out of the Vessels; by a preceding Dissipation of the most fluid Parts; and by an Hardness of the Pulse.

The Velocity may be calculated from the Number of Pulsations of the Heart, compared with the Magnitude of these Pulsations.

The great Resistance is to be known by the Bulk of the inert Fluids to be moved; and from the Paucity, Narrowness, and Immobility of the Canals, which transmit them.

The Bulk of the Fluids is perceived by the Signs of a Plethora, or Cacochymia; or by a sudden Solution of those Liquids, which before were in a State of Stagnation, as of the Fat; but principally by an Inflation of the Veins, together with a quick and strong Motion of the Arteries.

The Paucity of Vessels is to be learned from the History of Obstructions, or of Wounds. See OBSTRUCTION, and VULNUS.

The Narrowness of the Vessels is known by the Sight, the Touch, a dry Temperament, and a great Increase of Heat, upon a very small Degree of Motion.

The Immobility of the Canals which resists their Dilatation, is learned from all the Signs of a Rigidity of the Fibres, Vessels, and Viscera. See FIBRA.

Upon so many Causes depends the Origin of Febrile Heat; which, however, may have a great Variety of other remote Causes.

But Heat may be increased, by an Increase of one of these Causes only; and, in this Case, the Increase of Heat is in proportion to the Cause.

But if two of the Causes are, at the same time, increased, the Heat is as the Product of the Increases of the Causes multiplied by each other.

And this Method of calculating will hold, with respect to the Accumulation of more Causes.

An increased Heat dissipates the most liquid Parts of the Blood, that is, the Water, Spirit, Salts, and most subtle Oils; dries and condenses the Rest of the Mass, and causes it to concrete into an immoveable, irrefoluble Substance; disengages, attenuates, renders acrid, exhales, and moves the Salts and Oils: Hence the smallest Vessels are fretted and broken; the Fibres are rendered dry, rigid, and contracted; and hence many acute, dangerous, and fatal Diseases are produced, which may be accounted for from what has been said relative to Heat.

From this Doctrine we learn, what is required to mitigate Heat; and how various the Remedies are which tend thereto.

Thus, if an increased Velocity of the Blood excites Heat, the Remedy is, whatever diminishes that Velocity: The principal of these are, Rest of the Muscles, and of the Mind; Venesection; a slight Compression of the Veins in the Limbs, continued a very short time, by Ligatures; a gradual and cautious Application of cold Substances, both externally and internally; and Preparations of the Poppy prudently exhibited.

If Heat arises from the Density of the Fluids, it is cured by those Remedies mentioned above, which diminish the Velocity; and by drinking Water, and Oxymel, and such Medicines as relax the Vessels.

The Bulk of the Fluids, in a Plethora, is easily diminished; but in a Cacochymia, the Diminution is to be brought about by evacuating slowly, and at Intervals: But when the Fat, which was before stagnant, is resolved, the greatest Difficulty arises; in this Case, aqueous Fluids, impregnated with an Acid, Honey, the Yolks of Eggs, or Sugar, together with perpetually continued Evacuants, are of the utmost Importance, because they render the Fat, or Oil, miscible with the Blood.

The Cure of Heat excited by Obstruction, may be learned from the Article OBSTRUCTION; and that Part of the Article VULNUS, which treats of the Accidents supervening upon Wounds, attended with Loss of Substance.

If Heat depends upon the Narrowness of the Vessels, they are to be dilated by relaxing Remedies. See FIBRA.

And Heat arising from a Rigidity of the Vessels, is removed by the same relaxing Remedies. See FIBRA.

When Heat is excited by many of these Causes combined, it must be removed by the proper Remedies above described, combined, also, together.

From all this Doctrine of Heat we learn, why a Fever, attended with excessive Heat, is acute, quick in its Progress, putrid, and, if there is the greatest Degree of Heat, pestilential: Why the Heat of a Bed, of Air confined, of Regimen and Medicines, must necessarily be, in such Cases, extremely prejudicial; and why Heat about the Heart and Hypochondria is of fatal Presage.

From this Doctrine, also, the Origin, Nature, and Effects of Dryness may be understood; and the Cure may hence be learned, which consists in the Exhibition of Drinks, Fomentations, Baths, Clysters, and Gargarisms, which are aqueous, somewhat acid, impregnated with Honey, and relaxing. *Boerhaave.*

PROGNOSTICS IN ACUTE DISEASES FROM HEAT.

Since Heat, Coldness, Dryness, Humidity, Softness, Asperity, and Pains, have relation to the Sense of Feeling, and furnish us with Signs and Symptoms for Prediction, as good and firm as any taken from other Heads, we think ourselves obliged to treat of them distinctly, with regard to our Subject of *Prognostication*. And here, first, we shall begin with Heat, from whence, the Observation of other Signs not being neglected, may be drawn Presages of Life and Death.

Heat, then, it must be observed, with relation to Prognostics, is either mild, or tepid, or high and vehement. A mild and gentle Heat is always good, especially if, according to *Hippocrates*, in his Book of *Prognostics*, it be attended with an equal Softness of the whole Body, or be like the Heat of the

the same Person when in Health. The Flesh of some Persons in Health is observed to be cool; of others temperately hot; of others again, hot to a pretty high Degree: Whence, if the Heat of the Sick be much the same as usual in a State of Health, it is a good Sign: And hence it is, that sometimes an high and vehement Heat, and sometimes a moderate Degree of the same, or Coolness, are laudable in the Patient, on account of their Approach to the Degree of Heat familiar to the Body whilst in Health: And the like Judgment is to be formed of the Urine, and other Excretions, which, if resembling those usually discharged in time of Health, are esteemed good. It is best, therefore, when the Body, under a Disease, suffers little or no Alteration with respect to Heat.

Of febrile Heat, the best Kind is what is mild, temperate, equal in all Parts of the Body, and united with a sort of Humidity, in which it chiefly resembles the natural Heat, which, as *Galen*, in 2. de Natur. Hum. tells us, is not only temperately hot, but, also, humid, in Opposition to acute and igneous, which kind of Heat is most contrary to the natural. This temperate Degree of Heat, therefore, will always be best, unless it happens, that we are deceived by the Malignity of the Disease: For there are several malignant Distempers, attended with a mild and gentle Heat, extremely like the natural; the Heat, in reality, being confined to the inward Parts, and not freely diffused abroad; for which Reason this good Heat must be accompanied with an equal Softness of the whole Body, as required by *Hippocrates*, in his *Prognostics*: "It is best, he there says, for the whole Body to be equally hot and soft;" for an equal Softness distinguishes a good Heat from bad ones, since the Heat of a Patient may seem to be temperate and equal, and yet proceed from a very malignant Disorder. In such a Circumstance the State of the Sick is known, and distinguished by an unequal Softness of the Body; where, in particular, the Hypochondria are commonly observed to be hard, and the Heat is by no means equally diffused over the whole Body; the extreme Parts, for Example, being less hot than the Belly, whose Region and Contents are under a more intense Degree of Heat. We conclude, therefore, that a temperate Heat, equally diffused over the Body, and united with an equal Softness, will always be a good Sign, since it is impossible for a Body, under such an equal Heat and Softness, to be fatally sick; the Union of these Properties being a sure Indication, that the Viscera are free from a Phlegmon, Obstructions, and any considerable Degree of Putridness.

An equal Softness of the whole Body distinguishes, also, a good from an hectic Heat, which latter being sometimes observed mild and gentle to the Touch, has given Occasion to mistake the Case of an hectic Patient: But an hectic Heat is not usually attended with a Softness, but rather with a Squalidness; and an Hectic Fever is not only known by this Mark, but, also, by an Inequality of the Heat itself: For the Fever, as *Galen*, on the *Prognostics*, observes, is exasperated after taking Food.

The best Heat, therefore, is what is temperate, equally diffused over the whole Body, and united with an equal Softness of the Flesh. And not only an Heat thus qualified, but even an intense and vehement Heat, diffused over all Parts of the Body in burning Fevers, is not to be condemned, since it is a Property of malignant burning Fevers, as *Galen* on the *Prorrhetica* observes, not to heat the outer Parts; as it is, on the contrary, of those which are not malignant, to put the whole Body in an equal Degree of burning Heat, even to the outermost Parts, by which they indicate, as *Galen* tells us, on the *Aphorisms*, the Viscera to be free from any violent Inflammation.

It is, also, often best, and most desirable, for presaging a Recovery in acute Disorders, for some Parts of the Body to grow hot, or kindle into an extraordinary Degree of Heat, especially the Parts towards the Skin, upon which Nature often discharges and deposits both the Vehemence of the Heat, and the peccant Humours. For the extreme Parts, in such Cases, to undergo an extraordinary Degree of Heat, is a very hopeful Sign; as the contrary is of bad Prognostication: Hence a Coldness of the extreme Parts in acute Diseases is a very bad Symptom, as, on the other hand, an Heat in the same Parts is a good Sign, as indicating the internal Viscera to be free from any great Phlegmon, Inflammation, or considerable Putrefaction of Humours; and that Nature is not oppressed with a Multitude of Crudities. It, also, signifies, that the febrile Heat has left the Viscera, and discharges itself upon the remote Parts; or, that the noxious Humours are propelled and deposited upon the same; for an extraordinary Heat extending itself to the Feet, is, in many Cases, a Sign of the Decline of the Disease: Whence we are directed by *Hippocrates*, de R. V. I. A. in the Decline of a Fever, when the Heat descends to the Feet, to offer the Patient Food.

An Heat of the extreme Parts, attended with a Redness and Inflammation, is, also, a good Prognostic. In Confirma-

tion hereof we are told by *Hippocrates*, in his *Prognostics*, that "The Patients [under a Quinsy] are very much relieved, if the Neck and Breast contract a Redness, and the Erysipelas returns not upon the inward Parts." And a little after he says, "It is safest when the Tumor and Redness are for the most part turned outwards."

Having made these Observations concerning good and salutary Heats, we are to take some Notice of the contrary to these, or the bad and pernicious; of which Nature is, first, an Heat of the Body, attended with a Colliquation and Tabes; such is the Heat of Hectics, which, unless corrected before it has colliquated the solid Parts, infallibly brings the Patient to the Grave. This kind of Heat is equal and uniform, acute, and not very obvious to the Touch and Senses; on which account an hectic Fever, in the Beginning, escapes the Knowledge of many Practitioners. *Galen*, as we have observed in another Place, in his Comment on the *Prognostics*, has taught us to know this Heat by the following Signs: "By an Hectic Fever the solid Parts of the Body become ignited; for which Reason the Fever remains constant to itself, without Alteration, under an Heat weakly affecting the Touch, after the manner of Lime-stone. As often, therefore, as the Patient eats or drinks, it is much the same as if you poured Water on Quick-lime; whence the Heat becomes much more sensible to the Touch."

That uniform Heat, also, of the whole Body under a continual Fever, though amounting to no more than a tepid Warmth, or perhaps Coolness, is to be suspected, as indicating the whole Force of the Burning to be contained within the Viscera. *Galen*, in his second Comment on *Hippocrates*, de R. V. I. A. and on the Book of the *Prognostics*, tells us, that "For the Body, under acute Diseases, not to be hot in proportion to the Nature of the Fever, and to lie with the Limbs naked, though cold or tepid, as if they were in a burning Heat, is a Sign of Malignity." Such a tepid Heat, though never good, is, however, no sure Prognostic alone, no more than a vehement Heat, which, though always bad in itself, will yet afford no certain Grounds for predicting a fatal Event; since, on the contrary, for the Body to grow hot to an intense Degree, after a Rigor, is a Sign to us of the near Approach of a Crisis; and therefore that Measure of Certainty which it may carry with it, must be taken from other Signs.

A vehement Heat, either of the whole Body, or only of the Thorax and Belly, if it continue long, is pernicious, since it exhausts the Strength, dries and colliquates, and, if succeeded by Spasms, portends Death; for Convulsions from such a Cause as produces a Dryness of the Nerves, are all mortal. Hence *Hippocrates*, 7 Aph. 13. pronounces Convulsions, or a Tetanus, after violent burning Heats, a bad Sign.

A violent Degree of Heat, also, in the Face, or in the Hypochondria, or in the Thorax, is very bad; since the two latter indicate a Phlegmon of some one of the Viscera; and the first an Inflammation of the Brain; though it must be confessed, that a fiery Redness of the Face is not always a Sign that the Brain is thus affected, but, on the contrary, is sometimes the Forerunner of a critical Hæmorrhage; but when it appears accompanied with some other pernicious Sign, it forebodes a bad Event. Hence we read, 1 *Prorrhetic*. 49. "That a good Colour in the Face, with a very stern and sour Aspect, is a bad Sign." For, as *Galen* says, when the Face is of a florid Colour, and the Countenance remarkably sour and sad, it indicates the Brain to labour under some very hot Affection, by which the Blood is rendered adust. A very high and fiery Redness of the Face, attended with Sweating, is, by the same Author, pronounced a Sign of Malignity, and a just Ground for predicting a fatal Event to the Disease, since it indicates a great Inflammation of the Brain, which is reckon'd among mortal Distempers, as the Sweat, also, which in no measure relieves the Patient, is one of the pernicious Signs. The same is confirmed, and in a manner repeated, 1 *Prorrhetic*. 67. where it is said, that "Burning Rigors are, in some measure, pernicious, and a fiery Redness of the Face, with Sweating, in such Cases is bad."

An Estuation, or intense Heat in the Belly, or Thorax, is always bad, for it often indicates some great and deadly Disorder in those Parts; as when it proceeds from a great and malignant Phlegmon of one of the Viscera. In this Case the extreme Parts are either tepid or cold; agreeably to what we read 1 *Prorrhetic*. 7. where it is said, that "Those burning Heats which remain in the Hypochondria, after a general Refrigeration, are bad at all times, but especially when attended with Sweats." And more expressly to the Purpose, in 4 Aph. 48. "In Fevers not intermittent, if the outward Parts are cold, whilst the inward burn with Heat and labour under a Thirst, the Case is mortal."

In Fevers, a vehement burning Heat about the Stomach, with a CARDIOGMOS [see that Word], is bad, 4 Aph. 64. And

And burning Heats in the Sides, attended with Pain, and a Rigor, are condemned by the Author of 1 *Prorrh.* 66. "For a burning Heat in the Side, attended with a Pain, says *Galen* on the Place, is a Sign of a Phlegmon infesting that Part; and if a Rigor supervenes, expect a Suppuration of the Phlegmon." Now a Suppuration of a Phlegmon of the Viscera is seldom cured; but, when the Strength is much exhausted beforehand, never at all.

For the Patient, after some preceding Evacuation, to be so far from being relieved from his Fever, that he perceives an Increase of Heat, it is bad, according to 1 *Prorrh.* 66. where we are told, "That a Return of the febrile Heat, after Refrigeration from Sweats, is bad; and burning Heats in the Sides, with Pain, and a supervening Rigor, are bad." "For, as *Galen* says in his Comment, if any Person under a Disease, after Sweating, grows colder than Nature requires; and afterwards becomes feverish again, his Case is not free from Danger." Again, the Author of 1 *Prorrh.* T. 68. says, "That a Return of the febrile Heat, after Watchings and Sweating is bad." And the same is repeated *Coac.* 41.

We may add, with relation to this Subject, that for refrigerated Bodies to be almost totally incapacitated for recovering Health, is highly pernicious in acute Diseases, as it is occasioned by an Extinction, Resolution, or Suffocation of the natural Heat. And the Case seems to be no less mortal, if the Symptom be observed of the exterior and outermost Parts of the Body, or if these are hardly capable of recovering Heat. To this Purpose we read, 1 *Epid. Sect. 1. Stat. 1.* that in a very mortal epidemic Fever, the Patients were much affected with Refrigerations of the extreme Parts, and that it was scarce possible to recal the Heat into them.

For Bodies, also, in the last Place, to be soon heated, and soon cooled, is a bad Sign; for it shews, as *Galen* says, the Disease to be highly malignant, and if not mortal, yet of long Continuance: But in acute Diseases, which speedily exhaust the Strength, the same Symptom portends Death. *Prosper Alpinus, de Præfag. Vit. & Mort.*

PROGNOSTICS IN ACUTE DISEASES FROM HUMIDITY AND DRYNESS.

We sometimes form Presages in acute Distempers, from the Humidity or Dryness of the whole Body, or of some of its Parts. In those who die of an Empyema, or a Phthisis, may often be observed a little before their Decease, a copious Humidity, sometimes diffusing itself over the whole Body, sometimes no farther than the Legs and Belly. And *Hippocrates, Lib. Prognost.* pronounces a Dropsy in or from acute Diseases, mortal, as proceeding from an utter Decay of the natural Heat. "Dropsies, he there says, caused by an acute Disease, are bad; for they remove not the Fever, but increase the Pain and Sickness, and end in Death."

Deficcations, Dryness, and Hardness, either of the whole Body, or of any of its Parts, give, also, frequent Occasions for prognosticating an unhappy Event in acute Disorders. A Dryness and Extenuation of the whole Body, after a long Burning Fever, are just Grounds for presaging an hectic Habit of Body, terminating at last in Death, as every one versed in Medicine knows. An extraordinary Dryness, also, of the Forehead, Tongue, and other Parts, pretty often portend a fatal Event, as it did, for Instance, in the Case of the young Man of *Melibæa*, 3 *Epid. Sect. 3. Æg.* 16. who, before his Death, was observed by *Hippocrates*, to have the Skin of his Forehead extremely dry and tense. *Prosper Alpinus, de Præfag. Vit. & Mort.*

FEBRILE DELIRIUM.

A Delirium is a Production of Ideas not corresponding to external Causes, but excited by the internal Disposition of the Brain, whilst the Judgment is conformable to such Ideas, and the Affections of the Mind, and Motions of the Body, correspond therewith: And these, either alone, or combined, form various Species of Deliria.

It always, therefore, witnesses a morbose Affection of the medullary Part of the Brain, which may arise from any kind of Obstruction; from an Impediment to the Influx, Transflux, or Efflux of the Fluids, through the Brain; from a violent Velocity, or Stagnation, of the Liquids, and many other Causes, which must be investigated with the utmost Diligence, in order to acquire a just Knowledge of the Method of Cure.

For various Remedies, and Methods of Cure, must be adapted to the various Causes; among which the principal are, Baths for the Feet; Epispastics apply'd to the Feet and Legs, and Frictions of these Parts; diluting Clysters frequently administered; a thin Diet; sedative, deobstruent, and diluting Portions; emollient Applications to the Head; gentle Anodynes; Bleeding in the Feet; and exciting the hæmorrhoidal, or menstrual Flux.

For an Account of Prognostics from a *Delirium*, see the Article DELIRIUM.

A FEBRILE COMA.

A *Coma* is a perpetual Inclination to sleep in a Fever, either with, or without Sleep; and always witnesses such a State of the Brain, as prevents the Exercise of the Senses, and animal Motions. It may arise from a Deficiency of the Arterial Fluid convey'd to the Brain; from an Impediment to its Circulation through the Brain; from an Impediment to the Secretion of the nervous Fluid from the Blood; or from whatever prevents the Flux and Reflux of the Spirits through the Nerves.

Hence various, and those often different, and even contrary Causes, may produce this Symptom, in a Fever; as all violent Evacuations, or Repletions; all glutinous, pinguious, or inflammatory Inspissations of the Blood; all Causes, of what kind soever, which may excite a Compression of the Brain, which may, also, have the same Effect, if they act upon the Nerves.

Hence appears the Necessity a Physician is under of investigating the particular Cause of a *Coma*, before he can determine what Remedies are to be apply'd, and in what manner: For, frequently, quite contrary Methods are required; and it often happens, that a *Coma* obstinate to all Remedies, ceases spontaneously, when the Concoction of the Fever is completed.

Those Remedies, however, recommended above in a *Delirium*, are proper in this Case; especially Fomentations apply'd to the Head and Neck.

But if there are Signs of a great Inflammation, it must be treated as an original Disease. See PHRENITIS, and SOMNUS.

A FEBRILE PERVIGILIUM, OR OBSTINATE WATCHING.

A *Pervigilium*, or obstinate Want of Sleep, is the direct contrary to a *Coma*; whence its Nature may be understood: It is caused by the first Tendency to a slight Inflammation of the Brain; an Increase of which often excites a *Coma*.

It is cured by Rest of the Muscles; Calmness of Mind; the Absence of all Objects of Sense; moderate Cold; a moist Air; mild and emollient Aliments; a gentle, continual, grateful, agreeably ringing hushing Murmur; farinaceous, subuleous, moistening, and demulcent Medicines; the Smell of soporiferous Vegetables; and the prudent Use of Anodynes, Paregorics, soporiferous Remedies, and Narcotics; always premising those Remedies, which are capable of checking and curing the Inflammation.

OF PROGNOSTICS IN DISEASES FROM WATCHING.

Watching, as well as Sleep, with respect to what they may portend, are to be considered first in their natural State; for when no Change or Alteration can be perceived on this Head, we have good Room and Opportunity for Prediction; since, if the Patient sleeps and wakes, according to Custom in time of Health, it is a good Sign, and gives Occasion to preface an happy Event. For it seems impossible for a Person to die of any Distemper, while his Times of Sleep and Watching remain entire, and without any manner of Alteration. On this Subject, *Hippocrates*, in his *Prognostics*, thus pronounces: "As to Sleep, it is best when conformable to natural Custom, or when the Patient wakes by Day, and sleeps by Night; but if there be any Alteration in this respect, it is so much the worse." And 2 *Aph.* 2. he says, that "when Sleep comes poses a Delirium, it is a good Sign."

As to *Watching*, of which we will now treat in particular, it is defin'd by *Galen*, "An Extension of the Soul from its Original to all Parts of the Body, which sometimes happens to be great and copious, at other times little and inconsiderable; because the Soul is extended from its Original sometimes for a long time together, and in an abundant manner; at other times, for a shorter while, and more sparingly." Hence then proceed much and little Watching; But what we treat of at present is, a great and preternatural Extension and Effusion of the Soul from its Original to all Parts of the Body, proceeding from a Dryness of the Brain, occasioned by hot and acrid Juices, or Exhalations; as we are taught by *Galen* in many Places, particularly *Lib. 3. de Loc. Affect.* and *Com. 4. in Lib. de R. V. I. A.* And *Com. in Prognost.* and *Lib. 4. de Præfag. ex Puls. Cap. 4.* and *Lib. 3. de Loc. Affect.* and in other Places, he tells us, that Watching is the proper Effect of Dryness, as Sleep is of Humidity; and that, as it is a Property of Heat to produce Deliriousness, so it is of Dryness to be the Cause of Watching: Whence they who have their Brains affected at the same time with an Excess of Heat and Dryness, are at once both wakeful and delirious, as the same Author observes, *Lib. 4. de Præfag. ex Puls. Cap. 8.* And in his *Comment* on 3 *Aph.* 31. he says, that old Persons are wakeful from Dryness.

From the Causes of *Watchings*, we shall now consider what may be learnt for prognosticating their Event; and here, first, we shall speak of *Watchings*, from which we may draw favourable Prognostics: For though all *Watchings* are in themselves bad, yet there are some which have a very good Signification; and such are those which precede good Crises, and are accompanied with Restlessness, Anxiety, Delirium, Convulsions, Pains, and other Symptoms, as *Galen, Lib. 3. de Crisibus*, observes. These *Watchings* are perceivable in the Increase or Height of the Disease, at which time it is usual for the Patients to be almost perpetually waking, to be under great Disorder, and to have the Fever more and more exasperated, the nearer they approach to a Crisis, as we are told by *Galen in 4 Aph. 70*. And the same Author, *Lib. 3. de Crisibus*, pronounces *Watching* with Signs of Concoction, in acute Diseases, the Forerunner of a Crisis. Of such Patients we read, *1 Prorrh. 132—135, 136*. where it is said, "They who on a sudden [*ἐκθῶς*, for which some read *ἐκθῆς*], sedate, composed] appear very much disorder'd, are wakeful, and bleed at the Nose, are in some measure relieved on the sixth Day." And, *Text. 135*. "They who are affected with an Heaviness of the Head, and a Pain in its fore Part, with perpetual *Watching*, are subject to an Eruption of Blood at the Nose." And, *Text. 136*. "Perpetual *Watchings*, with sudden Jactations and Inquietude, signify an Hæmorrhage, and especially if there has been any previous Discharge of that Nature." "Again, *Text. 149*. "An Horror, attended with critical Sweats, and returning on the next Day, with unaccountable *Watchings*, portend, in my Opinion, an Hæmorrhage." Once more, *Coac. 110*. "Sudden Inquietudes with *Watchings*, and black and hard Stools, are sometimes Forerunners of an Hæmorrhage." These then are the *Watchings* from which we may venture to predict the Recovery of the Patient, on the same Ground, as from Pains, Convulsions, Deliriums, and Anxieties preceding a Crisis.

All *Watchings*, except those before taken notice of, however caused or circumstantiated, are bad; for *Watching* dries the whole Body; and as *Galen, 7 M. M. Cap. 6*. observes, is extremely prejudicial to such as labour under a Dryness, and induces on them, if it continues long, Convulsions, and a Consumption. It is no Wonder, therefore, that, in burning Fevers, obstinate and perpetual *Watchings* bring on mortal Convulsions, since in other Cases they cause violent Inflammations, and, in some Subjects, Fevers, especially as *Galen, Lib. 1. de Sanitatuenda*, observes, in Infants, *Watchings* refrigerates the internal Viscera, by resolving their Heat. Agreeably to this, it is asserted by *Hippocrates, 6 Epid. Sect. 4. Aph. 12*. "In *Watching*, he says, the external Parts are evidently hotter, and the internal colder." He there teaches us, also, that *Watching* digests and resolves Bodies: Whence it is necessary, as *Galen, Lib. 12. de M. M. Cap. 8*. infers, that by its long Continuance, the Patient must be extremely weakened and exhausted. We may add to this, that *Watching* foment and increases the Crudities of the Humours, as we are told by *Galen, Com. 1. in Lib. de R. V. I. A*.

For the Reasons aforesaid, all *Watchings* in acute Diseases, are to be esteemed bad; but the most pernicious are those which are perpetual, and which by inducing all the bad Symptoms before-mentioned, cannot but afford too just Grounds for prognosticating a fatal Event. It is, indeed, customary for perpetual *Watchings* to bring on Convulsions, and a Delirium; which they effect by two different Ways and Means, one by drying and inflaming the Brain, and the other by an Oppletion of that Part with an hot Humour; since all *Watching*, as we observed before, indicates either a Vacuity and Exsiccation of the Brain, or a Repletion of it with hot Humours, or an Inflammation of that Part. Convulsions and a Delirium from *Watching*, procured by this latter means, are not indeed absolutely fatal; for either by a Resolution and Evacuation of the hot Humour, or a Propulsion of it to some other Part, they are sometimes removed. With relation to this Subject, we read *Coac. 109*. "That in Children under an acute Fever, Costiveness with *Watching*, much Crying and Striving, Alteration of Colour, and great Redness, indicate Convulsions." But tho' *Watchings* with those Symptoms are not always mortal, they are, however, very much to be dreaded. Wherefore, *Hippocrates, 7 Aph. 18*. justly pronounces *Watchings*, attended with Convulsions and a Delirium, a bad Sign.

Convulsions and a Delirium, attendant, or consequent, on perpetual *Watchings*, and not caused by a Repletion of the Brain with hot Humours, are absolutely mortal, in the same manner as Convulsions, supervening upon burning Fevers, indicate inevitable Destruction. Thus it was in the Case of the phrenetic Patient, who could not sleep, and dy'd on the fourth Day, as is observed by *Hippocrates, 3 Epid. Sect. 3. Agr. 4*. *Watchings*, with some other attendant Signs, as æruginous Vomitings, and Pain of the Head, portend a furious Delirium

and Death; agreeably to what we are told by the Author of *1 Prorrh. 10*. "A Pain of the Head, he says, attended with æruginous Vomitings, *Watchings*, and Deafness, are soon succeeded by a Mania;" as it was in the Instance of the phrenetic Subject before-mentioned.

We may conclude, that constant and perpetual *Watchings* in acute Diseases are deadly; as they were in the Case of the phrenetic Person aforesaid; and of the Wife of *Dromeades, 1 Epid. Sect. 3. Agr. 11*. who continued without Sleep from the first to the fourth Day, and dy'd on the sixth. *Hippocrates, 1 Epid. Sect. 2. Stat. 3*. informs us, that many, under burning Fevers, dy'd after perpetual *Watchings*: Whence, in *Prognost.* he justly pronounces it "a very bad Sign," when the Patient can neither sleep by Day nor by Night, for either Pain, and great Anxiety, or a Delirium, are signified by it.

Watchings, attended with some mortal Sign, are absolutely fatal. Here we ought attentively to consider the Evacuations attending this constant Want of Sleep; and, if these are all bad, as indicating a symptomatical, useless, or depraved Excretion of Nature, they portend certain Death.

Watchings, accompanied with Cold, copious and constant Sweating of the Head, are bad. With relation to this, we read *Coac. 41*. that "They who are affected with cold Sweats, *Watchings*, and Vicissitudes of Head and Cold, are in a bad State."

Of no better Signification are *Watchings*, attended with other Excretions, which give no Relief to the Patient, but are Signs of Crudity; such are a Stillation, or Falling by Drops, of Blood from the Nose, and virulent Vomitings.

Sometimes *Watchings* are succeeded by Evacuations, which, affording no Relief, are esteemed very bad, prove injurious to the Sick, and increase the Disease: Such a Consequence in all Evacuations and Symptoms, under which, the Patient might reasonably expect to be eased, is pernicious, as we are taught by *Galen, Com. in Prorrh.* and other Places, because in acute Diseases, Excretions, or other Circumstances, which use to relieve the Patient, if they answer no such Purpose, are said to be bad; but if they are so far from proving beneficial, that they render the Case of the Sick really worse than it was before, they may safely be pronounced fatal.

As pernicious Convulsions, furious Phrensies, and Tremblings, are frequently the Consequences of continual *Watchings*, so it sometimes happens, that a mortal *Coma* succeeds them: For, as a long Sleep, after much *Watching*, which refreshes the Sick, is a very good Sign, so a long Sleep, which is so far from refreshing, that the Patient rather finds himself fatigued and injured by it, must be of deadly Signification; agreeably to that of *Hippocrates, 2 Aph. 2*. "Sleep which composes a Delirium, is good;" and the preceding Aphorism, "A Disease, in which Sleep creates Pain and Anxiety, proves mortal." But where Sleep helps and relieves the Patient, the Disease is not mortal.

A *Coma* succeeding a perpetual *Watching* is generally fatal, as proceeding from a Refrigeration and Resolution of the natural Heat, which must be highly destructive, as *Galen, Com. in 4 Aph. 67*. observes; for Coldnesses, he there says, which are consequent upon hot and dry Affections, are incurable. A *Coma* sometimes succeeds a *Watching*, or Want of Sleep, from a Resolution of the Bile, and a dry Evaporation, which was the Cause of that *Watching*, the pituitous Humour still remaining, which moistens and dilutes the Brain; and such a *Coma*, with Signs of Concoction, and the Strength not much injured, cannot be thought pernicious. *Prosper Alpinus de Præseg. Vit. & Mort. Agrot.*

FEBRILE CONVULSIONS.

See VULNUS.

A Convulsion in a Fever, is always excited by some Injury done to the Brain, either by Vellications convey'd to it by the Nerves from the inferior Parts, or from an inordinate Appulse, Transflux, or Egress, of the Liquid secreted in the Brain; which may arise from every Cause capable of exciting a *Delirium*, *Coma*, or obstinate *Watching*: And on this Account, there is a great Variety in the Ætiology and Cure.

If it continues long, it easily affects the entire nervous System: Whence fatal Disorders are excited.

If Convulsions succeed the Signs of an Inflammation of the Brain, they are generally fatal Symptoms.

If a Discharge of thick Urine is succeeded by one of the aqueous and pellucid kind, and Convulsions immediately follow, it is the worst of Symptoms.

If Convulsions arise in Fevers, after profuse Evacuations, they generally prove fatal; as do those, also, which are accompanied by a perpetual *Delirium*.

In order to a Cure, the particular Cause is, first, to be investigated, and the affected Part must be discovered, whence the Convulsions primarily arose; then Medicines are immediately to be apply'd, which are capable of correcting Acrimony, of resolving the impacted Matter, and relaxing the Parts

Parts which are contracted. We are, therefore, to attempt the Cure of Convulsions by diluting, relaxing, making Revulsion, and lenifying, never trusting to the specious Character of Antispasmodics.

But if the Head is found to be primarily affected, recourse must be had to the Methods of Cure recommended above, in case of a Delirium, and Coma. Boerb. Aph.

PROGNOSTICS FROM CONVULSIONS.

Convulsions, when alone, or attendant on other Disorders, though always bad, yet sometimes prove Indications for prognosticating a good Event; but oftener portend Death than Recovery; of which fatal Tendency are those excited in Fevers from a Dryness of the Nerves. *Convulsions* suddenly seizing the Patient in the Beginning of the Disease, afford no certain Prognostic. They are much attendant, also, on Fevers, and indicate nothing of themselves but a Multitude of Humours, without any Tokens of a Recovery, unless they are critical. But we shall treat more accurately of the Prognostics of *Convulsions*, after we have first shewn what they are, with their Causes and Differences.

A *Convulsion*, in Greek *σπασμός*, *Spasmus*, according to *Galen*, de Sympt. Caus. Lib. 2. Cap. 2. is an involuntary Tension of the Nerves and Muscles, by which they are reduced to the same Posture and Disposition, as would happen to them from a natural and spontaneous Motion. And in the *Definitiones Medicæ*, ascribed to the same Author, it is said, that a *Convulsion* is an Affection incident to the Nerves and Muscles; by which sometimes the whole Body, sometimes a Part of it, is distended. Hence, this Kind of Disorder is by many properly enough called a *Tension*, and a *Distension*, tho' some make a Distinction between a *Convulsion*, or *Spasm*, and a *Distension*, from that Passage of *Hippocrates*, 4 Aph. 57. "A Fever coming upon a *Convulsion*, or *Distension*, [τὸ σπασμὸν], removes the Disorder." But *Galen*, in Comment, has removed this Difficulty, and very well stated the Case, where he tells us, that of the three different Kinds of *Convulsions*, what the *Greeks* call *Tetanus*, may more properly be called a *Distension*, and not a *Convulsion*, if it were only, because in such a Disorder the Parts appear not convulsed, but are equally distended both Ways; on which account principally it has the Name of *Distension*.

There is, also, a twofold Distinction of *Convulsions*, one permanent, and without conspicuous Motion, of which there are three subordinate Kinds, one called by the *Latins*, *Distentio*; by the *Greeks*, *Tetanus*, and by *Celsus*, particularly *Rigor*, in which Affection, the Neck, together with the rest of the Body, remains immoveable, and inclined to neither Side, but erected in a right Angle to both. And this seems most properly to be what *Hippocrates* calls *Tetanus*, a *Distension*, which differs from a *Convulsion*, in that, as we just said from *Galen*, the Parts appear not to be convulsed.

A second Kind is called *EMPROSTHOTOSIS*, [see *TETANUS*] which is, when the Head, Neck, and rest of the Body are contracted towards the Breast; on which account it is called *Tentio ad anteriora*, "a Tension towards the anterior Parts."

The third has the Name of *OPISTHOTOSIS*, [see *TETANUS*] from the *Greeks*; and by the *Latins* is expressed by *Tentio ad posteriora*, "A Tension towards the posterior Parts." *Galen*, in his Book of Medicinal Definitions, has comprehended these three Kinds of permanent *Convulsions*, in the following Words: "Travellers, says he, who die of Cold on the Roads, are seized with such Kinds of Rigors as the *Greeks* call *Emprosthotonos*, *Opisthotonos*, and *Tetanos*, because under such Accidents the Body is inflected sometimes to the anterior, sometimes to the posterior Parts, sometimes neither Way, but is distended in a strait and immoveable Posture."

The other Kind of *Convulsions* is distinguished by frequent and interrupted Motion; and, therefore, called by Physicians, *convulsivæ Motions*, or *Convulsions*, ex *Materia non proportionata*, as when they are excited by a Stimulation and Vellication of the nervous Parts, or a violent Straining, and Stretching of the same, as in the Disease which the *Greeks* call *Epilepsia*, or are caused by Consent from a biting Sensation at the Mouth of the Stomach, or from some Injury received first by the Brain. This last Species of *Convulsions* is not *per se*, and in Strictness of Speech, called a *Convulsion*, but rather a *convulsivæ Motion*: And this is either universal, as when the Brain is primarily affected; or particular, from a Vellication of some particular Muscle or Nerve, in the same manner as a permanent or motionless *Convulsion*, is called *universal*, when, from an Affection of the Brain, it seizes the whole Body; and *particular*, when it affects only one Part; as, for Instance, in the Disorder which some call *Spasmus Cynicus*, in which the Mouth is distorted, or rather the Parts of the Mouth are convulsed.

As to the Parts which may labour under a *Convulsion*, or *Distension*, and the Place affected in *Convulsions*, *Galen*, de Loc. Affect. Lib. 3. Cap. 6. tells us, that all Parts of the Body

which are fitted for Motion, may be convulsed; for the Parts of the Body which are moved, are put in Motion by Help of the Nerves and Muscles, which being convulsed, there is a Deprivation of that Motion, as it happens in a Grinding of the Teeth; which the *Greeks* call *Trysmos*, and is a *Convulsion* of the Muscles, as we are taught by *Galen*, de Loc. Affect. Lib. 2. Cap. 2. And in the same Treatise, Lib. 3. Cap. 6. he teaches us from the convulsed Part to know, whether the spinal Marrow, or the Brain, or the Nerves, or which of them, are affected, in the following Words: "When the whole Body is convulsed, all imagine such a Part to be affected, as, like the Trunk with respect to the Branches of a Tree, is the common Trunk of all the Nerves, and not of a few only in one Part, in nature of a Branch; as is the Case, when a Leg, or one of the Hands, happens to be convulsed, where a Convulsion of the whole Member shews the Original of the Nerves distributed on it to be affected, from the Example of a Branch of a Tree. But when the whole Body is affected, we must suppose the common Origin of all the Nerves below the Face, which answers in proportion to the Trunk of a Tree, to be affected, that is, the first Parts of the spinal Marrow; for which Reason, the most experienced Physicians adapt their Remedies to those Parts, and take no Notice of the Heart. But if, with the rest of the Body, the Face be, also, convulsed, we take care not only of the Beginning of the spinal Marrow, but of the Brain itself. And, indeed, we often see the Lips, the Eyes, the Skin of the Forehead, the whole Jaws, and the Root of the Tongue, affected with *Convulsions*; and, because we learn from Anatomy, that all these Parts are moved by Muscles, which receive their Nerves from the Brain, we judge that to be affected whenever those Parts are convulsed; but when we see the other Parts of the Body labouring under *Convulsions*, while those remain in a due Disposition, we conclude the Origin or Beginning of the spinal Marrow to be affected."

Having thus learnt to know the Part originally affected by the Part convulsed, we proceed to inquire into the Causes of *Convulsions*; and, first, of those which are perpetual and permanent without Motion. *Convulsions*, says *Hippocrates*, 6 Aph. 39. "are occasioned either by Repletion, or Inanition." The same is confirmed by *Galen*, Lib. 2. & 3. de Loc. Affect. & in 4. & 6. Lib. Aph. & Lib. de Trem. Palpit. & Convuls. and in innumerable other Places; but especially, Lib. 2. de Symptom. Caus. where he says, that "a *Convulsion* draws the Nerves and Muscles into the same Posture and Disposition, as that into which they were brought by the animal Force, when in their natural State. Whether, therefore, voluntary Motions are performed by a Tension of the Muscles at their Origin, or an Impletion of them by a flatuous Influx, the Effects are the same in a *Convulsion*, whether from a flatulent Spirit, which may be generated in the Veins, or a Multitude of other Disorders, among which is a Phlegmon, which may create a Tension." And these are all comprehended, according to *Hippocrates*, under the two general Heads of *Repletion* and *Inanition*, of which the first takes place in a Phlegmon, and the other in burning and dry Fevers. And that immoderate Impletion and Inanition may either of them cause a Tension in nervous Bodies, we may learn from what happens to the tense Strings of musical Instruments, which break whenever those Instruments be laid in a moist and humid, or a dry and dusty Room; and they are therefore relaxed, before laid aside. This Generation of *Convulsions* is illustrated by *Galen*, Lib. 3. Cap. 6. in the following Words: "If you observe nervous Bodies, particularly the Strings of an Harp, by an immoderate Distemperature of the Air, distended to such a Degree as to break, you will easily imagine, that the same thing may happen to the Nerves of Animals." But how are Strings, from an Affection of the Air, as when it is immoderately dry or moist, stretched in such a manner as to break? The Humour, to answer, moistens them so as to raise them into a preternatural Tumor, which must of Necessity cause extraordinary Tenseness; on the other hand, as the Sun by drying Skins contracts them, so Dryness draws and stretches Cords and Strings; and thus we observe Thongs of Leather, when dry'd by the Fire, reduced to a State of Tenseness and Contraction.

To these two Causes of *Convulsions*, *Galen*, in Aph. 25. adds a third, which is, the Weakness of the nervous Parts; on which account Children, he says, are much subject to *Convulsions*, as well as from the crude Aliment with which they abound.

The nervous Parts often labour under a Repletion from a crude Humour, by which they are convulsed, as we are told by *Galen*, de Sympt. Caus. Lib. 2. Cap. 2. Thus it is with Children, who, abounding with crude Aliment, and having their nervous Parts not very strong, are easily affected with *Distensions*,

sions, as *Hippocrates* tells us, 3 *Aph.* 25. Hence, 2 *Epid. Sect.* 5. he advises, when Children * are affected with *Convulsions* to excite a Fever, by which means that Disorder, together with the Fever; is sometimes removed in a safe Manner.

To this Head of *Repletion* may be reduced *Convulsions* from an Humidness of the Air, as when we are told by *Galen*, in *Epid. Sect.* 2. that in a moist and cold Constitution of the Air, many Persons, and especially Children, as *Hippocrates* writes, were afflicted with *Convulsions*; and, also, those proceeding from an immoderate drinking of Wine.

Sometimes, also, the nervous Parts are stretched and convulsed from their being imbued with Blood, or bilious Excrements, sometimes from a Flatus, and frequently from a Phlegmon, either immediately, or by Consent of the neighbouring Parts. After this manner are occasioned Tensions of the Hypochondria, which proceed from a violent Inflammation of the Diaphragm, Pleura, or Liver; and to the same Head appertain *Convulsions* from Wounds attended with an Inflammation.

The Parts are dry'd, or, to speak in the Phrase of *Hippocrates*, emptied, or evacuated, as well by a burning Heat, as an immoderate Cold. Of the latter we read, 5 *Aph.* 17. that it "produces *Convulsions* and Distensions;" and, *ibid.* *Aph.* 20. it is said, that "Cold is biting to Ulcers, hardens the Skin, renders Pain insupportable, blackens, and excites febrile Rigors, *Convulsions*, and Distensions." Here *Galen*, in his Comment, says, that "Immoderate Cold excites those *Convulsions* and Distensions, with a Refrigeration of the Nerves; for as it is not convenient, that this Substance should be dissolved by an immoderate Heat, it is no less prejudicial to them to be refrigerated and contracted." For excessive Cold, affecting the Nerves, Muscles, Tendons, and Ligaments, first causes an Inequality of the Skin, by repelling the Heat and Moisture inwards; then dries by expressing the finer Parts, compresses, condenses, hardens, and, by closing the interior Sinuses and Bores, prevents Diffusion and Perspiration, as well as Reception of Aliment, so that the Parts remain rigid, hard, and distended. To this Purpose we read, *Coac.* 23. that "a Rigor, producing an *Opisthotonos*, is mortal;" and *Galen*, in his Book of medicinal Definitions, before quoted, says, that "Travellers oppressed with Cold, die of an *Empoisthotonos*, *Opisthotonos*, or *Tetanos*."

Immoderate Heat produces the same Effect, and much more efficaciously; for by dissipating all the humid Substance of the Muscles, and other nervous Bodies, it renders those Parts extremely dry'd and parched; whence they are distended and convulsed. Burning Fevers, therefore, which, like a Fire, dry the Nerves, produce a Distension and *Convulsion* of the same; and, as *Galen*, on 4 *Aph.* 66. teaches, induce *Convulsions* of a pernicious Kind. After the same manner mortal Phrenesies, by dissolving the Substance of the Nerves with their immoderate Heat, usually end in *Convulsions*. On the same account, all considerable feverish Estuasions have the like Effect by Drying, as we are assured by *Galen*, on 7 *Aph.* 13. and the same Consequence follows from constant Watchings, and all great and immoderate Evacuations and Purgations, as we learn from the same Author, on 5 *Aph.* 3. 4 & 7. *Aph.* 9. And he calls all those Drynesses, if I may use the Word, the Causes of *Convulsions*, de *Loc. Affect.* Lib. 3. Cap. 5. comprehending them all in the following Words: "For since a *Convulsion* is occasioned either by Labour, Watching, Hunger, Solitude, or a dry and burning Fever, as we see in Phrenesies, you may justly impute the Cause to a Dryness and Inanition."

Thus have we assigned the various Causes of perpetual and permanent *Convulsions*, and have reduced them under the general Heads of *Repletion*, and a Dryness, Evacuation, or Inanition, of the nervous Parts. But *Convulsions* attended with manifest Motion, such as those of the epileptic Kind, and those they call *convulsive Motions*, have other Causes. For sometimes they proceed from a gross and viscid Humour obstructing the Ventricles of the Brain; which is the Cause of that universal *Convulsion* which the Greeks call *Epilepsia*, and others *Morbus Comitialis*, according to *Galen*, de *Loc. Affect.* Lib. 3. Cap. 7. where he tells us, that "the Epilepsy is a *Convulsion* of all the Parts of the Body, not perpetual, as is observed in the *Empoisthotonos* and *Tetanos*, but incident at certain Intervals; and this *Convulsion* is occasioned when the Brain is primarily and in itself affected; whence, by Consent of Parts, we often observe Bodies to labour under *Convulsions* both general and partial." The same Author, de *Loc. Affect.* Lib. 5. Cap. 6. has demonstrated, that a Disorder of the Mouth of the Stomach has not only occasioned *Convulsions*, by communicating the Injury to the Brain, the Origin of the Nerves,

but other very severe Symptoms; and, he tells us of a young Grammarian, who, whenever he was too intent on Teaching or Thinking, or fasted too long, or fell into a Passion, was seized with a Fit of an Epilepsy, from a bilious and acrid Juice vellicating the Mouth of the Stomach. And, in his Comment on 5 *Aph.* 1. he speaks of a young Man who was frequently affected with an universal *Convulsion*, from an æruginous Humour gnawing the Mouth of the Stomach; and recovered not from his Fit, before he had discharged the æruginous Matter by Vomit. Again, in his Book of *Venefection* against *Erasistratus*, he tells us, that *Diodorus* the Grammarian was affected with *Convulsions* after long Fasting.

A *Convulsion*, also, is occasioned by much Straining and Retching, when the Stomach labours to expel some malignant and noxious Matter, in the same manner as a true Epilepsy is induced, while the expulsive Faculty in the Brain makes Efforts to expel the gross and viscid Juices which obstruct its Ventricles, and intercept the Passage of the animal Spirits thro' them. *Hippocrates*, therefore, had good Reason to say, that *Convulsions* were produced from White Hellebore, by its pernicious Juices gnawing and vellicating the Mouth of the Stomach. An Instance of this fell within our own Observation, while we practised Medicine at Padua, in a young Man, who, by the Carelessness of an Apothecary, took White instead of Black Hellebore. But many Instances may be given of such as have been affected with convulsive Disorders from some bilious, or æruginous Humour, or some poisonous Juice infesting the Stomach, and vellicating its Mouth.

It appears, therefore, that an Injury done to the Mouth of the Stomach is, by Consent of Parts, communicated to the Brain; whence *Convulsions* are excited. And not only the Mouth of the Stomach, but the Uterus, and this last, most of all, communicate, by Consent, their Disorders to the Brain; whence hysterical Women are often observed to be molested with *Convulsions*. *Galen*, de *Loc. Affect.* Lib. 6. Cap. 5. gives an Instance of this in a Widow, who was affected with *Convulsions*, from the Uterus being injured by a Retention of the Semen; and was freed from them by gross, ferid, feminal Excretions. Hence the Author of 1 *Prorrh.* T. 129. says, "that Women affected with Hysterics, without a Fever, are subject to *Convulsions*; as was the Case, for Instance, of *Doria*."

And not only from the Uterus, but from other Parts, by a poisonous and highly pernicious Vapour ascending to the Brain, may convulsive Disorders be excited; in Proof of which, *Galen*, de *Loc. Affect.* Lib. 3. Cap. 7. gives Instances of two Boys affected with an anomalous Epilepsy.

Such, then, we may suppose, are the Causes not only of permanent, but moveable *Convulsions*; but *Galen*, Lib. 12. *Meth. Med.* Cap. ult. has comprehended in few Words the Cause of all *Convulsions*, and convulsive Motions, where he says, they are occasioned either by a Dryness, *Repletion*, a considerable Inflammation, a biting Humour, or violent Cold.

But we have treated, we hope with sufficient Accuracy, of the Causes of *Convulsions*; and proceed now to consider the Signs from which we may predict their future Appearance. And here we read, *Coac.* 85. 157. that Deliriums increasing sensibly in Ferocity become at last outrageous, and portend *Convulsions*; and a little after, T. 162. "They who are affected with a Pain of the Head, and labour under a Catochus, with a Constipation of the Belly, have a fierce Look, and a florid Colour in the Face, are seized at last with an *Opisthotonos*." That *Convulsions* should succeed mortal Inflammations of the Brain, is agreeable to Reason, since they are Signs of a mortal Phrensy, under which it is proper and usual for the Patient, as *Galen* says in 1 *Prorrh.* to be convulsed, and to die in *Convulsions*. The Author, also, of 1 *Prorrh.* T. 28. tells us, "That frequent Mutations in Phrenesies indicate *Convulsions*." And, *Coac.* 171. we read, "That an acute Pain in the Head, attended with a Torpor and Heaviness, are usually succeeded by *Convulsions*." And, *ibid.* T. 177. "That a Pain of the Head, with a small Sweat, and a Constipation of the Belly, end in *Convulsions*."

These, then, are the prognostic Signs of *Convulsions*, of which Signs only violent Pains of the Head, and a furious or outrageous Delirium are to be reckoned as certain, the other Marks not affording any sure Grounds for Prediction. As for Children, we are told by *Hippocrates*, in the *Prognostics* towards the End, that "They become affected with *Convulsions*, if they labour under an high Fever, and are costive, wakeful, frightful, much given to Crying, and change their Colour to pale, livid, or red; and these Symptoms are incident to Children from their Birth to their seventh Year."

* The Author of the Notes and Emendations to *Prosper Alpinus*, reads *Puerperas* with *Foetus*, as rendered from *παιδίαι*, and not *Pueros*, with *Alpinus*, because, as he says, no such Directions concerning Children are to be found in all the *Epidemics*.

Children more advanced in Years, and full-grown Persons are not so subject to *Convulsions* in Fevers, unless at some very violent and dangerous Crisis, as is usual under a Phrensy.

But we have said enough on this Head, and shall now take into Consideration the *Prognostics* from *Convulsions* which offer themselves to our Examination, in order to the Prediction of Death, or Recovery in acute Diseases. And here, first, we shall speak a little of those *Convulsions* which are not attended with a Fever. *Convulsions* of this Kind, which proceed from a Repletion of the nervous Parts with a crude Humour, are less dangerous than such as are excited by a Dryness and Arefaction of the Nerves; and *Convulsions* which owe their Original to a Repletion, are distinguished from the others by their Suddenness.

Of the three distinct Kinds of *Convulsions*, what they call the *Tetanus* is the most acute Disorder, and often kills in three or four Days; the Muscles of the Jaws and the Gullet being convulsed in such a manner, that Deglutition is entirely destroyed, and the Patient rendered incapable of being nourished with Food, or relieved with Medicines: But when the Disease is protracted to a greater Length, there are good Hopes of Recovery. What we have said is the same with that of *Hippocrates*, 5 *Aph.* 6. *Whoever happen to be seized with a Tetanus, die in four Days; but if they survive that Term, recover.* The Patient, in such a Case, always meets with the best Relief from a supervening Fever; for the febrile Heat consumes the Humours which obstruct the nervous Parts. On this Subject we find *Galen* discoursing, in 2 *Aph.* 26. where he says, *If any Person in Health happens to be suddenly seized with Convulsions, they must of Necessity be occasioned by a Plenitude. Now the Nerves suffer a Repletion from cold and viscid Humours, by which, also, they are nourished, so that they become convulsed: And this Disorder is remedied by a supervening Fever, which heats the cold, and attenuates and discusses the viscid Humours.* This is no more than a Comment on that of *Hippocrates*, 4 *Aph.* 57. before-quoted. Very justly, therefore, it is said, 2 *Aph.* 26. that it is better for a Fever to come upon *Convulsions*, than *Convulsions* upon a Fever. And with good Reason does the same Author*, 2 *Epid. Sect.* 5. advise exciting a Fever in Children for *Convulsions*; by which means, the crude and gross Humours are heated, attenuated, and discussed. Hence the more violent the supervening Fever, and the more intense its attendant Rigor, the more effectually will it remove the *Convulsions*. Thus qualified is a Quartan, which is accompanied not only with an intense Degree of Coldness, but a most efficacious Heat; by virtue of which it gives Relief under a great Disease, if we may believe *Hippocrates* and Experience, for which we have good Reason; for this Kind of Fever is attended with a more effectual Heat than other Fevers; because it has its Foundation in a more gross and dense terrene Matter; as may be inferred from what we read 5 *Aph.* 70. where we are told by *Hippocrates*, that they who are seized with a Quartan are not very subject to *Convulsions*; and such as are first taken with *Convulsions*, are relieved by the coming-on of a Fever. Such is the good Effect of a Quartan, not only by its Heat, which effectually discusses the Repletion of the nervous Parts; but by the Intenseness of its Cold, with which it shakes the Body so long till the Humour is by that Motion digested, or expelled from the nervous Parts. A Fever, therefore, coming upon *Convulsions*, is good; because it removes the Repletion by a Discussion. And this is further illustrated and confirmed by *Hippocrates*, in what he says of those who are convulsed from Drunkenness, 5 *Aph.* 5. where we read, that if a Person who is drunk be taken suddenly speechless, he dies in *Convulsions*, unless a Fever seizes him.

And these are the *Convulsions* from which we may hope a good Event, especially in Children; who, the more subject they are to *Convulsions*, both on account of the crude Aliment with which they abound, and the Weakness of their nervous Parts, as *Galen*, on 3 *Aph.* 5. has it, the less are they in danger from such Disorders, and the more easily are they relieved from them by a supervening Fever. Hence *Convulsions* in Children labouring under Fevers, are not so much to be dreaded; but in adult Persons they are usually pernicious, as they are generally owing to a Dryness and Rarefaction of the nervous Parts by the febrile Heat, than which nothing is more pernicious, in the Opinion of *Galen*; who, in his *Metb. Med. Lib.* 12. *Cap.* 8. has these Words, with respect to a *Convulsion* from Dryness: *We must know, he says, that an Affection of this Kind, if ever it be cured, requires Humectation. But it is extremely difficult to be cured, or rather incurable, if it be contracted by a Fever, and succeeds a Phrensy of the most mortal Kind. For my part, I never knew, nor heard of any one cured, who was convulsed in this manner.* In Children, indeed, affected with feverish Disorders, *Convulsions* are not so bad, or so much to be dreaded, as we

shall by-and-by demonstrate more plainly, from 1 *Epid. Sect.* 2. but in all other Ages, *Convulsions* proceeding from Dryness are pernicious. For this Reason, *Convulsions* attending Fevers are to be dreaded. Whence *Hippocrates* might very justly say, that it is better for Fevers to succeed *Convulsions*, than for those to come upon Fevers; for if they are the Consequence of Purgation, or any other considerable Evacuation, they are of the worst Sort, because all Evacuations dry the Body. In Confirmation of this Doctrine, we are told, by the Author of 1 *Prorrhet. T.* 145. that a violent and copious *Hæmorrhage* from the Nose sometimes induces *Convulsions*; and, by *Hippocrates*, 5 *Aph.* 3. that *Convulsions* or *Hicups* succeeding a copious Discharge of Blood by the Anus, are bad: And *ibid.* 56. that *Convulsions* and a *Lipobymy* after a Flux of the Menses, are bad. Again, 7 *Aph.* 9. we read, that a *Delirium* or *Convulsions* succeeding an *Hæmorrhage*, are bad. The same Position is more generally and expressly asserted by *Galen*, in his Comment on *Lib.* 6. *Aph.* where he says, that *Convulsions* from an Evacuation are most acute and pernicious. To the same Purpose we read, 7 *Aph.* 13. that *Convulsions*, or a *Tetanus*, after violent burning Heats, are bad; and, *ibid.* *Aph.* 18. *Convulsions* and a *Delirium* after Watchings, are bad. The Reason is, because violent Heats, or burning Fevers, and immoderate Watchings, resolve and evacuate the humid Parts. In the same manner; that is, by drying the Body, do immoderate Purgations produce pernicious *Convulsions*, according to 5 *Aph.* 4. where it is asserted, that *Convulsions* or *Hicups*, succeeding an *Hypercatarrhis*, (or profuse Purgation) are bad. Moreover, we read, 7 *Aph.* 25. that *Convulsions* from a purging Draught are mortal: And 5 *Aph.* 1. that *Convulsions* from (white) *Hellebore* are deadly.

Having spoken hitherto of the *Prognostics* from what they call permanent, or perpetual *Convulsions*; we proceed to treat, in a few Words, of such *Convulsions* as are occasioned by a Straining, or Stimulation, while Nature attempts an Excussion of the gross and viscid Humours which obstruct the Ventricles of the Brain, as in a Fit of the Epilepsy. *Galen*, in *Lib.* 5 *Aph.* says, that an Epilepsy is not a very acute nor dangerous Disease; and justly, because it belongs to the Lists of chronic Diseases; and the Patients are often perfectly freed from it, especially Children; according to that Aphorism of *Hippocrates*, 2 *Aph.* 45. *Very young Persons subject to an Epilepsy, are cured chiefly by Change in Age, Place, and Way of Living.* And 5 *Aph.* 7. we are told who are capable, and who are incapable of a Cure; where it is said, "An Epilepsy before the Age of Puberty, admits of a Metastasis (a Solution, see *METASTASIS*); but if it molests the Patient after twenty-five, it generally accompanies him to his Grave." And *Galen*, in his *Treatise de Puero Epileptico*, tells us, that he had cured several Children; and in his Book *de Purg. Med. Fac.* that in several others, who were not cured, he had prevented a Return of the Disorder, by the proper Precautions of Purgings and Phlebotomy in the Spring.

As for other Kinds of *Convulsions*, which are excited from Consent of Parts, by some acrid Humour, or Poison, or from some poisonous and malignant Vapour, they are all curable. Of this Nature were the *Convulsions* under which the Grammarian before-mention'd labour'd, from bitter Bile; and the young Man, also, spoken of, who was molested with an æruginous Matter, gnawing and vellicating the Mouth of the Stomach; and was freed from the same by Vomiting. Examples may, also, be given, of *Convulsions* from malignant Vapours, remov'd; and perfectly cur'd; but we have, perhaps, said enough, as to the *Prognostics* from *Convulsions* excited without a Fever; and shall, therefore, proceed to speak of such as happen under acute Fevers.

Of the Signification of CONVULSIONS in acute Fevers.

All *Convulsions* which happen in the Beginning of Diseases, indicate a Multitude of Humours, by the nervous Parts labouring under a Repletion, which occasions a Tension, or *Convulsion*. This Kind of *Convulsion* affords no sure Grounds for Prognostication, but indicates, however, that the Disease is very severe, and not void of Danger; since all Disorders, proceeding from a Multitude of crude Humours, are violent, and dangerous. Instances of this are many, in the Books of the *Epidemics*, of those who were restored to Health; particularly, the Woman who was three Months gone with Child, and lay ill in the Strand; Pythion, who liv'd near the Temple of Tellus; the Man who lay ill in the Garden of *Deacles*; *Charion* at *Demæretus*; and the morose Woman, who was seized with *Convulsions*, as it were, on a sudden, on the first Day. In all these Cases, except his who lodged in the Garden of *Deacles*, where a Crisis was indicated, *Convulsions* were Signs of a Multitude

* The Passage here meant runs thus: *ἢν λέγοις σπασμὸς ἐπιγίνεται. τὸν πύει.* Where our Author, for λέγοις, reads παύσεις; and translates τὸν πύει, literally, *Ignem exerceamus seu inuramus*; but we have followed *Feesius*. See the preceding Note.

of Humours, and had nothing in them of Certainty, with respect to Prediction. In *Charion* and *Pythion*, indeed, they were not so much to be dreaded, because on the ninth Day attended with a Discharge of Urine, in which appeared some Signs of Concoction; but in the Case excepted they were critical: For, as *Galen* says, in his Comment, "the Delirium on the ninth Day, and squinting of the Right Eye, were usual Incidents in a Crisis."

Convulsions, also, in Fevers which proceed from the Brain, affected by Consent of Parts from a Disorder in the Mouth of the Stomach, are not to be feared, since they may be remov'd by a Vomit. An Instance to this Purpose we find recorded by *Hippocrates*, 5 *Epid. T. 40.* in "the Son of *Hermophilus*, who was ill eleven Days. His Disorder was a Fever, and he took no Sustainance: On the first Day he was delirious, but recovered his Senses at Night. The next Day he lay speechless, under a Stertor, with his Eyes distorted, and was feverish; but by Intromission of a Feather he vomited black Bile; and, by means of a Clyster, had a plentiful Discharge of stercoraceous Matters by Stool."

Convulsions, in such Cases, proceeding from the Uterus, are, also, easy to be cured; according to that in 1 *Prorrh. T. 119.* "*Convulsions* in hysteric Women are easily removed; as in the Case of *Dorcas*." [See a more just Translation of this Passage before.]

Convulsions, also, in Children affected with feverish Disorders, as they are no Indications of any great Alteration from a healthy State, because Children abound much with crude Aliment, and have, besides, weak Nerves, are not much to be dreaded. "Children, says *Galen*, *Com. in 1 Epid.* because of the Weakness of their Nerves, are very subject to *Convulsions*." And the more easily they are liable to be convulsed on slight Occasions, the less is the Danger. It is no wonder, therefore, if Disorders of this Kind are not so formidable in Children, even under Fevers, as in adult Persons. To this Purpose is the Observation of *Hippocrates*, 1 *Epid. Sect. 2.* "that many were at first seized with *Convulsions*, and a Fever, especially Children; the Fever was, also, succeeded by *Convulsions*. These Symptoms were generally of long Continuance, and had no ill Consequence, except in those where all other Signs were pernicious." And the same is confirm'd by the Author of the *Coac. T. 356.* where he says, that "*Convulsions* succeeding a Fever are mortal, but least of all so to Children." But if to *Convulsions* there succeeds a Fever, or, if there be a Fever already, an Exacerbation of the same, it is a good Sign, with respect to the *Convulsions*, provided they proceed from a Repletion of the nervous Parts. Hence we are told, *Coac. 358.* "that an acute Fever, coming upon *Convulsions*, removes the Disorder; whether it is a new Fever, or an Exacerbation of the old." The same Symptom is much alleviated by a Discharge of much vitreous Urine, or what resembles Semen.

Convulsions in the Beginning of Fevers, if the Fever increases, usually cause an Alleviation of the Rigor. Thus it was in the Case of *Philistides*, the Wife of *Heraclides*, 7 *Epid. T. 130.* "who, it is said, was seized with a high Fever, and a Redness of the Face, without manifest Cause; soon after, on the same Day, she was affected with a Rigor, and recovered no Heat; then was convulsed in her Fingers and Toes; and, shortly after, her Heat was revived. On the second Day she had a new Fit of a Rigor, but recovered a little more Heat than before; her Redness was less, and the supervening *Convulsions* were more moderate."

We may add, that some Sorts of *Convulsions* in Fevers much alleviate, and even remove the Disease; and these ought to be called critical, being occasioned by a Translation of the morbid Matter from the Veins to the Nerves and Muscles; and if they effect a Solution the first Days, they are critical and salutary, according to *Coac. 157.* where we read, "that a *Convulsion* excited in a Fever removes it the first, second, or third Day; but if it transgresses the Time in which it first began, and ceases not, it is a bad Sign." *Convulsions* of this Nature are occasioned, as we said, by a Metastasis of the morbid Matter from the Veins to the nervous Parts; which Metastasis, or Translation, may possibly diminish, or even quite remove the Fever, the Humours being excreted from the Veins, and no longer left to putrefy in them.

And thus far have we spoken of those Kinds of *Convulsions*, which, though not properly good, for all *Convulsions* in themselves are bad, yet sometimes happen to be salutary Prognostics. We come now to treat of those which are universally bad and pernicious, and of destructive or fatal Signification.

It is an Observation of *Hippocrates*, *Lib. Prognost.* that in acute Diseases a *Convulsion* of the Testes and Pudenda is succeeded by a violent Pain, or Death; and *Convulsions* in acute Fevers are always of bad Signification to adult Persons, but worst of all in burning Fevers, as we are assur'd by *Galen*, in

4 *Aph. 66.* because these dry the Nerves like a Fire, and excite pernicious *Convulsions*. We have observ'd, that *Convulsions* from a Dryness of the nervous Parts are not only difficult, but impossible to be cur'd; for which Reason, they must be always pernicious in acute Fevers, as being occasion'd by a Dryness of the Nerves, from a Consumption of the humid by the igneous Heat of the Fever. Thus *Galen*, in 4 *Aph. 35.* tells us, "that in burning Fevers, if the whole Body be dry'd, and a *Convulsion* of the Nerves happens to proceed from that Dryness, it is a very great Disorder, and almost incurable, because a long time is requir'd for removing the Dryness of the Nerves; whereas the Violence of the Disease will not allow Time to Nature, but speedily exhausts the Strength, and destroys the Patient." *Hippocrates*, therefore, had good Reason to say, that "*Convulsions* and violent Pains about the Viscera, in acute Fevers, are bad;" but if attended with a Decay of the Strength, they shew Death to be very near. *Hippocrates*, 4 *Aph. 49.* is very express and elegant to this Purpose, when he says, "In a not intermittent Fever, if the Lip, or Eyebrow, or Eye, or Nose, be distorted, or the Patient cannot see, or hear, the Body being at the same time very weak; which ever of these Symptoms appears, Death is at hand." Thus it happened, for Instance, to the Wife of *Dromeades*, 1 *Epid. Sect. 3. Aeg. 11.* who died suddenly in *Convulsions* which began at the Head.

Convulsions in a Delirium are very dubious, but in Phrenesies are the most pernicious of all Symptoms, and indicate the speedy Approach of Death. *Galen*, as before observ'd, *M. M. Lib. 12. Cap. ult.* says, he never knew or heard of any Person who recover'd in such Circumstances. *Hippocrates*, in his Description of the Epidemic Constitution, 1 *Epid. Sect. 2.* says, that those who were affected with Phrenesies, were convulsed, and molested with virulent Vomiting; and some of them died suddenly. And this he had an Opportunity of observing more exactly, in the Case of the phrenetic Patient, 3 *Epid. Sect. 3. Aeg. 4.* who on the second Day, in the Morning, lost his Voice, had a high Fever, sweated, without Intermision of the Fever, was affected with Palpitations in all Parts of his Body, and at Night with *Convulsions*. On the third Day all the Symptoms were exasperated; and on the fourth he dy'd.

We have before demonstrated, from *Hippocrates* and *Galen*, that it is a Property of mortal Phrenesies to end in *Convulsions*: For it is the Nature of a true Phrensy to excite *Convulsions* a little before Death, the Nerves being dry'd by an Inflammation of the Brain: We have an Instance to this Purpose in the Maid-servant of *Conon*, 7 *Epid. T. 98.* who dy'd at the End of forty Days, and was speechless and convuls'd for some Days before her Decease.

Tremors ending in *Convulsions*, or *Convulsions* from Tremors, are affirm'd by *Galen*, on the *Prorrh. T. 119.* to be mortal.

Convulsions occasion'd by Pains, or obstinate Watching, in acute Fevers, are pernicious, 7 *Aph. 18.* and so are those which proceed from profuse Purgation, or immoderate Evacuations of any Kind, 5 *Aph. 3, 4. 56.* before quoted. The Reason is, because all immoderate Evacuations dry the whole Body, and occasion a *Convulsion* from a Dryness of the Nerves, which is of the worst Sort, as we have observ'd. Hence *Galen*, *Com. in 7 Aph.* says, that "a *Convulsion* from an Evacuation is most acute and pernicious."

A *Convulsion* proceeding from an Inflammation of the Ileum is pernicious, 7 *Aph. 10.*

Convulsions from Wounds are, for the most part, mortal. Death is not the necessary Consequence of all *Convulsions* occasion'd by Wounds, as *Galen* observes, *Com. in 5 Aph.* though *Hippocrates*, 5 *Aph. 2.* pronounces them mortal. They are, however, for the most part, deadly; and we have many Instances of it in the *Epidemics*, particularly in *Scamander*, who was convulsed after a Section; another from a Wound with a Dart; the fair Daughter of *Nireus* from a Blow; a certain Pilot from a Fracture of the Finger; another from a Luxation of the Finger; who all died of *Convulsions*. Of *Scamander*, 5 *Epid. 15.* it is said, that "his Hip was sphacelated, and the Bone had for a long time been dislocated. The Operation of the great Section was performed upon him, and he was cut home to the Bone, and the Wound afterwards cauterized. The twelfth Day after the Section he began to be taken with *Convulsions*, which held him pretty strongly; he was convulsed from the Leg, on the infirm Side, up to the Ribs; and the *Convulsion* was communicated to the other Side; the Leg was contracted and extended; the other Limbs were moved, and his Jaws set. The Patient died in *Convulsions* on the eighth Day after he was first seized with them." In the second Instance, *ibid. T. 47.* it is said, "that a certain Person received a Wound with a sharp-pointed Dart, a little below the Neck behind, which appeared scarce worthy Notice; for it was not deep. But, not long after the Dart was taken out, the Patient felt himself distended, and drawn backwards,"

“ backwards, like one seized with an *Opisthotonos*; his Jaws
 “ were under a Constriction, and if he received any Liquid
 “ into his Mouth, and tried to swallow it, the same was dis-
 “ charged again at his Nostrils, and he immediately grew worse
 “ and worse in all other respects, and died on the second Day.”
 The tragical Story of the beautiful Virgin-daughter of *Nireus*
 is thus related: “ This young Woman being about twenty
 “ Years of Age, in playing and sporting with one of her
 “ female Friends and Companions, received a Blow from her
 “ with the Flat of the Hand, on the fore Part of the Head:
 “ She was immediately taken with a Dimness of Sight, and her
 “ Breath failed her; and when she came home she was imme-
 “ diately seized with a high Fever, attended with a Pain of
 “ the Head, and a Redness about the Face. On the seventh
 “ Day she had a Discharge of above a Cyathus of fetid, red-
 “ dish Pus by her Right Ear, and she seemed to be better, and
 “ easier; but the Fever increased again upon her, with a Cata-
 “ phora; she lost her Voice; the Right Side of her Face was
 “ contracted; she fetch'd her Breath with Difficulty; labour'd
 “ under Convulsions and Tremblings, with an Impediment of
 “ the Tongue, and a Stupor of the Eye; and died on the
 “ ninth Day.” Again, *ibid.* T. 74. we have a pretty remark-
 “ able Case of a “ Pilot belonging to a great Ship, who crushed
 “ the fore Finger of his Right Hand, and the Bone below it,
 “ with an Anchor: The Consequence was, an Inflammation,
 “ Sphacelus, and a Fever; he had a gentle Purge administer'd,
 “ and his Heats and Pains were mild and favourable. Some
 “ Part of his Finger was separated, and after seven Days a
 “ laudable Ichor was discharged from the Wound. Some time
 “ after he complained of an Impediment in his Tongue,
 “ whence an *Opisthotonos* was predicted, and a Tendency to
 “ that Disorder further appeared first from a Constriction of
 “ the Jaws, and afterwards by an Affixion of the same to the
 “ Neck. On the third Day he was wholly convulsed, and
 “ under a perfect *Opisthotonos*, attended with a Sweat; and
 “ on the sixth Day from the Prediction he died.” Much of
 “ the same Nature was the Case of *Telephanes*, the Son of *Har-
 palus* by his freed Woman, related *ibid.* T. 75. “ This young
 “ Man had his Thumb luxated towards the lower Parts, the
 “ Consequence of which was, an Inflammation, and Pain.
 “ When the Luxation was reduced, he went into the Field,
 “ and at his Return had a Pain in his Loins; he bathed, and
 “ towards Night had a Constriction of the Jaws, and was
 “ seized with an *Opisthotonos*. A spumous Saliva made its
 “ way through his Teeth, with much Difficulty; and on the
 “ third Day he died.” In the same manner one *Tychon*, *ibid.*
 T. 94. who received a Wound in his Breast by a Dart from an
 Engine, at the Siege of *Datos*, died suddenly, on the third Day,
 in Convulsions. From these Cases it appears, that Convulsions
 from Wounds are generally mortal.

Convulsions of the permanent Kind from drastic, or
 very strong Cathartics, or poisonous Medicines, are fatal.
 Thus Convulsions from Hellebore taken inwardly, are by
Hippocrates pronounced mortal, 5 *Aph.* 1. and, in general,
 Convulsions from any violent Cathartic are by the same Au-
 thor judged fatal, 7 *Aph.* 25. And he gives an Instance of
 the same, 5 *Epid.* T. 53. “ in a young Woman about twenty,
 “ who took a Medicine to procure Abortion; after which she
 “ was taken with a Pain, and vomited much bilious, pale, and
 “ porraceous Matter; and when she drank was convulsed, and
 “ bit her Tongue. On the fourth Day I (*Hippocrates*) at-
 “ tended her, and observed her Tongue to be much swelled,
 “ [μεγάλη] and black, and the White of her Eye to be red:
 “ The same Day, towards Night, she died.” In the same
 Book, T. 85. he gives us a Relation of a young Man who died
 in Convulsions, from swallowing a Serpent [See the Story under
 the Article ARGES]. And 7 *Epid.* T. 20. we have an Ac-
 count of a Woman labouring under a Quinsy, who was con-
 vulsed on the fourth Day, and died on the fifth or sixth.

These, then, are the mortal Convulsions observed in acute
 Diseases; and the most pernicious of them all, as we have ob-
 served, are those which happen in acute and burning Fevers,
 especially when consequent upon a Phrensy; and that Convul-
 sions from Wounds are very much to be dreaded, we have
 proved, from Cases related out of *Hippocrates*. It remains to
 give some Marks or Signs by which we may know whether
 those Kinds of Convulsions, which in the Beginning of acute
 Diseases are necessarily owing to a Repletion of the nervous
 Parts, or at any other time of the same acute Diseases, are by
 the same Cause in any manner whatsoever excited, are salutary
 or pernicious. For our Satisfaction in this Point, we are taught
 to form a Judgment of such Convulsions from the Signs which
 precede, accompany, or follow them: And here we ought to
 have a principal Regard to the Signs of Concoction, and Cru-
 dity: For when Convulsions appear under an absolutely crude
 State of the Disease, they always threaten a bad Event. And,
 indeed, those Kinds of Convulsions, when pernicious, never use

to appear alone, but attended with other pernicious Signs.
 Thus it was in the Cases of the Wife of *Philinus*, the Wife of
Dromeades, *Philister*, the phrenetic Person, and the Woman of
Cyzicus, related in the first and third Books of the *Epidemics*;
 to all which Persons these Convulsions proved fatal. In the Wife
 of *Philinus*, 1 *Epid.* Sect. 3. Ægr. 4. these Convulsions appear'd
 on the eighth Day in great abundance, attended with Pain, and
 a high Delirium. The Convulsions continued upon her the ninth
 Day; on the eleventh Day, after being convulsed, she voided
 great Plenty of white, thick, turbid Urine, which deposited no
 Sediment; and these concomitant and subsequent Signs were,
 no doubt, to be esteemed mortal. Much of the same Nature
 was the Case of the Wife of *Dromeades*, 1 *Epid.* Sect. 3. Ægr.
 11. for “ on the sixth Day, in the Morning, she was seized
 “ with a new Rigor, but soon recovered Heat; sweat in all
 “ Parts of her Body; was cold in her extreme Parts, and de-
 “ lirious; her Respiration was great (full), and at long Inter-
 “ vals [ἀπαύς] See *ARÆAS*; and soon after she died suddenly
 “ in Convulsions, which began at the Head.” The Signs pre-
 ceding, it must be observed, are related, among others, to be
 an Evacuation of thin, oleous Urine, and a small Distillation of
 Blood from the Nose; which, with the others before-mention'd,
 portended nothing but Death. The same Judgment was to be
 form'd from a Tension of the Hypochondria in *Philister*, 3
Epid. Sect. 2. Ægr. 4. who died on the fifth Day; for his
 Convulsions were preceded by an Inflammation of the Dia-
 phragm, with other very bad Signs. In the phrenetic Patient,
 3 *Epid.* Sect. 3. Ægr. 4. besides what we have before proved
 out of *Galen*, that all Convulsions are destructive, his Convul-
 sions were, moreover, attended with other mortal Signs; such
 as, on the first Day, virulent Vomiting, a Fever with a Hor-
 ror; a copious, constant, and universal Sweat; and a high De-
 lirium: On the second Day a Loss of Voice; a high Fever;
 Sweating, without any Remission of the Fever; and Palpitations
 in all Parts of the Body: These, among others, were the per-
 nicious Signs which preceded those fatal Convulsions, which seiz'd
 him the same Night, and were sure Prognostics of his Death,
 which happened on the fourth Day. Thus, also, the Woman
 of *Cyzicus*, who was taken with Convulsions on the fourteenth
 Day, had them accompanied with a Coldness of the extreme
 Parts, and a Delirium, which never went off, in an absolutely
 crude State of the Disease.

Thus much we think proper to be said of Convulsions, with
 respect to their Prognostics; and under them some may, per-
 haps, think, that we should have comprehended the *Singultus*,
 or *Hiccough*, which is a Species of Convulsions: But since the
Hiccough is a very particular Convulsion, affecting only the
 Stomach, we have chosen to treat of it apart, under its proper
 Article; and the rather, because *Hippocrates* has written of the
 same as distinct from Convulsions. *Prosper Alpinus de Præsa-
 git. Vit. & Mort.*

FEBRILE SWEATS.

A Sweat in the Beginning of an acute Fever, whose Cause is
 somewhat obstinate, arises from a lax Debility of the extreme
 Vessels, a vehement Circulation of the Blood, and a ready
 Separation of the aqueous Particles from the other Principles of
 the Blood.

If it perseveres, it deprives the Blood of its diluting Fluid,
 inspissates the Remainder, and causes fatal Obstructions, it being
 afterwards almost impossible to dilute, or resolve the Blood:
 Hence almost every kind of acute Disease may be produced.

These Sweats are, therefore, always to be restrained in
 the Beginning, unless it is certain that the Matter, which ex-
 cites the Disease, is sufficiently thin to be carried off, together
 with the first Sweats.

Sweat is check'd by rising out of Bed, and sitting up; by
 avoiding too many Integuments; by admitting the cool Air;
 by abstaining from warm and heating Medicines; by using
 copious Draughts of mild, soft, and cool Liquors; that the
 Loss of what is dissipated may be quickly repair'd; and by
 checking the Violence of the Circulation.

PROGNOSTICS IN ACUTE DISTEMPERS FROM SWEAT.

As the Crisis of acute Diseases often turns upon Sweats, the
 Prognostics which may be formed from them, with respect to
 the Fate of the Patient, deserve to be carefully considered.
 For this End, therefore, we shall first explain the Nature of
 Sweat, with its Differences; and, also, its Causes; that we
 may understand how it is generated.

We say, then, a Person sweats, when he excretes through
 the Pores of the Skin a Humour which is actually moist; to
 distinguish it from Perspirations, or Exhalations, which pass
 through the same Pores, and are called, by Physicians, Insen-
 sible Evacuations; because they are imperceptible to the Senses.
 Whence it follows, that Sweat is a particular Sort of sensible
 Evacuation made through the Pores or Passages of the Skin.

As to the Differences of *Sweats*, they are of several Kinds : Some are taken from their *Substance* ; in which respect they are sometimes thick and viscid, sometimes thin, and without any Viscidity : They differ, also, in *Figure* ; for some, as we are assured by *Hippocrates*, *Lib. Prognost.* appear like Millet ; others are in the Form of Drops. There is a Distinction observ'd in their *Colour* ; for some are yellow, others green ; and, besides, they must of Necessity assume the Colour of the Humour from which they are excreted through the Skin. There is some Difference, also, to be made in their *Taste*, though they are all, as *Galen* says, *Lib. 10. Simpl. Cap. de Sudore*, more or less salt and bitterish, as are the Humours whence they are evacuated. They differ in *Smell*, since some are fetid, others not ; in *Quantity*, some are copiously effused, others are sparingly excreted, or vanish immediately after their Appearance. Again, as to their active Qualities, they are either hot, or cold, or of a middle Temperament ; and they have their Differences, also, with respect to the Times in which they appear ; for some are observed in the Beginning of a Disease, some at its Height, and others at its Decline : And with regard to the Times of their Duration, some are continual, others are observed at Intervals ; some *Sweats*, again, appear with Signs of Concoction ; others with Signs of Crudity : Some are critical, and determine the Fate of the Patient ; others symptomatical, as appearing only after the manner of Symptoms : And some are periodical ; as those which are observed in Tertian and Quartan Fevers. And these are all the Differences of *Sweats* which we shall observe at present.

In treating of the Generation of *Sweats*, we are to consider the Matter of which they consist, and the efficient Cause of them. The Matter of *Sweat* and *Urine* is the same, as *Galen* says, *Lib. 10. Simpl. Cap. de Sudore*, and in sound Persons is the Liquid they receive by the Mouth, only more elaborate, as having passed through all the Ducts, from the internal Parts to the Skin. Hence it appears to be the thinner Part of the Aliment, which they call the serous Humour, or Ichor, but what has acquired somewhat of a bilious Substance ; and by its Thinness is capable of being eliminated from the Body through the Pores of the Skin ; as a thick Humour, by a like Reason, seems indisposed for the Generation of *Sweat*. Such, then, is the Matter of *Sweat* in healthy Persons ; and hence it follows, that they who eat and drink plentifully, sweat copiously ; as do, also, plethoric Bodies, which have wide Pores, and such as have a moist Liver and Spleen. Hence it is said, by *Hippocrates*, 4 *Aph. 41. that copious nocturnal Sweats, without manifest Cause, indicate the Body to be too plentifully fed ; if this be not the Case, you may be assured that the Body requires Evacuation.* The Matter of *Sweat*, then, in healthy Persons, is either the thinner Part of the humid Aliment, as was said before ; or a redundant Humour in the Body. In Valetudinarians, or sick Persons, it sometimes consists of Serosities generated from too humid an Aliment, as may be observed in those who have transgressed the Laws of Temperance ; but most frequently from a Redundance of too thin Humours, as Blood, yellow Bile, and, also, from a cold pituitous Humour. Hence it is said by *Galen*, *Lib. 3. de Crisibus, Cap. 3.* that *Sweats* are proper to all Fevers, especially to burning Fevers ; and that Semitertians, Quotidians, and Quartans, form their Crises by them ; that they are a considerable Relief under excessive Heats, Inflammations, Parotides, Lethargies, and all other Cephalic Affections ; and that all Humours, whether cold or hot, with a proper Degree of Thinness, may excite a *Sweat*, or discharge themselves in *Sweat* ; but, most of all, putrid Humours find a Vent this way, as being the thinnest, and most fluid. Sometimes it happens, though only in malignant and dangerous Disorders, that the alimental Humidities of the solid Parts, which Physicians call the natural Humid, by which the natural Heat is maintained, being colliquated and dissolved, pass through the Pores of the Skin in the Form of *Sweat*.

The efficient Cause of *Sweat* is Heat, either natural or preternatural, existing in the Body ; for it is Heat which attenuates the Humour, and conveys it to the Skin : For Bodies, when they are heated, fall into a *Sweat*. Hence it is that in continual Fevers, under that extraordinary Degree of Heat which succeeds a Rigor, there is usually an Eruption of *Sweat* : For while the Body is under a Rigor, the Heat retires to the inward Parts ; but afterwards, if it be strong enough, breaks forth, and, diffusing itself through the Body, extenuates the Humours ; and, being resolved almost into Vapours, conveys them, with itself, to the Skin, and there causes a *Sweat*. *Hippocrates*, in his Book of *Prognostics*, says, *Some Sweats are occasioned by a Faintness or Feebleness of the Body ; others by the Violence of an Inflammation.* From the first Cause is produced not simply a *Sweat*, but a small Desudation, or rather a kind of dewy Moisture, which the *Greeks* call *epidrosis* (*Epidrosis* ; see that Word) and the *Latins* *Desudatio*, over all the Body ; as we are taught by *Galen* on the *Prorrhetica* ; or only on the

Head and Thorax, and indicates the Imbecillity of the retentive Faculty, or the Redundance of Humours in the sweating Parts. Desudations (in the Sense before implied) are occasioned by the Violence of an Inflammation oppressing or resolving Nature ; or because the thinner Part of the Humidities which are rarefied by the burning Heat, settles on the Skin : Wherefore *Sweat* is generated by Heat, changing into Vapour the thin Humour which is the Serum or Ichor of the Blood, proceeding from the Humidities of the Meat and Drink, or rarefying the Blood, Bile, or Phlegm, and raising them into Vapours. In Fevers, which the *Greeks* call *Eldes*, and we *Sweating Fevers*, *Sweat* is a proper Symptom ; for in this Case the suppressed Humour is, by the Violence of the Heat kindled in the inward Parts, resolved into a continual Exhalation and *Sweat*. But Desudations, which are, according to *Galen*, small *Sweats*, or Moistnesses, of no Signification or Benefit, affecting the whole Body, or rather the superior Parts, are to be ascribed to another Cause, as we observ'd, proceeding, as *Hippocrates* says, from a Faintness or Resolution of the Body, or the Violence of an Inflammation ; or, according to *Galen*, from a Resolution of the retentive Faculty, occasioning a Desudation not only of the redundant excrementitious Humour, but of the alimentary Portion appropriated to the solid Parts. These Things premised, concerning the Nature and Causes of *Sweat*, we proceed to the Prognostics which may be formed from them.

Of good and salutary SWEATS, prognosticating Recovery.

It often fortunately happens, that Persons under acute Diseases are freed from them by a profuse and critical Eruption of *Sweat* ; and with good Reason, since, as *Galen*, in *Lib. Art. Med.* observes, the whole Body is evacuated by sweating. *Sweats* of this beneficial Sort are distinguished from the contrary, by the following Properties or Characters.

First, These salutary *Sweats* appear when the Disease is concocted, and are attended with Signs of Concoction ; as we are taught by *Galen*, *Lib. 1. de Crisibus, Cap. 7.* where he writes, that *Sweats* effecting a happy Crisis, happen not in the Beginning, but in the Increase, or at the Height of a Disease, when Nature has either made a perfect Concoction, or has done Part of her Work, and proceeds in the rest with Vigour and Success. This, then, is one considerable Character of a good *Sweat*, without which *Sweats* are so far from being serviceable, that they portend a long Disease, much Pain and Anxiety, Relapses, and either no Crisis at all, or a fatal one ; according to the Observations of *Hippocrates*, 1 *Epid. Sect. 2.* *Sweats*, then, appearing after Concoction, are Signs of a speedy Crisis, and safe Recovery ; but in a crude and unconcocted State, they signify either that the Disease will be converted into an Abscess of a bad Kind ; or that the Crisis will be frustrated ; or that the Disease will be very painful and lingering, or mortal ; or else it foreshews a Relapse. A necessary Mark, then, of a salutary *Sweat* is, that it appear after Signs of Concoction.

Secondly, A good *Sweat* must make its Eruption on some critical Day. On this Subject we find *Hippocrates*, 4 *Aph. 36.* thus pronouncing : *Good Sweats in Persons labouring under a Fever, he says, are those which appear on the third, fifth, seventh, ninth, eleventh, fourteenth, seventeenth, twenty-first, twenty-seventh, and thirty-fourth Days ; for these Sweats are critical : But those which break out at other times, signify that the Disease will be painful and tedious, and the Patient subject to Relapses.* *Galen*, in his Comment on this Place, says, that the fourth Day was either omitted by *Hippocrates* because there are several Diseases, of a very acute Nature, which have their Fits or Paroxysms on odd Days, and their Crises at the same time with their Fits ; or that the fourth Day was omitted by the Negligence of some Transcriber : But, for our Part, we have often admired the divine *Hippocrates* on this Head, since we have rarely observed *Sweats* of a very good Kind appearing on the fourth Day.

A third Character of a good *Sweat* is, its succeeding some critical Rigor : For when Nature has succeeded in her Efforts to expel the thin and sharp Humours out of the Veins into the superficial Parts, it occasions a vehement Rigor from a Dispersion of the same Humours over the sensible Parts, and vellicating them, as we are taught by *Galen*, *Lib. de Rigor. Convuls. & Palpit.* together with a Refrigeration of the extreme Parts ; the Consequence of which violent Rigor and Coldness, when Nature is strong and vigorous, is, the exciting an acute and high Fever, by the breaking forth of the Heat, which, also, attenuates and rarefies those Humours, and resolves them into a copious *Sweat*. As an Instance to this Purpose, *Hippocrates*, 1 *Epid. Sect. 2. Aeg. 6.* observes a very good Kind of *Sweat* succeeding a Rigor in the Case of *Cleonaides*. He was seized, he says, with a Rigor, had a high Fever, and fell into a copious *Sweat* ; the Consequence of which was, a perfect and salutary Crisis. This is further confirmed in the Case of the sick Woman in the Strand, *ibid. Aeg. 13.* of whom he says, *On the*

the eleventh Day she had a new Fit of a Rigor, succeeded by a high Fever; on the fourteenth she fell into a Sweat, which proved critical, and removed the Fever. Another Instance we have in Chæron, 3 Epid. Sect. 2. Ægr. 5. who on the seventeenth Day had a new Fit of a Rigor; had a high Fever; fell into a Sweat; underwent a Crisis; and was freed from his Fever. It is on this Account that we are told by Hippocrates, a Aph. 58. that a Rigor coming upon a burning Fever causes a Solution of the Disorder; because, says Galen, such Rigors are succeeded by Sweats, or some other good Evacuations. A Sweat, then, following a Rigor, is a very good Sign; and therefore Galen, Lib. 3. de Crisibus, Cap. 3. says, that those who are seized with a Rigor sweat very well; and Com. 1. in Prorebet. that Sweats succeeding a Rigor are good, if they appear with Signs of Concoction. And, as a further Confirmation, it is observed by Hippocrates, 1 Epid. Sect. 2. Stat. 3. that the greatest Part of those who lay sick (at that Season), were seized with a Rigor about the Time of the Crisis, and especially those who had not been affected with an Hemorrhage from the Nose; these latter had, besides, a Return of the Rigor with a Sweat.

A fourth Qualification of a good Sweat is, that it be copious, hot, and break forth from all Parts of the Body: These are Marks which shew the Firmness and Strength of the Faculty, in equally diffusing the Heat over all Parts of the Body, and resolving the superfluous Humours with equal Efficacy on every Side into a Sweat, which it were impossible for it to effect if it were either very weak, or were contending with a malignant Disease; in which Cases the Evacuations of that Kind would be unequal, in some Parts much in Quantity, in others little, or, perhaps, nothing. The best Kinds of Sweats, then, you see, are hot, copious, and universal; whereas those which appear only on the Head or Thorax, or on all Parts of the Body, but little in Quantity, or cold, are esteemed very bad and pernicious; as we shall shew hereafter. The Truth of this Observation is confirmed by Hippocrates, in many Instances in the Epidemics; particularly, 3 Epid. Sect. 3. Ægr. 6. in the Case of Pericles, of whom he writes, "that on the fourth Day, about Noon, a hot and copious Sweat broke forth over all his Body, he had a Crisis, and was freed from his Fever without any Relapse." And *ibid.* Ægr. 10. in Nicodemus, "who on the four-and-twentieth Day fell into a profuse and hot Sweat, which was universal, and proved critical, in the Removal of the Fever." And of the morose Woman, *ibid.* Ægr. 11. we read, "that on the third Day, towards Night, there was a plentiful Effusion of hot Sweat throughout all Parts of the Body; she was freed from the Fever, and fell asleep." Once more it is related of the Virgin of Larissa, *ibid.* Ægr. 12. "that after a Horror she fell into a hot and plentiful Sweat over all her Body, underwent a Crisis, and was freed from her Fever."

Fifthly, It is an additional Mark of a very good Sweat, that it be not only universal, copious, and hot, but discharges itself in Drops and Vapours. Lib. Prognost.

Lastly, A singular Mark and Character of the best and most salutary Sweat, given by Hippocrates, in the Book just quoted, is, that it effects an entire Solution of the Fever, or wholly frees the Patient from it. For this Reason, he always, in his Epidemics, gives it as a distinguishing Characteristic of a critical and most beneficial Sweat, that the Patient is, by means thereof, *ἀνρῶς*, "free from a Fever;" or *ἀνρῶς ἐκρίθη*, "that he had a Crisis with the Removal of his Fever;" or *ἰσπασεν ἀνρῶς*, "his Fever went off with a Sweat." Those Sweats, also, according to Hippocrates, Prognost. justly deserve the Name of salutary, which, by their free and plentiful Effusion in all Parts of the Body, though they do not entirely remove the Fever, are, yet, the Cause that the Patient can more easily support himself under it; since they alleviate the Disease, and diminish the Symptoms. But these Sweats differ from those of the best Kind, in not effecting a perfect Crisis, though they are Prognostics of Recovery at a longer Distance of time. Sweats of this Kind were often observed by Hippocrates, particularly of him who lay ill in the Garden of Deales, 3 Epid. Sect. 1. Ægr. 3. in whose Case it is related, "that on the seventeenth Day his extreme Parts were cold; they covered him with Clothes; he had a high Fever; sweated over all his Body; found some Relief, and had the freer Use of his Reason; but the Fever did not leave him, and he had a Thirst." On the twentieth Day he slept; had the perfect Use of his Reason; had an Eruption of Sweat; was without a Fever, or Thirst; which, however, return'd upon him; and it was the fortieth Day, when, after frequent Evacuations of white pituitous Matters by Stool, he fell into a profuse and universal Sweat, and had a perfect Crisis.

Thus we have given you the Marks or Characters of the best Kinds of Sweat, and such as are critical, which you will find comprehended by Hippocrates, in his Book of Prognostics, in the following Words: "In all acute Diseases the best Sweats are

"such as happen on a critical Day, and entirely remove the Fever. They are good, also, which arise over all the Body; and render the Disease more tolerable to the Patient; but those which produce no such Effect, are of no Service." And good Sweats are not only known by these Marks in themselves, but by the Attendance of other good Signs, as a good Hemorrhage, or some other salutary Evacuation; and, also, as we said, by the Patient's finding himself in some measure relieved by them. Sweats of this happy Influence were observed by Hippocrates in many Instances, particularly Cleonæides, Maton, the sick Woman who lived in the Strand, and Melidia, recorded in the first of the Epidemics; and in the Patient who lay ill in the Garden of Deales; Chæron, Pericles, the Virgin of Abdera, Anaxion, Nicodemus, the morose Woman, and the Virgin of Larissa; whose Cases you find related in 3 Epid. with many others: In whose Histories the intelligent Reader may find the forementioned Signs, and Matter to exercise his Judgment in forming such salutary Prognostics as will not fail to justify themselves by the Event.

Of bad and pernicious SWEATS, which portend a fatal Event.

Hippocrates, in his Book of Prognostics, speaking of bad Sweats, makes Degrees of them; and tells us, that such Sweats are in a great measure bad, as neither remove the Fever, nor render it more tolerable to the Patient; that is, afford him not the least Relief, though proceeding from all Parts of the Body. A worse Sort than those are such as neither proceed from the whole Body, nor alleviate the Disease: Still more pernicious are Sweats which exasperate the Disease; but the worst, and most pernicious of all are cold Sweats, and such as arise only about the Head, Face, and Neck; for such Sweats, he says, in a high Fever, portend Death; in one of a milder Nature the long Continuance of the Disease. But we shall consider all the bad Kinds of Sweat distinctly, under some general Heads, for the sake of Accuracy, and that we may be the better enabled to form just Prognostics from them.

First, then, we shall take into Consideration such bad Kinds of Sweat as appear in a crude State of the Disease, and unattended with the least Signs of Concoction. Secondly, We shall treat of bad Sweats with regard to their Quantity; or as they are more or less copious. Thirdly, We shall consider them with respect to Heat and Coldness. Fourthly, with regard to the Parts of the Body whence they proceed. Fifthly, as they injure, or at least no way relieve the Sick. And, lastly, as they appear attended with other bad Signs.

In examining the first general Head, that we may have a clearer Notion of what it contains, we shall distinguish Sweat into periodical, critical, and symptomatical. We call that a periodical Sweat, which attends the Periods or Returns of intermittent Fevers; as Tertians, or Quartans. Such was the Sweat observed by Hippocrates, 7 Epid. T. 4. in the Case of Pythodorus. A critical Sweat, of which we have spoken before, is such as appears, in continual Fevers, on some critical Day; and either entirely removes the Fever, or diminishes it, and relieves the Patient: And the Effect of this Sweat we call a Crisis, either perfect or imperfect. The Characters of a critical Sweat, we have told you, are, its Appearance with manifest Signs of Concoction, on a critical Day, when Nature is strong and vigorous; that it is hot, copious, and universal, yet not diminishing the Strength; and removes, or much diminishes the Fever, with its Symptoms. To a critical Sweat is opposed a symptomatical one, which happens in manner of a Symptom, and is never of any Benefit, but generally attended with destructive Signs; and portends Death, or, at least, a long Continuance to the Disease, with many Relapses, and much Pain and Trouble. On all such Sweats we bestow the Appellation of symptomatical, as we do, also, on all other Excretions which happen when the Disease is crude, or when no Signs of Concoction appear. Wherefore all bad Sweats appear in a crude State of the Disease, when there is no manifest Sign of Concoction. For which Reason Hippocrates, 2 Epid. near the Beginning, makes the Sweats which appeared at the Beginning of an epidemic Fever, there described, to be Prognostics of a difficult and dangerous Crisis: And these Kinds of Sweats are the worse, if they appear only on the Head, Neck, Throat, or Thorax; and if they are cold, scanty, or cease immediately; or if they are copious, continued, or immoderate, they are worst of all. Secondly, we are to speak of bad Sweats, with respect to Quantity, as they are copious, or scanty, or none at all. Sweat is said to be much, and copious, when it breaks forth in a thick and profuse manner; when it is assiduous and continual; and when it is both assiduous and copious. Copious Sweats, according to Galen, Lib. 3. de Sympt. Caus. are occasioned either by the Rareness of the Body, or the Thinness of the Matter evacuated. Sweat which flows for either of these Reasons, comes not forth in a pressing and profuse manner, but assiduously and constantly.

constantly. Much Sweating, therefore, in Fevers, if occasioned neither by the Thinness of the Matter, nor the Rareness of the Pores, (which sort of Sweat, according to *Galen*, in 4 *Aph.* 41. is never copious) always indicates a Redundance of Humours, as we are told by the same Author, in 4 *Aph.* 42. And hence, *Hippocrates*, in the first-mentioned *Aphorism*, says, that "Much Sweating from Sleep, without any manifest Cause, indicates too plentiful Feeding; but if it happens, though the Patient takes no Food, it shews that the Body wants Evacuation." Much Sweat, says *Galen*, signifies Plenty of Excrements: These Sweats, therefore, appearing in Fevers, and affecting nothing towards a Crisis, are constantly pernicious, for this very Reason, that they indicate a Redundance of Humours, which requires a long Time for Nature to digest and subdue; whence in acute Diseases, which extinguish Nature in a short time, they often portend Death. Hence *Hippocrates*, 4 *Aph.* 42. says, that "A constant Flux of much Sweat, if cold, indicates a severe Disease; if hot, a milder." Because, as *Galen* says in his Commentary, both of them are Signs of a Multitude of Humours, the cold Flux of cold Humours, which are the worst; and the hot of hot Humours, which are less dangerous than the other. These Sweats neither remove nor alleviate the Fever, and break forth when the Disease is crude; and therefore are, at best, Prognostics of a long Disease, subject to Relapses, and attended with much Pain and Trouble. The Author of 1 *Prorrh.* 58. calls those Sweats unserviceable in acute Fevers; and *Hippocrates*, 1 *Epid. Sect.* 2. speaking of an epidemic continual Fever, says, that the Patients sweated much; but were so far from being relieved, that they were rather injured by it.

Sweats not copious, but yet constant or perpetual, are, also, bad, and, for the most part, mortal; since they are occasioned, as *Galen* says, *Lib.* 3. *de Sympt. Caus.* Cap. 2. and *Com.* in 4 *Aph.* 41. either by the Rareness of the Pores, or Imbecillity from a Resolution of the Habit of the Body, as the Case is in a Syncope: These Sweats then, are all pernicious, as indicating a Languor of Nature; but the worst are those symptomatical Sweats which are copious as well as constant, since they indicate an extreme Weakness, as well as an extraordinary Redundance of Humours, in which Circumstance Death is unavoidable, as is confirmed from the Instances of *Erasinus*, 1 *Epid. Sect.* 3. *Ægr.* 8. and the phrenitic Patient, 3. *Epid. Sect.* 3. *Ægr.* 4. of the first of whom it is said, that He had a Fever with perpetual Sweating: And of the other, that He vomited much thin, virulent, and æruginous Matter; had a Fever, attended with an Horror, and a copious and continual Sweat over all his Body. Some read this Place not according to *Galen*, as above, but from other Copies, thus, He had a copious and continual Sweat, which affected his Head and Neck during the whole Day. And it is usual with Persons under a Lipothymy to sweat in their Head and Neck. But this is no Reason that we should not, with *Galen*, read δ' ὅλα τὰ σώματα, over all the Body; since every Physician knows, that Persons under a Phrensy, before their Death, fall into a Sweat, from an universal Resolution of the Parts: Hence we conclude, that copious Sweats, in acute Diseases, not being critical, are not only of no Benefit, but, for the most part, fatal, and, when attended with a Languor, or total Decay of Strength, are most certain Signs of approaching Death; and that constant Sweats, whether copious or not copious, are alike pernicious in acute Diseases.

Sweat, little in Quantity, is usually of the same pernicious Signification as when much. *Galen*, *Lib.* 3. *de Symptom. Caus.* Cap. 2. writes, that small Sweats are occasioned by the small Quantity, or gross and glutinous Quality, of the superfluous Humours, or the Straitness of the Pores, which are rendered narrower, either by Contraction or Obstruction. The cutaneous Passages are obstructed by thick and glutinous Juices, and closed up, or contracted from an Atrophy, Refrigeration, or Softness: These little Sweats, if they break forth on a critical Day, are an undoubted Indication, that Nature makes fruitless Efforts to expel the Humours; and that its Attempts are frustrated by their Thickness or Viscidity, or the Narrowness of the Passages. But where there is no Constriction of the Passages (as may be known, because the Skin is neither contracted by an Atrophy, nor much refrigerated, nor remarkably soft) and there are Signs of a Redundance of Humours, little Sweats indicate Plenty of gross and viscid Humours; and if the Strength, at the same time, be very much exhausted, are mortal; and so much the more, if they appear without Signs of Concoction; in which Case, all Excretions are symptomatical, and indicate a Redundance of Humours. Sweats of this Kind shew, that Nature had begun to expel the Humours through the Skin, and could eliminate no more than the thinnest Portion of them, which must prove insufficient for a Solution of the Disease. Under this Head may be reduced Sweats which cease immediately after their Eruption, and are con-

demned by *Galen*, *Com.* 1. in 1 *Prorrh.* Sweat, therefore, little in Quantity, is always bad.

But the worst and most fatal of all Sweats, is that thin scanty sort of Sweat which the *Greeks* call *Ephidrosis*, and the *Latins* *Desudatio*, or *Mador*, "A Desudation, or Moistness." This Kind of Sweat appears sometimes on all Parts of the Body, but generally about the Head, Neck, Throat, Breast, and sometimes about the Extremities. Of this Subject we find *Galen* discoursing, in his Comment on the *Prorrhetica*, where he says, "We meet with the Word *Ephidrosis* several times in this Book; but we are not certain whether the Author means by it, those Sweats which appear about the Head and Thorax, or those which break forth from all Parts of the Body, but in a weak and faint manner, and of no Benefit to the Patient." Both of these indeed are bad; but the worst of them is what appears only on the upper Parts: For since all *Desudation* demonstrates either a Plenitude in the sweating Parts, or an Imbecillity of the retentive Faculty, if either of these affects the Parts about the Head and Thorax, it is a worse Sign, than if it were in any other Region. Of the Judgment that is to be made of Sweats indicating a Redundance of Humours, we have said enough already; but we may conclude the other Sort to be, also, pernicious, since they proceed from an extreme Decay of Nature, which is too weak to retain the alimentary Humid of the solid Parts, dispersed by Oppression or Resolution. These *Desudations* are distinguished from those occasioned by a Multitude of Humours, in that they generally break forth about the Forehead, Neck, Breast, or extreme Parts, with a slight Moistness, not increasing, seldom hot, but generally coldish, with a very low Pulse, and other Signs indicating Nature to be in a very languid State. Of this Nature are the Sweats, which owe their Rise to immoderate Evacuations, concerning which we read, 1 *Prorrh.* 126. A slight Sweat with a Refrigeration, after an Hemorrhage from the Nose, is bad.

But is it not a bad Sign in some acute Disorders not to sweat at all? Yes, certainly, in all those which, as *Galen*, *Lib.* 3. *de Crisibus*, has taught us, are critically terminated by Sweats: Such are all continual, and especially burning Fevers, which form their Crises by Sweat, or some other laudable Evacuation; whence the Fever is either entirely removed, or much diminished, with its Symptoms, and the Case of the Patient altered much for the better. Without such an Evacuation we are not to trust to any Remission of the Disease, as *Galen*, in 3 *Epid.* advises, agreeably to that of *Hippocrates*, 2 *Aph.* 27. We are not to place our Dependence on Things which give Relief after an unaccountable manner. The Necessity of such Caution is exemplified in the Instances of *Hermocrates*, 3 *Epid. Sect.* 1. *Ægr.* 2. and the Virgin Daughter of *Euryanactes*, *ibid. Sect.* 2. *Ægr.* 6. Of the first it is said, On the fourteenth Day he was free from a Fever, did not sweat, slept, and was in his perfect Senses: His Urine was the same. About the seventeenth Day, the Disease returned, the Patient was very hot, and on the following Days he had an high Fever, his Urine was thin, and he was delirious. On the twentieth Day he had another Crisis, and was free from a Fever, but sweated not. Such deceitful Remissions of Diseases without Sweat, or any other laudable Evacuation, are distinguished from such as may be trusted by the subsequent Signs, which, in the latter, are very good, in the former bad; as appears in *Hermocrates*, from what followed after the Crisis. On the twentieth Day he had another Crisis, was free from a Fever, sweated not: He had all the Time hitherto an Aversion to Food; had the Use of his Reason, but not of his Speech; his Tongue was dried up, but without Thirst; and his Sleep was comatous. On the twenty-seventh he died. And thus you see, that not to sweat at all, in burning Fevers, is sometimes a Prognostic of a fatal Event.

We proceed to take into Consideration those Sweats which are cold, since they are often observed to be mortal in acute Distempers; but, first, we are to have a thorough Insight into the Generation and Causes of them, which will very much illustrate the Reasonableness of grounding Predictions upon them.

First, then, Cold Sweats, as they consist of a cold and crude Matter, demonstrate, in continual Fevers, a Redundance of crude Humours, as *Galen* shews, *Com.* in 4 *Aph.* 42. especially when there is a copious Eruption of them. These Sweats, according to *Galen's* Opinion, *Com.* in 4 *Aph.* 37. are generated when the Humours putrefy in the Vessels; and Nature, which moderates and rules the solid Parts, and is, according to *Hippocrates*, the natural Heat, is either wholly or nearly extinguished; the Matters evacuated are indeed cold to the Sense, though the Heat, proceeding from the Putrefaction, may, for all that, be very violent; for which Reason it is a very destructive Sign, as it shews, that the excessive Quantity of Humours in the animal Body is ended with so great a Coldness, as not to be heated by either the natural or febrile Heat. Cold Sweats, then, indicate a Redundance of very cold Humours, by which Nature is either totally,

totally, or very nearly, extinguished. But when there happens to be kindled in the Vessels a most violent Heat, from the Putrefaction of the Humours, and the natural Heat retires to the inward Parts, there is a Refrigeration of the Extremities, with a very cold Humour, without considering their acting one upon another; but when there comes to be a mutual Acting and Resistance of the Humours, it is necessary, either that the cold Sweat should be heated, or the Heat soon extinguished by it. Agreeable to this is the Observation of Galen, in *Lib. 4. Aph. In Diseases not acute, but of a milder Nature, if the natural Heat, after maintaining itself a long Time, prevails not at last, it is extinguished, which happens much sooner in a violent Disorder from a speedy Resolution of the Strength.* Justly, therefore, is it said by Hippocrates, 4 *Aph. 37.* that Cold Sweats, in an acute Fever, prognosticate Death; in a milder one, the long Continuance of the Disease: Since, as Galen, in his Comment, says, if the Fever be of a gentler Kind, the Patient may recover, the Redundance of the Humours being concocted, and subdued by Length of Time. But an acute Fever is both a Cause, and a very pernicious Sign: As a Cause, it naturally effects a Resolution of Bodies; and as a Sign, it shews the Multitude of Humours, which are too intensely cold to be altered by the febrile Heat.

But perhaps you will ask, How it is possible for these Humours, which are cold, and, consequently, unfit for Motion, and much more under an extreme Weakness, and almost Extinction of Nature, to be conveyed to the Skin?

I answer, That the Humour being in some measure heated by the febrile Heat, though naturally unfit for Motion, is conveyed to the Skin, where the adventitious Heat it had received being resolved, it begins to cool again, and so turns out cold.

Cold Sweats, then, in acute Diseases, are always of fatal Signification, whether much or little in Quantity, howsoever they come forth; or whether they proceed from the whole Body; or from the Head, Neck, and Breast; or from the Extremities. Instances of this were observed by Hippocrates, in the first and third Books of the *Epidemics*, in *Philiscus*, the Wife of *Dromeades*, the Woman who lay ill in *Foro Mendacium*, and *Philistion*, who all died with cold Sweats upon them. And the most destructive of this kind is a petty thin cold Sweat, which comes out about the Head, or extreme Parts, as the Hands and Feet, because they indicate a near Extinction of the Faculty. Justly, therefore, was it said by Hippocrates, *Lib. Prognost.* that Cold Sweats are worst, and, in acute Diseases, indicate Death; in milder ones, a long Continuance of the Disorder. Cold Sweats, then, are bad in all Cases; agreeably to the Observations of Hippocrates, 3 *Epid. Sect. 3. Stat. Pest.* where, among other Symptoms peculiar to the reigning Fevers of that Season, were Cold unseasonable Sweats, which came forth in a plentiful manner, and held the Patient continually. The destructive Tendency of these Sweats is confirmed by other concomitant Signs; which, taken all together, and especially such as are subsequent, are necessarily pernicious. Of this kind were those observed by Hippocrates, in *Philiscus*, and the others just mentioned. Of *Philiscus*, 1 *Epid. Sect. 3. Agr. 1.* it is said, "At the Close of the fifth Day he grew speechless, fell into a cold Sweat, and his extreme Parts were livid: On the sixth Day about Noon he died." It is farther remarked of this Patient, that "He was continually under a cold Sweat." The Wife of *Dromeades*, *ibid. Agr. 11.* "On the sixth Day in the Morning had a new Fit of a Rigor, succeeded by a speedy Return of the Heat, and a Sweat all over her Body; her extreme Parts were cold; she was delirious; her Respiration was great and rare [*ἀγυλόν*]. See *ARÆON*], and soon after she died in Convulsions, which began at the Head." And of the Woman who lay ill in *Foro Mendacium*, 3 *Epid. Sect. 2. Agr. 12.* we read, that "On the seventh Day she was seized with a Return of a Rigor, succeeded by an high Fever, with an intense Thirst, and Jaunditions [*ἰκτερίκη*]. See *BLESTRISMUS*]: Towards Evening she fell into an universal cold Sweat, and her extreme Parts were cold." From these Instances, and what has been said, it abundantly appears, that cold Sweats in acute Diseases are destructive, and constantly portend Death; which may be predicted with the greater Certainty, if those Sweats make their Eruption on some critical Day, and are succeeded by some pernicious and mortal Sign.

Let this suffice concerning destructive cold Sweats; and let us now proceed to consider Sweats, with respect to the Partiality, and the Parts of the Body whence they break forth. For Sweats, as we have said, are very good and salutary, when they make their Eruption from all Parts of the Body, because they demonstrate Nature to be robust, and under no inward Impediment, from a malignant Disorder, or any morbid Cause, which might frustrate her Efforts in making Excretions of the Humours from all Parts. But, on the contrary, when any one of the internal Viscera is seized with a

violent Inflammation, or oppressed with a Multitude of Humours, there arises a partial and unequal Sweat. Such Sweats, therefore, as make their Eruption not from the whole Body, but from the Head or Thorax, are, according to Hippocrates, *Prognost.* of the worst Kind; and, whether they be hot or cold, in acute Diseases portend Death; in milder Disorders, a long Continuance, Relapses, and much Pain and Sickness. Hippocrates, 1 *Epid. Sect. 1. Stat. 1.* speaking of epidemic, and very mortal kind of Fevers, says, that the Patients "were under a perpetual Sweat, but not in all Parts of the Body." And a little after, enumerating the Symptoms by which burning Fevers were known to be mortal, even at the Beginning, says, that "The Patients sweated a little about the Forehead and Clavicles; but not one of them in all Parts of the Body." Hence the Author of 1 *Prorrhetic.* 39. had Reason to say, that "Sweats, and especially about the Head, with a kind of Uneasiness [*ἀνέσις*], in acute Diseases, are a bad Sign." All Sweats, therefore, which proceed not from the whole Body, are bad, as being Prognostics of Death, or a long Sickness. Justly, therefore, has Hippocrates said, *Lib. Prognost.* that "The worst Kind of Sweats are those which are cold; and especially when they happen only about the Head, Neck, and Face: For such Sweats, in acute Fevers, portend Death; in less violent Distempers, their long Continuance." And very right is the Judgment which Galen on the *Prorrhetica*, passes on them, when he says, "Every Desudation, that is, Sweat breaking forth about the Forehead, the fore or hinder Part of the Neck, or Clavicles, indicates an Imbecillity of the retentive Faculty, or a Redundance of Humours." And, in another Passage of the same Comment, he tells us, that "Such Sweats are not good, both because they arise on the superior Parts, and, also, for a double Reason, which is, that they proceed from a Language of the Faculty, or an Oppression of the same in its Original." Sweats arising in the Head and upper Parts, are very bad, particularly in a Suppuration and Phthisis, of which the Author of the *Coac.* 402. says, "They who are affected with a Suppuration, especially from a Pleurisy or Peripneumony, have their Disorder attended with Heats, which are but slight in the Day, but more intense at Night; they, also, spit forth something not worth Notice, sweat about the Neck and Clavicles, have hollow Eyes, and red Cheeks." With good Reason, therefore, are such Sweats esteemed mortal in an acute Fever, as indicating an Extinction of the Faculty, before it can accomplish the Concoction of the Humours; and when they are occasioned through an Imbecillity of the retentive Faculty, being unable to retain the Humour, or even the alimentary Juice proper to the Solids, portend, in a Fever, not only unavoidable but speedy Death, and with the greater Degree of Certainty, if they are, also, cold; of which Nature were those observed in *Pythion*, and the Woman in *Foro Mendacium*, 3 *Epid.* before-mentioned; and in *Meton*, *Aristocrates*, and *Pherecydes*, 7 *Epid. T. 47. 57. 91.* and in many others, who all died. But if the Disease be more favourable, and the Strength extraordinary, such Sweats indicate not Death, but the long Continuance of the Distemper; as it was in the Case of the Patient who lay ill in the Garden of *Dealces*, 3 *Epid. Sect. 2. Agr. 3.* of whom Hippocrates says, that "On the fourth Day there flowed from his Left Nostril a small Quantity of pure Blood; he had a Sweat about the Head and Clavicles, a Tumor of the Spleen, and a Pain in the Thigh on the same Side."

Sweats are, also, known to be bad, from their being unattended with any other Evacuation; and more from the Injury the Patients experience from them. For when a Sweat is found to be so far from being beneficial that it proves of ill Consequence to the Sick, it is to be esteemed one of those pseudo-critical Signs which determine nothing, and, consequently, according to Galen, *Com. in Prorrhetic.* are mortal. Hippocrates, in his Book of *Prognostics*, pronounces such Sweats as neither remove the Fever, nor render the Disease more tolerable to the Patient, to be useless and bad, and Prognostics either of Death, or a long Sickness. And the Author of the *Prorrhetic.* 58. says, that "Much Sweating, in acute or high Fevers, is of no Service to the Patient," as not removing the Fever. And, *ibid. 7.* "Burning Heats in the Hypochondrium, remaining after a Refrigeration of the Fever, are a bad Sign; and especially when attended with Sweats." Because, as Galen says, in his Comment, they extend not over the whole Body; but are small and inconsiderable, and incapable of extinguishing the flammeous Heat in the Hypochondrium. Again, 1 *Prorrhetic.* 68. it is said, that "They who lie waking in a Sweat, and have a Return of the Fever [*ἀναβραρυμένη*], are in a bad State." And, *ibid. 67.* "A fiery red Face, and Sweating, in a burning Rigor, are bad;" because, if the Sweat were good, the Heat of the Face would be resolved by it, which the Sweat not doing, indicates a Malignity. To the

the same Purpose, but more express, is 4 *Apb.* 56. "If a Person under a Fever fall into a Sweat, and finds no Remission of his Fever from the same, it is a bad Sign; for the Disease is prolonged, and a Redundance of Humidities is indicated." Such Sweats, in an acute Fever, portend Death; in a more gentle one, a long Continuance.

Among bad Sweats are, also, to be reckoned, all those which precede, accompany, or follow, other pernicious Signs: From such Sweats as these we may prognosticate a fatal End; since, if succeeded by bad Signs, they prove themselves of the Number of those critical undetermining Signs, by which the Patient is so far from being relieved, that he finds himself worse; and, consequently, are to be esteemed mortal. Of pernicious Signs succeeding bad Sweats we find *Hippocrates* speaking, 1 *Epid. Sect. 1.* where he says of some Patients under an epidemic Fever, that "They had continual Sweats, but not diffused over the whole Body, and their extreme Parts were refrigerated, so as to become almost incapable of recovering Heat." And the Author of the 1 *Prorrhetica* 126. says, that "An Hæmorrhage from the Nose, with thin cold Sweats, and a general Refrigeration, indicate Malignity, and are bad for the Patient." And, *ibid.* 102. "They who in the Beginning (of acute Diseases) are affected with cold Sweats, make concocted Urine, and are in a burning Heat, then unaccountably [*ἀφ' ὧν*] refrigerated, till a sudden Return of the hot Fit, and moreover labour under a Torpor, Coma, and Convulsions, are in a very dangerous State." Once more, *Coac.* 40. "Refrigerations, with thin cold Sweats, succeeding a Rigor [for *ῥίγος* I read, with *Prosper Alpinus*, *ῥύγος*], are bad." Of this Nature were the Sweats observed by *Hippocrates*, in the Wife of *Dromeades*, 1 *Epid.* the Virgin Daughter of *Euryanactes*, and the young Woman who lay ill in *Foro Mendacium*, 3 *Epid.* and in the Wife of *Theodorus*, *Aristocrates*, and the Wife of *Euxenus*, 7 *Epid.* T. 27. 52. 58. who all died. Of the Wife of *Dromeades* we have taken Notice above; and of the Daughter of *Euryanactes* it is said, that "On the seventh Day after a Crisis she was seized with a Rigor, was feverish, and sweated: The eighth Day after the Crisis she had something of a Rigor; and afterwards her extreme Parts became cold, and always so continued. About the tenth Day, after a Sweat which she had, she was delirious; but soon recovered her Senses." Of the young Woman who lay ill in *Foro Mendacium*, we read, that "On the second Day all the Symptoms were exasperated; she had frequent and unseasonable Stools, had no Sleep, was disturbed in her Reason, and sweated a little. On the third Day she was very uneasy, thirsty, nauseating, very restless and impatient, delirious, and her extreme Parts were cold and livid." The Wife of *Theodorus* "had first a small Eruption of Sweat about the Forehead, which, after a considerable Time, diffused itself over the whole Body and Feet, after which the Fever seemed to remit. The Body of the Arteries seemed cold to the Touch; but those at the Temples had more than an ordinary Degree of Pulsion: Her Breath grew short; she was delirious at every Turn, and she became worse on all Accounts." The Wife of *Euxenus*, "Had a Remission of her Fever, with a copious Sweat; was much refrigerated; laboured under an Asthma of various Kinds," and so died. By these, and other Instances which might be given, it appears, that all Sweats which are succeeded by pernicious Signs, have a destructive Tendency.

Sweats are, also, pernicious, when attended with bad Signs and Symptoms; and this is confirmed by *Coac.* 10. where it is said, that "They who are molested with frequent thin or cold Sweats and Rigors by Turns, are in a very dangerous Way." And, *ibid.* 13. "They who labour under frequent Returns of Horrors and Sweats, are in a very dubious State." Again, *ibid.* 53. "Sweats with a kind of Uneasiness, in acute Diseases, are bad." And, *ibid.* 327. compared with 1 *Prorrhetic.* 127. "An Hæmorrhage at the Nose, on the contrary Side is bad; as, for Instance, if it proceed from the Right Nostril, in a Tumor of the Spleen; but it is worse if attended with a Sweat." And, *ibid.* 35. compared with 1 *Prorrhetic.* 74. "Fever, attended with a Coma, Lassitude, Dimness of Sight, Want of Sleep, and Sweats, are malignant." Such were the bad Symptoms attending the Sweats under which *Aristocrates* laboured, 7 *Epid.* T. 52.

The same Judgment is to be made of Sweats succeeding very bad Signs or Symptoms. Thus, 1 *Prorrhetic.* 126. "A small Sweat, with a general Refrigeration succeeding an Hæmorrhage at the Nose, is malignant and pernicious." And we may say the same of it, when succeeding any bad Evacuation in general, whether it be an immoderate Hæmorrhage; or Distillation of Blood by Drops from the Nose, in burning Fevers, or a bad Flux of the Belly, or Vomiting. Sweat therefore, consequent upon bad Signs, is very pernicious, and especially if it neither removes nor alleviates those bad Symptoms.

Thus it was in the Case of the Wife of *Olympiades*, 7 *Epid.* T. 49. of whom we read, that "Her Speech was not restored, nor was she any way relieved; that her Eyes were cast down, her Respiration was sublime [*πρεβυα μάλιστα*. See *PNEUMA*], and performed through the Nose; she had an ill Colour, and, when she was near Death, had a Sweat about her Feet and Legs." *Prosper Alpinus, de Præseg. Vit. & Mori. Egratorum.*

A FEBRILE DIARRHOEA.

The Matter of a Diarrhoea is the Mucus, Lymph, *Gluten*, Pus, Sanies, or Blood, from the Nose, Mouth, Fauces, Oesophagus, Stomach, Liver, Gall-bladder, Pancreas, Intestines, and Mesentery: It arises from too great an expulsive Force of these Substances into the Intestines, and a Weakness of the contracting Force of the Intestines; or from some Obstruction of the absorbing Vessels of the Intestines, which prevents the Admission of what ought to pass through them.

Hence it appears, that Fluxes of the Belly in Fevers are of various Kinds, with respect to the Matter, Cause, Effect, and Event; they are, therefore, sometimes utterly incurable; and sometimes colliquative, in which Case they seldom admit of a Remedy.

If a *Diarrhoea* perseveres long, it disposes the abdominal Viscera more and more to the same Disorder; weakens them, excoriates, and inflames them; empties and exhausts the other Vessels and Viscera: Hence arise an Atrophy, Emaciation, Weakness, a Dysentery, an Inspissation of the Fluids throughout the whole Habit of the Body; a Laxity of the Solids; a Loss of the Fluids; a *Leucophlegmatia*; Dropsy; and Tabes.

The Cure is performed by destroying the Acrimony which irritates the Intestines, and by expelling it by means of Emetics, Purges, and Clysters; by corroborating the relaxed Parts; by mitigating the Violence of the Diarrhoea with Narcotics; by determining the morbose Matter to some other Excretion; as those by Sweat and Urine; by diminishing the Cause, and correcting it at the original Fountain.

For an Account of Prognostics from Stools, see the Article *DEJECTIO*.

FEBRILE ERUPTIONS.

The Matter of inflammatory Pustules is, generally, something which cannot pass the cutaneous Vessels, but sticks therein; and they are excited by the Force of the circulatory, secretory, and excretory vital Powers: Hence Eruptions are various, according to the Variety of Causes which produce them; and on this account Fevers acquire different Appellations, from the different Eruptions with which they are attended, as *Erysipelatous*, *Scarlet*, *red Petechial*, *purple Petechial*, *Morbillose*, and *Variolose*.

It is customary to treat of the last three separately; as for the three first, the Diagnostics, and Prognostics are easily found.

The Cure is not difficult; for it only requires, that the eruptive Matter be kept in a moveable State, by the Exhibition of a sufficient Quantity of light Fluids, and preserving a due Moderation of the vital Powers; for by this means they soon come to a Period, with a Desquamation of the Cuticle.

The other febrile Symptoms, which are similar to these, and of the like kind, require the same Treatment as the Diseases on which they depend.

Hence we learn, what Judgment is to be formed of the Variety of acute Fevers; for those in which the febrile Motion, when once begun, is continued equally to the End, are called *Continual Fevers*; those in which the febrile Force remits, and is again exasperated alternately, in such a manner, however, that the Fever never ceases, are called *Continual Remittent Fevers*; those, lastly, which remit so entirely, that the Patient is absolutely free from a Fever in the Intervals betwixt the Paroxysms, are called *Intermittents*.

A CONTINUAL FEVER.

The most simple of continual Fevers, is an *Ephmera*, or Diary Fever, which goes through the different Stages, as the Beginning, Increase, State, and Declension, in the Space of twenty-four Hours. It arises from a more vehement Motion only, excited by some Error with respect to the Non-naturals; and has scarcely any material Cause. It is distinguished by the Slightness of the Cause; the Purity of the Body; the Mildness of the Symptoms; the expeditious Crisis; and a Restoration of the Pulse to its natural State, immediately upon the Cessation of the Fever. The Cure is easily performed, by Abstinence, Rest, and Diluting.

If this Species of Fever continues many Days, it is called *A continual but not putrid Fever*. The Causes, Signs, and Cure are the same with those of the *Ephmera*; but it requires particularly copious Bleeding; and refrigerating Medicines.

A CONTINUAL PUTRID FEVER.

That Species of Fever, which is called a *putrid Synochus*, arises from Causes somewhat greater than a simple Inflammation; an Obstruction of the Viscera; an Oppilation of the Skin, and almost all the Capillaries; and a considerable Degree of Acrimony.

It is known by a Degree of Heat which is pungent to the Touch; a febrile, but unequal and irregular Pulse; Urine which is thick, red, and turbid, without a regular Sediment; and by an hot and sanguineous Temperament, Age, and Habit of the Patient.

This Fever is distinguished by the Name *Homotenus*, when it preserves the same Tenor through all its Stages, neither increasing, nor diminishing: When it perpetually increases, it is called *Epacmaistica*, or *Anabatica*: But when it continues perpetually to decline, it acquires the Title of *Paracmaistica*.

Of these the first Species is esteemed salutary; the second the worst; and the third better.

This Fever is esteemed the more dangerous and fatal, in proportion as the Pulse is more weak, frequent, unequal with respect to Strength, inordinate with respect to Time, and intermittent; as the Respiration is more difficult, frequent, and laborious; the more the *Pinnæ* of the Nostrils are agitated; the more Pain it excites about the vital Parts; and the more inordinate it is; the more vehemently a Sensation of Lassitude and Weakness, is perceived; the more frequently the Patient changes his Posture of lying, tosses about, and lies on his Back, with his Limbs extended; the more the rational Faculties, and Affections, are injured; the more the Appetite is impaired, the Digestion difficult, the Urine red, thick, and turbid, or pale, watery, discharged in small Quantities, and difficultly retained; the more tremulous Motions are perceived in the Patient; the more he starts from the Touch; the more he trifles and fumbles with his Hands; and the more he picks the Naps of the Bed-cloaths; the more ghastly his Eyes appear, and the more moist they are with involuntary Tears; for these are all very bad Symptoms.

But when Sleep is laborious and difficult, and affords no Relief; when purple or livid Eruptions appear on the Body; when the Hypochondria are tense and inflated, the Patient generally dies.

The Cure delivered above, is to be varied according to the Variety of Indications, the Violence of the Symptoms, the Condition of the Patient, and the Stage of the Fever; and, therefore, does not require to be particularly treated of.

The Antients called these Fevers *ὑποχολα*, and the Schools, *Continentes*; because in them there is no Remission of Heat: But Continual Remittent Fevers, the Antients called *ὑποχολαίαι*, in Latin *Continua*.

A CAUSUS, OR ARDENT FEVER.

Among these Fevers, we may justly reckon the *Causus*, or burning Fever, on account of its Frequency, Danger, and Difficulty of Cure.

The primary Symptoms of this Disorder, are an Heat almost burning to the Touch, unequal in different Parts of the Body, most intense in the vital Parts, (but more mild towards the Extremities which are some times cold) and rendering the Breath intensely hot, a Dryness in the whole Skin, Nostrils, Mouths, and Tongue; a dense, difficult, and quick Respiration; a dry, yellow, black, parched, and rough Tongue; an insatiable Thirst often suddenly removed; a Leathing of the Aliments, a Nausea and Vomiting; the greatest Anxiety, Inquietude, and Weariness; a gentle Cough, and a shrill Voice; a Delirium, Phrenitis, obstinate Watching, Coma, and Convulsions, and Exacerbations on the odd Days.

The Causes of a burning Fever may be excessive Labour; long Journeys; the Heat of the Sun; Thirst long endured; the Use of heating, fermented, aromatic, and acrid Substances; excessive Venery; and immoderate Weariness, especially in the Summer.

This is the Progress of this Disease: On the third and fourth Day it often proves mortal; and, if it is violent, rarely exceeds the seventh, without putting an End to the Patient's Life. It is frequently terminated by an Hemorrhage, (which, if it is sparing on the third or fourth Day, is a mortal Sign) which may be predicted by the Pain of the Neck, the Heaviness of the Temples, a Distension of the Præcordia without a Sense of Pain, a spontaneous Discharge of Tears without any other mortal Sign, a Redness of the Face, an Itching of the Nostrils; and this Hemorrhage is most salutary on the critical Day. This Species of Fever is, also, terminated on the critical Day, by Vomit, Stool, Sweat, Urine, and the Expectoration of a thick Matter: If the Exacerbation of the Fit happens before the sixth Day, it is a very bad Symptom; black and thin Urine, discharged in a small Quantity, is, in this Disorder, a mor-

tal Sign; as, also, a Spitting of Blood, and a Discharge of bloody Urine; an injured Deglutition is a bad Sign; and a Refrigeration of the Extremities, among the worst of Symptoms; a Redness and Sweating of the Face is, also, a bad Sign; and an Inflammation of the Parotid Glands, which does not come to Suppuration, proves mortal; an excessive Flux is, in this Disorder, also, mortal: This Species of Disorder, when accompanied with a Tremor, terminates in a Delirium, and then in Death; it, also, terminates in a Peripneumony, often accompanied with a Delirium: That Species of burning Fever, which arises after violent Gripes of the Belly, is of the worst Kind; it is critically terminated by a Rigor.

From these Signs the Disorder is easily known to be present, nor can its proximate Cause be mistaken; for it arises from the Blood's being deprived of its milder and more liquid Parts by an Inflammation through the Whole of the Body, whilst the Strength of the Patient is vigorous. Hence, also, sure Prognostics may be made with respect to the Termination of this Species of Fever.

The Cure of a burning Fever requires a pure cold Air frequently renewed; Cloaths, which by no means suffocate or burden the Patient; a frequent erect Posture of the Body; large Quantities of mild, demulcent, subacid, aqueous, and warm Liquors used as Drink; light farinacious Foods prepared of Barley, Oats, and subacid Fruits; Venesection, if the Disease is in the Beginning, if the Marks of a Plethora appear, if there are Signs of a considerable Inflammation, if the Heat is intolerable, the Rarefaction of the Fluids excessive, a Revulsion necessary, and the Symptoms so violent, that they cannot be easily removed by any other Remedy; the Injection of mild, diluting, laxative, antiphlogistic, and refrigerating Clysters to be repeated as the Heat, Costiveness, and Revulsion require; Humectation of the whole Body, by drawing into the Nostrils a mild Air, impregnated with the Steam of warm Water, by washing the Mouth and Throat, by bathing the Hands and Feet with tepid Water, and by fomenting, with warm Sponges, the Places where most Vessels are exposed to the Touch; aqueous, mild, nitrous, gratefully acid, and gently laxative Substances; together with such as supply the Matter of the Urine, and without any Acrimony, by their Quantity, afford a Vehicle for the Sweat; such as remove Contractions of the Fibres, resolve and dilute the Thickness of the Humours, and, at the same time, correct their Acrimony.

To these if we add what has been said in the general Rules relating to the Cure of acute Disorders, and their Symptoms, and the Doctrine of each particular acute Disease, arising from the Affection of each of the Viscera, to be found under their respective Articles, he shall clearly understand what Remedies are proper for the Cure of any burning Fever.

Besides, from what has been said, all other particular acute Fevers may be understood, since they may either be referred to particular Symptoms, or are the Effects of some other Disorder. See CAUSUS.

INTERMITTENT FEVERS.

We have already given the Definition of an intermittent Fever, the Diagnostics of which are obvious, and its Distinction into various Classes easy, since these depend only on the Difference of Time.

But 'tis to be observed, that intermittent Fevers, in general, are either vernal, and rage from February till August; or autumnal, and rage from August till February; which Distinction is necessary on account of the various Conditions, Symptoms, Terminations, Durations, and Cures of different Intermittents: Besides, one Intermittent Fever sometimes removes another.

Intermittent Fevers, in the Beginning of the Autumn, often resemble those of the continual Kind, on account of their longer and redoubled Paroxysms, whereas their Nature and Cure are widely different.

Fevers of this Kind begin with an Oscitation, Pandiculation, Weariness, Weakness, Cold, Horror, Rigor, Tremor, and Paleness of the Extremities, a difficult Respiration, an Anxiety, a Nausea, a Vomiting, and a quick, weak, and slow Pulse. The more violent and numerous these Symptoms are, the worse the Fever is; and afterwards the Heat, and other Symptoms, are the worse. This is the first Stage of intermittent Fevers, which correspond to the Increase of continual Fevers, and is of all the other Stages the most dangerous; for, in this Condition, the Urine is generally crude and thin.

This Stage of intermittent Fevers is succeeded by another, which begins with Heat, Redness, a strong, large, and free Respiration, a small Anxiety, a large and strong Pulse, an excessive Thirst, and a Pain of the Limbs and Head, and generally a Redness of the Urine: This Stage corresponds to the State or Height of continual Fevers.

Then, last of all, there generally appears a profuse Sweat, a Remission of all the Symptoms, a thick Urine, with a Sediment resembling Brick-dust, Sleep, a total Absence of the Fever, Lassitude, and Weakness.

Intermittent Fevers frequently terminate in those of the acute and dangerous Kind, which is generally owing to an excessive Heat, and too brisk a Motion of the Fluids.

Intermittent Fevers, running through their three different Stages, greatly injure the minute Fibres of the Vessels and Viscera, by producing Stagnations, Obstructions, Coagulations, Impulsions, Resolutions, and Attenuations of the Fluids: Hence the Vessels are weakened, and the Fluids become morbid, especially in that Species of the Disease, in which their Parts are less assimilated, and not duly mixed, by which Circumstances in Conjunction, an acrimonious State of the Juices is produced. Hence all these things concurring produce an easy Propensity to sweat, which greatly weakens the Patient, since, sometimes, the viscid Part of the Blood transpires. In this Situation of the Patient, the Urine is surprisingly thick, turbid, pinguious, like that of Horses, or like Saliva. Hence the weak, resolved, and hardly coherent Blood, being deprived of its best Parts, is at once acrid and thick; so that, in consequence of the Laxity of the Vessels, and the Acrimony of the Humours, those long-continued Fevers sometimes terminate in chronical Disorders, such as a Scurvy, a Dropsy, a Leucophlegmatia, scirrhus Tumors of the Abdomen, and the several Misfortunes produced by these.

But if intermittent Fevers are not of the malignant Kind, they dispose the Patient to Longevity, and cleanse the Body from inveterate Disorders.

Hence, after an accurate Examination of the whole History of Intermittents, their proximate Cause seems to be a Viscidity of the arterial Blood upon the Accession of any Cause which produces a brisk and strong Contraction of the Heart, and a Resolution of the stagnant Fluids.

Since, therefore, this Order is always observed in Intermittents, the Physician who can surmount the first Time, and the first Cause, may by that means remove the whole ensuing Paroxysm.

Besides, as an infinite Number of Causes, and these not very considerable, may produce the first Stage of a perfectly intermittent Fever, and its Cause; and as many such Causes may be produced, increased, and fomented, in all the Fluids, formed and secreted in the human Body, it is more difficult to distinguish the Cause already formed from infinite possible Circumstances, than to invent one possible Cause, sufficient from the Laws of the animal Economy to account for the stated Periods of Intermittents. This is sufficiently obvious to every accurate Inquirer.

The Cure, therefore, requires that we should use aperient, saline, alkaline, aromatic, mineral, diluting, mild, and oleous Substances, Heat, Motion, Fomentation, and Friction, during the Intermittion, or in the first Stage. The Medicines of this Kind are all *Tachenius's* Salts of Herbs, the most considerable of which, are obtained from Wormwood, *Carduus Benedictus*, and Stalks of Beans; Nitre; antimoniated Nitre; diaphoretic Antimony unwashed; Sal Ammoniac; Sal Prunellæ; and Sal Polychrestus; Tartarus regeneratus; Tartarus Tartarificus; Salt of Tartar reduced to a saponaceous Mass with Oil of Turpentine; and all the Parts of all the aromatic Herbs, especially of those which are resolvent.

In order to purge the *Prima Via* from the redundant Sordes, a Purge, or a Vomit, are often very beneficial, exhibiting either so long before the Paroxysm, that its Operation may be over before the Fit comes on. That this Method is to be taken, may be known from the Patient's way of living, preceding Diseases and Symptoms, a Nausea, a Vomiting, Eructations, Tumors, the Breath, the Sordes of the Tongue, Throat, and Palate, want of Appetite, Bitterness of the Mouth, and a Vertigo accompanied with Dimness of Sight; and, after the Operation, the tumultuous Commotion of the Fluids is to be allayed by an Opiate before the Paroxysm. Thus,

Take of emetic Tartar, five Grains, reduced to a Powder; to be taken at one Dose: Or,

Take of emetic Tartar, five Grains; and of the Crumbs of Bread, a sufficient Quantity; to make five Pills, to be taken for one Dose: Or,

Take of emetic Wine, two Ounces; and of Oxymel of Squills, six Drams: Mix up for a Draught: Or,

Take of emetic Tartar, five Grains; Rob of Currans, half an Ounce; and Oil of Cinnamon, one Drop: Make into a Bolus.

Forms of Purges, are these following:

Take of the Pulvis Cornachini, two Scruples for a Dose: Or,

Take of the *Pilula Cochiae majores*, two Scruples; of Solutive Syrup of Roses, half an Ounce; and of distilled Elder-flowers, two Ounces: Mix for a Draught: Or,

Take of washed Aloes, twelve Grains; of Myrrh, ten Grains; of *Opopanax*, five Grains; and of Sal Gemmæ, five Grains: Mix, and make up into nine Pills.

These are beneficial, when, by their Stimulus, they operate both Ways.

But they prove injurious when they weaken, evacuate the most liquid Parts of the Juices, and disturb the necessary Digestions; and thus either protract the Disease, or bring on Death. The cold and hot Fits are often removed by Sudorifics, whilst a few Hours before the known time of the Paroxysm, after filling the Patient's Body with an aperient, diluting, and gently narcotic Liquor, an Hour before the Paroxysm, a Sweat is excited, and continued till two Hours after the Paroxysm usually began.

Take of Sal Polychrestum, two Drams; of the Syrup of the Five aperient Roots, two Ounces; of pure Opium, two Grains; of the distilled fermented Waters of *Carduus Benedictus*, Wormwood, Rue, Marjoram, and Mint, each one Ounce; and of the Extract of Wormwood, two Ounces: Mix all together, and let the Patient take one Spoonful every Quarter of an Hour, drinking after each, four Ounces of the following Decoction:

Take of the Root of Masterwort, six Drams; of the Roots of *Sassafras*, and red-Saunders, each two Ounces; of the Leaves of Golden-rod, two Handfuls; of the Leaves of the Lesser Centaury, half an Ounce; and of the bruised Seeds of Candy Carrot, six Drams: Infuse for two Hours in a close-stopt Vessel, without boiling, though very hot; then let them boil a little, and exhibit two Pints of the Decoction for a Dose.

Venefection, considered in itself, is always pernicious, though it may prove accidentally beneficial, as, also, a light and exactly regulated Diet.

When intermittent Fevers are in the second Stage, aqueous Substances actually warm, mixed with subacid aperient, nitrous Ingredients, or Preparations of Succory, and other mild Substances of a similar Nature, are indicated, whilst the Patient is to be kept in a State of Rest, and moderate Warmth. The Medicines before recommended in a febrile Anxiety and Thirst are to be used in this Stage of Intermittents.

When the Paroxysm is terminated by a Crisis, then it is expedient to supply the Matter of Sweat and Urine, by vinous Potions, Broths prepared with Fleth, and temperate Decoctions: Thus those two Excretions are to be excited, not by the Force of Heat, Medicines, or Bed-cloaths; but gently promoted by an increased Quantity of their Materials long persisted in.

Violent Symptoms are to be removed by the Rules laid down for the Cure of febrile Symptoms in general.

When the Fever is removed, the Patient is to have his Strength restored by analeptic Aliments, and corroborating Medicines; then after his Strength is increased, he is to be purged several times.

But if an autumnal intermittent Fever is very violent; if the Patient is weakened by the Disease; if the Disorder is of a considerable Standing; if there are no Signs of an internal Inflammation, nor of Pus collected any-where, nor of a considerable Obstruction of any of the Viscera, the Disorder is to be removed by the *Peruvian Bark*, exhibited in the Form of a Powder, an Infusion, an Extract, a Decoction, or a Syrup, with proper Specifics, during the Intermittion, in a due Order, a proper Dose, and in Conjunction with a proper Regimen. For this Purpose,

Take of the *Peruvian Bark*, one Ounce; reduce to a Powder, to be divided into twelve Doses; one of which is to be taken by the Patient every Hour in Wine: Or,

Take of *Peruvian Bark*, three Ounces; and common Water, twelve Ounces: Infuse for two Hours; then boil for an Hour; and add four Ounces of *French Wine*; then let the Whole boil a little longer in a tall Vessel; and of this Decoction, when pure, let the Patient take one Ounce and an half every two Hours: Or,

Take of the *Peruvian Bark*, three Ounces; boil for two Hours in a close Vessel in common Water to sixteen Ounces of strained Liquor, of which let the Patient take an Ounce and half every two Hours: Or,

Infusate the preceding Decoction to the Consistence of Honey, and divide into four Doses, one of which is to be taken every two Hours : Or,

Take the preceding Extract, dilute in one Ounce of the Syrup of the Five aperient Roots : Make a Syrup to be used in the same manner with the Extract : Or,

Take the preceding Extract ; mix with it a sufficient Quantity of the Powder of Liquorice, and reduce to a Mass of Pills, of which the Patient is to take four Grains, during the time of Intermiffion.

Epithems are, also, frequently beneficial, as, also, Unctions of the Spine of the Back, and the drinking astringent Liquors. Thus,

Take of the Oils of Scorpions, Castor, Juniper-berries, Camphire obtained from the Root of the Cinnamon-tree, Bays, and Turpentine, and of the terebinthinated Balsam of Sulphur, each half an Ounce : Mix for a Liniment.

Take of the Whole of the broad-leaved Plantain, ten Ounces ; and of recent Tormentil-root, two Ounces : Boil in two Pints of Water ; and let the Patient drink three Ounces of the Decoction every two Hours.

Take of Roch-alum, one Dram ; of Nutmeg two Drams ; and of the Powder of *Armenian Bole*, twelve Grains : Reduce to a Powder, to be taken an Hour before the Paroxysm.

Epithems for the Wrists may be prepared in the following manner :

Take of Currants, and Hops, each two Ounces ; and reduce to a Poultice, to be applied to the Wrists : Or,

Take of the Tops of green Rue, two Ounces ; and of Mustard-seeds, two Drams : Bruise, and apply to the Wrists.

That the Cure of particular Intermittents may be understood, 'tis to be observed, first, that the shorter the Intervals of true Intermittents are, the sooner they are cured ; and the longer the Intervals are, the more Time is required to their Cure. Secondly, that, for this Reason, they approach much to the Nature of acute Fevers, and are sometimes converted into them. Thirdly, that for this Reason, their Cause is more moveable, tho' more copious. Fourthly, that vernal Intermittents, upon the Approach of warm Weather, are spontaneously terminated. Fifthly, that autumnal Intermittents, on the Approach of cold Weather, are increased. Hence 'tis obvious what Fevers are curable, and by what Medicines. *Boerhaave Aph. & Mat. Med.* See ARANEA.

Sydenham, speaking of the intermittent Fevers, which raged from the Year 1675, to 1680, observes, that though Quartans were more frequent formerly, yet now Tertians and Quotidians were most common, unless the latter may be intitled double Tertians ; and, also, that though these Tertians sometimes began with Chills and Shivering, which were succeeded first by Heat, and soon after by Sweat, and ended at length in a perfect Intermiffion, returning again after a fixed time ; yet they did not keep this Order after the third or fourth Fit, especially if the Patient was confined to his Bed, and used hot Cardiacs, which increase the Disease. But afterwards this Fever became so unusually violent, that only a Remission happened in place of an Intermiffion ; and approaching every Day nearer to the Species of continued Fevers, it seized the Head, and proved fatal to abundance of Persons.

As to the Cure, I have learnt, says he, from the Experience of many Years, that 'tis dangerous to attempt to remove Tertians and Quotidians by Sudorifics ; for when they are recent, and have assumed no certain Shape, they nearly approach to continued Fevers. And though it is well known, that as soon as the Sweat flows, the Restlessness, and other Symptoms, presently go off, and a perfect Intermiffion succeeds, and consequently that it should be somewhat promoted, or, at least, not hindered, when the Fit is going off ; yet 'tis manifest, that, if Sweat be forced beyond the due Degree, the Intermittent becomes a continued Fever, and Life is endangered. I conceive the Reason of this to be, that so profuse a Sweat, (since it exceeds the Degree of the febrile Matter, already so exalted by the Heat of the Fit, that it may now be expelled by Despumation) after it has expelled that Part thereof, which might produce a single Fit, proceeds to inflame the Blood. Upon considering, therefore, the Inefficacy of this Method, and the Inconveniencies attending other Evacuations, as Bleeding and Purging, both which, by weakening the Texture of the Blood, prolong the Disease, the *Peruvian Bark* afforded me the surest Hopes ; of which I can truly affirm, notwithstanding the Prejudice of the Vulgar, and a few of the Learned, that I never found, or

could reasonably suspect, any ill Consequence follow its Use ; unless, that such as have taken it for a considerable time, are sometimes seized with a scorbutic Rheumatism. But this Disorder rarely proceeds from this Cause, and when it does, readily yields to the Remedies adapted to it.

And, in reality, if I were as certain of the Continuance of its Effects, as I am of the Innocence of the Bark, I should not scruple to prefer it to all the Medicines hitherto known ; since it is not only excellent in this Disease, but, also, in those of the Uterus and Stomach : So little Reason there is to complain of its Unwholsomeness.

But, I conceive, that the Bark has been ill spoken of, principally, for the following Reasons : (1.) Because the numerous Train of violent Symptoms, which accompany, previously to the Use of the Bark, inveterate Intermittents, are ascribed to it, though it has been taken only once. (2.) As it cures the Disease by a secret Virtue, and not by any sensible Evacuation, several Persons maintain, that the morbid Matter, which ought to have been expelled, is retained in the Body by its Astringency, ready to occasion fresh Disturbance, the Disease not being entirely carried off. But such Persons do not sufficiently consider, that the Sweats, happening at the Decline of the Fit, have expelled all the morbid Matter that was collected during the preceding Interval, so that only the Seeds of the Disease remain, which require time to be ripened ; and the Bark, by closely pursuing the retiring Fit, and cutting off the Supplies of the Disease, cannot be a means of retaining any morbid Matter in the Blood, which is now existent there only in Embryo ; consequently the Bark is not to be esteemed productive of those Obstructions, which are commonly judged to proceed from its Use.

But how does it appear, that the Bark cures Intermittents by its Astringency ? In order to prove this, other Astringents, possessed of the same Virtue, must first necessarily be produced : I have tried the strongest ineffectually. Besides, the Bark effects a Cure, even where it purges, which is sometimes the Case. Upon the Whole, therefore, they act the wisest Part, who limit their Inquiries to their Abilities. But, if a Person, imposing upon himself, should imagine, that he is possessed of other Faculties than such as are useful, either to Natural Religion, by which we learn that God, the Creator and Governor of all things, is to be worshipped with profound Veneration, as he justly merits ; or to moral Philosophy, that he may practise Virtue, and render himself every way useful to Society ; or, lastly, to the Medicinal, Mathematical, and Mechanical Arts, which supply Mankind with many Helps and Conveniences ; I would have him in the first place, deduce an Hypothesis from Natural Philosophy, that may enable him to explain the Cause of but a single specific Difference of Things in Nature. For Instance, let him account for the universal Greenness of Grass, and why it is never found of any other Colour, and the like. And if he can do this, I will readily embrace his Sentiments ; but, if not, I shall not scruple to affirm, that all the Diligence and Caution of a Physician should be employ'd in investigating the History of Diseases, and applying those Remedies which stand recommended by Experience for the Cure thereof ; observing, notwithstanding, that Method which is founded on right Reason, and not the Result of idle Speculations. I will, therefore, briefly deliver what Experience hath taught me, relating to the Method of exhibiting the Bark.

The *Peruvian Bark*, commonly called the *Jesuits Powder*, to the best of my Remembrance, began to be esteemed at London, for the Cure of Intermittents, and especially Quartans, about twenty-five Years since ; and, indeed, very deservedly, as these Diseases before this time were seldom cured by any other Method, or Medicine ; whence they were reputed the *Opprobria Medicorum*, and not without Cause. But, not long after, it lost its Character, and was entirely disused, for two considerable Reasons : (1.) Because, being exhibited only a few Hours before the coming of the Fit, according to the received Custom of that Time, it sometimes destroyed the Patient ; which I remember happened to Mr. *Underwood*, a Citizen and Alderman of London, and to one *Potter*, an Apothecary in *Black Fryars*. This fatal Effect of the Powder, though very rare, did, however, deservedly prevail with the more prudent Physicians to refrain from its Use. (2.) Because, tho' the Patient was, for the most part, freed from the Fit, that would otherwise have come, by this Medicine, yet a Relapse commonly happened within a Fortnight, particularly when the Disease was recent, and had not been weakened by a long Continuance. These Reasons weigh'd so much with the Generality, that they lost all Hopes they had hitherto conceived of this Medicine ; nor did they esteem it so material to prevent the Access of a Fit for a few Days, as, upon this account, to endanger their Lives by taking the Bark.

But, having some Years since thoroughly considered the extraordinary Virtues of the Bark, I was firmly persuaded, that Intermittents

intermittents could not be better cured than by this efficacious Medicine, provided it were given with proper Caution. For this Reason I spent much time in considering how I might prevent the Danger ensuing from its Use, and the Relapse that succeeded in a few Days, which were the two Inconveniencies to be remedied, and by means thereof, to restore the Patient to perfect Health.

1. I conceived, that the Danger proceeded less from the Bark itself, than from the unseasonable Use thereof; for when a large Quantity of febrile Matter is collected in the Body upon the intermediate Days, the Bark, if taken immediately before the Fit, obstructs the Expulsion of the morbid Matter in the natural way (that is by the Violence of the Fit); which, being preternaturally detained, usually endangers Life. But I judged I could remedy this Evil, and, also, prevent the fresh Generation of febrile Matter, by giving the Powder directly upon the Departure of the Fit, so that a Stop might be put to the succeeding one; and by repeating it upon the intermediate Days, at proper Distances, till the Approach of a new Fit; and that by this means the Blood might be impregnated gradually, and consequently safely, with the Virtue of the Bark.

2. As the Relapse, which generally happened in a Fortnight, seemed to me to proceed from not sufficiently impregnating the Blood with the Virtue of the Febrifuge, which, however efficacious, was not powerful enough to cure the Disease at once, I judged, that the best Method of preventing a Relapse, would be to repeat the Powder, at proper Intervals, before the Virtue of the preceding Dose was quite spent, even though the Intermittent appeared to be conquered for the present.

These Considerations led me to the following Method, which I now use. When I am called to a Person afflicted with a Quartan, suppose on a *Monday*, if the Fit is expected the same Day, I refrain from doing any thing, and only give the Patient Hopes, that he shall be freed from the next Fit. And, in order to effect this, I exhibit the Bark upon the two intermediate, or well Days, that is, *Tuesday* and *Wednesday*, in the following manner:

Take of *Peruvian Bark*, very finely powdered, one Ounce; Syrup of Cloves, or of dried-Roses, enough to make it into an Electuary, to be divided into twelve Doses; whereof let the Patient take one every fourth Hour, beginning immediately after the Fit is gone off, and drinking, after each Dose, a Draught of any Kind of Wine.

Or, if Pills be more agreeable;

Take of the *Peruvian Bark*, very finely pulverized, one Ounce; Syrup of Cloves, enough to make it into Pills of a middling Size; of which let the Patient take six every fourth Hour.

But an Ounce of the Powder may be mixed with a Quart of Claret, with less Trouble, and equal Success, and eight or nine Spoonfuls of it may be given at the Intervals above-mentioned. I order nothing on *Thursday*, when the Fit is expected, because, for the most part, it does not come, the Remainder of the febrile Matter being despumated and expelled the Blood by the usual Sweats, which terminated the preceding Fit, and a Collection of fresh Matter being prevented by the Repetition of the Powder upon the intermediate Days.

But, in order to prevent a Relapse, which was one of the Inconveniencies above recited, I always gave the same Quantity of the Powder, an Ounce divided into twelve Doses, upon the eighth Day precisely, after taking the last Dose. But though a single Repetition of the Bark in this manner frequently removes the Disease, yet the Danger is not over, unless the Patient will comply with the Directions of his Physician, and take it thus a third or fourth time; especially when the Blood has been impoverished by some preceding Evacuation, or the Body unadvisedly exposed to the cold Air.

Now, though there is no inherent purgative Virtue in this Medicine, yet a violent Purgings is frequently occasioned thereby, on account of some peculiar Idiosyncrasy in the Constitution. In this Case, it is indispensably necessary to exhibit Laudanum therewith, to prevent its having this Effect, which is manifestly as opposite to its own Nature, as it is to this Disease, and that it may be retained long enough to answer its End. Therefore I direct ten Drops of Laudanum to be given in a little Wine, after every other Dose of the Powder, provided the Purgings does not go off.

I follow the same Method in other Intermittents, whether Tertians or Quartans; for, immediately upon the Fit's going off, I administer a Dose of the Powder, and repeat it in point of Frequency, at as close Intervals, during the time of the Intermittion, as the Nature of the Disease will admit; but with this Difference, that a Tertian may be so far conquered with

six Drams of the Bark, as at least to give a Respite; whereas a Quartan can very rarely be removed with less than an Ounce of it, divided into proper Doses.

But tho' Tertians and Quotidians, after a Fit or two, may seem entirely to intermit, yet, as I have before observed, they afterwards frequently degenerate into a Species of continued Fevers, and only come to a Remission even upon those Days that promised an Intermittion; especially when the Patient has been kept too warm in Bed, or been tormented with Medicines to carry off the Intermittent by Sweat. In this Case, I have no other way left, but to take Advantage of the Remission, though it be ever so small; and accordingly, I give the Powder immediately after the Fit is gone off, as near as I can conjecture, and repeat it every four Hours, as above-mentioned, without waiting for a regular Intermittion, because otherwise the alexiterial Virtue of the Bark cannot be communicated to the Blood in so short an Interval.

And though the present reigning Intermittents, after the second or third Fit, incline to continued Fevers, yet they must be referred to the intermittent Kind; and, therefore, I scruple not to order the Bark, even in the most continued of this Species; the Repetition of which, in the above-mentioned manner, will certainly remove the Disease, provided the constant Warmth of the Bed, and the improper Use of Cardiacs, have not rendered it a continued Fever; in which Case, I have frequently observed, that the Bark proves ineffectual. Nor have I ever found, that the Wine, wherein the Bark is administered, did the Patient Harm, which might reasonably be suspected; but, on the contrary, the Heat, Thirst, and other febrile Symptoms, generally went off soon after taking a sufficient Quantity of this Medicine. But it must be here observed, that the nearer the Intermittent approaches to a continued Fever, either spontaneously, or from using too hot a Regimen, so much the more necessary it is to exhibit a larger Quantity of the Bark; for I have sometimes found, that Intermittents would not yield to less than an Ounce and an half, or two Ounces, of the Bark.

As some Persons can neither take the Bark in Powder, an Electuary, or in Pills, I give them an Infusion of it, which is made with two Ounces of Bark grossly powdered, infused cold for some time in a Quart of *Rhenish Wine*. This Infusion, being several times passed through a fine Strainer, becomes so clear, as not to be nauseated by the nicest Palate. Four Ounces of this Infusion, after it has stood some Days, should seem equivalent in Virtue to a Dram of the Powder in Substance; and, as it is neither disagreeable, nor lies heavy upon the Stomach, it may be exhibited with twice the Frequency of the other Formulæ, till the Disease vanishes.

When this Disease hath assumed no regular Appearance, it is sometimes attended with an almost continual Vomiting, so that the Bark cannot be retained in any Form; in which Case the Vomiting must be stopt, before it can be administered. For this Purpose I order a Scruple of Salt of Wormwood to be dissolved in a Spoonful of fresh Lemon-juice, and taken six or eight times in the Space of two Hours; and afterwards I give sixteen Drops of Liquid Laudanum in a Spoonful of strong Cinnamon-water; and soon after, if the Vomiting stops, I proceed to use the Bark.

For Children, who, on account of their tender Age, can scarcely bear to take this Remedy in any other Form, at least in a suitable Quantity to effect a Cure, I generally prescribed the following Julap:

Take of black Cherry-water, and *Rhenish Wine*, each two Ounces; *Peruvian Bark* finely powdered, three Drams; Syrup of Cloves, an Ounce: Mix them together for a Julap. Let a Spoonful or two (according to his Age) be given to the Child every fourth Hour, till the Fits return no more, dropping into every other Dose, in case of a Looseness, one or two Drops of Liquid Laudanum.

It must be further observed, that the Intervals between the Fits in Tertians and Quotidians are so short, that they do not allow sufficient time to impregnate the Blood perfectly with the febrifuge Virtue of the Bark; so that 'tis not to be supposed, that the Patient should so certainly miss the next Fit after the first time of taking it, as it commonly happens in a Quartan; for the Medicine, in these Cases, will frequently not effect the Cure in less than two Days.

It must, also, be remark'd, that if the Patient, notwithstanding the Observance of the Cautions above delivered, should relapse, which happens less frequently in a Quartan than in Tertians and Quotidians, it will become a prudent Physician not to adhere too closely to the Method of giving the Bark at the above-mentioned Intervals; but to attempt the Cure, as his Judgment shall direct, by some other Procedure: And here the bitter Decoction is generally esteemed of most powerful Efficacy.

With respect to Diet and Regimen, the Patient must be allowed the Use of all Kinds of solid and liquid Aliment that agree with his Stomach, Fruit and cold Liquors always excepted; because they impoverish the Mass of Blood, and are very subject to occasion a Relapse. Let the Diet, therefore, be Flesh of easy Digestion; and a moderate Use of Wine may be permitted for common Drink; by the sole Use whereof I have sometimes recovered such as have been so debilitated by the frequent Return of the Intermittent, that the Bark proved ineffectual to their Cure. The Patient, also, must not unadvisedly expose himself to the cold Air, till the Blood has recovered its former healthy State.

It must here be remark'd, that tho', in treating of Intermittents heretofore, we recommended due purging after the Disease was gone off, yet this practical Caution is only to be understood of such Intermittents as either went off spontaneously, or were cured without the Assistance of the Bark: For when the Cure is effected by this Medicine, Cathartics are unnecessary and injurious; so powerfully does the Bark, alone, resist the Fits, and the Indisposition they occasion. Hence, therefore, all Kinds of Evacuations must be refrained from; for the gentlest Purge, even a Clyster of Milk and Sugar, will certainly endanger a Relapse, and, perhaps, reproduce the Disease.

And here it is proper to mention, that a very remarkable Symptom sometimes succeeded these Intermittents in the first Years of this Constitution: For the Fits did not begin with Chills and Shivering, which were succeeded by a Fever; but the Patient was seized with the Symptoms of a true Apoplexy; though, in Reality, how nearly soever it resembled this Disease, it was nothing more than the Effect of the Fever's seizing the Head; as plainly appeared from other Signs, as well as the Colour of the Urine, which in Intermittents is usually of a deep red, though not so red as in the Jaundice, and, also, lets fall a lateritious Sediment. But though in this Case all Kinds of Evacuation seem to be indicated, in order to make a Revulsion of the Humours from the Head, as is generally practised in the genuine Apoplexy, yet they are to be wholly refrained from, because they are very prejudicial in the Intermittents, whence this Symptom originally proceeds, and, consequently, endanger Life, as I have observed. On the contrary, therefore, we must wait till the Fit goes off spontaneously, when the Bark, in case it could not be given sooner, must immediately be exhibited, and repeated with sufficient Frequency in the Intervals, till the Patient be perfectly recovered.

And these are the Observations I had to communicate, in a summary way, concerning the Use of the Bark; for my Design was not to consult the Pomp of Medicine: And, in reality, they who add any thing more to the Bark than a Vehicle, which is necessary to carry it into the Stomach, in my Opinion either do it ignorantly, or fraudulently; which every good Man must detest, who, as a Part of the Whole, would not be induced to commit such a Fraud, for his private Advantage. As to what remains, if my Contemporaries had pleased to have considered what I published in my History of acute Diseases, (which, it is highly probable, I was acquainted with before that time) relating to the Method of exhibiting the Bark in the Intervals of the Fits, and the succeeding Repetition of it when the Disease was gone off, perhaps the Lives of many Persons had been saved; how much soever some Men contemned my slender Endeavours for the public Good, and slighted the Cautions there delivered in the following Words; which contain, in a concise manner, what I have here judged proper to enlarge upon.

1. "Great Caution must be had not to give this Bark too early, that is, before the Disease be in some measure spontaneously abated; unless the extreme Weakness of the Patient requires it to be given sooner: For the giving it too soon may render it ineffectual, and even fatal, if a sudden Stop should be thus put to the vigorous Fermentation raised in the Blood, in order to its Despumation. 2. We must not direct Purging, much less Bleeding, in order to carry off a Part of the febrile Matter, and render the Bark more effectual; for they both weaken the Tone of the Parts, whence the Disease returns so much the more expeditiously and certainly, after the Virtue of the Bark is spent. It were better, in my Opinion, to impregnate the Blood with this Medicine by Degrees, and at distant Intervals from the Fit, rather than endeavour to stop it at once, just upon its coming; for by this means the Bark has more time to produce its full Effect in; and, besides, the Mischief is avoided that might happen by putting a sudden and unseasonable Stop to the Fit just approaching. 3. The Bark must be repeated at short Intervals, that the Virtue of the former Dose may not be entirely gone off, before another be given; and by repeating it frequently the Disease will, at length, be perfectly cur'd. For these Reasons, I prefer the following Method of giving the Bark to all others.

"Take of the *Peruvian Bark*, one Ounce; Conserve of "Roses, two Ounces: Make an Electuary thereof. Take "the Quantity of a large Nutmeg, every Morning and "Night, on the intermediate or well Days, till the whole "be taken; and let it be repeated thrice, interposing a "Fortnight between each time."

But though the Bark is the best Medicine hitherto discover'd, for the Cure of these Diseases; yet I have known Vernal Tertians, in Persons in the Prime of Life, and of a sanguine Constitution, yield to the Use of the following Remedies: For Instance, Bleed in the Arm upon the intermediate Day; and some Hours afterwards, upon the same Day, give an Emetic of the Infusion of *Crocus Metallorum*, regulating the time in such manner, that its Operation may be over before, the Fit comes on; and as soon as it is gone off, let the following Electuary be given.

Take of the Extract of Wormwood, Gentian, and the lesser Centaury, each two Drams: Mix them together, and divide the Whole into nine Doses. Of which, let one be taken every fourth Hour; drinking, after each Dose, of the bitter Decoction without Purgatives, and of White-wine, each three Ounces.

There is another Method of curing these Tertians in Persons of low Circumstances, who are unable to be at the Expence of a long Course of Medicines, in order to their Cure. As,

Take of *Virginian Snakeweed*, in fine Powder, a Scruple; White-wine, three Ounces: Mix them together. Let the Patient take it two Hours before the Fit comes on; and, being well covered with Cloaths, let him sweat three or four Hours afterwards; and let it be repeated twice in the same manner.

In the following Year 1679. these Intermittents re-appeared at the Beginning of July, and, increasing every Day, proved very violent and destructive in August: But, having already treated of these at large, I shall only observe, that they gave way to a new Epidemic, which proceeded from the manifest Qualities of the Air in November. *Sydenham*.

OF THE SALUBRITY OF FEVERS.

Such is often the wise and admirable Oeconomy of Nature, that what at first Sight appeared noxious and prejudicial, tends to promote and advance the Happiness and Health of Mankind. In no Instance is this Doctrine more remarkably verified, than in Fevers, since the febrile Commotions of the Blood, which accompany many Disorders, both of the chronic and acute Kind, are of such a Nature, as to banish and extinguish morbid Causes; and, consequently, they must be rather beneficial than detrimental to the human Body.

Before we proceed to the Confirmation of this Assertion, we shall observe, that this Doctrine is supported by the Authorities of the Antients. Thus the divine *Hippocrates*, in his Writings, often affirms, that a supervening Fever cures some Disorders, to be afterwards mentioned: And *Celsus*, in *Lib. 2. Cap. 8.* tells us, that a Fever itself, which to some may seem strange, often proves salutary: For a Fever allays Pains of the Præcordia, if not attended with an Inflammation, mitigates Pain, and, succeeding Convulsions of the Nerves, and a Rigor, totally removes them. It, also, relieves the Disease of the small Intestines arising from a Difficulty of Urine, if by the Heat it promotes a Discharge of it: Besides, a Fever was by the sagacious Antients defined the Struggle, Motion, or Contest of Nature, against the morbid Cause and Force of the Disorder; by which they intended to insinuate, that it was rather of a salutary, than of a noxious Nature: For that which fights against the Enemy of Life, which is the morbid Cause, cannot, in its own Nature, be pernicious. Hence *Linden*, in *Selectis Medicis*, cannot sufficiently wonder, that, notwithstanding the many Instances of this, in the Writings of *Hippocrates*, some should yet ascribe this Doctrine to *Campanella*, and damn it as a Novelty invented by a Man who was no Physician: For that Author, in *Tr. de Sensu Rerum, Lib. 7. Cap. 2.* affirms, that no Fever is a Disease, but a Remedy against other Diseases. This Opinion is, also, espoused by *Joh. de Meig.* in *Comment. Philos. Cap. 5. Loc. 5.* and the celebrated *Sydenham* is at a great deal of Pains to prove, that a Fever is the Effort or Instrument of Nature, by which the pure are separated from the impure Parts, and the morbid Cause exterminated and expelled.

Hence the Reason is obvious, why *Hippocrates*, in *Epidem. Lib. 2.* informs us, that it is the Office of a prudent Physician, sometimes, to excite Fevers: Besides, nothing more confirms this Doctrine, than the universal Agreement of the Antients in this, that Nature was the best Physician; cured best; terminated

nated Disorders most happily; and, as *Galen* expresses it, made a violent Insurrection against the morbid Cause; strongly attempted Crises and Excretions; and at last, by Concoction and Evacuation, freed from mortal Disorders: For the Struggle or Effort of Nature against the morbid Cause, is nothing but a Fever. Hence we justly conclude, that a Fever is the Instrument by which Nature preserves the human Body, opposes morbid Causes, and, by expelling them, restores Health.

All Physicians, both antient and modern, have accounted a Fever a Disease in a certain Sense; and *Hippocrates*, in *Lib. de Flatibus*, *Sect. 3.* calls a Fever a common Disease, which accompanies other Disorders, and especially an Inflammation: For a Fever is a preternatural Commotion of the Blood and Humours, which not only injures and weakens the Functions of the Body and Mind, but, also, proves mortal: For few are taken off without a Fever. But this does not hinder it from being, in other respects, the Remedy not only of its own Cause, but, also, of other Disorders: So that we cannot sufficiently admire the stupendous Skill of the adorable Architect, who has so artfully contrived the human Structure, that by its Force and Strength it cannot only defend itself from impending Injuries, but, the Commotions or Effects of the morbid Cause are of such a Nature, that, if all other Circumstances are equal, they are, also, sufficient for removing themselves, and the Disorder. But that this Doctrine may be the better comprehended, we shall inquire into the Nature and Essence of a Fever, examine how it is created by Nature, and determine what Fevers produce such salutary Effects, at what Time, in what Diseases, and under what Circumstances, such laudable Consequences may be expected.

How common a Fever is, how often it accompanies most other Disorders, and how much the Knowledge of it has hitherto been involved in Perplexities and Obscurities, is sufficiently known; for almost all the celebrated Writers embrace different Opinions and Hypotheses, with respect to Fevers: But, without enumerating them, we shall only observe here, that as Health and Life depend on the due Motion of the animal Spirits, and Circulation of the Blood, so the Origin and Causes of all internal Disorders ought to be deduced and explained from some preternatural Circumstance in these Fluids. Hence we define a Fever, a too brisk Motion of the Muscles, especially of the Heart, accompanied with an unequal Circulation of the Blood, a Change of the Excretions, of the natural Heat, Pulse, and remitting or intermitting at certain Times.

A Fever is, therefore, a strong and increased Motion of the muscular System. Motion, by the Consent of the greatest Physicians, is performed in the human Body by means of an highly subtil and fluid Substance, by some called the animal Spirits, and by others the vital Principle, which exists originally in the Semen, is contained in the Blood, and afterwards supported by the external Air, and spirituous Aliments. This Substance was by the Antients called *Nature*, the *Anima purpurea*, and the *Calidum innatum*; and is the Cause not only of intestine, but, also, of circular Motion; moves all the Limbs, and is the genuine Instrument of Sensation and Reasoning. This Substance is capable of having its Motion augmented and accelerated in the Nerves, and muscular Fibres; as evidently appears in Spasms of the Skin, and internal Parts, and during an increased and more frequent Action of the Heart, accompanied with preternatural Heat. We, therefore, affirm, with *Helmont*, in *Lib. de Febris*, *Cap. 1.* that the febrile Heat is not proper to the peccant Matter, or the Effect of it; but that it is the Effect of the animal Spirits acting too violently, which, as in a sound State, they are the Source of natural Heat, so they are, also, the immediate, primary, and efficient Cause of a febrile Heat. But I differ from *Helmont* in this, that he says the material Cause of a Fever is only occasional, and free from a material physical Influence and Concurrence, to the Production of a Fever; but that it affords an Occasion or Opportunity to the intelligent *Archæus*, or Nature, which, in the same manner as when an Object of Anger is externally presented, by her proper Force and Energy, rouses herself, attacks the Enemy, and endeavours to expel him. But I cannot deny, that the morbid Cause has a certain Power of Action and Motion, which, by acting inordinately on the animal Spirits, or vital Principle, by a certain mechanical Necessity, excites that impetuous Motion observable in the Heart, Arteries, and Muscles: For the febrile or morbid Motion is produced by the Action and Reaction of the active morbid Matter, and the moving vital Principle in the human Body; in which Sense it may be admitted, that Nature, or *Archæus*, is the Author of Fevers.

But we must determine by what means the febrile Matter acts on the animal Spirits in the Nerves and Membranes; what sort of Effect or Reaction succeeds this Operation, and how the Symptoms, common to Fevers, are produced. Now we assert,

that all Motion of the muscular Fibres is active, systaltic, or contractory: Hence such a Motion must be rendered preternatural, either by Intension, or Relaxation, of the Fibres. The Intension is generally called a Spasm, which is a preternaturally strong and long-continued Contraction of the muscular Fibres. Such Spasms constitute the first and fundamental Cause of all preternatural Disorders, and morbid Commotions, and produce many and various Effects; since there is hardly any Disease without Spasms: These happen more especially in Fevers, and the Generation of excessive Heat, where Spasms are the Cause of the unequal Circulation of the Blood, the irregular and increased Pulse, and the other Symptoms: For as when the Tone of the Muscles, and Pulsation of the Heart, are moderate, and in due Proportion, the Fluids circulate regularly, the excrementitious Parts are secreted and eliminated, and such Substances, as are subservient to Life and Health, are retain'd, so, on the contrary, as soon as the Tone of the Muscles is vitiated, or as soon as a Spasm happens, and the Motion of the Heart becomes inordinate, the whole Order of the vital Motions, and the Oeconomy of the Secretions and Excretions, are disturbed and perverted.

The evident Signs and Effects of spasmodic Contractions of the muscular Fibres and Membranes, which in the Beginning of Intermittents appear evidently, but in a more languid manner in the Remission of continual Fevers, are various, according to the Diversity of Patients and Fevers. The following Symptoms, especially in the Beginnings of these Disorders, appear: The Skin, which is highly sensible, and the Organ of Touch, is much constricted, the lax Pores contracted, and the Skin raised into Tubercles, like that of a Goose: The Vessels, which were before tumid, and full of Blood, subside and disappear; the natural Redness is converted into a livid Colour; the turgid State of the whole Body subsides; there is a violent Horripilation, Rigor, and Refrigeration, especially of the Extremities; the Skin, which was before moist, becomes dry and parched; and the Sweat is suppressed. But this Compression and Constriction of the Fibres and Vessels is not only found on the Surface of the Body, but, also, in the internal Parts; as is obvious, about this time especially, in flow and continual Fevers, from the copious Discharge of aqueous limpid Urine, an obstinate Costiveness, a Retention of the Flatulencies, the Impossibility of injecting Clysters, the Anxiety of the Præcordia, the Nausea, and Disposition to vomit, and the intense Pain about the spinal Marrow, and Region of the Loins; all which Symptoms sufficiently evince, that not only the Stomach and Intestines, but, also, the Kidneys, and hepatic Vessels, are spasmodically constricted. Nor is the Substance of the Heart, Arteries, and Muscles, free from such Spasms, which, being rooted in the Spirits, by Consent affect the whole Body; as is evident, from the small, frequent, hard, and weak Pulse, arising from an insufficient and less free Influx of the Spirits. All these Symptoms differ not only in Degree, but, also, with respect to the Time of their Accession; since in Intermittents they appear in the Beginning, whereas, in those of the continual Kind, they appear in the Height and Decline of the Disorder, without observing Time, Tenor, or Proportion. And, certainly, there is no Fever with which the skilful Physician will not observe such Symptoms complicated. These Things were diligently observed by *Helmont*, who, in *Lib. de Febr. Cap. 9.* gives us the following remarkable Observations: The Part in which the febrile Matter is lodged, is first corrugated, which is easily perceptible in the Præcordia; in the affected Part all the Veins are disorder'd and constricted, by a Contraction of their oblique Fibres: Hence arises a rare, hard, and small Pulse, at once the Sign and the Cause of the cold Fit. This corrugating Stricture of the Veins will be easily perceived by every feverish Person, if he carefully adverts to his own Condition; and even a sound Person, by careful Attention, may be sensible of the natural State of the Veins: For when the Scrotum is lax, and hanging down, it is spontaneously corrugated, when the Excrements arrive at the Sphincter of the Anus. It is, therefore, natural for the Veins, and Parts primarily affected, to corrugate themselves; and as almost all Veins have corresponding Arteries, these must, also, in Consequence of their Communication, be seized with Convulsions. Spasms constitute the principal Cause both of the febrile Rigor and Heat; for, by means of the Spasms, the Circulation of the Blood through the Parts of the Body is rendered unequal, so that some Parts are turgid with Blood, whilst others are entirely deprived of it. In some Parts it, also, moves more quickly, and in others more slowly: Hence some Parts are affected with a Horror and Coldness, whilst others are seized with a preternatural Heat: And this unequal Circulation of the Blood, arising from Spasms, constitutes the very Essence of a Fever. None, either of the Antients or Moderns, has more judiciously treated of this, than *Hippocrates*, in his Treatise *de Flatibus*. For, says he, when the lower Belly is obstructed, Flatulencies run through all the Parts of the

the Body [by Flatulencies he means irregular Motions of the Spirits, which produce Spasms, as is obvious from what he had before said], and, being conveyed to the Parts full of Blood, refrigerate them; since, by constricting them, they hinder the Afflux of the Blood. But when those Parts, which are the Source and Fountain of the Blood, are refrigerated, such as the Heart and Liver, an Horror penetrates through the whole Blood; and, when the whole Blood is refrigerated, an Horror must, of course, seize the whole Body. For this Cause, therefore, the Horrors first arise before the Fever; and, according to the Quantity in which the disorderly Spirits have made their Influx, such will the subsequent Rigor be: If many cold animal Spirits have made their Influx, the Rigor will be vehement; but if a smaller Quantity of less cold Spirits have made their Influx, the Rigor will be less violent. These Horrors are, also, accompanied with Tremors, which happen by this means: The Blood, dreading a present Horror, runs through all the Parts of the Body, and flows principally to the warmest Parts: For when the Blood flows rapidly from the Extremities, the Viscera and Flesh tremble; for some Parts of the Body are full of Blood, whilst others contain none at all: And the Parts without Blood cannot rest for Cold, but shake, because depriv'd of Heat: Those Parts, on the contrary, which are full of Blood, tremble, and are seized with Inflammations, in Consequence of the Redundance of the Blood. This Doctrine he confirms in *Lib. 2. de Morbis, Sect. 5.* The Blood being condensed, the Veins are contracted, and, in their Contraction, contract the Body, and excite a Tremor. If the Blood is but little condensed, the Symptom produced is only called a Rigor; but if it is greatly condensed, a Horror is excited, which greatly afflicts the Patient. That a greater or less Fever is necessarily produced after the Horror, is owing to this: When the Blood, by any Force, (that is, an increased Motion of the Heart and Arteries) becomes warm, and again resumes its own Nature, that is, exchanges a cold for a hot State, the Phlegm and Bile mixed with the Blood, by the violent Motion, also, become warm, and even much hotter than the Blood: When these Fluids are, therefore, warmed after the Rigor, a Fever must succeed the Heat of the Blood. In this Passage *Hippocrates*, from mechanical Principles, and the Laws of Motion, so accurately describes the Progress and Generation of these Fevers, that we may justly doubt whether the Moderns can give a more distinct Account of them.

Nor is the Doctrine of *Erasistratus* very different from this of *Hippocrates*: For that Physician, as *Celsus*, in *Lib. 1.* observes, was of Opinion, that if the Blood was conveyed into the Veins accommodated to the Spirits, that is, into the Arteries, and excite an Inflammation, which the *Greeks* call *Phlegmone*, that Inflammation excites such a febrile Commotion as is perceived in a Fever: And, afterwards, when, mentioning *Erasistratus*, he tells us, that he affirmed, that a Fever was produced by a Transfusion of the Blood into the Arteries, in consequence of its Redundance. By these Passages, the Inequality of the Circulation of the Blood, in all febrile Commotions, is excellently described: For the Rigor which generally precedes the febrile Heat, is a Kind of Spasm, by which the capillary Vessels, being obstructed, hinder the free Circulation and Return of the Blood through the Arteries to the Heart: Hence the Blood, regurgitating to the Arteries and Left Ventricle of the Heart, and pressing upon them by its Weight, invites a freer Influx of the Spirits, and increases the Pulse. Hence *Hippocrates*, in *Lib. de Flatibus*, informs us, that the Blood, when warm, and forcibly propelled, cannot pass through a narrow way (the Arteries) with Celerity, because many Things hinder and obstruct its Motion: By these means, the Pulsations of the Arteries are produced, and in this manner Fevers and Pains are excited.

From what has been said, it is sufficiently obvious, that, in Fevers, the Cold which is principally perceived towards the Extremities, is owing to the Defect of a sufficient Influx of Blood, and a languid intestine Motion of that Fluid; whereas the succeeding febrile Heat depends upon an increased intestine Motion of the Fluids.

But as the Effence of a Fever consists in an unequal Circulation of the Blood, and the Cold, Horror, Heat, and other Symptoms depending upon it; we shall, having already considered the Origin of the Refrigeration, now investigate the Source and Causes of the febrile Heat. The various Opinions of Authors, concerning this Phenomenon, are found in *Frid. Hoffmanni Dissertat. de Caloris & naturalis & præternaturalis Causis.*

It is an usual Question, among Physicians, Whether the Violence of the febrile Heat depends on an increased Circulation of the Blood. *Borelli*, in *Tr. de Motu animal.* seems to have been the first who maintained this Opinion: For, says he, the most proper Affection and Characteristic of a Fever is, an increased Pulse, and a violent Commotion of the Heart and Ar-

teries succeeded by a febrile Heat. This is not only universally agreed upon, but, also, confirm'd by Reason and Experience; because, upon a violent Commotion and Concussion of the Heart, there soon after succeeds a new and preternatural Heat of the whole Body, as is obvious in Anger, and violent Commotions of the Body. In like manner, when such a Motion of the Heart is removed, that is, when its Action is diminished, and rendered slower, a Tepidity, Rigor, and Coldness, succeed; as it happens in the Colds and Rigors of Quartan Fevers. He afterwards, in the same Work, tells us, that, by the vehement and quick Pulsation of the Heart, the Blood, which is return'd during the Rest of the Heart, being poured from the *Vena Cava*, must be impelled into the Arteries, as far as the minutest Capillaries, by the same brisk Motion with which the Heart is contracted; as is obvious, from the Laws of the Circulation. It is, also, certain, from the Evidence of Sense, that, by a violent and brisk Circulation of the Blood, a Fervor and Heat, which did not before exist, are excited through the whole Body; the Origin of which is not, in my Opinion, to be deduced from Motion, considered as Motion, but, rather, from the Nature of the Blood itself, which contains a Spirit, or Oil, or, rather, igneous Particles, sheathed up; which, when dissolved, and disengaged from their Fetters, in such a manner as to exert their Motion, excite a sensible Heat.

Next, therefore, *Borelli* deduces the Heat of the Blood from an increased intestine Motion of its subtil and sulphureous Parts; for, by the Consent of all modern Philosophers, Heat is nothing but an highly rapid Motion of sulphureous Parts: Nor is it to be doubted but this hot intestine Commotion of the Parts of the Blood is increased, by an accelerated Circulation, which is discovered by the Vehemence, the Frequency, and the Fullness of the Pulse: For when the Pulse is frequent, vehement, and full, the Blood must necessarily be moved briskly through the Vessels of the Body, and the Heat be sensibly increased. Nor is it to be doubted, that not only in a sound State, by an increased Vehemence and Largeness of the Pulse, in Consequence of a violent Motion of the Body, or Commotion of Mind, the Circulation of the Blood, and, consequently, the Heat is increased, but, also, in an unsound State, and even in Fevers, especially those of the intermittent, tertian, and continual Kind, as, also, those of the burning Kind, and the *Synocha*, the same Species of Pulse must produce a brisker Circulation, and, consequently, an increased Heat of the Blood. But this does not happen universally; nor do I assert, that where-ever there is a preternatural Heat in the Blood, there its Circulation must be increased: For an increased Circulation is not the only Cause of the hot intestine Motion of the Parts of the Blood, since various important Arguments convince me, that several other Causes may concur to throw the minute Particles of the Blood into a violent vertical Motion, even when its Circulation is slow and languid: For it is certain, that not only in malignant, but, also, in several other Fevers, there is a preternatural and intense Heat, where the Pulse is neither vehement, strong, nor large; but only quick, or frequent, small, and even weak; which Species of Pulse by no means discovers a quick Circulation of the Blood through the Heart: Besides, the inflammatory Stagnations of Blood in the Lungs, and other Viscera, which are accompanied with an internal uneasy Heat, a Thirst and Refrigeration of the Extremities, sufficiently evince that all excessive Heat does not proceed from an increased Circulation of the Blood: And, certainly, nothing is more observable in Practice, than that an intolerable Heat preys upon the internal Parts of the Body, when the external Parts are obstructed, contracted, dry, and parched; and that, on the contrary, that Heat is less troublesome, which seizes only the Surface of the Body, or tends towards the external Parts; since this latter Species of Heat indicates a free Circulation of the Blood through the Surface of the Body, whereas the former Species discovers an obstructed or retarded Motion of the Blood through the internal Parts: So that, in Practice, this Difference is to be perpetually observed, that, in an internal Heat, the Danger is always great; whereas, when the Heat is external, there are greater Hopes of the Patient's Recovery.

Besides, it is, also, confirmed by Experience, that all such Things as render the Blood fluid, and invite its Motion and Circulation to the external Parts, so that a gentle Sweat may succeed, which happens under a full and quick Pulse, which is, a Proof of the increased Circulation of the Blood, instantaneously extinguish the most uneasy Heat; so that the Physician acts a judicious Part, who, a few Hours before the Paroxysm, disposes the Body to sweat; by which means, the succeeding Paroxysm is always rendered more mild. It, therefore, seems consentaneous to Truth, that, under the intestine Commotion of the Fluids, many Effluvia, of an igneous Nature, are excited, that is, put in a violent Motion, which, if they can be freely discharg'd through the Emunctories of the Body, greatly lessen the Cause

of the Heat. But if these igneous Effluvia remain in the Habit, which happens by a Diminution of the Circulation, and an Obstruction of Perspiration, they must, by returning into the Blood, redouble, and greatly increase, the Heat: For we find, that the Heat excited on the Surface of the Body, proceeds more from the reflected intestine Motion of the subtil Parts, than from the Circulation of the Blood. It is, therefore, certain, that the Essence of Heat consists in an highly quick Motion of sulphureous Parts; and that this Heat becomes violent under every progressive Motion, by an increased Impulse and Attrition on the Vessels and Fibres of the solid Parts: But it by no means follows, that, where the Heat is increased, this should always happen by an increased Circulation, since such an Heat often proceeds from a Retention of the hot Exhalations, and their fresh Repercussions on the same Object; as is sufficiently obvious, in violent Inflammations, and hectic Heats.

But they who derive the Origin of febrile Heat from an increased Circulation of the Blood, build their Hypotheses on this Foundation, that a quick Pulse, which is the pathognomic Sign, and inseparable Companion of a Fever, is an infallible Proof of an increased Circulation of the Blood; and that there is a great Difference between a quick and a frequent Pulse, which are not to be confounded by Practitioners, since the latter is rather found in a natural State, and in young Persons, upon an increased Agitation, either of Body or Mind, upon drinking Wine, as, also, in a Palpitation of the Heart, and an Asthma; and, consequently, cannot be the genuine Sign of a Fever; whereas a quick Pulse is never absent from a Fever.

This Doctrine I have investigated with the more Accuracy, not only that we might be the more certain, with respect to the Origin of febrile Heat; but, also, that, knowing the Nature of the Pulses exactly, we might be able to form a Judgment, with respect to a Controversy long agitated among celebrated Physicians, Whether a frequent, rather than a quick Pulse, is the essential Mark of a febrile Commotion. See PULSUS.

Having already treated of the Causes of the Horror, Rigor, and Cold, which are always observed in Fevers, and generally precede them; having, also, explained the Nature and Origin of febrile Heat; and demonstrated the Reciprocation of two Kinds of Motions in Fevers, one of which tends from the external Parts to the Centre, and the other from the Centre to the external Parts; we now come briefly to inquire, whether these two Motions depend upon merely physical, or on moral in Conjunction with physical Causes; as, also, what End they answer, and for what Purposes they are destined. In order to answer the first Part of this Question, it is to be observed, that the Mind, though incorporeal, has, nevertheless, in thinking and reasoning, a powerful Influence on the vital Principle, or the Motion of the animal Spirits, which it either increases, diminishes, or variously determines. As this was never denied by any Person who knew the Powers of the Passions and Imagination, and in what manner they change not only the Motion and Crasis of the Fluids, but, also, the Configuration of the Solids; so it is not to be doubted, but a certain febrile Commotion may be excited by Causes merely of an intentional and moral Nature. But it is principally to be determined whether a Fever is not most frequently produced by Causes merely physical, acting without any Morality, and without any spontaneous Direction of such an increased febrile Motion. The first who asserted moral intentional Causes which tend to a certain End, and which are only on the Presentation of a certain Object, received into the internal Agent, or *Archæus*, was *Helmont*, in *Lib. de Morborum Ortu & Febribus*; where he preposterously attempts to reduce the physical Causes of Diseases to the Class of moral Causes. But I was always of Opinion, that where known Causes, and Explications by sensible, obvious, and physical Matters, are or can be found, and where Phenomena can be accounted for from the Properties of Bodies, we are never to have recourse to unknown or incorporeal Qualities in them; for it is to be observed, that the Antients carefully distinguished the Effects of Nature from the Operations of the Mind; for they never call the Mind the *Curer of Diseases*, which, however, they affirm concerning Nature.
